to prepare them for the action of pancreatic and intestinal fat-splitting enzymes. The salts are large, negatively charged ions that are not readily absorbed by the upper region of the small intestine; consequently, they remain in the intestine until most of the fat is digested. In the lower intestine, the salts and acids are absorbed and passed back into the bloodstream until they are once again extracted by the liver; this cycle, from the liver to the intestine and blood and then back to the liver, is called enterohepatic circulation. Some salts and acids are lost during this process; these are replaced in the liver by continual synthesis from cholesterol. The rate of synthesis is directly related to the amount of acids and salts lost. Bile salts do not normally reach the colon; when they do, however, they inhibit the absorption of water and sodium, causing a watery diarrhea.

Bile salts and acids are transported in a fluid that contains water, sodium, chloride, and bicarbonates. This fluid is produced in the liver, and it serves to neutralize hydrochloric acid passed from the stomach into the small intestine. Water-insoluble wastes that the liver removes from blood, such as cholesterol, steroids, drugs, and hemoglobin pigments, are carried in the fluid to the excretory system. Hemoglobin pigments are broken down, producing several bile fluid compounds, including bilirubin (q.v.), which has no known function other than that of a colouring agent. Traces of other substances can also be found in bile, but their significance there is not fully understood; a few of these substances are mucus, serum proteins, lecithin, neutral fats, fatty acids, and urea.

Bilecik, city, northwestern Turkey. Bilecik lies along the Karasu River, a tributary of the Sakarya River. It was captured from the Byzantines by the Ottoman ruler Osman I in 1298. The city and its famous silk industry suffered heavily during the Turkish War of Independence (1919–22), when it was occupied by Greek forces. The old town is on the upper slopes of a hill, while the modern quarter lies around the railway station, on the Ankara-Istanbul line. Pop. (1990 prelim.) 23,050.

Bilfinger, Georg Bernhard (b. Jan. 23, 1693, Cannstatt, Württemberg [now in Germany]—d. Feb. 18, 1750, Stuttgart), German philosopher, mathematician, statesman, and author of treatises in astronomy, physics, botany, and theology. He is best known for his Leibniz-Wolffian philosophy, a term he coined to refer to his own position midway between those of the philosophers Gottfried Wilhelm Leibniz and Christian Wolff.

At Tübingen, Bilfinger was made court preacher and, in 1721, professor of philosophy at the university there. In 1724 he was appointed professor of moral philosophy and mathematics; but his association with Wolff, who was expelled from Halle in 1723, led to charges of atheism against him, and he was removed from his teaching positions. With Wolff's help, he in 1725 became a professor at the University of St. Petersburg. His dissertation *De Causa Gravitatis Physica Generali* (1728; "On the General Physical Cause of Gravity") won the highest award in a contest sponsored by the Paris Academy. His reputation improved, Bilfinger returned to the University of Tübingen as professor of theology in 1731.

Bilfinger was one of the most accomplished and versatile thinkers of his time. Although he was the pupil, friend, and defender of Wolff, it was rather on Leibniz' work that he concentrated his attention. Bilfinger's most original contribution to philosophy—a theory of possibility—is found in *Dilucidationes Philosophicae de Deo, Anima Humana, Mundo, et Generalibus Rerum Affectationibus* (1725), a discussion of God, the human soul, and the physical world in general. In this work he

differs from Leibniz' views on two important points, both concerning monads, the infinitesimal psychophysical units of force that constitute the universe (according to Leibniz). Whereas Leibniz had held each monad to be at once physical and spiritual, Bilfinger insisted on the heterogeneity of material and spiritual monads, with the consequence that he could not regard all monads as percipient: some of them rather were endowed only with moving force. His other major deviation from Leibniz was on the question of preestablished harmony, which he held to apply not to the whole universe but only to the relationship between the soul and the body and to consist in a correspondence of inner states in the percipient and in the nonpercipient monads.

Bilge, also spelled **BILGÄ**, Wade-Giles romanization **P'İ-CHIA**, or **MO-CHI-LIEN**, Pinyin **PIJIA**, or **MOJILIAN** (d. 734), khagan, or great khan, of Mongolia from 716 until his death. His name literally translates as "Wise Emperor."

Bilge assumed leadership of the T'u-chüeh, a tribe of Turks in control of southern Central Asia, when his brother instigated a palace coup against the old ruler. When the Tang emperor Hsüan Tsung refused his offer of an alliance, Bilge decimated the Chinese army, forcing them to sue for peace in 721. Bilge is even better known, however, for advising his successors that the power of the T'u-chüeh came from their nomadic life and that to settle in agricultural communities on the Chinese border would weaken them.

bilharziasis (disease): see schistosomiasis.

Bilhorod-Dnistrovskyy, Russian **BELGOROD-DNESTROVSKY**, Turkish **AKKERMAN**, Romanian **CETATEA ALBÄ**, city, Odessa *oblast* (province), southernmost Ukraine. It lies on the southwestern shore of the broad, shallow Dniester River estuary. In the 6th century BC, Greeks from Miletus established the colony of Tyras on the site. It later came under the Scythians, and it was settled by Slavs in early Kievan times (9th century). After the fall of Kiev to the Tatars, Belgorod became a republican city-state under Moldavian princes, and the Genoese established their trading station of Mauro Castro there. Stormed by the Turks in 1484, it remained Turkish under the name Akkerman until 1812, when it was ceded to Russia. From 1918 to 1940 it was included in Romania with the name Cetatea Albä. It was retaken by the Soviet Red Army in 1944 and given back its original Slavic name. The modern city is a minor regional centre with light industries, notably fish canning. Pop. (1991 est.) 56,800.

bilin, also called **BILICHROME**, any biological pigment (biochrome) belonging to a series of yellow, green, red, or brown nonmetallic compounds that are formed as a metabolic product of certain porphyrins. In addition to their presence in the bile pigments of mammals, bilins also occur in invertebrates, lower vertebrates, red algae, and green plants. Bilin pigments not only impart various colours to certain animal parts or products but are also indispensable in a number of photoperiodic processes in green plants and as accessory pigments in the photosynthetic process in red algae. As accessory pigments, bilins absorb photons of wavelengths not absorbed by chlorophyll pigments.

bilirubin, a brownish yellow pigment of bile, secreted by the liver in vertebrates, which gives to solid waste products (feces) their characteristic colour. It is produced in bone marrow cells and in the liver as the end product of red-blood-cell (hemoglobin) breakdown. The amount of bilirubin manufactured relates directly to the quantity of blood cells destroyed. About 0.5 to 2 grams are produced daily. It has no known function and can be toxic to the fetal brain.

Bilirubin in the bloodstream is usually in a free, or unconjugated, state; it is attached to albumin, a protein, as it is transported. Once in the liver it conjugates with glucuronic acid made from the sugar glucose. It is then concentrated to about 1,000 times the strength found in blood plasma. Much bilirubin leaves the liver and passes to the gallbladder, where it is further concentrated and mixed with the other constituents of bile. Bile stones can originate from bilirubin, and certain bacteria can infect the gallbladder and change the conjugated bilirubin back to free bilirubin and acid. The calcium from the freed bilirubin can settle out as pigment stones, which may eventually block the passageway (common bile duct) between the liver, gallbladder, and small intestine. When blockage occurs, conjugated bilirubin is absorbed into the bloodstream, and the skin becomes yellow in colour (*see* jaundice).

Normally, conjugated bilirubin passes from the gallbladder or liver into the intestine. There, it is reduced by bacteria to mesobilirubinogen and urobilinogen. Some urobilinogen is reabsorbed back into the blood; the rest goes back to the liver or is excreted from the body in urine and fecal matter. In humans, bilirubin is believed to be unconjugated until it reaches the liver. In dogs, sheep, and rats, there is no bilirubin in the blood, though it is present in the liver.

bill (zoology): *see* beak.

Bill, Max (b. Dec. 22, 1908, Winterthur, Switz.—d. Dec. 9, 1994, Berlin, Ger.), Swiss graphic artist, industrial designer, architect, sculptor, and painter, primarily important for

"Konkrete Kunst," poster by Max Bill, 1944

By courtesy of the Bibliotheque Nationale Suisse, Bern

his sophisticated, disciplined advertising designs.

Bill's early ambition was to become a silversmith, but the work of the architect Le Corbusier influenced him to study architecture at the Bauhaus, Germany's foremost school of design. He also studied metalwork, stage design, and painting. In 1930 he set up his own studio in Zürich and concentrated on sculpture, painting, and architecture while earning his living by designing advertisements. After 1944 he became increasingly active as an industrial designer, creating products as diverse as chairs and wall sprockets with the same elegance of line and form that characterized his marble sculpture "Construction from a Circle" (1942). His use of austere geometric forms echoed his Bauhaus training.

Bill cofounded and was rector of the College of Design in Ulm, W.Ger. (1951–56). He designed the school's buildings, planned its curriculum, and was director of the department of architecture and product design there. He then served as a professor of environmental

design at the State Institute of Fine Arts, Hamburg (1967–74).

bill of —: *see under* substantive word (*e.g.*, exchange, bill of).

Billaud-Varenne, Jean-Nicolas (b. April 23, 1756, La Rochelle, France—d. June 3, 1819, near Port-au-Prince, Haiti), lawyer and pamphleteer, a member of the Committee of Public Safety that ruled Revolutionary France during the period of the Jacobin dictatorship (1793–94).

Billaud-Varenne was the son of a lawyer of La Rochelle. After studying at the universities of Paris and of Poitiers, he taught at the Oratorian college at Juilly. In 1785 he was admitted to the bar at Paris, and by 1787 he was writing anonymous tracts attacking the French church and government. He joined the Club of the Jacobins soon after the outbreak of the French Revolution in 1789.

As a member of the "revolutionary Commune," he helped plan the popular insurrection that overthrew the monarchy on Aug. 10, 1792. He was elected a deputy to the revolutionary National Convention, which convened on September 21, and, on his motion, the republic was declared the next day. Billaud-Varenne then threw himself into the struggle against the deputies of the moderate Girondin faction. The leading Girondins were expelled from the Convention on June 2, 1793, and the Jacobins took control of the Revolution.

By that time Billaud-Varenne had formed close ties with the Parisian sansculottes (wage earners and shopkeepers), who looked for leadership to the left-wing Jacobins under Jacques Hébert. Billaud-Varenne's *Éléments du républicanisme* (1793; "Elements of Republicanism") set forth such Hébertist demands as the redistribution of wealth and guaranteed employment for all workers.

Taking advantage of popular unrest in Paris, the Hébertists forced the Convention to appoint Billaud-Varenne and Jean-Marie Collot d'Herbois to the Committee of Public Safety on Sept. 6, 1793. On 14 Frimaire (Dec. 4, 1793) Billaud-Varenne secured passage of a law giving the committee absolute authority over provincial officials. Robespierre, the committee's chief spokesman, had the leading Hébertists guillotined in March 1794, and in the following month Billaud-Varenne and Collot d'Herbois forced him to eliminate Georges Danton, the leader of the Jacobins' right wing. Soon Billaud-Varenne was challenging Robespierre's leadership. Conspiring with Collot d'Herbois and other dissidents, he

Billaud-Varenne, engraving by F. Bonneville, late 18th century

By courtesy of the Bibliotheque Nationale, Paris

helped bring about Robespierre's downfall on 9 Thermidor (July 27, 1794). In the ensuing Thermidorian Reaction against the Jacobin regime, Billaud-Varenne and Collot d'Herbois were deported to French Guiana (April 1795), where Billaud-Varenne married and became a farmer. In 1800 he turned down Napoleon Bonaparte's offer of a pardon. He made his

way to New York in 1816 but settled in Haiti the following year.

billbergia, any member of a genus (*Billbergia*) of evergreen epiphytes of the pineapple family (Bromeliaceae), containing more than 50 South American species. Several species are grown indoors as decorative plants for their colourful foliage, flowers, or bracts (leaflike

Billbergia
Sven Samuelsson

clusters beneath the flowers). The stiff, spiny, often strap-shaped leaves grow in a rosette, sometimes up to 90 cm (35 inches) in diameter, directly from the root. The flowers are on a spike or panicle (loose cluster) growing from the centre of the rosette.

Consult the INDEX first

billbug, any of certain beetles of the insect family Curculionidae (order Coleoptera). Billbugs are stout-bodied beetles with short snouts; they range up to 5 cm (2 inches) in length. Some (*e.g.*, *Rhynchophorus*) are found mainly in the tropics, boring through the new growth of palm trees. The larvae of *R. cruentatus* are about 5 cm long and make a clucking sound while boring in cabbage palms. These larvae are eaten, either fried or raw, by natives of

Billbug (*Diaprepes*)

Raymond A. Mendez—Animals Animals

tropical America. A similar species (*R. ferrugines*) has threatened copra (dried coconut meat) production in the Pacific because it attacks coconut and wine palms.

Other billbug genera include *Diaprepes*, *Rhodoabaenus* (cocklebur weevils), *Sitophilus* (granary and rice weevils), and *Sphenophorus* (corn billbugs).

Billetdoux, François (b. Sept. 7, 1927, Paris, France—d. Nov. 26, 1991, Paris), French playwright whose works, linked with the avant-garde theatre, examined human relationships and found them doomed to failure.

As a youth, Billetdoux studied at the Charles Dullin School of Dramatic Art and the Institute of Higher Cinematographic Studies. From 1949 to 1950, he was director of the French Radio Department in Martinique.

Tchin-Tchin (1959; *Chin-Chin*), his first play

to win popular acclaim, traces the decline into alcoholism of a couple brought together by the infidelity of their spouses. In *Le Comportement des époux Bredbury* (1960; "The Behaviour of the Bredbury Couple"), a wife attempts to sell her husband in the classified pages of a newspaper. *Va donc chez Torpe* (1961; "Go to the Torpe Establishment"; Eng. trans. *Chez Torpe*) tallies the suicides in an inn whose owner insists on breaking down her guests' defenses. Other plays include *Il faut passer par les nuages* (1964; "You Must Pass Through the Clouds") and *Comment va le monde, monsieur? Il tourne, monsieur!* (1964; "How is the World, Mister? It's Turning, Mister!"). For several years Billetdoux worked in films and television, but he did write a fantasy play for the stage, *Reveille-toi, Philadelphia* (1988; "Wake Up, Philadelphia"). Structured around rapid, unexpected variations in mood and emotions, Billetdoux's plays are complex works, emphasizing social and philosophical arguments.

billfish, any of several long-jawed fishes, including the gar (*q.v.*).

billiards, any of various games played on a rectangular table with a designated number of small balls and a long stick called a cue. The table and the cushioned rail bordering the table are topped with a feltlike tight-fitting cloth. Carom, or French billiards, games are played with three balls on a table that has no pockets. The other principal games are played on tables that have six pockets, one at each corner and one in each of the long sides; these games include English billiards, played with three balls; snooker, played with 21 balls and a cue ball; and pocket billiards, or pool, played with 15 balls and a cue ball. There are numerous varieties of each game—particularly of carom and pocket billiards.

Many countries—among them France, England, China, Italy, and Spain—have been credited with the invention of the game, but, in fact, nothing is really known about the origin of billiards. It may be inferred that it developed from a variety of games in which propelling a ball was a main feature. The earliest references to the game in Europe occur in the 15th century.

All billiards games require the basic equipment of a table, cue sticks, and balls. The traditional mahogany billiards table is still in use, but tables are now generally made of

other woods and synthetic materials. The large rectangular table typically is twice as long as it is wide. It has a bed usually of polished slate covered by a woven woolen cloth, sometimes referred to as felt. Angled rails of hardened rubber or synthetic rubber, known as cushions, rim the inner edge of the table. The cue is a tapered rod of polished wood or synthetic material, ranging in length from about 40 to 60 inches (100 to 150 cm). The small end of the cue, with which the ball is struck, is fitted with a plastic, fibre, or ivory reinforcement to which is cemented a leather cue tip. Chalk in small cubes is applied uniformly to the cue tip permitting the players to strike the cue ball off centre on purpose in order to impart a spinning motion, called "side" in Great Britain and "English" in the United States. The billiard balls, formerly made of ivory or Belgian clay, are now usually plastic; they each measure from about 2¼ to 2⅜ inches (5.7 to 6 cm) in diameter, the larger balls being used in carom billiards.

Different forms of the game tend to be played in certain groups of countries or areas of the world, though many of the games cross many national boundaries. The game of carom is still played primarily in France and other European countries and to a lesser degree in the United States and has many players in Japan, Indonesia, the Philippines, Taiwan, and South Korea and in Central America, South America, Africa, and the Middle East. The game of English billiards is most popular in Britain and the former empire countries. The game of pocket billiards, or pool, which uses six large pocket openings, is primarily the game played on the American continents and, in recent years, has been played in Japan. The game of snooker is primarily British and is played to a small degree in the Americas.

Carom, or French billiards, games. Carom billiards is played on a table usually 5 by 10 feet (1.5 by 3 m) or 4.5 by 9 feet (1.4 by 2.7 m). It has no pockets. The game is played with three balls, two white and one red, with one of the white balls having a small red dot, or spot, to distinguish it. One of the white balls (plain or spot) serves as the cue ball for each player, the red ball and other white ball serving as his object balls. In play, the object is to stroke the cue ball so that it hits the two object balls in succession, scoring a carom, or billiard, which counts one point; in some carom games the cue ball must also touch a cushion or cushions one or more times to complete a carom. Scoring a carom also entitles the player to another shot, and his turn,

or inning, continues until he misses, when it becomes his opponent's turn.

English billiards. The game of English billiards is played on a relatively large table, usually 6 feet 1.5 inches by 12 feet (1.9 by 3.7 m); it is played with three balls as in carom—a plain white, a white with a spot, and a red. There are three ways of scoring: (1) the losing hazard, or loser, is a stroke in which the striker's cue ball is pocketed after contact with another ball; (2) the winning hazard, or pot, is a stroke in which a ball other than the striker's cue ball is pocketed after contact with another ball; (3) the cannon, or carom, is a scoring sequence in which the striker's cue ball contacts the two other balls successively or simultaneously. The skill involved consists of developing one scoring stroke after another. A player continues at the table for as long as he succeeds in scoring.

Snooker. Snooker is played on the same table and with the same size balls used for English billiards. The game is played with 22 balls, made up of one white ball (the cue ball), 15 red balls, and six numbered coloured balls including one yellow 2, one green 3, one brown 4, one blue 5, one pink 6, and one black (valued at 7 points). The player must first pocket a red ball and then try to pocket any colour he may choose, scoring the value of the ball that he has pocketed. He then alternately pockets red and coloured balls. Each red ball when pocketed remains in the pocket, while the colours when pocketed, as long as any reds remain on the table, are placed on their respective spots. Play continues until only the six colours remain on the table. Finally, the six coloured balls must be pocketed in the order of their values. When the last ball is pocketed, the game is ended. During play, when a player cannot hit the ball that the rules require him to hit (because of obstruction by another ball or balls), he is said to be snookered and loses his turn; this situation gives the game its name.

Pocket billiards, or pool. Pocket billiards is usually played on a table 4.5 by 9 feet (1.4 by 2.7 m), although in special championships the table is sometimes 5 by 10 feet (1.5 by 3 m), and in some areas of North and South America the tables are as small as 4 by 8 feet (1.2 by 2.4 m). Pockets on the pocket billiards table are wider than those on the English billiards and snooker tables. In pocket billiards, 15 numbered object balls are used in addition to one white ball; the object balls numbered from 1 to 8 are in solid colours, those from 9 to 15 in stripes. At the beginning of play the

Plans of billiard tables

15 object balls are racked at one end of the table in a triangular pattern, using a triangular wooden or plastic "rack." The first shooter breaks the formation with the cue ball; he then tries to sink the object balls in some designated order or manner. Not making a shot successfully allows another player to shoot. So does sinking the cue ball, which is known as "scratching." Many varieties of pocket billiards, or pool, are possible, the most popular probably being that known as rotation, or "Chicago," in which the object is to pocket the balls in numerical order, starting with the lowest number. The numbers of the balls are added up to determine the winner of the game. In so-called straight pool (also called 14.1 continuous pool, or rack pool), each player tries to sink 14 of the object balls in any order or combination. Before each shot, however, the player must call the number of the ball and the designated pocket; if successful, he scores one point.

Governing bodies. The world governing body of English billiards and of the English form of snooker is the Billiards and Snooker Control Council. Formed in 1919, it represents an amalgamation of the former Billiards Association, established in 1885, and the Billiards Control Club, established in 1908. It frames the conditions and rules of both games and publishes the official organ, *Billiards and Snooker*.

The principal governing body of the American pocket billiards games, including the American form of snooker, is the Billiard Congress of America, which has been the ruling body since 1948. It maintains the rules of the games and sanctions championship tournaments including the U.S. Open Pocket Billiards Championship, regarded as the world championship.

stagecoach station called Coulson was established there in 1877. Surveyed in 1882 by the Northern Pacific Railway Company, it was renamed for a president of the railroad, Frederick Billings. Early prosperity collapsed after 1887 but returned after 1900 with the rise of the cattle industry and irrigated agriculture.

Billings is the metropolis of the "Midland Empire," a rangeland and irrigated river valley region that produces sugar beets and varied truck crops, wool, and livestock. Beet sugar, oil refining, and food processing are important. The city is a gateway to Yellowstone National Park and Little Bighorn Battlefield National Monument. It is home to Montana State University-Billings, founded as a normal school (teachers college) in 1927, and to Rocky Mountain College (1898). Pictograph Cave State Park, 7 miles (11 km) southeast, has prehistoric artifacts. Inc. 1885. Pop. (2002 est.) city, 92,008; Billings MSA, 129,352.

Billings, Josh, pseudonym of HENRY WHEELER SHAW (b. April 21, 1818, Lanesboro, Mass., U.S.—d. Oct. 14, 1885, Monterey, Calif.), American humorist whose philosoph-

ical comments in plain language were widely popular after the American Civil War through his newspaper pieces, books, and comic lectures. He employed the misspellings, hapless grammar, and hopeless logic then current among comic writers who assumed the role of cracker-barrel philosophers. His special contributions were his rustic aphorisms ("The biggest pool in this world haint bin born yet; there iz plenty ov time yet") and his droll delineations of animal life.

Expelled from Hamilton College, Clinton, N.Y., in his second year for removing the clapper from the chapel bell, he drifted about for some years in the West and Midwest before settling in Poughkeepsie, N.Y., in 1858 as an auctioneer and land dealer. He began writing when he was 45, but he became successful only when he adopted the misspelling vogue. His "Essa on the Muel" made him suddenly famous, and after joining the *New York Weekly* in 1867 he became a national idol. Some of his best work is in a 10-year series of *Josh Billings' Farmer's Almanac*; he started in 1869 as a burlesque of *The Old Farmer's Almanac*. His other books were hasty collections of his newspaper writings, the most comprehensive being *Everybody's Friend* (1874).

Billings, William (b. Oct. 7, 1746, Boston, Mass., U.S.—d. Sept. 26, 1800, Boston), foremost composer of the early American primitive style, whose works have become an integral part of the American folk tradition. A tanner by trade, he was self-taught in music. Among his friends were many prominent figures of the American Revolution, including Samuel Adams and Paul Revere.

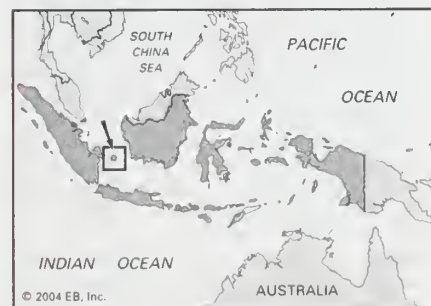

Billings' compositions include hymns, anthems, psalms, and fuguing tunes. His music is noted for its rhythmic vitality, freshness, and straightforward harmonies. The emotions embodied in his music range from the exuberant glory of the anthem "The Lord Is Risen Indeed" and the profound grief of the anthem "David's Lamentation" to the buoyant humour of the secular song "Modern Music" and the austerity of the canon "When Jesus Wept." His lyrical hymn "The Rose of Sharon" was one of the most popular of early American hymns.

Billings was active as an itinerant singing master and was influential in furthering the singing-school tradition of American folk culture. His six publications include *The New-England Psalm-Singer* (1770; the first collection entirely by an American composer), *The Singing Master's Assistant* (1778; known as "Billings' Best"), and *The Continental Harmony* (1794).

Billingsgate, market, the oldest in London until its closure in 1982, situated at the north end of London Bridge. From the 16th century it was principally a fish market, though most of the fish handled latterly was carried to and from the site by land. Market activities were moved in 1982 to a large modernized warehouse (built 1915) in the peninsular Isle of

Dogs overlooking the West India Dock near the River Thames. The word "Billingsgate" is derived from the coarse vituperative language for which the old fish market was famous.

Billiton, Indonesian BELITUNG, also spelled BELITOENG, or BELITONG, island, Bangka-Belitung *propinsi* (province), Indonesia. With 135 associated smaller islands, it lies between the South China and Java seas, southwest of Borneo and east of Bangka island (*q.v.*). The main town is the port of Tanjungpandan on the west coast. Billiton's area is 1,853 square miles (4,800 square km). Its coasts are sandy, marshy, and studded with rocks and coral banks, but the tidal Cerutuk River is navigable for 7 miles (11 km). Most of the land lies less than 130 feet (40 m) above sea level. Hills rise from flat or slightly undulating country, and in the central parts are treeless plains covered with cogon grass (used for thatching).

Billiton

The island is important for its tin mines, discovered in 1851. First exploited by a private Dutch company, later with participation of the colonial government, the tin is now worked by the Indonesian government. Most ore comes from alluvial deposits, but there is some lode mining. The island was ceded to the British in 1812 by the sultan of Palembang, Sumatra, but Britain recognized the Dutch claim in 1824. In 2000 Billiton, Bangka, and neighbouring islands were split from Sumatera Selatan province to form Bangka-Belitung province.

Billy THE KID, byname of WILLIAM H. BONNEY, JR., original name HENRY McCARTY? (b. Nov. 23, 1859/60, New York, N.Y., U.S.—d. July 14, 1881, Fort Sumner, N.M.), one of the most notorious gunfighters of the American West, reputed to have killed at least 27 men before being gunned down at about age 21.

Born on New York City's East Side, Billy as a child migrated with his parents to Kansas; his father died there, and the mother and her two boys moved to Colorado, where she remarried. The family moved to New Mexico, and, in his early teens, Billy fell into a career of thievery and lawlessness, wandering throughout the Southwest and northern Mexico, often with gangs. In December 1880 he was captured by Sheriff Patrick Floyd Garrett and stood trial for murder in Mesilla, N.M., in April 1881; he was found guilty and sentenced to hang. He escaped jail on April 30, however, killing two deputies, and remained at large until tracked down and ambushed by Garrett, who shot him dead on the evening of July 14 at the ranch home of Pete Maxwell. Billy the Kid's grave is in Fort Sumner, N.M.

As a child, Billy the Kid went under the name of Henry McCarty. Scholarly opinion is divided over whether that or William H. Bonney, Jr. (the name he used later, as in the trial), was his true name. Another hypothesis is that Billy the Kid was in fact Ollie L. "Brushy Bill" Roberts, who escaped, lived in Mexico and the U.S. Southwest, rode in Wild West shows, and died in Hico, Texas.

Biloxi, city, coveast (with nearby Gulfport) of Harrison county, southern Mississippi, U.S. The city lies on a narrow Gulf Coast peninsula. In 1699 the explorer Pierre Le Moyne d'Iberville planted the French flag across Biloxi Bay at Old Biloxi (now Ocean Springs). The settlement there, at Fort Maurepas, was the first capital (1699–1702) of the Louisiana Territory. Fort Louis, the site of present-day Biloxi, was the territorial capital c. 1719–22. Biloxi has been under the flags of France, Spain, Great Britain, the West Florida Republic, the Confederacy, and the United States. During the American Civil War, it submitted to Union forces from Fort Massachusetts on Ship Island (12 miles [19 km] offshore and now part of Gulf Islands National Seashore). The city is named for the Biloxi, a Native American people who once inhabited the area; the name is thought to mean "first people."

Beginning in the 1990s, casino gambling became one of Biloxi's chief economic activities. Government services and seafood processing are also important. Beauvoir, the final home of former Confederate president Jefferson Davis, is 5 miles (8 km) west. Biloxi is subject to periodic devastating hurricanes (tropical cyclones), including Hurricane Camille in 1969 and Hurricane Katrina in 2005. Keesler Air Force Base is in the city. Inc. village, 1838; city, 1896. Pop. (2004 est.) city, 50,115; Gulfport-Biloxi MSA, 252,771.

bimah, also spelled BIMA, also called ALMEMAR, or ALMEMOR (from Arabic *al-minbar*, "platform"), in Jewish synagogues, a raised platform with a reading desk from which, in the Ashkenazi (German) ritual, the Torah and Haftarah (a reading from the prophets) are read on the Sabbath and festivals. In the Sephardic (Spanish) rite, the entire service is conducted from a platform called a *teba* ("box"). At an earlier date, when the bimah was positioned in the centre of the synagogue (as it still is in Sephardic and many Orthodox Ashkenazi synagogues), the attention of the congregation was divided between it and the Ark of the Law. Although Maimonides and others insisted on this location in the Middle Ages, many modern synagogues now place the bimah in front of the Ark. This arrangement conserves space, facilitates listening, and is, some feel, architecturally more pleasing.

bimetallism, monetary standard or system based upon the use of two metals, traditionally gold and silver, rather than one (monometallism). The typical 19th-century bimetallic system defined a nation's monetary unit by law in terms of fixed quantities of gold and silver (thus automatically establishing a rate of exchange between the two metals). The system also provided a free market for the two metals, imposed no restrictions on the use and coinage of either metal, and made all other money in circulation redeemable in either gold or silver. A major problem in the international use of bimetalism was that, with each nation independently setting its own rate of exchange between the two metals, the resulting rates often differed widely from country to country.

In an attempt to establish the bimetallic system on an international scale, France, Belgium, Italy, and Switzerland formed the Latin Monetary Union in 1865. The union established a mint ratio between the two metals and provided for use of the same standard units and issuance of coins. The system was undermined by the monetary manipulations of Italy and Greece (which had been admitted later) and came to a speedy end with the Franco-German War (1870–71). The future of the bimetallic standard apparently had been sealed at an international monetary conference held in Paris in 1867, when most of the delegates voted for the gold standard.

Supporters of bimetalism offer three arguments for it: (1) the combination of two metals can provide greater monetary reserves; (2) greater price stability will result from the larger monetary base; and (3) greater ease in the determination and stabilization of exchange rates among countries using gold, silver, or bimetallic standards will result.

Arguments advanced against bimetalism are: (1) it is practically impossible for a single nation to use such a standard without having international cooperation; (2) such a system is wasteful in that the mining, handling, and coinage of two metals is more costly; (3) because price stability is dependent on more than the type of monetary base, bimetalism does not provide greater stability of prices; and (4) most importantly, bimetalism in effect freezes the ratio of the prices of the two metals without regard to changes in their demand and supply conditions. Such changes can disrupt attempts to maintain the double standard. See also Gresham's law.

Bimini Islands, also called BIMINIS, string of islands, northwestern Bahamas. They extend 40 miles (65 km) north to south and lie about 50 miles (80 km) east of the Florida coast, U.S., and 110 miles (175 km) west of the Bahamian capital of Nassau. The main island, North Bimini, on the northern end, contains many yacht harbours and tourist beaches, as well as the chief towns: Alice Town, Bailey Town, and Paradise Point. The other nearby main island, South Bimini, is largely agricultural. Little cays to the south, including Cat Cay, contain superlative game-fishing grounds. Pop. (2000) 1,717.

bin Laden, Osama, also spelled USĀMAH IBN LĀDIN (b. 1957, Riyadh, Saud.Ar.), militant Muslim leader and mastermind of numerous terrorist attacks against the United States.

Bin Laden was born into one of Saudi Arabia's wealthiest families. Shortly after the Soviet Union invaded Afghanistan in 1979, he joined the Afghan resistance, where he formed a loose network of like-minded individuals, later known as al-Qaeda (*q.v.*). Following the Soviet withdrawal in 1989, bin Laden returned home but was quickly disappointed with what he perceived as the corruption of the Saudi government. His objection to the presence of U.S. troops in Saudi Arabia during the Persian Gulf War (1990–91) led to a rift with his country's leaders. In 1994 the Saudi government accused him of subversion for his continued criticism of their pro-U.S. policies. He soon fled to The Sudan, where he was joined by a number of al-Qaeda associates and from where he was expelled in 1996. He then returned to Afghanistan, where he received the protection of its ruling Taliban militia.

A self-styled Muslim scholar, he issued a series of *fatwas* (religious opinions) between 1996 and 1998 declaring a holy war against the United States, which he accused, among other things, of looting the natural resources of the Muslim world. Bin Laden's apparent goal was to draw the United States into a large-scale war in the Muslim world that would overthrow moderate Muslim governments and reestablish the Caliphate (*i.e.*, a single Islamic state). To this end, al-Qaeda, aided by bin Laden's enormous wealth, trained and equipped thousands of Muslim militants and organized numerous terrorist attacks, including bomb attacks against the American embassies in Nairobi, Kenya, and Dar es Salaam, Tanzania (1998), the suicide bombing of a U.S. warship in Aden, Yemen (2000), and the September 11 attacks (*q.v.*) in New York City and near Washington, D.C. (2001). Bin Laden fled to hiding when a U.S.-led coalition overthrew the Taliban in late 2001.

binary form, in music, the structural pattern of many songs and instrumental pieces, primarily from the 17th to the 19th century,

characterized by two complementary, related sections of more or less equal duration that may be represented schematically as *ab*. In 18th-century compositions, including dance-inspired movements by J.S. Bach and keyboard sonatas by Domenico Scarlatti, the two sections are separated by double bars with repeat signs, so that a proper performance actually yields an *aabb* structure.

The first section of a binary composition in a major key typically modulates to the dominant, thus displacing the centre of harmonic gravity to the fifth degree above the tonic; compositions in minor keys similarly modulate to the relative major (*i.e.*, the major key centred on the third degree above the tonic). The second section begins in the new key and, after thriving for a period on the harmonic thus generated, returns to the home key. Binary structures, though not necessarily monothematic, tend to rely on closely linked melodic-rhythmic materials.

In the "rounded" binary form, as exemplified by many of Scarlatti's sonatas, the second section returns rather quickly to both the original key and the melodic-rhythmic features of substantial portions of the first section. By the same token, binary organization of this sort begins to approximate the ternary outline of a number of later 18th- and 19th-century pieces.

binary number system, in mathematics, positional numeral system employing 2 as the base and requiring only two different symbols, 0 and 1. The importance of the binary system to information theory and computer technology derives mainly from the compact and reliable manner in which data can be represented in electromechanical devices with two states—such as "on-off," "open-closed," or "go-no-go." See number system.

binary star, also called DOUBLE STAR, pair of stars in orbit around their common centre of gravity. A high proportion, perhaps one-half, of all stars in the Milky Way Galaxy are binaries or members of more complex multiple systems. Some binaries form a class of variable stars (*see* eclipsing variable star).

If the images of the two components of a binary star system can be separated by telescope, it is called a visual binary. Stars whose components are too close to each other to be distinguished visually can sometimes be identified as binaries by spectroscopic observation; as the members of these spectroscopic binaries move alternately toward the Earth and away from it, a Doppler effect of frequency change is observed in their spectral lines. Binary stars are sometimes detectable by changes in apparent brightness, as the darker (or dimmer) star occludes its brighter companion. Some stellar systems with so-called invisible companions are binaries; these companions can be detected through changes in the proper motion—that is, the rate of motion of the visible stars across the background of more distant stars.

Binchois, Gilles, in full GILLES EGIDIUS BINCHOIS, Binchois also spelled DE BINCHE (b. c. 1400, Mons, Hainaut [now in Belgium])—d. Sept. 20, 1460, near Mons), Flemish composer of church music and of secular chansons that were among the finest of their genre, being notable for their elegance of line and grave sweetness of expression.

Binchois was in Paris in 1424 serving William de la Pole, earl of Suffolk, and returned with him to Hainaut in 1425. In 1430 Binchois joined the chapel of Philip III the Good of Burgundy, where he remained until his death, eventually becoming second chaplain and cantor. By 1437 Binchois had become canon at Mons, Soignies, and Cassel. In both his sacred and secular music, Binchois cultivated the gently subtle rhythm, the suavely graceful melody, and the smooth treatment of dissonance of his English contemporaries.

binding: *see* bookbinding.

binding energy, amount of energy required to separate a particle from a system of particles or to disperse all the particles of the system. Binding energy is especially applicable to subatomic particles in atomic nuclei, to electrons bound to nuclei in atoms, and to atoms and ions bound together in crystals.

Nuclear binding energy is the energy required to separate an atomic nucleus completely into its constituent protons and neutrons, or, equivalently, the energy that would be liberated by combining individual protons and neutrons into a single nucleus. The hydrogen-2 nucleus, for example, composed of one proton and one neutron, can be separated completely by supplying 2.23 million electron volts (MeV) of energy. Conversely, when a slowly moving neutron and proton combine to form a hydrogen-2 nucleus, 2.23 MeV are liberated in the form of gamma radiation. The total mass of the bound particles is less than the sum of the masses of the separate particles by an amount equivalent (as expressed in Einstein's mass-energy equation) to the binding energy.

Electron binding energy, also called ionization potential, is the energy required to remove an electron from an atom, a molecule, or an ion. In general, the binding energy of a single proton or neutron in a nucleus is approximately a million times greater than the binding energy of a single electron in an atom.

bindweed, plants of the closely related genera *Convolvulus* and *Calystegia*, mostly twining, often weedy, and producing handsome white,

Field bindweed (*Convolvulus arvensis*)

Kitty Kohout from Root Resources—EB Inc

pink, or blue funnel-shaped flowers. Bellbine, or greater bindweed (*Calystegia sepium*), native in Eurasia and North America, bears arrow-shaped leaves and white to pink, 5-centimetre (2-inch) flowers. This twining perennial grows from creeping, underground stems and is common in hedges, woods, and along roadsides. Its range tends to coincide with that of its principal pollinator, the hawkmoth. Sea bindweed (*C. soldanella*), with fleshy, kidney-shaped leaves and deep pink, 5-cm blooms, creeps along European seaside sand and gravel. Several *Convolvulus* species are widespread or conspicuous. The weedy, perennial field bindweed (*C. arvensis*), which is European but widely naturalized in North America, twines around crop plants and along roadsides. It bears long-stalked clusters of fragrant pink, white, or striped blooms, 2 cm across, among arrow-shaped leaves. Scammony, a purgative, is derived from the rhizomes of *C. scammonia*, a trailing perennial with white to pink flowers, native in western Asia. Rosewood oil comes from certain species of *Convolvulus*.

Binet, Alfred (b. July 8, 1857, Nice, Fr.—d. Oct. 18, 1911, Paris), French psychologist who played a dominant role in the development of experimental psychology in France.

Fascinated by the work of the French neurologist Jean Charcot on hypnosis at the Salpêtrière Hospital, Paris, Binet abandoned a law career in 1878 to devote himself to medico-scientific studies at the hospital, remaining until 1891. He then became associated with a research laboratory at the Sorbonne (1891) and served as its director from 1895 to

1911. Seeing little value in German laboratory research of sensation and perception, he sought to develop experimental techniques to measure reasoning ability and other higher mental processes, devising techniques using paper, pencil, pictures, and portable objects. In 1895 he founded the journal *L'Année Psychologique*, the first French journal devoted to psychology. About the same time he opened a Paris laboratory for child study and experimental teaching.

Impressed by the attempt of the English psychologist Sir Francis Galton to record individual differences by means of standardized tests, Binet adapted the method to studies of eminent writers, artists, mathematicians, and chess players, often supplementing the more formal tests with observations on body type, handwriting, and other characteristics. A notable work was *L'Étude expérimentale de l'intelligence* (1903; "Experimental Study of Intelligence"), an investigation of the mental characteristics of his two daughters, which he developed into a systematic study of two contrasted types of personalities. Between 1905 and 1911 he and Theodore Simon developed highly influential scales for the measurement of intelligence of children. Binet also published works on suggestibility (1900) and hysteria (1910) and was working on a revision of his scales at the time of his death.

Bing, Sir Rudolph (b. Jan. 9, 1902, Vienna, Austria—d. Sept. 2, 1997, Yonkers, N.Y., U.S.), British operatic impresario who oversaw the Metropolitan Opera in New York City for 22 years (1950–72) as general manager.

The son of an Austrian industrialist, Bing grew up in a musical household and studied at the University of Vienna. He first worked in theatrical agencies casting singers for opera houses. From 1928 to 1935 he assisted Carl Ebert in managing opera companies in Germany and England. In 1935 Bing was appointed general manager of the Glyndebourne Opera Company. In 1947 he helped found the Edinburgh Festival, establishing it as a major European festival.

Three years later Bing was appointed general manager of the Metropolitan Opera Company in New York City. During Bing's tenure he improved standards of performance and production and was especially praised for his attention to scenic design. He shaped the repertoire to ensure success at the box office and was therefore often criticized for his musical taste: Italian Romantic operas became the mainstay, while Baroque and 20th-century works were rarely programmed. He concentrated on attracting singers of international fame but neglected to retain conductors of equal stature, which resulted in some lackluster performances. Bing's imperious and autocratic manner contributed to the conflicts that flared during his successful and tempestuous career at the Met.

Bing was knighted in 1971 and wrote two memoirs, *5,000 Nights at the Opera* (1972) and *A Knight at the Opera* (1981).

Bing Xin, Wade-Giles romanization PING HSIN (Chinese: "Pure in Heart"), pseudonym of HSIEH WAN-YING (b. Oct. 5, 1900, Minhou, Fukien Province, China—d. Feb. 28, 1999, Peking), Chinese writer of sentimental stories and poems that enjoyed great popularity in the early 1920s.

Bing Xin studied the Chinese Classics and began writing traditional Chinese stories as a child, but her conversion to Christianity and her attendance at an American school in Peking soon were reflected in a didactic and Western influence in her writing. The short stories and poems that Bing Xin published during her college years at Yen-ching University—lyrical pieces about childhood and nature—won her instant fame and a grant to study at Wellesley College in the United States, where she received an M.A. degree in 1926.

After she returned to China, Bing Xin married Wu Wen-tao, whom she had met in the United States. She continued to write throughout the 1940s and 1950s, producing such works as *Hsü chü hsiao-tu-che* ("More Letters to Young Readers"), *Kuan-yü nü-jen* (1943; "About Women"), *T'ao Ch'i te shu-ch'i jih-ch'i* ("T'ao Ch'i's Summer Schedule"), and *Shih-sui hsiao-ch'a* ("Miscellaneous Essays"), a volume of essays written between 1959 and 1964. Bing Xin wrote little after the early 1960s, but she became very active in cultural affairs under the Communist government, especially in children's literature.

Bingen, in full BINGEN AM RHEIN, city, Rhineland-Palatinate Land (state), southwestern Germany. Bingen is a port at the confluence of the Rhine and Nahe rivers, near the whirlpool known as Binger Loch. It originated as the Roman fortress of Bingham and later became an imperial free city, joining the Hanseatic League in 1254. The archbishops-electors of Mainz held the town from 1281 until it fell to Hessen in 1803, after the secularization of the electorate. The Nahe bridge and Klopp Castle (destroyed 1689, restored 1854) are built on Roman foundations, and the local museum has a display of Roman surgical instruments. Other historic buildings include St. Rochus Chapel (built in thanksgiving for deliverance from the plague of 1666) and the well-known Mäuseturm (Mouse Tower) on a rock in the Rhine where, according to Saxon legend, Archbishop Hatto I of Mainz was gnawed to death by mice in 913. Bingen is an old-established centre of the wine trade. Pop. (1998 est.) 24,803.

Bingerville, town, southeastern Côte d'Ivoire, on the Ebrié Lagoon. Named for Captain Louis-Gustave Bingcr, first governor of the French Ivory Coast colony, the town was the colonial capital from 1900 to 1934. Formerly a trade centre among the Ebrie (Kyama) people, it is now the site of agricultural research stations for oil palm, coffee and cacao, and livestock. Pineapples and avocados are among the crops grown in the region. Pop. (1988) 28,741.

Bingham, George Caleb (b. March 20, 1811, Augusta County, Va., U.S.—d. July 7, 1879, Kansas City, Mo.), American frontier politician and painter noted especially for his representations of Midwestern river life.

"Fur Traders Descending the Missouri," oil on canvas by George Caleb Bingham, 1845; in the Metropolitan Museum of Art, New York City

By courtesy of the Metropolitan Museum of Art, New York. Morris K Jesup Fund, 1933

In 1819 Bingham's family moved to Franklin, Mo., on the Lewis and Clark trail, where he grew up and became an itinerant preacher and portrait painter. Except for three months of study at the Pennsylvania Academy of the Fine Arts, Bingham was self-taught.

After his brief stay in Philadelphia, where he studied paintings by Benjamin West, Thomas

Lawrence, and Thomas Sully, he returned to Missouri and entered politics. He continued to paint, however, and his most mature works date from this period. In such works as the "County Election" (1851-52; St. Louis Art Museum) and the "Verdict of the People" (1855; Boatmen's National Bank, St. Louis), Bingham has left a vivid account of the rough and lively political life of the frontier. These works display his facility for incisive characterization as well as his talent for clearly organizing large, dense compositions.

Among Bingham's most memorable works are scenes of river life. His "Jolly Flatboatmen in Port" (1857; St. Louis Art Museum) shows his continued preference for compositions crowded with lively figures. But, in his "Raftsmen Playing Cards" (1847; St. Louis Art Museum), the number of figures is greatly reduced and the composition is more static; and the sweeping view of the mist-covered river shows his growing ability to manipulate space and light to heighten the mood of the picture, a quality exemplified in the well-known "Fur Traders Descending the Missouri" (c. 1845; Metropolitan Museum of Art, New York City).

In 1856 Bingham visited Germany to study the masters of the Düsseldorf school, a group of painters whose work is characterized by sentimentality and careful attention to detail. Influenced by the paintings he saw there, he altered his style and lost the directness and integrity he had achieved in earlier works. In 1875 he was appointed adjutant general of Missouri, and his activity as a painter decreased. During the last two years of his life he taught at the University of Missouri, Columbia.

Bingham, George Charles: see Lucan, George Charles Bingham, 3rd earl of.

Bingham, Hiram (b. Nov. 19, 1875, Honolulu—d. June 6, 1956, Washington, D.C.), American archaeologist and politician who

Hiram Bingham at Machu Picchu, 1912
Yale University Peabody Museum of Natural History

in 1911 located the "lost city of the Incas," Machu Picchu, in a nearly inaccessible part of the Peruvian Andes.

As a boy Bingham learned mountaineering from his father, a well-known Pacific mission-

ary. This skill vastly aided his Inca research. In 1906, seeking to enhance his ability to teach Latin-American history, he traveled the Andean route taken in 1819 by Simón Bolívar from Venezuela to Colombia. In 1908 he followed the old Spanish trade route through the Andes from Buenos Aires to Lima, Peru.

Bingham was a member of the history faculty at Yale University from 1909 until 1924. In 1911 he directed the Yale archaeological expedition whose main objective was to find Machu Picchu. Prospects for locating it were poor: not even the Spanish conquistadores had discovered it. It was believed to be situated somewhere near Cuzco, Peru, where the problems of crossing the Andes were formidable. Clues from early chronicles of the Incas were scanty. The expedition owed its success largely to Bingham's steadfastness and courage. He visited several Inca sites, sometimes risking his life to do so.

On July 24 he reached the fortress city of Machu Picchu. There he found well-preserved stonework remains and was particularly struck by the similarity of one of the structures to the Temple of the Sun at Cuzco. In August he found another important Inca site, Vitcos. In 1912 he led the expedition that excavated Machu Picchu. His publications on South America include *Inca Land* (1922), *Machu Picchu* (1930), and *Lost City of the Incas* (1948).

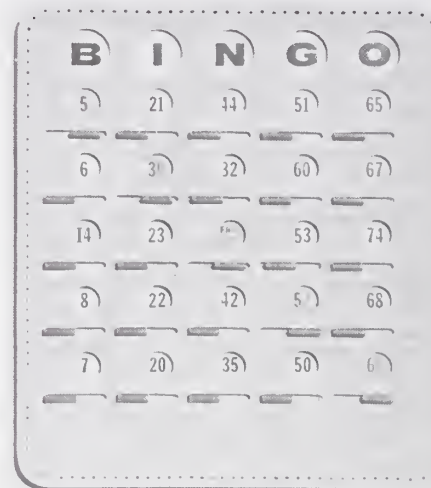

He entered politics and was elected lieutenant governor of Connecticut (1922-24). After winning the governorship in 1924, he almost immediately resigned to fill a vacancy in the U.S. Senate. He was reelected to a full term in 1926, after which he devoted himself to business interests. In 1951 he was appointed to the Civil Service Loyalty Review Board by Pres. Harry S. Truman and helped investigate controversial cases of suspected subversion in the State Department.

Binghamton, city, seat (1806) of Broome county, south central New York, U.S. It lies at the confluence of the Chenango and Susquehanna rivers, near the Pennsylvania border, 75 miles (121 km) south of Syracuse. With Johnson City and Endicott, it forms the Triple Cities. Settled in 1787 at the site of an Iroquois village (Ochenang), it was first known as Chenango Point and was later named for William Bingham, who owned land tracts on both sides of the Susquehanna. Laid out in 1800, the village prospered after the Chenango and Erie canals were linked in 1837 and the Erie Railroad arrived in 1848. Its transportation advantages encouraged industrial development. Leading manufactures of the area include shoes, textiles, photo supplies, machinery, electronic equipment, computers, and cosmetics. Dairy, livestock, and poultry industries and ski resorts augment the economy. In 1946 Broome Community College and the State University of New York at Binghamton were opened. The city's Roberson Center is a museum complex (arts, science, history) and includes a planetarium and civic theatre. Inc. village, 1834; city, 1867. Pop. (2000) city, 47,380; Binghamton MSA, 252,320.

bingo, also called LOTTO, game of chance using cards on which there is a grid of numbers, a row of which constitute a win when they have been chosen at random. Bingo is one of the most popular forms of low-priced gambling in the world.

To play bingo, which is a form of lottery, each player purchases one or more cards divided into numbered and blank squares. Randomly chosen numbers, usually up to 75 or 90, are called out by a "banker." The first player to achieve a card (or a line) in which all of the numbers have been called shouts "bingo" or "house" and collects the entire stake money, usually less a specified percentage, if that is permitted by local law. In another popular variation, the central square

on the card is free, and the first player on whose card five of the called numbers appear in a row—vertically, horizontally, or diagonally—is the winner. The prize (jackpot) may amount to thousands of dollars. Bingo is legal in most U.S. states that prohibit other forms of gambling. It is permitted in Ireland when the profits are for charity; and it is closely regulated in the United Kingdom, where lotto halls were subjected to a tax in 1966.

Bingo card

By courtesy of the Mar Matic Sales Company, Inc.

Bingo has had many names and variations. The earliest name, lotto (or loto), a children's game, was first recorded in 1778. The original American form, called keno, kino, or po-keno, dates from the early 19th century. The only form of gambling permitted in the British armed services, the game is called in the Royal Navy tombola (1880) and in the Army, house (1900), or housy-housy. Other American names are beano, lucky, radio, and fortune. At the height of its popularity during the Great Depression of the 1930s, a variant (often called screeno) was played in motion-picture theatres, with one night in the week designated bank night, when patrons received free bingo cards with their admission tickets; prizes amounted to hundreds of dollars in cash or merchandise.

Bingo has been played enthusiastically in Japan and has even been introduced at the casino in Monte-Carlo. In Great Britain the game received its greatest impetus when the Betting and Gaming Act of 1960 permitted the formation of a large number of commercial lotto clubs. Within a few years, the game achieved a popularity equaling or exceeding that which it had formerly enjoyed in the United States.

Bingöl, formerly ÇAPAKÇUR, city in eastern Turkey, lying along the Gönöksuyu, a tributary of the Murat River. It is a market for grain, livestock, and livestock products of the area. The city takes its name (*bin*, "thousand," *göl*, "lakes") from numerous small lakes that dot the Bingöl Mountains to the northeast. Bingöl suffered heavy damage by earthquake in 1966. The city is linked by main roads with Elâzığ to the east and Muş to the west.

The surrounding area is drained by the Murat River and its tributaries and is largely mountainous. Croplands are scarce, and livestock raising is the main activity. Many of the people are Kurds. Once part of the Assyrian Empire, the region was added to the Ottoman Empire in the early 16th century. Pop. (1997) city, 67,022.

Bini (people): see Edo.

Binkis, Kazys (b. Nov. 4, 1893, Gudeliai, Russian Lithuania—d. April 27, 1942, Kaunas, Lithuanian S.S.R.), poet who led the

"Four Winds" literary movement, which introduced Futurism into Lithuania.

From 1920 to 1923 Binkis studied literature and philosophy in Berlin, where he became acquainted with the newest trends in western European literature. The poems he wrote during his connection with the "Four Winds" movement, published in *Šimtas pavasarių* (1926; "One Hundred Springs"), caused a sensation because of their break with traditional forms. His best work, however, was done mainly before World War I and is contained in his first collection of verse, *Eilėraščiai* (1920; "Poems"). A poet of rare talents in Lithuanian literature, he wrote lyric poetry with an effortless, soaring quality.

In 1927 Binkis turned from Futuristic poetry to humorous pieces in verse, with themes drawn from Lithuanian country life. They were published in provincial newspapers and became immensely popular. He also wrote a number of successful children's books, edited several anthologies of poetry, and wrote two successful plays: *Atžalynas* (1938; "The Younger Generation") and *Generalinė repetitija* ("General Rehearsal"), first performed in 1948 in Germany.

Binney, Horace (b. Jan. 4, 1780, Philadelphia Pa., U.S.—d. Aug. 12, 1875, Philadelphia), American lawyer and politician who established the legality of charitable trusts in the United States.

Binney graduated from Harvard in 1797 and was admitted to the bar in 1800. He became an expert on marine-insurance and land-title law, and from 1809 to 1814 he published six volumes of authoritative court reports of cases heard in the state Supreme Court of Pennsylvania. By 1820 Binney had become the acknowledged leader of the Pennsylvania bar, but he declined repeated offers of judgeships in the state and federal courts. He served in the U.S. House of Representatives for one term from 1833.

One of Binney's two most important legal cases was *Lyle v. Richards* (1823), in which his arguments established the common-law basis of real property in the United States. His second landmark case was *Vidal et al v. Philadelphia et al* (1844). In this case he successfully opposed Daniel Webster before the U.S. Supreme Court in arguing the city of Philadelphia's right to carry out a charitable trust created by Stephen Girard for the founding of a school for orphans. Binney gave up his legal practice in 1850 and thereafter spent his time writing. During the American Civil War he wrote three memorable pamphlets defending President Lincoln's suspension of the writ of habeas corpus during that conflict.

Binnig, Gerd (b. July 20, 1947, Frankfurt am Main, W.Ger.), German-born physicist who shared with Heinrich Rohrer (*q.v.*) half of the 1986 Nobel Prize for Physics for their invention of the scanning tunneling microscope. (Ernst Ruska won the other half of the prize.)

Binnig graduated from Johann Wolfgang Goethe University in Frankfurt and received a Ph.D. from the University of Frankfurt in 1978. He then joined the IBM Research Laboratory in Zurich, where he and Rohrer designed and built the first scanning tunneling microscope (STM). This instrument produces images of the surfaces of conducting or semiconducting materials in such fine detail that individual atoms can be clearly identified. Quantum mechanical effects cause an electric current to pass between the extremely fine tip of the STM's tungsten probe and the surface being studied, and the distance between the probe and the surface is kept constant by measuring the current produced and adjusting the probe's height accordingly. By recording the varying elevations of the probe, a topographical map of the surface is obtained on which the contour intervals are so small that individual atoms are clearly recognizable. The tip of

the STM's probe is only about one angstrom wide (one ten-billionth of a metre, or about the width of an atom), and the distance between it and the surface being studied is only about 5 or 10 angstroms.

Binnya Dala (d. 1774), last king (reigned 1747–57) of Pegu in southern Myanmar (Burma), whose independence from the northern Burmans was revived briefly between 1740 and 1757.

In 1747 Binnya Dala succeeded Smim Htaw Buddhaketi, who had seven years earlier been set up as king of the Mon in the new capital of Pegu after their successful revolt against the Burmans. Binnya Dala, who was his predecessor's chief minister and a more capable military leader, made numerous raids into northern Myanmar, penetrating beyond Ava, the capital. In 1751 he raised a large army for the conquest of northern Myanmar, capturing Ava in April 1752. Two years later he executed the last king of the Toungoo dynasty, which had been founded in 1486.

Binnya Dala was eventually deposed by Alaungpaya, the founder of the Burman Alaungpaya dynasty, who captured Pegu in 1757. He was kept captive and was executed by Alaungpaya's son, Hsinbyushin, in 1774.

binocular, optical instrument for providing a magnified view of distant objects, consisting of two similar telescopes, one for each eye, mounted on a single frame. A single thumbscrew may control the focus of both telescopes simultaneously, and provision may be made for focusing each separately to allow for varying characteristics in the two eyes.

In most binoculars, each telescope is provided with two prisms. The prisms reinvert the inverted image provided by the ocular, or eyepiece, of each telescope. They prescribe a folded path for the light rays, allowing a shorter overall length for the instrument. The prisms

Prismatic binoculars

By courtesy of Bausch and Lomb

also provide better stereoscopic effect—that is, depth perception at greater distances—by allowing the two objectives (object lenses) to be set farther apart than the eyepieces. The arrangement of these prisms and the other optical components is shown in the illustration.

Binoculars are commonly designated as 6 × 30, 7 × 50, or 8 × 30. The first number indicates the magnification and the second the diameter of the objective lens in millimetres (one inch is about 25 millimetres). This latter figure is a measure of the light-gathering power of the instrument.

In applications in which depth perception is not essential, a single telescope, called a monocular, may be employed. It is essentially one-half of a pair of binoculars.

Opera glasses are binoculars with simple, inexpensive lens systems and narrow fields of view and are usually made with magnifications of only 2½ to 4. The lenses used in most binoculars are coated to prevent reflections.

binomial nomenclature (biology): *see* nomenclature.

binomial theorem, statement that, for any positive integer n , the n th power of the sum of two numbers a and b may be expressed as the sum of $n + 1$ terms of the form

$$\binom{n}{r} a^n r^b;$$

in the sequence of terms, the index r takes on the successive values 0, 1, 2, ..., n . The coefficients, called the binomial coefficients, are defined by the formula

$$\binom{n}{r} = \frac{n!}{(n-r)!r!},$$

in which $n!$ (called n factorial) is the product of the first n natural numbers 1, 2, 3, ..., n (and where 0! is defined as equal to 1). The coefficients may also be found in the array often called Pascal's triangle

$$\begin{array}{ccccccc} & & & & 1 & & & & \\ & & & & 1 & & 1 & & \\ & & & 1 & & 2 & & 1 & \\ & & 1 & & 3 & & 3 & & 1 \\ & 1 & & 4 & & 6 & & 4 & & 1 \end{array}$$

by finding the r th entry of the n th row (counting begins with a zero in both directions). Each entry in the interior of Pascal's triangle is the sum of the two entries above it.

Isaac Newton stated in 1676, without proof, the general form of the theorem (for any real number n), although mathematicians had been aware of simple cases long before his time. A proof by Jakob Bernoulli was published in 1713, after Bernoulli's death.

Binswanger, Ludwig (b. April 13, 1881, Kreuzlingen, Switz.—d. Feb. 5, 1966, Kreuzlingen), Swiss psychiatrist and writer who applied the principles of existential phenomenology, especially as expressed by Martin Heidegger, to psychotherapy. Diagnosing certain psychic abnormalities (*e.g.*, elation fixation, eccentricity, and mannerism) to be the effect of the patient's distorted self-image and his inadequate relation to the world, he developed a form of psychoanalysis to establish the patient's consciousness of self as a total person, uniquely existing in and communicating with the concrete world as it is. Among his important writings are *Grundformen und Erkenntnis menschlichen Daseins* (1962; abridged Eng. trans., *Being-in-the-world*) and *Erinnerung an Sigmund Freud* (1956; *Sigmund Freud: Reminiscences of a Friendship*).

binturong (*Arctictis binturong*), catlike carnivore of the civet family (Viverridae), found in dense forests of southern Asia, Indonesia, and Malaysia. It has long, shaggy hair, tufted ears, and a long, bushy, prehensile tail. The colour generally is black with a sprinkling of whitish

Binturong (*Arctictis binturong*)

Philip Wayne

hairs. The head and body measure about 60–95 centimetres (24–38 inches) and the tail an additional 55–90 cm (22–35 in.); weight ranges from about 9 to 14 kilograms (20 to 31

pounds). The binturong is principally nocturnal and arboreal in habit, using its prehensile tail as an aid in climbing. It apparently feeds mainly on fruit but also takes eggs and small animals. In some areas it is tamed and is reported to make an affectionate pet.

Binxian (China): see Pin-hsien.

Binyon, (Robert) Laurence (b. April 10, 1869, Lancaster, Lancashire, Eng.—d. March 10, 1943, Reading, Berkshire), English poet, dramatist, and art historian, a pioneer in the European study of Far Eastern painting.

The son of a clergyman, Binyon was educated at St. Paul's School, London. At Trinity College, Oxford, he won the Newdigate

Binyon, pencil drawing by William Strang, 1901; in the National Portrait Gallery, London

By courtesy of the National Portrait Gallery, London

Prize for his poem *Persephone* (1890). He combined his lifelong interests—books and painting—when in 1893 he began work at the British Museum, London, where later he was in charge of Oriental prints and drawings. His first book on Oriental art was *Painting in the Far East* (1908), which is still a classic. His later books on art included *The Flight of the Dragon* (1911) and *The Spirit of Man in Asian Art* (1935), as well as writings on English watercolours.

World War I came as a devastating experience, and Binyon's poem "For the Fallen" (1914) won immediate recognition as the expression of the feelings of a disillusioned generation. The poem was set to music by Sir Edward Elgar. His best poetry, though written after the war, employed the diction traditional in the prewar years. *Collected Poems* appeared in 1931. He was also concerned with the revival of verse drama; his works in that form included *Attila* (1907), *Arthur* (1923), and *The Young King* (1934). His verse translation of Dante's *Divine Comedy* was published in three parts in 1933, 1938, and 1943.

Bio-Bío, región, central Chile, bordering Argentina to the east and fronting the Pacific Ocean to the west. It was given its present boundaries in 1974. Its area of 14,262 square miles (36,939 square km) includes the *provincias* of Nuble, Concepción, Arauco, and Bio-Bío. The islands of Santa María, in the Bay of Arauco, and Mocha, 14 miles (23 km) offshore, are part of Arauco *provincia*. Bio-Bío *región* spans the coastal mountain range, the cool, fertile Central Valley, and the Andean cordillera. Bio-Bío *región* is drained in the north by the northwestward-flowing Itata River and its main tributary, the Nuble River, and in the south by one of Chile's major rivers, the Bio-Bío, and its principal tributary, the Laja River.

When the Spaniards attempted to conquer the southern half of the *región* (the present *provincias* of Arauco and Bio-Bío), it was skillfully defended by the Araucanian Indians, who fiercely resisted the Spaniards near the town of Cañete in the 16th century. Not until

the 1860s, some 50 years after Chile gained its independence from Spain, did the Chilean army pacify the Indians in this part of Araucanía. Only then was this Frontera (Frontier) territory widely settled, primarily by European immigrants but also by Chileans.

Most of the population is in the rural areas, and the *región's* economy is based upon diversified crops, timber trees, and mineral wealth. The chief crops are wheat, wine grapes, sugar beets, corn (maize), oats, and vegetables, cultivated in the Central Valley. Cattle and sheep are common in the open brush and forest range; pine forests yield lumber and tanning materials, and there are coastal fisheries. Concepción, the capital of the *región*, is economically important because of its mineral resources and industries. Near the coast at Coronel, Lota, and Penco, all served by railroad from Concepción, are coal and copper deposits. There is a large steel plant at Huachipato, near Talcahuano; other important economic activities in the *región* include textile manufacturing, flour milling, fish canning, sugar refining, and brewing. The Pan-American Highway, on which are located Los Angeles and Chillán, and the main north-south railroad pass through the central part of the *región*. Several resorts are on the coast. Pop. (1987 est.) 1,625,840.

Bio-Bío River, Spanish *río Bio-Bío*, river in south-central Chile. It rises in the Andes of eastern *Cautín provincia* and flows generally northwestward through Malleco, Bio-Bío, and Concepción *provincias* to enter the Gulf of Arauco on the Pacific Ocean near Concepción after a course of 240 miles (380 km). The Bio-Bío traverses the fertile Central Valley and then forms the only major transverse valley through the coastal mountain range. Although it is one of Chile's longest rivers, it is navigable only by flat-bottomed boats. The Bio-Bío is commonly referred to as the southern limit of middle Chile, where about three-fourths of the nation's people live.

biocenology: see synecology.

biochemical oxygen demand (BOD), the amount of oxygen used by microorganisms in the process of breaking down organic matter in water. The more organic matter there is (e.g., in sewage), the greater the number of microbes. The more microbes there are, the greater the need of oxygen to support them; consequently, less oxygen is available for higher animals such as fishes. The BOD is therefore a reliable gauge of the organic pollution of a body of water. One of the main reasons for treating sewage or waste water prior to its return to a water resource is to lower its BOD—i.e., reduce its need of oxygen and thereby lessen its demand from the streams or rivers into which it is released.

biochemical taxonomy: see chemotaxy.

biochemistry, the field of science concerned with the chemical substances and processes that occur in plants, animals, and microorganisms. Specifically, it involves the quantitative determination and structural analysis of the organic compounds that comprise the basic constituents of cells (proteins, carbohydrates, and lipids) and of those that play a key role in chemical reactions vital to life (nucleic acids, vitamins, and hormones). Biochemistry entails the study of all the complexly interrelated chemical changes that occur within the cell—e.g., those relating to protein synthesis, the conversion of food to energy, and the transmission of hereditary characteristics. Both the cell's degradation of substances that release energy and its buildup of complex molecules that store energy or act as substrates or catalysts for biological chemical reactions are studied in detail by biochemists. Biochemists also study the regulatory mechanisms within the body that govern these and other processes.

Biochemistry lies in the border area between the biological and physical sciences. Accordingly, it makes use of many of the techniques common to physiology and those integral to analytical, organic, and physical chemistry. The field of biochemistry has become so large that many subspecialties are recognized, as, for example, clinical chemistry and nutrition. Molecular biology, the study of large molecules—for example, proteins, nucleic acids, and carbohydrates—that are essential to life processes is a field closely allied to biochemistry. Taken as a whole, modern biochemistry has outgrown its earlier status of an applied science and has acquired a place among the pure, or theoretical, sciences.

Biochemistry is treated in a number of articles in the *MACROPAEDIA*. For the history and principal treatment of the discipline, see *Biological Sciences, The*. For the primary subjects of study, see *Biochemical Components of Organisms*; *Chemical Compounds*; *Cells*; *Genetics and Heredity*, *The Principles of Genes*; *Metabolism*; *Photosynthesis*. For basic methodology and instrumentation, see *Analysis and Measurement*, *Physical and Chemical*.

For a description of the place of biochemistry in the circle of learning and for a list of both *MACROPAEDIA* and *MICROPAEDIA* articles on the subject, see *PROPAEDIA*: Part Ten, Division III.

bioclimatology, branch of climatology that deals with the effects of the physical environment on living organisms over an extended period of time. Although Hippocrates touched on these matters 2,000 years ago in his treatise on *Air, Waters, and Places*, the science of bioclimatology is relatively new. It developed into a significant field of study during the 1960s owing largely to a growing concern over the deteriorating environment.

Because almost every aspect of climate and weather has some effect on living organisms, the scope of bioclimatology is almost limitless. Certain areas are emphasized more than others, however, among them studies of the influence of weather and climate on small plant organisms and insects responsible for the development of plant, animal, and human diseases; the influence of weather and climate on physiological processes in normal healthy humans and their diseases; the influence of microclimate in dwellings and urban centres on human health; and the influence of past climatic conditions on the development and distribution of plants, animals, and humans.

biocology: see ecology.

bioelectricity, electric potentials and currents produced by or occurring within living organisms. Bioelectric potentials are generated by a variety of biological processes and generally range in strength from one to a few hundred millivolts. In the electric eel, however, currents of one ampere at 600 to 1,000 volts are generated.

A brief treatment of bioelectricity follows. For full treatment, see *MACROPAEDIA*: *Electricity and Magnetism*.

Bioelectric effects were known in ancient times from the activity of such electric fishes as the Nile catfish and the electric eel. The experiments of Luigi Galvani and Alessandro Volta in the 18th century on the connection between electricity and muscle contraction in frogs and other animals were of importance in the development of the sciences of physics and physiology. In modern times the measurement of bioelectric potentials has become a routine practice in clinical medicine. Electrical effects originating in active cells of the heart and the brain, for example, are commonly monitored and analyzed for diagnostic purposes.

Bioelectric potentials are identical with the potentials produced by devices such as batteries or generators. In nearly all cases, however, a bioelectric current consists of a flow of ions

(i.e., electrically charged atoms or molecules), whereas the electric current used for lighting, communication, or power is a movement of electrons. If two solutions with different concentrations of an ion are separated by a membrane that blocks the flow of the ions between them, the concentration imbalance gives rise to an electric-potential difference between the solutions. In most solutions, ions of a given electric charge are accompanied by ions of opposite charge, so that the solution itself has no net charge. If two solutions of different concentrations are separated by a membrane that allows one kind of ion to pass but not the other, the concentrations of the ion that can pass will tend to equalize by diffusion, producing equal and opposite net charges in the two solutions. In living cells the two solutions are those found inside and outside the cell. The cell membrane separating inside from outside is semipermeable, allowing certain ions to pass through while blocking others. In particular, nerve- and muscle-cell membranes are slightly permeable to positive potassium ions, which diffuse outward, leaving a net negative charge in the cell.

The bioelectric potential across a cell membrane is typically about 50 millivolts; this potential is known as the resting potential. All cells use their bioelectric potentials to assist or control metabolic processes, but some cells make specialized use of bioelectric potentials and currents for distinctive physiological functions. Examples of such uses are found in nerve and muscle cells. Information is carried by electric pulses (called action potentials) passing along nerve fibres. Similar pulses in muscle cells accompany muscular contraction. In nerve and muscle cells, chemical or electrochemical stimulation results in temporary changes in the permeability of cell membranes, allowing the electric potential between inside and outside to discharge as a current that is propagated along nerve fibres or that activates the contractile mechanism of muscle fibres. The transport of sodium ions is involved in the production of action potentials. Among other cells in which specialized functions are dependent on the maintenance of bioelectric potentials are the receptor cells sensitive to light, sound, and touch and many of the cells that secrete hormones or other substances.

Various fishes, both marine and freshwater, have developed special organs that are capable of generating substantial electric discharges, while others have tissues that can sense feeble electric fields in water. In more than 200 fish species, the bioelectric organ is involved in self-defense or hunting. The torpedo, or electric ray, and the electric eel have especially powerful electric organs, which they apparently use to immobilize or kill prey. The electric eel has three pairs of electric organs; they constitute most of the mass of the body and about four-fifths of the total length of the fish. This fish is reputed to be able to generate a sufficiently powerful electric shock to stun a man. Electric rays have two large, disk-shaped electric organs, one on each side of the body, that contribute to the disklike shape of the body.

The electric catfish of Africa, the knife fish of Latin America, and the stargazers probably use their bioelectric organs as sense organs in the detection of other fishes.

The basic element of a bioelectric organ is a flattened cell called an electroplaque. Large numbers of electroplaques are arranged in series and in parallel to build up voltage and current-producing capacity of the electric organ. Fishes deliver a sudden discharge of electricity by timing the nervous impulses that activate individual electroplaques, thereby providing simultaneous action of the entire array.

bioengineering, application of engineering principles and equipment to the biological

and medical sciences. It includes the development and fabrication of life-support systems for underwater and space missions, machines for medical treatment (e.g., heart-lung machines), and instruments for monitoring biological processes.

A brief treatment of bioengineering follows. For full treatment, see *MACROPAEDIA: Engineering*.

Of relatively recent origin, bioengineering has provided some of the most remarkable breakthroughs in medical science. Prosthetic limbs have been developed that can replace or augment normal functions; such prostheses are equipped with the ability to move and to operate by touch feedback. Development has been particularly rapid in the area of artificial organs, which culminated in the implantation of an artificial heart into a human being (1982).

Two of the most common examples of artificial organs are the artificial kidney and the heart-lung machine. An artificial kidney, or hemodialyzer, is used for those with chronic kidney malfunction, and a heart-lung machine is used to oxygenate the blood when the lung or heart muscles, or both, cannot. There are other mechanical devices used to aid heartbeat and blood circulation, such as pacemakers.

Bioengineering also has proved pivotal in the development of elaborate life-support systems that enable humans to maintain body functions in hostile environments—i.e., no oxygen, extremes of temperature and pressure, and so on. One such system is the space suit worn by astronauts during extravehicular maneuvers. This type of suit is a self-contained environment that supplies everything needed to sustain life. It provides a pressurized interior, without which an astronaut's blood would boil in the vacuum of space. In addition, the space suit provides oxygen, a means for removing excess products of respiration (i.e., carbon dioxide and water vapour), protection against extreme heat, cold, and ionizing radiation, and facilities for temporarily storing body wastes.

bioethics, the discipline dealing with the ethical implications of both biological research and the applications of that research, especially in medicine. The first bioethics study institute, the Hastings Center, was established in June 1969 and is now located in Briarcliff Manor, N.Y., U.S. In 1971 Georgetown University in Washington, D.C., established The Joseph and Rose Kennedy Institute of Ethics, which created a Center for Bioethics and sponsored the publication of the first *Encyclopedia of Bioethics*, 4 vol. (1978). By the 1990s there were well over a hundred bioethics organizations worldwide.

The rise of bioethics is traceable to several events. First, although ethical issues have been raised in medicine and biology since ancient times (witness, for instance, the Hippocratic oath), the large-scale introduction of biomedical and other technologies in the second half of the 20th century has intensified old problems and added new ones—such as issues over the definition of death and the withdrawal of life-sustaining medical treatment, prenatal diagnosis and abortion, the storage of frozen human embryos, the use of humans, animals, or fetal tissue for scientific research, the screening of persons for the AIDS virus or other infections, the disposition of toxic wastes, the expansion of genetic engineering, and the allocation of scarce health resources. Second, awareness of bioethics and other moral issues has been dramatically raised; professionals and

students now routinely raise ethical questions. In the course of such questioning, bioethics has affected philosophy, pushing it to pay more attention to practical problems. Finally, the growth of interdisciplinary and multidisciplinary work in academic institutions has facilitated dealing concurrently with biological research and with moral and social issues of human behaviour.

biofeedback, information supplied instantaneously about an individual's own physiological processes. Data concerning a person's cardiovascular activity (blood pressure and heart rate), temperature, brain waves, or muscle tension is monitored electronically and returned, or "fed back," to that person by a gauge on a meter, a light, or a sound. Though such activity of the autonomic nervous system was once thought to be beyond an individual's control, it has been shown that an individual can be taught to use the biological data to learn how to voluntarily control the body's reactions to stress or "outside-the-skin" events. An individual learns through biofeedback training to detect his physical reactions (inside-the-skin events) and establish control over them.

Biofeedback training is a type of behaviour therapy that attempts to change learned responses to stressors. It can be very successful in alleviating symptoms (e.g., pain and muscle tension) of a disorder, and its effects can be especially lasting if used in combination with psychotherapy to help the patient understand his reactions to stress.

Complaints that have been treated by biofeedback training include migraine headaches, gastrointestinal cramping (e.g., colitis), high blood pressure, tics, and the frequency and severity of epileptic seizures. Theoretically, many psychologists believe it possible to bring under partial control any physiological process that can be continuously monitored and displayed, including electrophysiological activity of the limbic system and other homeostatic processes.

Biofeedback training with brain waves has also been useful in enhancing mental functioning. "Alpha (wave) training" elicits the calming and integrative effects of meditation. Theta wave training has led to more focused attention, the control of "mental blocks" during examinations, and the control of anxiety.

biogenetic law, also called **RECAPITULATION THEORY**, postulation, by Ernst Haeckel in 1866, that ontogeny recapitulates phylogeny—i.e., the development of the animal embryo and young traces the evolutionary development of the species. The theory was influential and much-popularized earlier but has been of little significance in elucidating either evolution or embryonic growth.

biogeochemical cycle, any of the natural circulation pathways of the essential elements of living matter. These elements in various forms flow from the nonliving (abiotic) to the living (biotic) components of the biosphere and back to the nonliving again. In order for the living components of a major ecosystem (e.g., a lake or forest) to survive, all the chemical elements that make up living cells must be recycled continuously.

Each cycle can be considered as having a reservoir (nutrient) pool—a larger, slow-moving, usually abiotic portion—and an exchange (cycling) pool—a smaller but more active portion concerned with the rapid exchange between the biotic and abiotic aspects of an ecosystem.

Biogeochemical cycles can be classed as gaseous, in which the reservoir is the air or the oceans (via evaporation), and sedimentary, in which the reservoir is the Earth's crust. Gaseous cycles include those of nitrogen, oxy-

gen, carbon, and water; sedimentary cycles include those of iron, calcium, phosphorus, and other more earthbound elements.

Gaseous cycles tend to move more rapidly than do the sedimentary ones and to adjust more readily to changes in the biosphere because of the large atmospheric reservoir. Local accumulations of carbon dioxide, for example, are soon dissipated by winds or taken up by plants. Extraordinary and more frequent local disturbances can, however, seriously affect the capacity for self-adjustment.

Sedimentary cycles vary from one element to another, but each cycle consists fundamentally of a solution phase and a rock (or sediment) phase. Weathering releases minerals from the Earth's crust in the form of salts, some of which dissolve in water, pass through a series of organisms, and ultimately reach the deep seas, where they settle out of circulation indefinitely. Other salts deposit out as sediment and rock in shallow seas, eventually to be weathered and recycled.

Plants and some animals obtain their nutrient needs from solutions in the environment. Other animals acquire the bulk of their needs from the plants and animals that they consume. After the death of an organism, the elements fixed in its body are returned to the environment through the action of decay organisms and become available to other living organisms again.

biogeography, study of the geographic distribution of plants and animals. It is concerned not only with habitation patterns but also with the factors responsible for variations in distribution.

Strictly speaking, biogeography is a branch of biology, but physical geographers have made important contributions, particularly in the study of flora. The classification of vegetation and the preparation of maps of vegetation have been notably advanced by F. Shreve, H.L. Shantz, H.M. Raup, and others.

Biogeographic studies divide the Earth's surface—primarily the continents and islands—into regions exhibiting differences in the average composition of flora and fauna. It is thought that the present-day distribution patterns of plant and animal forms, as reflected in such biogeographic regions, are the result of many historical and current causes. These causes include present climatic and geographic conditions, the geologic history of the landmasses and their climates, and the evolution of the taxon (*e.g.*, genus or species) involved. Investigators have found that rate of dispersal, adaptability to prevailing environmental conditions, and the age of the taxa being studied also have a significant impact on pattern and extent of distribution.

Biograph Company, one of the major American motion-picture studios in the early days of filmmaking. Its most significant contribution to the film comes from the work of D.W. Griffith, the first great director, who developed the art of the cinema during his five years at Biograph. The American Mutoscope and Biograph Company released its first film, *Empire State Express*, in 1896. It quickly became a major producer of short pictures.

From 1908 to 1914 a great many of the Biograph films were directed by Griffith and executed by the cameraman G.W. (Billy) Bitzer. Griffith refined the use of the close-up, experimented with camera angles and film editing, and trained a group of actors that included Mary Pickford, one of the most popular film actresses of all time; Florence Lawrence, the first actual movie star; Mack Sennett, who later achieved fame as the director of the Keystone comedies; and the well-known leading men Lionel Barrymore and Owen Moore. Griffith made his last film for Biograph in

1914, and within five years the company had closed.

biography, form of nonfictional literature, the subject of which is the life of an individual. In general, the form is considered to include autobiography, in which the subject recounts his or her own history. Biography can be seen as a branch of history, because it depends on a selective ordering and interpretation of materials, written and oral, established through research and personal recollection. It can also be seen as a branch of imaginative literature in that it seeks to convey a sense of the individuality and significance of the subject through creative sympathetic insight.

A brief treatment of biographical literature follows. For full treatment, see *MACROPAEDIA: Literature, Art of*.

The earliest biographical writing probably consisted of funeral speeches and inscriptions, usually praising the life and example of the deceased. From this evolved the laudatory and exemplary biography with its associated problems of uncritical or distorted interpretation of available evidence. Such lives are still found, but they have produced their own antithesis in the denunciatory or debunking biography of which Lytton Strachey's *Eminent Victorians* (1918) is a famous modern example. Both kinds of biography were incorporated in early historical writing and oratory in which individual behaviour and character were of significance for the general discussion. Particular philosophical, religious, or political causes were often popularized by biographical means. Plato and Xenophon helped to vindicate Socrates by writing about his life as well as his teaching; the gospels did much the same for Jesus of Nazareth. Stoic biographies of Cato and Brutus served to attack the Roman principate, just as R.R. Madden's *Lives of the United Irishmen* implicitly attacked English rule in 19th-century Ireland.

The origins of modern biography as a distinct genre lie not with eulogy or admiring accounts of great sages and saints but with Plutarch's moralizing lives of prominent Greeks and Romans and Suetonius' gossip lives of the Caesars, which quote documentary sources. While kings and leaders of men attracted biographical attention as a part of the general historical record of their times, there are few vernacular lives of individuals considered for themselves until the 16th century. In England, William Roper's life of Thomas More (1626) is an important example, and in the next century Izaak Walton and John Aubrey produced brief biographies of writers and eminent persons. But the major developments of English biography came in the 18th century with Samuel Johnson's critical *Lives of the English Poets* and James Boswell's massive *Life of Johnson* (1791), which combines detailed records of conversation and behaviour with considerable psychological insight. This provided the model for exhaustive, monumental 19th-century biographies such as A.P. Stanley's *Life of Arnold* and Lord Morley's *Gladstone*. Thomas Carlyle's conviction that history was the history of great men demonstrated the general belief of the time that biographical writing was an important method of understanding society and its institutions. In modern times, impatience with Victorian reticence and deference and the development of psychoanalysis have sometimes led to a more penetrating and comprehensive understanding of the biographical subject. Leon Edel's massive *Henry James* is a good example. Another modern development has been the group-biography of a family or small body of close associates.

It has been recognized that a biographer is not neutral but discloses aspects of his own personality in the presentation and interpretation of the biographee. This is much more the case with autobiography; indeed the manner may reveal as much about the subject

as the matter. Though self-justification may provide the autobiographical impulse, so also may self-contempt, particularly when linked with some intellectual, religious, or emotional crisis that precipitates change. Such crises, beginning perhaps with the conversion of St. Augustine described in his *Confessions*, provide the focal point of many autobiographies but may have the effect of unconsciously distorting antecedent experience since the reader is offered a kind of manifesto that is only secondarily a personal record. But autobiography may recount the experiences, however scandalous, of travelers, lovers, or rascals, more or less for their own sake. Again, autobiography may be undertaken for partly therapeutic ends, seeking to establish an ironic or formal distance from painful or chaotic experience and to trace patterns of coherence in it.

Biographical and autobiographical writing can easily pass into fiction when rational inference or conjecture pass over into imaginative reconstruction or frank invention or when the biographical subject itself is wholly or partly imaginary.

bioherm, ancient organic reef of moundlike form built by a variety of marine invertebrates, including corals, echinoderms, gastropods, mollusks, and others; fossil calcareous algae are prominent in some bioherms. A structure built by similar organisms that is bedded but not moundlike is called a biostrome. Bioherms and biostromes occur in sedimentary rock strata of all geological ages, providing definitive information on paleoenvironments in the vicinity of their occurrence.

Bioko, also called FERNANDO PO, or FERNANDO PÓO, formerly (1973–79) MACIAS NGUEMA BIYOGO, island in the Bight of Biafra (Gulf of Guinea), lying about 60 miles (100 km) off the coast of southern Nigeria and 100 miles (160 km) northwest of continental Equatorial Guinea, western Africa. The island was named after the first president of the country in 1973, but Bioko became the local official name after he was deposed in 1979. Volcanic in origin, it is parallelogram-shaped with a north-south axis, embracing 779 square miles (2,017 square km), and rises sharply from the sea with its highest point being Santa Isabel Peak (9,869 feet [3,008 m]). Malabo, the republic's capital and chief port, stands near a crater breached by the sea.

The island was first sighted by the Portuguese explorer Fernão do Pó, probably in 1472, and was originally named Formosa ("Beautiful"). It was claimed by Spain after 1778, although the first attempt at firm Spanish control came only in 1858. For a short time (1827–34) Britain used the island as an antislavery base.

The original inhabitants, the Bubi, are descendants of Bantu-speaking migrants from the mainland. The so-called Fernandinos are of a later origin, being descendants of liberated slaves, mixed with settlers from former British West Africa. Both these groups have declined in status, as the Fang, who have flocked to the island from continental Equatorial Guinea, came to occupy most of the civil service posts. There was formerly a large transient population of contract plantation workers from Nigeria; most of these returned to Nigeria, however, following repressive acts by the government of Equatorial Guinea in the mid-1970s.

Bioko was one of the first African territories to grow cocoa. Timber and coffee are other important products. Pop. (1983) 57,190.

biological community: see community.

biological rhythm, periodic biological fluctuation in an organism that corresponds to, and is in response to, periodic environmental change. Examples of such change include cyclical variations in the relative position of the Earth to the Sun and to the Moon and in the immediate effects of such variations, *e.g.*,

day alternating with night, high tide alternating with low tide.

A brief treatment of biological rhythm follows. For full treatment, see MACROPAEDIA: Behaviour, Animal.

The internal mechanism by which such a rhythmic phenomenon occurs and is maintained even in the absence of the apparent environmental stimulus is termed a biological clock. When an animal that functions according to such a clock is rapidly translocated to a geographic point where the environmental cycle is no longer synchronous with the animal's cycle, the clock continues for a time to function synchronously with the original environmental cycle. Humans similarly transported over great distances often experience fatigue and lowered efficiency for several days, a phenomenon known as "jet lag."

A rhythm with a 24-hour cycle is called a circadian (from Latin *circa*, "about"; *di*, "day"—i.e., "about a day"), solar day, diel, daily, diurnal, or nycthemeral rhythm. A lunar tidal rhythm—the regular ebb and flow of oceans and large inland bodies of water—subjects seashore plants and animals to a rhythmic change; typically two high and two low tides occur each day (about 24.8 hours). Many species of shorebirds exhibit this rhythm by seeking food only when beaches are exposed at low tide. Monthly rhythms, averaging approximately 29.5 days, are reflected in reproductive cycles of many marine plants and of many animals. Annual rhythms are reflected in the reproduction and growth of most terrestrial plants and animals in the temperate zones.

biological warfare, also called GERM WARFARE, the military use of disease-producing agents, such as bacteria and viruses, on humans, animals, or plants and the means for combating such agents. Though direct use of biological warfare against enemy personnel is very old, it has acquired a stigma in modern times, and no country has admitted employing it. In 1972 a treaty was signed by more than 70 countries prohibiting the production, stockpiling, or development of biological weapons. Nevertheless, a number of nations, particularly developing states that found biological weapons to be an affordable and viable alternative to nuclear arms, began to engage in experiments in the late 20th century.

One of the grounds for opposition is the possibility of an agent getting out of control, as is said to have happened in the siege of Caffa (now Feodosiya, Ukraine) in the Crimea in 1347. The Mongols hurled bodies of plague victims over the walls of the Genoese defenders, and, purportedly, Genoese ships carried the bacillus to Europe, loosing the massive epidemic known as the Black Death.

In World War I the Germans infected Romanian cavalry horses, as well as livestock in the United States destined for shipment to the Allies, with glanders, a lesion-producing bacterial disease. Charges of germ warfare were made by the Chinese against United Nations forces in the Korean War (1950–53), but no substantiation was offered. No nation is known to have used germs successfully against the personnel of another in the 20th century, though Iraq admitted in 1995 that it equipped shells and warheads during the Persian Gulf War with anthrax, an especially virulent and deadly virus. None of these weapons was used. In the late 20th century security experts began to warn of the danger of biological attack against population centres by terrorist groups or individuals, because of the relative ease and low cost of developing such weapons.

biology, the study of living things and their vital processes. The field deals with all of the physicochemical aspects of life.

A brief treatment of biology follows. For full treatment, see MACROPAEDIA: Biological Sciences, The.

Because biology is such a broad subject, it has

been subdivided into separate branches for convenience of study. Despite apparent differences, all these subdivisions are interrelated by the basic principles that underlie all biological manifestations. The current approach to the study of living things is based on the levels of biological organization involved—whether molecules, cells, individuals, or populations—and on the specific subject matter under investigation—e.g., structure and function, types and classification, and growth and development. The study of the individual organism as a whole (organismic biology) dominated biology until the invention of the compound microscope (17th century) and the consequent rise of cell biology.

Because each of the aforementioned levels is still too broad to be easily grasped by any one individual, a number of subdivisions have arisen over time. These include morphology, the study of the shape and structure of plants and animals; physiology, the study of the functions of cells, tissues, organs, and organ systems in living things; taxonomy, which attempts to classify living things into groups according to observed natural or hypothetical relationships; embryology, which is concerned with the formation and development of the embryo in plants and animals; genetics, which is the study of inheritance and variation in organisms and the mechanisms by which these processes operate; and ecology, the study of organisms and their interactions with other organisms and their environment.

Each of these subdivisions, in turn, can be further subdivided: morphology, for example, is divided into anatomy, which is the study of structures that can be observed with the naked eye; histology, the study of microscopic structure; and cytology, the study of the particular minutiae of cellular structure. There has also been an overlapping of the field of biology with other scientific disciplines; for instance, the modern principles of chemistry and physics are integrated with those of biology in biochemistry and biophysics, respectively. Molecular biology, which studies the chemical structures and processes of biological phenomena at the molecular level, draws on several disciplines and has become one of the most important biological sciences.

In another approach to classification, a field of biology may be concerned with the investigation of one type of living thing—e.g., botany, the study of plants; zoology, the study of animals; ornithology, the study of birds; ichthyology, the study of fishes; herpetology, the study of amphibians and reptiles; entomology, the study of insects; mycology, the study of fungi; microbiology, the study of microorganisms; protozoology, the study of protozoa; and bacteriology, the study of bacteria.

The particular subjects of biological study—living organisms, their structures and processes, and the relationships among organisms—are treated in many articles in the encyclopaedia. For lists of these articles in both the MACROPAEDIA and the MICROPAEDIA, and for the place of biology in the circle of learning, see PROPAEDIA: Part Three; Part Four, Divisions I and II. For references to a particular biological subject, see INDEX.

bioluminescence, the emission of light by an organism or by a test-tube biochemical system derived from an organism. It could be the ghostly glow of bacteria on decaying meat or fish, the shimmering phosphorescence of protozoans in tropical seas, or the flickering signals of fireflies. The phenomenon occurs sporadically in a wide range of protists and animals, from bacteria and fungi to insects, marine invertebrates, and fish; but it is not known to exist naturally in true plants or in amphibians, reptiles, birds, or mammals. Bioluminescence results from a chemical reaction (chemiluminescence) in which the conversion of chemical energy to radiant energy is direct

and virtually 100 percent efficient; i.e., very little heat is given off in the process. For this reason the emission is called cold light, or luminescence (*q.v.*).

The role of bioluminescence in behaviour. Light production appears to be associated with the protection and survival of a species. This is quite clear in certain squids, who secrete a luminous cloud to confuse an enemy and make an escape, and in many deep-sea fishes who dangle luminous lures to attract prey or who show light organs to disguise their form from enemies, frighten predators, or simply light the way in the darkness of the ocean deeps. The survival value of bioluminescence is indisputable for many organisms who use their flashes as species-recognition and mating signals. In *Photinus pyralis*, a common North American firefly, the male flashes spontaneously while in flight, emitting on the average a 0.3-second flash every 5.5 seconds if the temperature is 25° C (77° F). The females watch from the ground and wait for a male to flash. Upon seeing a flash, a female flashes a response after an interval of about two seconds; it is this response that attracts the male. The female is unable to identify a male by his flashing; thus it is the male that recognizes the correct signal—i.e., interval between flashes—and seeks out the female. The interval between the male's signal and the female's response, therefore, is crucial. Similar specific recognition codes are used by many species of fireflies. Other fireflies possibly rely on colour differences in the light signals between sexes.

Lantern fishes and hatchetfishes, along with many other deep-sea organisms, possess distinct arrangements of light organs on the body that may serve as species- and sex-recognition patterns. The light organs, or photophores, of many deep-sea fishes are placed on the ventral and lateral surfaces of the body, and the light is emitted downward and outward. Such an arrangement is believed to allow the light of the photophores to be used to match the intensity of sunlight penetrating from above, thus concealing the fish's own shadow from a predator below. Some lantern fishes possess, in addition, a large nasal organ; others have a patch of luminous tissue in the tail region. In deep-sea angler fishes, the first dorsal spine is turned forward into an elongated rod, from the end of which dangles a luminous organ. When an unsuspecting prey approaches the luminous lure, it is engulfed in the fish's jaw.

The role of bioluminescence in metabolism. The functional role of bioluminescence in lower organisms such as bacteria, dinoflagellates, and fungi is difficult to discern. Partly because the glow of luminous bacteria is extinguished when oxygen is removed, it has been suggested that the bioluminescent reaction was originally used to remove oxygen toxic to primitive types of bacteria that developed during a time when oxygen was absent or very rare in the Earth's atmosphere. The metabolic reaction that combines the oxygen with a reducing substance (luciferin) liberates sufficient energy to excite a molecule in the organism to emit visible radiation. Most of those luminous primitive organisms have subsequently developed systems of utilizing oxygen, but they have retained the luminescent capability as parts of related metabolic pathways or for some survival value that luminescence may confer on the organism.

The range and variety of bioluminescent organisms. Luminous species are widely scattered taxonomically, with no clear-cut pattern discernible. Many luminous shrimps are known but no luminous crab. Many luminous squids are known but only a single luminous octopus (*Callistoctopus arakawai* of Japan). Again, luminous centipedes and millipedes are not uncommon, but luminous scorpions and spiders are apparently nonexistent. Many

plantlike protists (bacteria and fungi) exhibit bioluminescence, but no luminous true plant is known.

Almost half the animal phyla contain luminous forms, but the number of representatives is very small compared with the total number of known animal species. The protists are not so rich in luminous species but are greatest in sheer abundance, especially in tropical seas. In fact, the majority of luminous organisms are marine.

The ocean surface in many parts of the tropics is dense with single-celled luminous planktonic organisms, primarily dinoflagellates, that glow when stimulated mechanically, as by the churning of the waves, or, when washed ashore, by the pressure of a foot. Some organisms exhibit a 24-hour rhythm of light intensity, highest at night and lowest during the day.

Among crustaceans, luminous species are especially remarkable in the copepods, shrimps, and ostracods. Luminous copepods are widely distributed throughout the world's waters. Some are surface dwellers, while others live in the deep sea. Two famous groups of luminous copepods are *Pleuromma* and *Metridia*. Some shrimps (*Hoplophorus*) emit a luminous secretion from luminous organs, while others possess true light organs (photophores), which consist of a lens, reflector, and light-emitting photogenic cells. Of the three or four species of the ostracod genus *Cypridina* known to be luminous, the most famous is *Cypridina hilgendorffii*, found in the coastal waters and sands of Japan. This tiny, shelled organism, which ejects a blue luminous secretion into the water when disturbed, may be collected and dried for the light-emitting components, which are active indefinitely.

Other organisms responsible for large patches of light in the ocean are jellyfish and other coelenterates and comb jellies (ctenophores). A large proportion of the floating, transparent siphonophores and the feathery, bottom-dwelling sea pens are luminous. Many of the hydroids and jellyfish are also luminous. Sea pens (*Pennatula*), sea cactus (*Cavernularia*), and sea pansy (*Renilla*) are colonies, which upon stimulation generate a wave of luminous light that travels down the organism. The luminescence in these organisms appears to be under nervous control.

Among annelids, marine worms and earthworms both contain luminous forms. *Odontosyllis*, the fire worm of Bermuda, swarms in

great numbers a few days after the full moon. Female worms, about 2 cm (almost 1 inch) in length, rise to the surface shortly after sunset and swim in circles while ejecting a luminous secretion. Smaller male worms swim to where the females are circling and mate. The male is also luminous, but the light is intermittent and of intracellular character. It is not certain whether luminescence has any relationship to mating, since nonluminous *Odontosyllis* exhibits similar courtship behaviour. *Chaetopterus* spends its life in a tube of parchment membrane, with openings at both ends. It luminesces when disturbed, but it is doubtful whether the luminescence has any special purpose. *Polynoe* and *Polycirrus* are luminous annelids that usually live in sand or rock. Luminous mollusks include *Pholas* (a bivalve), *Phyllirrhoe* (a floating nudibranch), *Planaxis* (a marine gastropod), *Latia* (a freshwater limpet), and squids (cephalopods).

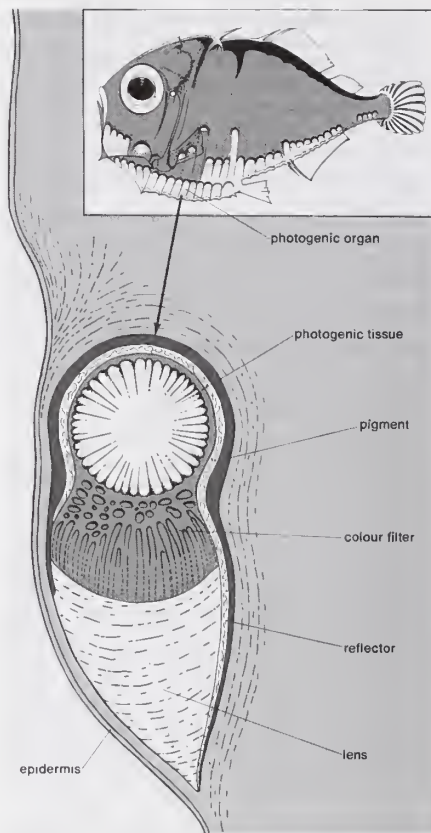

The luminous squids and deep-sea fishes possess the most complicated light organs; they consist of photogenic cells, reflector, lens body, and, in certain cases, colour filters. Of the open-ocean squids (oegopsids) such as *Lycoteuthis*, *Histioteuthis*, and *Enoploteuthis*, as many as 75 percent are self-luminous; i.e., light results not from symbiotic luminous bacteria but from an internal biochemical reaction. In deep-sea squids, the light organ is often found on the eyelid or on the eyeball itself. In others—e.g., *Watasenia scintillans*—light organs are present also at the end of the tentacles and over other surfaces of the body.

Deep-sea anglerfish, hatchetfish, and lantern fish are among the best-known luminescent fishes. In most such fishes, luminescence is produced intracellularly; the light is emitted by special cells called photocytes. The anatomical structure of the luminous organs of many fishes is similar to that of squids. Deep-sea fishes have photophores along the body, under the eyes, and often on barbels or antennae. The typical luminous organ consists of a lens, luminous body, colour filter, and reflector (see the Figure). The light is often under the fish's nervous control, and after death the ability to luminesce disappears rapidly. Whether the light-producing components are developed by the fish or ingested by the fish is not clear. A distinct possibility exists that a fish feeds on crustaceans such as *Cypridina* organisms and utilizes their light-emitting components for its own light production.

A few genera of deep-sea fishes and several families of shallow-water fishes produce light by virtue of harbouring symbiotic luminous bacteria within light organs. This type of organ is endowed with a rich blood supply that nourishes and maintains the luminous bacteria. It appears that each fish species becomes infected with a specific bacterial type. The bacteria-filled organ is continuously luminous, but the light can be controlled either by melanophores scattered over the surface of the organ or by a black membrane that may be mechanically drawn over the organ. Control is brought about by the contraction and expansion of melanophores, or pigment granules. Expansion of the melanophores cuts off the light, whereas contraction allows light to pass through. The well-known flashlight fishes (*Photoblepharon*) of Indonesia possess large light organs beneath the eyes. The light is extinguished when a fold of black skin is drawn upward over the organ.

An indirect-emission type of luminous organ is present in some fish. The luminous organ is connected to the gut via a short duct and is often embedded in tissue. The light passes to the outside through the translucent keel and ventral muscles, as in *Leiognathus*, *Acropoma* (lanternbellies), and *Archamia*.

Among other higher animals, the chordate subphylum Tunicata contains luminous forms. The genus *Pyrosoma* includes several species that account for the brilliant lumines-

Transverse section of a photogenic organ of a hatchetfish (*Polyipnus spinosus*)

cence among macroplanktons of the seas, giving rise to the name "fire body." *Pyrosoma* is a floating colonial form, pelagic and translucent. The colonies usually reach a length of 3 to 10 cm (about 1 to 4 inches); and each individual is about 5 mm (0.2 inch) long.

Luminous plantlike protists are represented by only two groups, bacteria and fungi. Luminous bacteria are all marine forms, requiring salt for growth and luminescence, and are widely distributed throughout the oceans of the world. The most common are *Vibrio* and *Photobacterium* species. While luminous bacteria come in various shapes, they do not form clusters or chains, as do many other bacteria. The light of an individual bacterium, of course, cannot be seen with the naked eye, but the light from a liquid or agar culture containing billions of bacteria is readily visible. The light is bluish and continuous. Many luminous bacteria live in the light organs of fish and squids, without adversely affecting their hosts.

Small, whitish, luminous fungi ("foxfire") commonly grow on dead wood of forests, particularly where the ground is moist and wet; these forms predominate in the tropics. The light of fungi ranges from blue to green and yellow, depending on the species. Among the large luminous forms are *Pleurotus lampsae* of Australia and the jack-o'-lantern (*Clitocybe illudens*) of the United States, which reach approximately 13 cm (about 5 inches) in diameter.

Luminosity among land animals is not associated with any particular habitat, but almost all these forms are nocturnal. The centipede *Orphanopus*, widely distributed in tropical Asia, gives off luminous secretions from each segment. The entire body of *Luminodesmus sequoiae*, a millipede found in the Sierra Nevada (mountains) of California, glows with a diffuse light. Luminous insects include some true flies (order Diptera), notably *Arachnocampa luminosa*, the larva of which luminesces a greenish blue from a knob at the end of its body. The larvae dangle at the ends of filaments that hang

Luminescent parchment worm (*Chaetopterus*)

George G. Lower

from the ceilings of caves in New Zealand. Luminous beetles include the fireflies and the elaterid *Pyrophorus* (the click beetle, or *cucujo* in South America). The luminescent larvae of fireflies and some luminescent wingless adults are known as glowworms. The female *Diplocladon hasseltii*, called starworm, or diamond worm, gives off a continuous greenish blue luminescence from three spots on each segment of the body, forming three longitudinal rows of light, the appearance of which inspired the common name night train. *Phrixothrix*, the railroad worm, possesses two longitudinal rows, with a red luminous spot on the head.

The limpet *Latia neritoides*, found in streams around Auckland, N.Z., is the only strictly freshwater luminous form known. The so-called firefly shrimp (*hotaru ebi*) is found in Lake Suwa, Japan, but the light is from luminous bacteria that infect the shrimp and kill it in about 24 hours.

Biochemical events of light emission. In most bioluminescent organisms, the essential light-emitting components are the oxidizable organic molecule luciferin and the enzyme luciferase, which are specific for different organisms. The present custom is to use generic names according to origin—e.g., firefly luciferin and luciferase, *Cypridina* luciferin and luciferase. The luciferin-luciferase reaction is actually an enzyme-substrate reaction in which luciferin, the substrate, is oxidized by molecular oxygen, the reaction being catalyzed by the enzyme luciferase, with the consequent emission of light. The light emission continues until all the luciferin is oxidized. This type of reaction is found in fireflies, *Cypridina*, *Latia*, and many types of fish, such as lantern fish, hatchfish, *Apogon*, and *Parapriacanthus*.

In firefly luminescence, the substance adenosine triphosphate (ATP) initially reacts with firefly luciferase, magnesium ion, and firefly luciferin to form a complex (luciferase-luciferyl-adenylate) and pyrophosphate. This complex then reacts with molecular oxygen to emit light. Enough energy is liberated in the last step to convert the electronic configuration of the luciferase-luciferyl-adenylate complex from a low-energy ground state to a high-energy excited state. The high-energy complex then loses energy by radiating a photon of visible light and returns to the ground state.

Luminescent bacteria employ the enzymatic oxidation of reduced flavin mononucleotide (FMNH₂). In the complete reaction, bacterial luciferase reacts with FMNH₂ and oxygen to form a long-lived intermediate complex, which then reacts with a long-chain aliphatic aldehyde molecule (e.g., decanal) to emit light.

The significance of bioluminescence in research. The luminescent reaction of the firefly has been used as an assay method for the determination of adenosine triphosphate (ATP), an important metabolic substance used by all living cells in numerous reactions in which energy is either stored or expended. The glow of a specially blended extract of firefly lanterns eventually dims and disappears as ATP is broken down. The addition of fresh ATP, either as a pure chemical or as a constituent of a tissue extract, immediately restores the luminescence. The intensity of the glow is a direct measure of the amount of ATP present in the extract. This assay method has been widely used in medical and biological research to determine the amount of ATP present in extracts of cells and tissues. The study of reactions involving ATP has led to a detailed understanding of the mechanisms of energy conversion in cells. The firefly reaction is one of the few reactions in which ATP is directly involved with light emission. All other bioluminescent reactions involve compounds that are chemically distinct from ATP.

biomass, the weight or total quantity of living organisms of one animal or plant species

(species biomass) or of all the species in the community (community biomass), commonly referred to a unit area or volume of the habitat. The number of organisms, or the biomass, in an area at a given moment is the standing crop. The total amount of organic material produced by living organisms of a particular area within a set period of time, called the productivity, is usually measured in units of energy, such as gram calories per square metre per year.

biome, also called MAJOR LIFE ZONE, the largest geographic biotic unit, a major community of plants and animals with similar life forms and environmental conditions. It includes various communities and developmental stages of communities and is named for the dominant type of vegetation, such as grassland or coniferous forest. Several similar biomes constitute a biome type—for example, the temperate deciduous forest biome type includes the deciduous forest biomes of Asia, Europe, and North America. "Major life zone" is the European phrase for the North American biome concept.

biomechanics, antirealistic system of dramatic production developed in the Soviet Union in the early 1920s by the avant-garde director Vsevolod Meyerhold. Meyerhold drew on the traditions of the commedia dell'arte and kabuki and on the writings of Edward Gordon Craig for his system, in which the actor's own personality was eliminated and he was entirely subordinated to the director's will. Coached as gymnasts and acrobats and emphasizing pantomime rather than words, the actors threw themselves about in puppet-like attitudes at the director's discretion. For these productions the stage was exposed to the back wall and was then furnished with harshly lit, bare sets consisting of scaffoldings, ladders, and ramps that the actors used. Biomechanics had lost its appeal by the late 1920s, though Meyerhold's emphasis on external action did become an element in Soviet actor-training techniques.

Bion (fl. 100 BC; b. Smyrna, Lydia, Asia Minor [now Izmir, Turkey]), minor Greek bucolic poet.

The *Lament for Bion*, written by an Italian pupil of the poet, suggests that he lived in Sicily. The 17 surviving fragments of Bion's *Bucolica*, mostly concerned with love, strike a playful, sometimes scintillating note. Since the Renaissance Bion has also been credited with the *Lament for Adonis*, whose overheated and highly coloured emotionalism may reflect the cult of Adonis, which was popular in the poet's homeland. The Greek text is in *Bucolici Graeci* (ed. A.S.F. Gow, 1952), and there is a translation by the same author in *The Greek Bucolic Poets* (1953).

Biondo, Flavio, Latin FLAVIUS BLONDUS (b. 1392, Forlì, Romagna [Italy]—d. June 4, 1463, Rome), humanist historian of the Renaissance and author of the first history of Italy that developed a chronological scheme providing an embryonic notion of the Middle Ages.

Biondo was well educated and trained as a notary before he moved in 1433 to Rome, where he was appointed apostolic secretary the following year. After serving on diplomatic missions to Venice and to the condottiere Francesco Sforza, he wrote *De Roma instaurata*, 3 vol. (1444–46; "Rome Restored"), a reconstruction of ancient Roman topography. In 1459 he wrote *De Roma triumphante*, a discussion of pagan Rome as a model for new reform in administrative and military institutions. The book was extremely influential, serving both to provide a new conception of the papacy as a modern continuation of the Roman Empire and to awaken Roman patriotism and respect for antiquity.

Biondo's two greatest works were the *Italia*

illustrata (written between 1448 and 1458, first published in 1474) and the *Historiarum ab inclinatione Romanorum imperii decades* (written from 1439 to 1453, first published in 1483; "Decades of History from the Deterioration of the Roman Empire"). The *Italia illustrata*, based on the author's extensive travels through Italy, described the geography and history of 18 Italian provinces, beginning with the Roman Republic and Empire, tracing 400

Biondo, portrait from Paulus Jovius "Elogia," 1517

years of barbarian invasion, and analyzing the influence of Charlemagne and subsequent emperors. In this work Biondo gave an acute description both of contemporary internal divisions between secular and papal power in Italy and of the restoration of the classics and revival in letters during the first half of the 15th century.

Biondo's other great work, the 32-book *Historiarum*, was a comprehensive treatment of both Europe and Christendom from the sack of Rome by the Goths in AD 410 to the rise of Italian cities and renewal of Italian dignity and glory up to 1442. A careful and critical work based on the most reliable sources, the *Historiarum* provided a definite chronological scheme between ancient Rome and Biondo's own time and influenced the later notion of a 1,000-year period of the Middle Ages. The work was consulted by Niccolò Machiavelli in his analysis of Italy's disunity.

bionics, science of constructing artificial systems that have some of the characteristics of living systems. Bionics is not a specialized science but an interdisciplinary discipline; it may be compared with cybernetics. Bionics and cybernetics have been called the two sides of the same coin. Both use models of living systems, bionics in order to find new ideas for useful artificial machines and systems, cybernetics to seek the explanation of living beings' behaviour.

Bionics is thus distinct from bioengineering (or biotechnology), which is the use of living things to perform certain industrial tasks, such as the culture of yeasts on petroleum to furnish food proteins, the use of microorganisms capable of concentrating metals from low-grade ores, and the digesting of wastes by bacteria in biochemical batteries to supply electrical energy.

Mimicry of nature is an old idea. Many inventors have modeled machines after animals throughout the centuries. Copying from nature has distinct advantages. Most living creatures now on the Earth are the product

of two billion years of evolution, and the construction of machines to work in an environment resembling that of living creatures can profit from this enormous experience. Although the easiest way may be thought to be direct imitation of nature, this is often difficult if not impossible, among other reasons because of the difference in scale. Bionics researchers have found that it is more advantageous to understand the principles of why things work in nature than to slavishly copy details.

The next step is the generalized search for inspiration from nature. Living beings can be studied from several points of view. Animal muscle is an efficient mechanical motor; solar energy is stored in a chemical form by plants with almost 100 percent efficiency; transmission of information within the nervous system is more complex than the largest telephone exchanges; problem solving by a human brain exceeds by far the capacity of the most powerful supercomputers. These exemplify the two main fields of bionics research—information processing and energy transformation and storage.

The general pattern of the information network of living organisms is the following: environmental sensations are received by the organs of sense and then coded into signals that are transmitted by nerves to the centres of processing and memorization of the brain. Pit vipers of the subfamily Crotalinae (which includes the rattlesnakes), for example, have a heat-sensing mechanism located in a pit between nostrils and eyes. This organ is so sensitive that it can detect a mouse at a few metres' distance. Though much more sensitive man-made infrared detectors exist, bionics can still profit from study of the vipers. First, it would be interesting and of potential value to understand the principle of energy transformation occurring in the rattlesnake's infrared pit, as well as the process by which the nerves are stimulated in the absence of an amplifying mechanism. Another striking example is the odour-sensing organ of the silk moth, *Bombyx mori*. The male can detect the chemical secreted by the female in a quantity as small as a few molecules.

In a conductor such as a telephone wire, the signal is attenuated as it travels along the wire, and amplifiers must be placed at intervals to reinforce it. This is not the case for the animal nerve axon: the neural impulse issued from sense organs does not weaken in travelling along the axon. This impulse can travel in only one direction. These properties make the nerve axon capable of logic operations. In 1960 a semiconductor device called a neuristor was devised, capable of propagating a signal in one direction without attenuation and able to perform numerical and logical operations. The neuristor computer, inspired by a natural model, imitates the dynamic behaviour of natural neural information networks; each circuit can serve sequentially for different operations in a manner similar to that of the nervous system.

Another question of interest to bionics is how a living system makes use of information. In changing circumstances, humans evaluate alternative courses of action. Every situation somehow resembles a situation experienced before. "Pattern recognition," an important element in human action, has implications for bionics. One way to design an artificial machine capable of pattern-recognition properties is to use learning processes. Experimental versions of such a machine have been developed; they learn by establishing and modifying connections among a large number of possible alternative routes in a net of pathways. This learning, however, is still rudimentary and far from human.

The first essential difference between existing electronic computers and the human brain lies in the way their memories are organized. In either the memory of a living being or that of a machine, the main problem lies in retrieving information once it has been stored. The method computers use is called "addressing." A computer memory can be compared to a large rack of pigeonholes, each having a particular number or address (location). It is possible to find a certain piece of information if the address—that is, the number of the pigeonhole—is known. The human memory works in a very different way, using association of data. Information is retrieved according to its content, not according to an external address artificially added. That difference is qualitative as well as quantitative. Man-made memory devices are now constructed using associative principles, and there is a great potential in this field.

The second main difference between electronic computers and the human brain resides in the manner of dealing with the information. A computer processes precise data. Humans accept fuzzy data and carry out operations that are not strictly rigorous. Also, computers perform only very simple elementary operations, producing complex results by performing a vast number of such simple operations at very high speed. In contrast, the human brain performs at low speed but in parallel rather than in sequence, producing several simultaneous results that can be compared (*see also* artificial intelligence).

In the living world, energy is stored in the form of chemical compounds; its use always is accompanied by chemical reactions. Solar energy is stored by plants by means of complex chemical processes. The energy of muscular motion is derived from chemical changes. The light produced by such living organisms as mushrooms, glowworms, and certain fishes is of chemical origin. In every case the energy transformation is remarkably efficient compared with thermal engines.

A beginning is being made in understanding how these transformations take place in living material and the nature of the complex role played by living membranes. Perhaps some of the limitations of molecular complexity and fragility could be overcome in man-made artificial-energy machines and better results achieved than in natural membranes.

bionomics: *see* ecology.

biophysics, discipline concerned with the application of the principles and methods of the physical sciences to biological problems.

A brief treatment of biophysics follows. For full treatment, *see* MACROPAEDIA: Biological Sciences, The.

The major areas of biophysics deal with biological function when the function depends on physical agents such as electricity (in nerves) or mechanical force (in muscles), the interaction of living organisms with physical agents such as light or sound or ionizing radiations (*e.g.*, X rays), and interactions between living things and their environment as in locomotion (swimming, flying, etc.), navigation, and communication.

Sophisticated methodology and instrumentation are crucial in biophysics. In molecular biophysics, for example, X-ray diffraction and a sedimentation technique carried out with the ultracentrifuge have been among the most productive. These have made possible precise descriptions of the structure and properties of macromolecules found in animals and plants. Moreover, with the aid of electron microscopy and nuclear magnetic resonance, the molecular configuration and bonding of the principal constituents of cell membranes and chromosomes have been determined.

Physicists and physiologists have been aware of the biological effects of electric currents since Luigi Galvani's discovery of bioelectric-

ity in the 18th century, and much work in biophysics has been concerned with the role of electric pulses in the conduction of information by nerves and in initiating muscular contraction. The generation of force by contracting muscle is also studied by biophysicists.

Biophysical studies of the senses have made much progress in the areas of vision and hearing. The use of light by plants is also investigated by biophysicists as the process of photosynthesis starts as a physical interaction even though it later develops through a chemical chain. Study of the effects of ultraviolet light is an extension of the study of the effects of visible light. No form of life is adapted to use ionizing radiations, but these constantly impinge on living organisms in the form of cosmic rays and naturally occurring radiations from uranium, radium, etc. The development of man-made sources of these radiations in the form of X-ray machines, nuclear-power reactors, and isotopes used as tracers, as well as nuclear weapons, has been the spur for extensive research into their biophysical effects. There have been studies of the biological effects of lower-energy electromagnetic radiations (radio and radar waves), and of intense beams of infrared and visible light such as may be produced by lasers.

Locomotion presents one of the more complicated biophysical problems. The ways in which birds fly and fish swim involve complex considerations of aerodynamics and hydrodynamics, respectively. Mathematical expression of human and animal locomotion is formidably complex. Animal movement also requires navigation, and this has revealed unexpected biophysical patterns, ranging from the use of ultrasonics by bats, to a kind of low-frequency radar used by certain fish, to the use of magnetic fields by pigeons and polarization of sunlight by bees.

biopoiesis, a process by which living organisms are thought to develop from nonliving matter, and the basis of a theory on the origin of life on Earth. According to this theory, conditions were such that, at one time in Earth's history, life was created from nonliving material, probably in the sea, which contained the necessary chemicals. During this process, molecules slowly grouped, then regrouped, forming ever more efficient means for energy transformation and becoming capable of reproduction (*see* eobiont).

Some scientists think that under present biospheric conditions new forms of life are not likely to be created from nonliving matter. Others feel that life is continuously being created but that the new forms are not so well adapted to the environment as existing ones and are thus unable to compete successfully.

biopsy, medical diagnostic procedure in which cells or tissues are removed from a patient and examined visually, usually with a microscope. The material for the biopsy may be obtained by several methods and with various instruments, including aspiration through a needle, swabbing with a sponge, scraping with a curette, trephining a bone, or excision with a forceps or electric snare. The biopsy is a standard step in the diagnosis of malignant and benign tumours and can also provide a wide range of other types of diagnostic information, particularly in connection with such organs as the liver or pancreas.

biopsychology: *see* psychobiology.

Biosatellite, any of a series of three U.S. Earth-orbiting scientific satellites designed to study the biological effects of weightlessness (*i.e.*, zero gravity), cosmic radiation, and the absence of the Earth's 24-hour day-night rhythm on several plants and animals ranging from a variety of microorganisms to a primate. Such space laboratories were equipped with telemetering equipment with which to moni-

for the condition of the specimens. Biosatellite 1 (1966) was not recovered. Biosatellite 2 (1967) was a complete success. It involved an assortment of biological experiments, including one concerned with mutations induced in the offspring of insects exposed to ionizing radiation in space. The flight of Biosatellite 3 (1969), scheduled to last 31 days, had to be cut short when the trained pigtail monkey that was aboard became ill. This proved to be the last flight of the project.

biosociology: *see* *synecology*.

biosphere, relatively thin life-supporting stratum of the Earth's surface, extending from a few kilometres into the atmosphere to the deep-sea vents of the oceans. The biosphere is a global ecosystem composed of living organisms (biota) and the abiotic (nonliving) factors from which they derive energy and nutrients.

A brief treatment of the biosphere follows. For full treatment, *see* MACROPAEDIA: Biosphere.

The biosphere can be broken down into segments of abiotic and biotic components, called ecosystems. Oceans, lakes, and wetlands are aquatic ecosystems, while forests, deserts, and tundras are terrestrial ecosystems. Through these systems, energy flows and chemicals essential to life are cycled. The biosphere itself can be studied as a worldwide ecosystem through which the interconnectedness of all life and life-supporting systems on the Earth can be understood.

Organisms in the biosphere are classified into trophic levels, or feeding relationships, that constitute the food chain. Primary producers, or autotrophs, are those organisms that convert energy from the Sun (photoautotrophs) or from inorganic substances (chemoautotrophs) to produce organic compounds. Green plants make up the largest group of primary producers. The next trophic level is that of primary consumers, or herbivores (organisms that eat plants or algae). Secondary consumers are carnivores that feed on herbivores, while tertiary consumers feed on secondary consumers, and so on. Detritivores, or decomposers, are consumers that feed on organic detritus.

The process of energy flow occurs across the trophic levels. Energy enters the system through solar radiation, which primary producers convert to chemical energy (organic compounds) by the process of photosynthesis. Of the light energy that strikes the Earth, only about 1 percent is used in photosynthesis. Energy flows unidirectionally through the food chain and is dissipated at each successive stage; roughly 10 percent of energy is transferred from one trophic level to the next.

Unlike energy, which flows into and out of the system, chemicals are recycled in the biosphere. Elements essential to life such as carbon, nitrogen, phosphorus, and sulfur are drawn from the geosphere, or nonliving world, which consists of the atmosphere (air), the hydrosphere (water), and the lithosphere (rocks and soil of the terrestrial surface). Once taken up by organisms, the elements cycle between biotic and abiotic states according to their biogeochemical cycles. The cycling of water is also necessary to the maintenance of life.

The biotic portion of ecosystems can be broken down into communities—*i.e.*, assemblages of populations of different species that live in proximity and may interact with one another. Populations, still smaller organizational units, are groups of individuals of the same species located in a particular geographic area. Environmental conditions such as temperature, water availability, light, and periodic disturbances affect the distribution of organisms, and interactions between the species themselves further influence the composition of the community. Interspecific interactions include competition, antagonism, and predation.

Interactions with the biotic and abiotic components of their ecosystems have shaped the

distribution and evolution of species, resulting in a diverse array of organisms. These organisms contribute to the steady-state environment of each ecosystem and, thus, to the maintenance of biospheric processes. Disturbances, both natural and man-made, to even seemingly small parts of the system may have significant and far-reaching effects.

Biot, Jean-Baptiste (b. April 21, 1774, Paris, France—d. Feb. 3, 1862, Paris), French physicist who helped formulate the Biot-Savart law, which concerns magnetic fields, and laid the basis for saccharimetry, a useful technique of analyzing sugar solutions.

Educated at the École Polytechnique, Biot was appointed professor of mathematics at the University of Beauvais in 1797, became professor of mathematical physics at the Collège de France in 1800, and was elected a member of the French Academy of Sciences in 1803. He accompanied J.-L. Gay-Lussac in 1804 on the first balloon flight undertaken for scientific purposes. The men showed that the Earth's magnetic field does not vary noticeably with altitude, and they tested upper atmospheric composition. Biot also collaborated with the noted physicist D.F.J. Arago in investigating the refractive properties of gases.

Biot
H. Roger-Viollet

In 1820 he and the physicist Félix Savart discovered that the intensity of the magnetic field set up by a current flowing through a wire is inversely proportional to the distance from the wire. This relationship is now known as the Biot-Savart law and is a fundamental part of modern electromagnetism theory. In 1835, while studying polarized light (light having all its waves in the same plane), Biot found that sugar solutions, among others, rotate the plane of polarization when a polarized light beam passes through. Further research revealed that the angle of rotation is a direct measure of the concentration of the solution. This fact became important in chemical analysis because it provided a simple, nondestructive way of determining sugar concentration. For this work Biot was awarded the Rumford Medal of the Royal Society in 1840.

Among his voluminous writings, the most important work was *Traité élémentaire d'astronomie physique* (1805; "Elementary Treatise on Physical Astronomy"). He was made a member of the French Academy in 1856.

Biot-Savart law, in physics, a fundamental quantitative relationship between an electric current and the magnetic field it produces, based on the experiments in 1820 of the French scientists Jean-Baptiste Biot and Félix Savart.

An electric current flowing in a conductor, or a moving electric charge, produces a magnetic field, or a region in the space around the conductor in which magnetic forces may be detected. The value of the magnetic field at a point in the surrounding space may be consid-

ered the sum of all the contributions from each small element, or segment, of a current-carrying conductor. The Biot-Savart law states how the value of the magnetic field at a specific point in space from one short segment of current-carrying conductor depends on each factor that influences the field. In the first place, the value of the magnetic field at a point is directly proportional to both the value of the current in the conductor and the length of the current-carrying segment under consideration. The value of the field depends also on the orientation of the particular point with respect to the segment of current. If the line from the point to the short segment of current makes an angle of 90° with the current segment or lies straight out from it, the field is greatest. As this angle gets smaller, the field of the current segment diminishes, becoming zero when the point lies on a line of which the current element itself is a segment. In addition, the magnetic field at a point depends upon how far the point is from the current element. At twice the distance, the magnetic field is four times smaller, or the value of the magnetic field is inversely proportional to the square of the distance from the current element that produces it.

The Biot-Savart law is applied in a specific case by adding up the contributions to the magnetic field at a given point from the whole series of short current segments that constitute a specific conductor of whatever shape. For instance, with a very long straight wire carrying current, the value of the magnetic field at a point nearby is just directly proportional to the value of the current and inversely proportional to the perpendicular distance from the wire to the given point. *Compare* Ampère's law.

biotechnology, the application to industry of advances made in the techniques and instruments of research in the biological sciences.

The growth of the field of biotechnology is closely linked to the development in the 1970s of genetic engineering (the directed alteration of genetic material). Substances that have been produced in this manner include human interferon (a natural virus-fighting substance), human insulin, and human growth hormone. The techniques of genetic engineering—splicing, transplantation, and chemical replantation of repressed, nonfunctional genes—also offer the possibility that a number of heredity disorders may be "corrected" by manipulation. Recombinant-DNA techniques in conjunction with the development of a technique for producing monoclonal antibodies (antibodies produced by single clones of antibody-producing cells) have made an evident impact on medical diagnosis and oncology. Another important use of genetic engineering is the production of bacteria used to biodegrade oil spills and toxic wastes.

Biotechnology had its origins in a 1980 decision by the U.S. Supreme Court that "a live human-made microorganism is patentable matter." This ruling resulted in the establishment of a number of commercial firms—among them Genentech, Biogen, New England BioLabs, Cetus, and Genex—that manufacture quantities of gene-engineered substances for a variety of mostly medical and ecological uses.

biotic interaction, association among living organisms in a biological community. *See* amensalism; carnivore; commensalism; competition; food chain; herbivore; mutualism; parasitism; predation; symbiosis.

biotic potential, the maximum reproductive capacity of an organism under optimum environmental conditions. Full expression of the biotic potential of an organism is restricted by environmental resistance, any condition that

inhibits the increase in number of the population.

Habitat resistance includes unfavourable climatic conditions; lack of space, light, or a suitable substrate; and deficiencies of necessary chemical compounds or minerals. Biotic resistance denotes the inhibiting effects of predators, parasites, disease organisms, or unfavourable genetic changes.

biotin, a water-soluble, nitrogen-containing acid essential for growth and well-being in animals and some microorganisms. Biotin functions in metabolic processes leading to the formation of fats and the utilization of carbon dioxide. A relatively stable substance, it is widely distributed in nature and is especially abundant in egg yolk, beef liver, and yeast.

Biotin

Biotin was first identified as a nutritive requirement of yeast. Originally called vitamin H, it was isolated in pure form in 1935; its structure was established in 1942, after it had been shown to be required by animals. Evidence for the necessity of biotin was provided by the discovery in 1927 that the addition of uncooked egg white to a diet that is otherwise adequate produces toxicity and disease. This is because egg white contains a specific protein, avidin, that combines with biotin and thus effectively prevents its action.

biotite, also called BLACK MICA, a silicate mineral in the common mica group. It is abundant in metamorphic rocks (both regional and contact), in pegmatites, and also in granites and other intrusive igneous rocks. For chemical formula and detailed physical properties, see mica (table).

Biotite mica from the district of Juchitán, Oaxaca, Mex.

Biotite is regarded as a mixture composed of variable proportions of four basic aluminosilicates of potassium, iron, magnesium, or aluminum: annite, $\text{K}_2\text{Fe}_4(\text{Si}_6\text{Al}_2\text{O}_{20})(\text{OH})_4$; siderophyllite, $\text{K}_2\text{Fe}_5\text{Al}(\text{Si}_7\text{Al}_3\text{O}_{20})(\text{OH})_4$; phlogopite, $\text{K}_2\text{Mg}_6(\text{Si}_6\text{Al}_2\text{O}_{20})(\text{OH})_4$; and eastonite, $\text{K}_2\text{Mg}_5\text{Al}(\text{Si}_6\text{Al}_3\text{O}_{20})(\text{OH})_4$. Biotite is arbitrarily designated as having a magnesium-to-iron ratio less than 2:1. Lepidomelane is a biotite very rich in iron.

Bioy Casares, Adolfo, pseudonyms JAVIER MIRANDA and MARTIN SACASTRU (b. Sept. 15, 1914, Buenos Aires, Arg.—d. March 8, 1999, Buenos Aires), Argentine writer and editor, known for his use of magic realism in both his own work and in his collaborations with Jorge Luis Borges.

Born into a wealthy family, Bioy Casares was

encouraged in his writing, publishing (with the help of his father) his first book in 1929. In 1932 he met Borges, a meeting that resulted in lifelong friendship and literary collaboration. Together they edited the literary magazine *Destiempo* (1936). Bioy Casares published several books before 1940, including collections of short stories (such as *Caos* [1934; "Chaos"] and *Luis Greve, muerto* [1937; "Luis Greve, Deceased"]), but he did not win wide notice until the publication of his novel *La invención de Morel* (1940; *The Invention of Morel*). A carefully constructed and fantastic work, it concerns a fugitive (the narrator) who has fallen in love and strives to establish contact with a woman who is eventually revealed to be only an image projected by a movie machine. The novel formed the basis for Alain Robbe-Grillet's film script for *Last Year at Marienbad* (1961). The novel *Plan de evasión* (1945; *A Plan for Escape*) and the six short stories of *La trama celeste* (1948; "The Celestial Plot," translated in *The Invention of Morel*) further explore imaginary worlds, tightly constructed to adhere to a fantastic logic.

In the novel *El sueño de los héroes* (1954; *The Dream of Heroes*), Bioy Casares through his characters examines the meaning of love and the significance of dreams and memory to future actions. The novel *Diario de la guerra del cerdo* (1969; *Diary of the War of the Pig*) is a mixture of science fiction and political satire.

Other works by Bioy Casares include the collections of short stories *El gran serafín* (1967; "The Great Seraphim"), *Historias de amor* (1972; "Love Stories"), *Historias fantásticas* (1972; "Fantastic Stories"), and the novels *Dormir al sol* (1973; *Asleep in the Sun*) and *La aventura de un fotógrafo en La Plata* (1985; *The Adventure of a Photographer in La Plata*).

In their collaborative efforts, Borges and Bioy Casares often employed the pseudonyms Honorio Bustos Domecq, B. Suarez Lynch, and B. Lynch Davis. Together they published *Seis problemas para Don Isidro Parodi* (1942; *Six Problems for Don Isidro Parodi*) and *Crónicas de Bustos Domecq* (1967; *Chronicles of Bustos Domecq*), both of which satirize a variety of Argentine personalities. The two also edited a two-volume book of gaucho poetry (*Poesía gauchesca*, 1955), *Los mejores cuentos policiales* (1943; "The Greatest Detective Stories"), and other works. Bioy Casares collaborated with his wife, the poet Silvina Ocampo, and Borges to edit *Antología de la literatura fantástica* (1940; "Anthology of Fantastic Literature") and *Antología poética argentina* (1941; "Anthology of Argentine Poetry").

In 1990 Bioy Casares was awarded the Cervantes Prize for Literature, the highest honour of Hispanic letters. Many of his short stories appeared in translation in the critically acclaimed *Selected Stories* (1995).

Consult the INDEX first

biphenyl, also called DIPHENYL, an aromatic hydrocarbon, used alone or with diphenyl ether as a heat-transfer fluid; chemical formula, $\text{C}_6\text{H}_5\text{C}_6\text{H}_5$. It may be isolated from coal tar; in the United States, it is manufactured on a large scale by the thermal dehydrogenation of benzene.

Biphenyl is slightly less reactive chemically than benzene. It is chlorinated industrially to a mixture, polychlorinated biphenyl (*q.v.*), known as PCB, which is now much restricted because of its toxicity but formerly was used in paper coatings and as a lubricant and a heat-transfer fluid. Pure biphenyl is a colourless crystalline solid with a pleasant odour; it is insoluble in water but soluble in ordinary organic solvents.

biplane, airplane with two wings, one above the other. In the 1890s this configuration was

adopted for some successful piloted gliders. The Wright brothers' biplanes (1903–09) opened the era of powered flight. Biplanes predominated in military and commercial aviation from World War I through the early 1930s, but the biplane's greater maneuverability could not offset the speed advantage of the lighter monoplane. After World War II, biplanes were used only for special purposes: crop dusting and sport (aerobatic) flying.

1930 Fleet, two-seat biplane

Peter M. Bowers

In the mid-1930s Adolf Busemann proposed the supersonic biplane, having a quite narrow gap (space between wings) in which expansion waves and shock waves would interact to reduce drag (the "shape drag" due to the thickness of the airfoil sections). A biplane having one much smaller wing (usually the lower) is called a sesquiplane. A few triplane designs proved successful during World War I; powered aircraft with four or more main lifting surfaces have never been more than curiosities.

bipolar disorder: see manic depression.

Biqā', Al-, also spelled BEKAA, or BEQAA, classical COELE SYRIA, broad valley region of central Lebanon, extending in a northeast-southwest direction for 75 miles (120 km) along the Liṭānī and Orontes rivers, between the Lebanon Mountains to the west and Anti-Lebanon Mountains to the east. The valley contains nearly half of Lebanon's arable land but is not as intensively farmed as the country's coastal plain because of less rainfall and a wider variation in temperature. Crops grown in this mostly dry-farmed area are grains, with fruits and vegetables of secondary importance. Main towns include Zaḥlah, noted for its vineyards and for its production of arrack (an alcoholic beverage made from dates); Baalbek, the site of several outstanding Roman ruins; and Rīyāq. The region was the scene of some factional fighting during the Lebanese Civil War (1975–90), and during that time Israel intermittently fought there against the forces of the Palestine Liberation Organization (PLO) and the Syrian army. Since the 1980s Al-Biqā' has been a stronghold of the Shī'ite militant organization Hezbollah.

Bīr (India): see Bhir.

Bīrah, Al-, town in the West Bank that is associated with the town of Rām Allāh (*q.v.*).

Bīrāk, also spelled BRACH, or BRAK, oasis, western Libya, on the southeastern edge of Al-Ḥamrā' Hammada, a stony plateau. One of the string of oases along the Wādī (seasonal river) ash-Shāṭī', it is isolated from Sabhā, 40 mi (64 km) south, by great sand dunes, but the Adīrī-Bīrāk road, running east, links with the north road from Sabhā to the Mediterranean coast.

Probably the most fertile oasis in the Fezzan (traditional region), it is irrigated by more than 50 artesian wells. The old town of narrow, dark alleyways contrasts with the modern, open settlement in the midst of a palm grove. The fort remains from the Italian occupations in 1914 and 1929. Produce includes dates, barley, vegetables, livestock, and poultry. There is a government experimental farm and air service. Pop. (latest est.) 19,360.

Birāk, Tall, also spelled TELL BRAK, ancient site located in the fertile Nahr al-Khābūr basin in al-Ḥasakah governorate, Syria; it was inhabited from c. 3200 to c. 2200 BC. One of the most interesting discoveries at Birāk was the Eye Temple (c. 3000), so named because of the thousands of small stone "eye idols" found

Eye idols from the temple area at Tall Birāk, late 4th millennium BC; in the British Museum

By courtesy of the trustees of the British Museum

there. These curious objects have almost square bodies and thin heads carved with two to six large eyes. The temple itself is important for its use of typically southern Mesopotamian decorative motifs.

During the time of the Akkadian king Naram-Sin (reigned c. 2254–c. 2218), a royal residence was built at Birāk, and the town served as a control point for all the roads of the Jazīrah desert.

Biran, Marie-François-Pierre Maine de: see Maine de Biran, Marie-François-Pierre.

Birātnagar, city, southeastern Nepal, in the Terai, a low, fertile plain, north of Jogbani, India. The city is Nepal's principal industrial and foreign trade centre; manufactures include jute, sugar, and cotton. The Birātnagar Jute Mills (1936) was Nepal's first industrial endeavour and remains the country's largest single employer. A fish breeding centre has been established there with financial and technical aid from the United States. The Kosi River project (hydroelectric) provides power for eastern Nepal. Pop. (2001) 166,674.

Birbhūm, district, West Bengal state, north-eastern India. Its area (1,757 sq mi [4,550 sq km]) comprises two distinct regions. To the west lies an undulating, generally barren upland, part of the eastern fringe of the Chōṭa Nāgpur plateau, rising to 3,000 ft (900 m); to the east is a densely populated, alluvial plain of the Gangetic Delta. The Ajay, Mor, Mayurākshi, Bakreswar, and Dwārka are the principal rivers. A project on the Mayurākshi provides irrigation for about 600,000 ac (240,000 ha) and 2,000 kW of electric power. Rice, legumes, wheat, corn (maize), and mangoes are the chief crops in the east; coal, china clay, and iron-ore deposits are worked in the west. The district's principal industries include cotton and silk weaving, rice and oilseed milling, and metalware and pottery manufacture. Sūri (*q.v.*) is the district headquarters. Pop. (2001) 3,012,546.

birch, any of about 40 species of short-lived ornamental and timber trees and shrubs constituting the genus *Betula* (family Betulaceae), distributed throughout cool regions of the Northern Hemisphere. Ivory birch (family Euphorbiaceae) and West Indian birch (family Burseraceae) are not true birches. The name

bog birch is applied to a species of buckthorn (*q.v.*), as well as to *B. glandulosa*.

A birch has smooth, resinous, varicoloured or white bark, marked by horizontal pores (lenticels), which usually peels horizontally in thin sheets, especially on young trees. On older trunks the thick, deeply furrowed bark breaks into irregular plates. Short, slender branches rise to a narrow pyramidal crown on a young tree; they become horizontal, often pendulous, on an older tree. The egg-shaped or triangular, usually pointed leaves have toothed margins; they are alternately arranged on the branchlets. They are usually bright green, turning yellow in autumn. The drooping male catkins flower before the leaves emerge; smaller, upright female catkins on the same tree develop in cone-like clusters, which disintegrate at maturity, releasing tiny, one-seeded, winged nutlets.

Gray birch, paper birch, river birch, sweet birch, yellow birch, and white birch are the best known; white birch is usually called silver birch in England, but the latter name is also sometimes given to paper birch and to yellow birch. The Japanese monarch birch (*B. maximowicziana*) is a valuable timber tree of Japan, especially in the plywood industry. Usually 30 metres (100 feet) high, with flaking gray or orange-gray bark, it has heart-shaped leaves about 15 centimetres (6 inches) long and is a hardy ornamental. The similar Japanese cherry birch (*B. grossa*) also produces useful timber.

Water birch (*B. occidentalis*; *B. fontinalis* of some authorities), a shrubby tree native to moist sites along the western coast of North America, has nonpeeling, dark-red bark; it grows in clusters, with all stems rising from a common root system. It is sometimes called red birch, black birch, or mountain birch. Swamp birch (*B. pumila*), a similar but smaller shrub, is found on boggy sites; it may be erect or trailing and matted. Bog birch (*B. glandulosa*) of North America, also called tundra dwarf birch or resin birch, and dwarf birch, or dwarf Arctic birch (*B. nana*), native to most far northern areas of the world, are small alpine and tundra shrubs commonly known as ground birch. Several Chinese birches and the Japanese white birch (*B. platyphyllo japonica*) are sometimes used ornamentally.

Pale- to red-brown birchwood is used for flooring, furniture, cabinetry, vehicle parts, plywood, pulp, and turnery. The thin, water-impermeable bark provided roofing, canoes, and shoes for North American Indians and early settlers. Birch oil and birch beer made from sap are obtained from the trees. Woodsmen rely on the ability of yellow and paper birch bark to burn even when wet.

Birches were among the first trees to become established after the glaciers receded. Hardy, quick growing, and relatively immune to disease and insect attack, they are valuable in reforestation, erosion control, and as protective cover, or nurse trees, for development of more permanent plants. Most require moist, sandy, and loamy soil; they are usually propagated by seeding or grafting. Many ornamental varieties are cultivated for their leaf colour, leaf shape, or growth habit.

birch mouse (*Sicista*), any of 13 species of small, long-tailed, mouselike rodents, family Dipodidae (order Rodentia). Birch mice are found in northern Eurasia, in woods, steppes, and fields. They are about 5–10 centimetres (2–4 inches) long, excluding the semiprehensile tail, and they have brown or yellowish brown fur. Some species have a dark back stripe. Birch mice live in burrows, eat plant material and insects, and hibernate underground from fall into spring. They leap, rather than run, and they climb well, supporting themselves with their tails.

bird, warm-blooded vertebrate of the class *Aves*, unique in having feathers and forelimbs modified into wings.

A brief treatment of birds follows. For full treatment, including illustrations, see MACROPAEDIA: Birds.

The dispersal of birds is almost universal due to their flight capacity. Generally, the number of species in any area of the world depends proportionately on the space and diversity of habitats.

Mankind has used birds and their eggs for food since the earliest times, and with the beginnings of agricultural society, domestication of some species of wild birds began. The red jungle fowl, the mallard duck, and the greylag goose were the ancestors of the domestic chicken, the duck, and the barnyard goose. Modern culture has changed the need for wild game from food source to sport. Bird feathers are used for decoration as well as insulation and many birds are kept as pets. Despite all their uses, birds can be serious pests due to depredations of grains and fruit.

Behaviour. Birds exhibit much behaviour that is stereotyped for the species. Wing-, leg-, and tail-stretching movements are almost universal in all species. Territories and defended areas are maintained during breeding season. The bird "song," an auditory signal, is used to attract mates, warn off rivals, alert other birds to danger, and, in the case of young birds with their parents, beg for food.

Nests vary widely. They can be deep burrows, woven hanging structures, a mere depression in the sand, a hole in a tree or rock, and others. Materials for lining can consist of sticks, leaves, algae, rootlets, small stones, dirt, mud, and animal materials like horsehair, snake-skin, or feathers. Except for mound builders, all birds incubate their eggs, with incubation varying from 11 to 80 days.

The feeding habit of the earliest birds was insectivorous and many modern members have specialized feeding techniques. Some, who catch insects on the wing, have wide gapes. There are woodpeckers who dig out wood-boring grubs, thrashers who use their bills to dig in the ground, and the raptorial varieties who feed on animals and who have evolved talons and hooked bills.

Form and function. The big flying birds have evolved skeletons that are highly pneumatic, with part of the bone replaced by air spaces, an adaptation for reducing weight. Because of forelimb modification for flight, birds have developed a bipedal gait.

Feathers, unique to birds, are made of a protein called keratin. The contour feathers both streamline and waterproof the body of a bird, with the basal part of the feathers serving as insulation. The contour feathers are shed in a process called molting. Coloration in birds is caused by pigments, structure, or both.

Structural modifications of birds include feet covered with scales, occasionally vestigial claws on wing tips, a bill covered with keratin, and an oil gland for dressing the plumage.

Strength and lightness of skeleton, necessary for flight, are due to pneumatic features and to the fusion of elements. Birds can move both upper and lower jaws, an ability mammals do not possess. The wing skeleton modifications include feathers, the restricted motion of elbow and wrist joints to one plane, loss of functional claws, and hollow wing bones. In large flying birds the pneumatic bones are strengthened by struts at stress points.

Like mammals, and unlike reptiles, birds have a circulatory system that separates the lung circulation from that of the body. Birds' hearts are large in proportion to body weight. The lung differs from that of other land vertebrates in having capillaries for passage of air and gas exchange. The crop, an enlarged part of the esophagus used for temporary food storage, is an adaptation for flight.

As with reptiles, male birds have internal

testes. The sexual organs of both sexes enlarge and regress according to season.

The body temperature of birds, which are warm-blooded, is approximately 41° C (106° F). Insulation is provided by feathers, together with layers of subcutaneous fat in some water birds. In cold temperatures, heat loss from the exposed, unfeathered feet is minimized by a reduction of blood flow to that part of the bird and by a network of heat-exchange in the blood vessels of the upper leg. Rapid panting dissipates heat when necessary, since birds do not have sweat glands.

Evolution and paleontology. *Archaeopteryx lithographica*, the earliest known fossil bird, found in Upper Jurassic deposits in Bavaria, was different from recent birds and resembled some reptiles. The jaws had teeth set in sockets, the bones were not pneumatic, and the wing bones contained three movable digits with functional claws. Avian characteristics were present in the structure of the beak, eye, and jaw articulation, and in the presence of feathers. The skeletal structure indicated that *Archaeopteryx* did not fly, it glided. Features of the limb bones indicate that it was descended from reptiles of the Triassic order Thecodontia.

Small bipedal reptiles, called pseudosuchians, were present in the Triassic Period (225,000,000 years ago). With a skull like that of *Archaeopteryx*, this group probably was arboreal, finding abundant insect food and safety from large terrestrial enemies. Selective evolution would bring forth avian characteristics such as the grasping foot, enlargement of claws and forelimb elongation for climbing, better visual capacity, and, most important of all, internal temperature control. The latter was advantageous in catching insects and in keeping warm in the arboreal breeze.

As the modern bird evolved, muscles for wing movement enlarged, the tail, used as a steering mechanism, became shorter and more easily moved, feathers took on functional specializations, and bird species dispersed worldwide.

Bird, (Cyril) Kenneth, pseudonym FOU-GASSE (b. Dec. 17, 1887, London—d. June 11, 1965, London), British cartoonist who, particularly in *Punch*, created warmhearted social comedies, using little stick figures to convey his point.

Originally a civil engineer, Bird was with the Royal Engineers during World War I. He decided on a drawing career after a shell fractured his spine at Gallipoli, Turkey, in 1915, when it appeared that he would not walk again. He contributed his first cartoon to *Punch* in 1916 and became art director for the publication in 1937 and editor in 1949, a position he held until 1953.

Bird decided to use a pseudonym to avoid confusion with another *Punch* artist, later explaining that "fougasse" was an old technical term used by sappers for a rough-and-ready land mine that might or might not go off. He gained widespread fame during World War II for a series of posters in behalf of various national causes. Particularly notable were those captioned "Careless talk costs lives," in which Adolf Hitler was portrayed listening in on conversations in public places. From the 1920s through the 1950s his drawings were collected in a succession of books.

Bird, Robert Montgomery (b. Feb. 5, 1806, New Castle, Del., U.S.—d. Jan. 23, 1854, Philadelphia), novelist and dramatist whose work epitomizes the nascent U.S. literature of the first half of the 19th century. Although immensely popular in his day—one of his tragedies, *The Gladiator*, achieved more than 1,000 performances in Bird's lifetime—his writings are principally of interest in the 20th century to the literary historian.

Bird graduated with a medical degree from the University of Pennsylvania in 1827 but practiced for only a year. He wrote poetry, some of it published in periodicals, and several unproduced plays. His first drama to be staged was *The Gladiator* (1831), produced by the famous tragic actor Edwin Forrest, who became a close friend until they fell out because Bird thought Forrest had paid him too little for his dramas. About a slave revolt in the Rome of 73 BC, *The Gladiator* by implication attacks the institution of slavery in the U.S. The play's indictment of Rome's imperial power was also a thrust against Britain's relationship to the U.S. during the colonial period. Bird employed his close study of Spanish-American history in *Oralloossa* (1832), a romantic tragedy of Peru at the time of the Spanish conquest. Eighteenth-century Colombia was the scene of *The Broker of Bogota* (1834), a domestic drama considered his best by many critics.

After his break with Forrest (who had produced all his plays), Bird turned to the novel, beginning with *Calavar* (1834), a tale of the Spanish conquistadors in Mexico, and its sequel, *The Infidel* (1835). His remaining novels were laid in the United States, generally in the frontier regions he knew from his travels. The most popular was *Nick of the Woods* (1837), in which he attempted to demolish the image of the American Indian as a noble savage by picturing him with the contempt and hatred that the backwoodsman often showed.

Finding it impossible to make a living from his writing, Bird taught at Pennsylvania Medical College in Philadelphia (1841–43) and tried his hand at farming. At the time of his death he was literary editor and part owner of the Philadelphia *North American*.

bird flu, also called AVIAN INFLUENZA, viral respiratory disease, mainly of birds including poultry and migratory waterbirds but also transmissible to humans.

Symptoms in humans include fever, sore throat, cough, headache, and muscle aches. Severe infections can result in life-threatening complications such as pneumonia and acute respiratory illness. The first known human cases occurred in Hong Kong in 1997, resulting in six deaths. Deadly outbreaks among poultry in several countries in eastern and central Asia between 2003 and late 2005 were accompanied by more than 100 human cases, about half of them fatal.

The causative agents of bird flu are subtypes of type A orthomyxovirus. Other subtypes of this virus are responsible for most cases of human influenza and for the great influenza epidemics of the past. The most virulent and contagious bird flu subtype, which is designated H5N1, has been responsible for nearly all confirmed bird flu infections in humans and for the most devastating outbreaks in poultry.

Among birds the disease is spread from region to region by migrating waterfowl and the international poultry trade. Humans in close contact with sick birds—e.g., poultry farmers and slaughterhouse workers—are at greatest risk of becoming infected. Sustained person-to-person transmission has not been observed, but the potential exists for genetic mutation to produce a subtype that can spread easily among people and lead to a new pandemic. A specific protective vaccine for the H5N1 subtype remains to be developed. Studies suggest that some antiviral drugs that work against human influenza may be effective in treating bird flu in humans.

Bird Island, also called AVES ISLAND, Spanish ISLA AVES, or ISLOTE AVES, coral-covered sandbank only 15 ft (4.5 m) high at low tide, located in the Caribbean Sea 350 mi (560 km) north of Venezuela and 70 mi west of Dominica. (The island is not a part of the group of Venezuelan islands of similar name, Islas de Aves, comprising Aves de Barlovento and

Aves de Sotavento, located 145 mi north of Caracas, just east of Bonaire.) The uninhabited islet was valued in the past for the economic value of its abundant guano, used as fertilizer, and was claimed or occupied by a number of powers (Spain, Venezuela, the United States, the Netherlands, Great Britain, and Dominica) after its discovery in 1492.

The islet acquired great political significance in the 1970s because of its strategic importance for the control of the Caribbean basin and became the subject of a tense dispute between Venezuela and Dominica. Dominica's claim is based on geographical criteria, since the island rises from a long submarine sandbank, the Aves Ridge, which apparently connects it with Dominica. Venezuela's claim stems from having maintained an armed force there and exercised acts of sovereignty by virtue of which it was awarded to Venezuela in 1865.

bird louse, any chewing louse (Mallophaga) living on birds. Probably all bird species have chewing lice. Bird lice feed on feathers, skin surface, and sometimes blood but normally are not harmful; however, if too numerous, their irritation may cause the bird to damage itself by scratching and may even interfere with egg production and the fattening of poultry. Two important species of chewing lice are the chicken louse, *Menopon pallidum*, and the pigeon louse, *Lipeurus baculus*.

bird-of-paradise, family name PARADISAEIDAE, any of about 40 species of small to medium-sized forest birds (order Passeriformes).

King of Saxony's bird-of-paradise (*Pteridophora alberti*)

Painting by Murrell Butler

They are rivalled only by a few pheasants and hummingbirds in colour and in the bizarre shape of the males' plumage. Courting males perform for hours on a chosen perch or in a cleared space on the forest floor. After mating, the plain females generally make the nest and raise the one or two young unaided.

Birds-of-paradise occur in New Guinea highlands and on nearby islands; species called manucodes and riflebirds are found also in Australia. The largest manucode is the 45-centimetre (17½-inch) curl-crested manucode (*Manucodia comrii*). The trumpetbird (*Phonygammus keraudrenii*) is 25 to 32 cm (10 to 12½ in.) long and has head tufts as well as pointed neck feathers. It is named for the male's loud call. Others having special names include sicklebills and standardwings.

Among the most notable birds-of-paradise

are the plumebirds—the seven species of *Paradisaea*, 29 to 46 cm (11½ to 18 in.) long. Their central tail feathers are elongated as wires or twisted narrow ribbons, and their filmy flank plumes can be raised and brought forward over the back, hiding the wings. The greater bird-of-paradise (*P. apoda*) has been introduced into the island of Little Tobago, in Trinidad and Tobago off the coast of Venezuela.

The 12-wired bird-of-paradise (*Seleucidis melanoleuca*, sometimes *S. ignotus*) is a short-tailed, 33-cm bird with flank plumes elaborated as forward-curving wires.

Grouped as flagbirds are the six-plumed birds-of-paradise—the four species of *Parotia*—and the King of Saxony's bird-of-paradise (*Pteridophora alberti*). The former have elaborate flank plumes as well as six flag-tipped wires projecting back from the head; the latter has a shoulder-cape and a pair of long head-streamers composed of about 40 squarish lobes with an enameled appearance.

The superb bird-of-paradise (*Lophorina superba*) has a spreading breast shield and a broad cape that turns into a head-fan. The magnificent bird-of-paradise (*Diphyllodes magnificus*) and Wilson's bird-of-paradise (*D. respublica*) are caped and have two wirelike tail feathers curving outward; in Wilson's the crown is bare and has a "cross of Christ" pattern. The king bird-of-paradise (*Cicinnurus regius*), only 13 to 17 cm long, has similar but flag-tipped tailwires and fanlike side plumes.

In the five species of long-tailed birds-of-paradise (*Astrapia*), males are shining black, sometimes with iridescent ruffs, and have long graduated tails of broad black or black-and-white feathers; total length may be 80 to 115 cm.

The other "paradise" birds are far less colourful. Among them are the sickle-crested, or mocha-breasted, bird-of-paradise (*Cnemophilus macgregorii*); the wattle-billed, or golden-silky, bird-of-paradise (*Loboparadisaea sericea*); and Loria's, or Lady Macgregor's, bird-of-paradise (*Loria loriae*)—three species formerly classified as bowerbirds.

Riflebirds are three species of the genus *Ptiloris*, named perhaps for resemblance of the males' plumage to an early-day British rifleman's uniform. The name has also been attributed to the calls of Queen Victoria's riflebird (*P. victoriae*) and the paradise riflebird (*P. paradiseus*)—prolonged hisses, like the passage of bullets through the air.

bird-of-paradise flower, also called CRANE FLOWER (*Strelitzia reginae*), ornamental plant of the family Strelitziaceae. There are five species of the genus *Strelitzia*, all native to southern Africa. They grow from rhizomes (underground stems) to a height of 1 to 1.5 metres (about 3 to 5 feet) and have stiff,

erect, leathery, concave, and oblong leaves. The leaves are bluish green and may have a red midrib.

The *Strelitzia* flower has two erect, pointed petals and five stamens. One main bract, shaped like a boat, is green with red borders. It holds many long-stemmed, orange and bright-blue flowers. *S. reginae* variety *citrina* has yellow flowers.

bird of prey, any bird that pursues other animals for food. Birds of prey are classified in two orders: Falconiformes and Strigiformes. Diurnal birds of prey—hawks, eagles, vultures, and falcons (Falconiformes)—are also called raptors, derived from the Latin *raptare*, "to seize and carry off." (In a broader sense, the name raptor is sometimes synonymous with the designation "bird of prey.") The nocturnal birds of prey are the owls (Strigiformes). The condors (species of vultures) and the eagles are among the largest and strongest of birds. All birds of prey have hook-tipped beaks and sharp curved claws called talons (in non-predatory vultures the talons are present but atrophied). In spite of the similarities between the two groups, many authorities believe that they are not closely related, but rather that they developed similar methods of living a predatory life.

bird rug, floor covering handwoven in Turkey from the 16th to the 18th century, carrying on a white ground an allover, stylized leaf design commonly thought to resemble a bird. A scarce, comparatively large version in bright colours seems to have been made along the Aegean coast of Turkey, possibly in the city of Usak.

Small rugs, progressively cruder and more degenerate in treatment with more sombre colouring, have been found in Transylvanian churches and were probably produced either there or in European Turkey. Bird rugs, as well as other white-ground Turkish rugs, have been forged extensively.

bird song, certain vocalizations of birds, characteristic of males during the breeding season, for the attraction of a mate and for territorial defense. Songs tend to be more complex and longer than birdcalls, used for communication within a species. Songs are the vocalizations of birds most pleasing to man.

From the advertising song of a male on its territory, other males learn what species it is, and some species can judge the mood of the singer and even its individual identity. The indigo bunting can learn all of this data from various parts of a conspecific's song, yet the total sequence of notes in the song, so conspicuous to humans, is not known to convey any information to the bird. In some birds the characteristic song is hereditary rather than learned. In others, such as the chaffinch, juveniles must hear the song from adult males in order to learn to sing it.

bird stone, abstract stone carving of a kind thought by many to be the most beautiful of all the artifacts left by the prehistoric Indian cultures inhabiting the area east of the Mississippi River in the United States and some parts of eastern Canada. They resemble birds and rarely exceed six inches (15 centimetres) in length.

The great majority were carved from black, brown, or dark green slate, with a few beautiful examples carved from porphyry. The stone was evidently chipped away to a rough approximation of the finished form and then smoothed to a high polish with sand and other abrasives. A distinctive feature of all bird stones is a pair of conical holes running diagonally through the base.

There have been many theories about the function of the bird stones, but none seems to have gained wide acceptance. Bird stones were probably not invested with ritual or ceremonial significance, for they are not typ-

ically found in burial mounds but dispersed in fields. The most credible theory is that the stone was either a weight or a handle for an *atlatl*, a short rod used to hurl spears or arrows, giving them more speed and power than would be possible if they were thrown by hand alone. Most bird stones have been found in New York, Ohio, Indiana, Illinois, Michigan, Wisconsin, and Ontario but they have been discovered in places as far from the Northeast as Georgia, Mississippi, and South Dakota.

bird-watching, the observation of live birds in their natural habitat, a popular pastime and scientific sport that developed almost entirely in the 20th century. In the 19th century almost all students of birds used guns and could identify an unfamiliar species only when its corpse was in their hands. Modern bird-watching was made possible largely by the development of optical aids, particularly binoculars, which enabled people to see and study wild birds, without harming them, better than ever before.

A great surge of interest in wild birds occurred from about the 1880s onward. Bird-watching first became popular in Great Britain, with the United States not far behind. Eventually, it became almost equally popular in Scandinavia, The Netherlands, Germany, Switzerland, and the older countries of the British Commonwealth.

Interest in bird-watching has been stimulated by bird books, stretching as far back as Gilbert White's *Natural History of Selborne* (1788) and John James Audubon's illustrated *Birds of America* (1827–38) and culminating in such essential aids to the bird-watcher in the field as H.F. Witherby's five-volume *Handbook of British Birds* (1938–41) and Roger Tory Peterson's *Field Guide to the Birds* (1947), which gives the field marks of all North American birds found east of the Rocky Mountains. Similar works are available for many other regions.

Journals and magazines, such as the *Audubon Magazine* (United States), *British Birds* (England), and *La Terre et la vie* (France), have also contributed to the growth of interest, as have the broadcasting media.

One of the great appeals of bird-watching is that it is a relatively inexpensive activity. Basic equipment includes binoculars, a field book to aid identification, and a notebook for recording time and place of sightings; it is not necessary to travel. Many bird-watchers set up feeding stations to attract birds. The lists of bird observations compiled by members of local bird-watching societies are very useful to scientists in determining dispersal, habitat, and migration patterns of the various species.

From about 1930 there was a great increase in fieldwork, including photography, by amateur bird-watchers. The British Trust for Ornithology organizes cooperative inquiries, such as sample censuses of herons and great crested grebes and surveys of winter roosts of gulls, in which large numbers of amateurs take part. The wildfowl counts of the International Wildfowl Research Bureau are run as a coordinated international effort throughout western Europe.

Bird Woman (Shoshone Indian): see Sacajawea.

Birdman of Alcatraz: see Stroud, Robert.

bird's-foot trefoil (*Lotus corniculatus*), perennial, spreading herbaceous plant, of the pea family (Fabaceae), native to Europe and

Bird-of-paradise flower (*Strelitzia reginae*)

Sven Samuelson

Asia but introduced to other regions. Often used as forage for cattle, it is occasionally a troublesome weed. The stem grows to about

Bird's-foot trefoil (*Lotus corniculatus*)
C. Foord

60 cm (2 feet) long. The leaves consist of three rather oval leaflets, broadest near the tip. The flowers, about 2 cm (0.8 inches) wide, are yellow, sometimes tinged with red, and grow in clusters of 5 to 10.

bird's-nest orchid (*Neottia nidus-avis*), European plant of the family Orchidaceae that lacks chlorophyll and obtains its food from decaying organic material. Its numerous pale brown flowers are borne on a leafless spike. The short, underground stem and the mass of roots that resembles a bird's nest store food until about the ninth year, when the plant first blooms.

Birdseye, Clarence (b. Dec. 9, 1886, New York, N.Y., U.S.—d. Oct. 7, 1956, New York), American businessman and inventor best known for developing a process for freezing foods in small packages suitable for retailing.

After working as a government naturalist, Birdseye went to Labrador as a fur trader in 1912 and in 1916. There the people often froze food in the winter because of the difficulty of obtaining fresh food; this solution to their problem spurred Birdseye's imagination.

After returning to the United States, he began to experiment and, in 1924, helped found General Seafoods Company. Five years later he began selling his quick-frozen foods. Birdseye's process consisted of rapid freezing of packaged food between two refrigerated metal plates. Though his were not the first frozen foods, Birdseye's freezing process was a highly efficient one that preserved the original taste of many foods, including fish, fruits, and vegetables. In 1929 Birdseye's company was bought by Postum, Inc., which changed its own name to the General Foods Corporation, retaining

Birdseye
By courtesy of General Foods Corporation

Birdseye as a consultant. Birdseye was president of Birds Eye Frosted Foods (1930–34) and of Birdseye Electric Company (1935–38).

Birdseye held nearly 300 patents. Besides his frozen food process, he developed infrared heat lamps, a recoilless harpoon gun for taking whales, and a method of removing water from foods. A few years before his death he perfected a method of converting bagasse (crushed sugarcane residue) into paper pulp.

Birendra Bir Bikram Shah Dev (b. Dec. 28, 1945, Kāthmāndu, Nepal—d. June 1, 2001, Kāthmāndu), king of Nepal from 1972 to 2001, 10th in the line of monarchs in the Shah Dev family.

Son of the crown prince (later, from 1955, king) Mahendra, Birendra was educated at St. Joseph's College (Darjeeling, India), Eton College (England), Tokyo University (1967), and Harvard University (1967–68) and traveled extensively before acceding to the throne on his father's death on Jan. 31, 1972. (He was crowned on Feb. 24, 1975.) Birendra continued the autocratic tradition of his father, who had dissolved the elected parliament in 1960 and banned political parties in the constitution of 1962; indeed, for a time, Birendra was one of the world's few remaining absolute monarchs. Internationally he managed to maintain Nepal's independence despite encroaching influences by India, China, and the Soviet Union. During his reign Nepal was opened up to extensive tourism.

Beginning early in 1990, a popular pro-democracy movement led to demonstrations that erupted into bloody riots between the soldiers and police and the demonstrators. Submitting to the pressures, Birendra lifted the ban on political activity, and on Nov. 9, 1990, he approved a new constitution that preserved his status as chief of state but confirmed multiparty democracy, a separation of powers, and the protection of human rights.

On June 1, 2001, Birendra was fatally shot by his son Crown Prince Dipendra during a dinner party. Also killed were Queen Aiswarya and seven other members of the royal family. After the attack, Dipendra shot himself and died three days later. He reportedly was deposed because his parents disapproved of his choice of a bride. Birendra was succeeded by his brother, Gyanendra.

biretta, stiff square hat with three rounded ridges, worn by Roman Catholic, some Anglican, and some European Lutheran clergy for

Cardinal de Richelieu wearing a red biretta as a symbol of his rank, detail of an oil painting by Philippe de Champaigne, middle of the 17th century; in the Condé Museum, Chantilly, France

By courtesy of the Musée Conde, Chantilly, France; photograph, Eddy van der Veen

both liturgical and nonliturgical functions. A tassel is often attached. The colour designates the wearer's rank: red for cardinals, purple for bishops, and black for priests.

The biretta developed from the medieval cap known as a *birettum*, or *pileus*. By the 16th century it had evolved through several forms and had essentially attained its present form.

Birganj, town, southern Nepal, in the Terai, a low, fertile plain, near the Indian border.

Southwest of Kāthmāndu, it is an important marketing centre (rice, wheat, barley, corn [maize], jute) and a terminus for the narrow-gauge railway running north to Amlekhganj and connecting with a ropeway leading to Kāthmāndu. The town is also served by the Indian North-Eastern Railway. Industry is limited to sugar processing and the manufacture of cigarettes and matches. A fish breeding and distribution centre was established there with assistance from the United States, which also sponsored construction of the Tilawe Nadi irrigation dam, 10 miles (16 km) north. Pop. (2001) 112,484.

Birger JARL (d. Oct. 1, 1266, Västergötland, Swed.), the virtual ruler of Sweden from 1248 until his death.

Before 1238 Birger married Ingeborg (d. 1254), the sister of King Erik Eriksson (1222–50), and was created *jarl* (earl) of Sweden in 1248. When Erik died, leaving no son, Birger obtained the election as king of his own son Valdemar, a minor for whom he acted as regent. He enlisted the support of the church against the magnates and the provincial assemblies and issued the first Swedish national laws developing the concept of the king's peace. He established closer links with Norway and Denmark, confirmed by marriage alliances: his daughter, Rikissa, in 1251 married the Norwegian heir apparent, and in 1261 he himself married Mechthild, widow of the Danish king Abel. He also extended Swedish influence to southern Finland and, by granting privileges, encouraged the Baltic city of Lübeck to increase its trade with Sweden. The claim that he founded Stockholm is in dispute, but under his regency Stockholm became the administrative centre of Sweden.

Birger MAGNUSSON (b. 1280—d. May 31, 1321), king of Sweden (1290–1318), son of Magnus I. He was nominally king under a regency during 1290–1302. He was crowned in 1302 and subsequently engaged in civil war with his brothers (1306–10). Later (1317–18), he had them imprisoned and killed but was himself driven into exile in Denmark (1318).

Biringuccio, Vannoccio (b. Oct. 20, 1480, Siena [Italy]—d. c. 1539), Italian metallurgist and armament maker, chiefly known as the author of *De la pirotechnia* (1540; "Concerning Pyrotechnics"), the first clear, comprehensive work on metallurgy.

As a youth Biringuccio enjoyed the patronage of Pandolfo Petrucci (1450–1511), the dictator of Siena. Sent to Germany by Petrucci to study technology, he returned in 1513 and took a series of posts in Siena, Parma, Ferrara, and Venice as an armourer and metallurgist. He returned to Siena in 1530 and eight years later became director of the papal arsenal under Pope Paul III.

De la pirotechnia contrasts strikingly with the obscure alchemical writings of the time. The book is replete with lavish woodcuts illustrating the equipment and processes then in use and includes clear, practical instructions for mining, smelting, and metalworking. It became a standard reference and remains a valuable source on the state of technology during the 15th and 16th centuries.

Birjand, town, eastern Iran, built on low hills in a barren valley 4,774 feet (1,455 m) above sea level. The town, divided by the Khūsf River (usually dry), was formerly the seat of semi-independent rulers and a caravan centre; it has in part maintained its commercial position. Local wool is excellent, and carpet making remains one of Birjand's most important industries. Pop. (1996) 127,608.

Birka, medieval city in southeastern Sweden, on the Lake Mälaren island of Björkö. It was Sweden's first major urban centre and served as a thriving international trade centre between western and eastern Europe.

Founded in the 9th century and thus one of the earliest urban settlements in Scandinavia, Birka was the Baltic link in the river and portage route through Russia to the Byzantine Empire. A major part of the city's commerce involved Russian, Byzantine, and Arabic goods, in addition to western European articles. Birka declined and disappeared after 975 because the Baltic island of Gotland was in a better strategic position for receiving Russian-Byzantine trade and perhaps also because the water level around Björkö had dropped. Birka's activity was taken over by Gotland and by a new Mälaren site, Sigtuna.

Birkarlar, Finnish *PIRKKALAISET*, group of Swedish and Finnish traders and trappers who, for approximately 300 years, explored, colonized, and governed the forest area extending from the eastern coast of the Gulf of Bothnia to the northern Norwegian hinterland. In 1277 the Swedish kings gave the Birkarlar the right to exploit this wilderness, amassing furs and fish and levying taxes on the Lapp population. In return, the Birkarlar paid a tribute to the royal treasury. These frontiersmen had Norwegian and Russian counterparts (especially the Novgorodian *Vatagi*) with whom they shared the tasks of subduing pagan tribes and developing the river and portage routes. They brought significant revenues and commerce to the advanced centres of Scandinavia and northeastern Europe. In 1552 Sweden's King Gustav I Vasa (reigned 1523–60) revoked the Birkarlar's taxing rights in the area in favour of direct royal control, and the frontier company passed from the historical scene.

Birkbeck, George (b. Jan. 10, 1776, Settle, Yorkshire [now in North Yorkshire], Eng.—

Birkbeck, lithograph after an oil painting by S. Lane
BBC Hulton Picture Library

d. Dec. 1, 1841, London), British physician who pioneered classes for workingmen and was the first president of Birkbeck College.

In 1799 Birkbeck was appointed professor of natural philosophy in a school in Glasgow. There he started a course of lectures on science, to which artisans were admitted for a low fee. In 1823 he helped found the London Mechanic's Institution, of which he was president until his death. In 1907 the institution was renamed Birkbeck College and in 1920 was recognized as a school of the University of London for evening and part-time students. The success of the London institution led to the establishment of similar vocational training schools all over Britain, some of which developed into technical colleges.

Birkenau (German Nazi extermination camp): see Auschwitz.

Birkenhead, seaport in the metropolitan borough of Wirral, metropolitan county of Merseyside, historic county of Cheshire, England, on the Wirral Peninsula facing Liverpool at the mouth of the River Mersey.

The community was a hamlet of 106 inhabitants as late as 1810. Its subsequent rapid development began with the establishment of

boiler works and a shipyard on Wallasey Pool, a creek of the Mersey, in 1824 by William Laird, a pioneer in the construction of iron ships. Laird also laid out the nucleus of the town on a grid plan. In 1828 proposals were made for the conversion of Wallasey Pool into an artificial basin. The first docks were built in less than five years and opened in 1847. With nearly 6 miles (10 km) of quay facilities, they have been under the control of the Mersey Docks and Harbour Company since 1857. Besides sharing in the general trade of the Mersey, Birkenhead developed an individual trade in the export of manufactures from the Midlands, the import of cattle from Ireland, and the export and import of goods with the Eastern tropics. The two main basins of the dock system attracted a gigantic flour-milling industry that made Birkenhead the largest milling centre in Europe. A vast cattle and meat trade is carried on at an abattoir on the riverfront. Shipbuilding and ship repairing continue, along with heavy and light engineering, food processing, and clothing manufacture.

A ferry crossing the Mersey to Liverpool dates from 1330. A railway tunnel under the river was completed in 1886, and the vehicular Mersey Tunnel was opened in 1934. Birkenhead Park was laid out in 1847. Pop. (1991) 93,087.

Birkenhead, Frederick Edwin Smith, 1st Earl of, VISCOUNT FURNEAUX OF CHARLTON, VISCOUNT BIRKENHEAD OF BIRKENHEAD, BARON BIRKENHEAD OF BIRKENHEAD, byname (until 1919) *F.E. SMITH* (b. July 12, 1872, Birkenhead, Cheshire, Eng.—d. Sept. 30, 1930, London), British statesman, lawyer, and noted orator; as lord chancellor (1919–22), he sponsored major legal reforms and helped negotiate the Anglo-Irish Treaty of 1921.

A graduate (1895) of Wadham College, Oxford, Smith taught law at Oxford until 1899, when he was called to the bar and began to practice in Liverpool. Elected to the House of Commons from a Liverpool district in 1906, he attracted attention by the brilliant invective of his first parliamentary speech (March 12) and soon became a leader of the Conservative Party. Sympathizing with his numerous Irish Protestant constituents in Liverpool, he favoured the exclusion of the largely Protestant counties of Ulster from Irish Home Rule. After the formation of H.H. Asquith's World War I coalition government, he became solicitor general (June 2, 1915) and later (Nov. 3, 1915) succeeded his friend, the Ulster leader

Birkenhead
Bassano & Vandyk

Sir Edward Carson, as attorney general. In that capacity he secured the conviction and execution (Aug. 3, 1916) of the Irish nationalist Sir Roger Casement for seeking German aid for Irish revolutionaries. In 1917 he visited the United States and Canada, speaking on behalf of the Allied cause.

After the election of 1918, David Lloyd George, prime minister in the second wartime coalition, offered Smith the lord chancellorship, which he, as Baron Birkenhead, assumed on Feb. 4, 1919. His greatest accomplishments were the Law of Property Act (1922) and subsequent real-property statutes (1925) that replaced a convoluted, largely medieval system of land law. Although enacted after he had left office (Oct. 24, 1922), the County Courts Act (1924) and the Supreme Court of Judicature (Consolidation) Act (1925), which reformed the judiciary, were also the results of his efforts.

As lord chancellor, Birkenhead worked for the treaty (Dec. 6, 1921) granting independence to Ireland apart from Ulster. While gaining the friendship of the Irish nationalist leaders Arthur Griffith and Michael Collins, he enraged some of his formerly close associates in the Conservative Party, notably Sir Edward Carson. In 1924, however, he was reconciled with the orthodox Conservatives; and, from then until his retirement in 1928, he served as secretary of state for India in Stanley Baldwin's second ministry.

Birkenhead was created Viscount Birkenhead in 1921 and Earl of Birkenhead and Viscount Furneaux in 1922.

BIBLIOGRAPHY. Biographies include Frederick Winston Birkenhead, *F.E. The Life of F.E. Smith, First Earl of Birkenhead* (1959), written by his son; and John Campbell, *F.E. Smith, First Earl of Birkenhead* (1983).

Birkenia, genus of extinct early fishlike vertebrates found in Late Silurian and Early Devonian rocks in Europe (from about 421 to 387 million years ago). *Birkenia* was a primi-

tive jawless vertebrate that attained a length of only about 10 cm (4 inches). *Birkenia* was adapted for active swimming, and its sucking mouth was in a terminal rather than a ventral position. The head of *Birkenia* was covered by small scales rather than by the fused bony shield of some of its relatives.

Birkhoff, George David (b. March 21, 1884, Overisel, Mich., U.S.—d. Nov. 12, 1944, Cambridge, Mass.), foremost American mathematician of the early 20th century, who formulated the ergodic theorem, which transformed the Maxwell-Boltzmann ergodic hypothesis of the kinetic theory of gases (to which exceptions are known) into a rigorous principle through use of the Lebesgue measure theory.

Birkhoff taught at the University of Wisconsin, Madison (1907–09); Princeton University (1909–12); and Harvard University (1912–44). He was an extraordinarily stimulating lecturer and director of research. In the mid-20th century, many of the leading American mathematicians had either written their

doctoral dissertations under his direction or had done postdoctoral research with him. He conducted research mainly in mathematical analysis and analysis applied to dynamics. His

Birkhoff
By courtesy of Harvard University Archives

dissertation and much of his later work dealt with the solutions of ordinary differential equations and the associated expansions of arbitrary functions. Using matrix methods, he also contributed fundamentally to the theory of difference equations.

His proof in 1913 of a geometric theorem of Henri Poincaré in topology (the study of surfaces and spaces) was a striking achievement. Birkhoff's formulation of the ergodic theorem (the so-called strong form), which was published shortly before the "weak" formulation of John von Neumann appeared, has important applications to modern analysis and is applicable in more cases than is the weak form. Birkhoff developed his own theory of gravitation after Albert Einstein had developed his, and he constructed a mathematical theory of aesthetics, which he applied to art, music, and poetry.

Birkhoff served as president of the American Mathematical Society (1924–26), as dean of the Harvard faculty of arts and sciences (1935–39), and as president of the American Association for the Advancement of Science (1936–37). His works include *Relativity and Modern Physics* (1923), *Dynamical Systems* (1928), *Aesthetic Measure* (1933), and *Basic Geometry* (1941; with Ralph Beatley).

birling, also called LOGROLLING, outdoor sport of the North American lumberjack. Its origin can be traced to the spring log drives of eastern Canada and the New England states, particularly the state of Maine, during the early lumbering era in the 19th century, from which it moved westward to the Great Lakes region and then to the Pacific Northwest.

On the spring drives, when the logs were floated downriver to sawmills, the lumberjacks were required to travel downriver to manage the moving carpet of logs. From their daily work of leaping from log to log, prying and pulling to keep the logs moving and to prevent

Lumberjacks birling
By courtesy of the Timber Carnival Association, Albany, Oregon

jams at bends in the river, on sandbars, rocky narrows, windfalls, and deadheads, the sport of birling developed. It consisted of hopping with an opponent on a log, spinning it rapidly in the water with the feet, stopping ("snubbing") it suddenly, reversing its motion, and in various ways trying to maneuver an adversary off balance and into the water. Dislodging an opponent constituted a fall; two falls out of three constituted a match.

The first public birling match was sponsored in 1888. The first world's championship tournament was held in 1898 at the Omaha, Neb., exposition. Competition declined in the 20th century, but exhibitions were held at riverside fairs.

Birmingham, second largest city of the United Kingdom and a metropolitan borough in the West Midlands metropolitan county. It lies near the geographic centre of England, at the crossing points of the national railway and motorway systems. Birmingham is the largest city of the West Midlands conurbation—one of England's principal industrial and commercial areas—for which it acts as an administrative, recreational, and cultural centre. The city lies approximately 110 miles (177 km) northwest of London.

St. Paul's Church in Birmingham
© John Reardon—Aspect Picture Library

The historic core of Birmingham, along with Edgbaston and northern neighbourhoods such as Sutton Coldfield, Erdington, and Sheldon, lies in the historic county of Warwickshire. Northwestern neighbourhoods, such as Handsworth and Kingstanding, and Harborne in the southwest lie in the historic county of Staffordshire. Southern and eastern neighbourhoods—such as Bartley Green, Northfield, Moseley, and Yardley—belong to the historic county of Worcestershire.

Birmingham's first market charter was granted in 1166, but it was not until the 14th century that it emerged as a settlement of any significance. Its lack of river transport, by cutting it off from maritime contacts important in the medieval period, impeded its development from a small manufacturing town to a large city until the late 18th century, when it became the leading nucleus of the Industrial Revolution in Britain. Birmingham's population grew from 15,000 in the late 17th century to 70,000 a century later; its metal and gun-making trades expanded, fine jewelry was made alongside cheaper lines, and its brass buttons and trinkets served a world market. The engineers James Watt (inventor of the

steam engine), Matthew Boulton, and William Murdock (pioneers in steam engine development), the chemist Joseph Priestley, and the printer John Baskerville all lived in the city at that time and greatly contributed to the technological progress of Birmingham and the nation. Boulton's Soho Manufactory, which developed the steam engine for industrial use, became famous throughout Europe.

It was not until after the Reform Act of 1832 that Birmingham elected its own members to Parliament, and the city was not incorporated until 1838. In that same year, rail links to Liverpool and London were completed. In 1873 local industrialist Joseph Chamberlain became the city's mayor, and during his three-year tenure he initiated important reforms, among them sweeping slum and city-centre redevelopment schemes. Birmingham became a British pioneer in town-planning schemes (1911), one-way-traffic experiments (1933), and municipal airports (1939). Wartime industrial activity and heavy bombing left the city exhausted in 1945, but it eventually began razing slums and bombed-out areas in the central districts and replacing them with tall blocks of apartments and office buildings. A new inner ring road system, a rebuilt central train station, and new shopping and commercial complexes were part of the city's postwar transformation. There is also a network of canals in the northwestern and southern parts of the city.

Birmingham remains the chief centre of Britain's light and medium industry and is still sometimes described as "the city of 1,001 different trades." The key to its economic success was the diversity of its industrial base, though it has been principally concerned with the metal and engineering trades. The largest single industry in terms of employment is the production of motor vehicles. Bicycles and motorcycles are made in the area, though the bicycle trade has somewhat declined. The city is also one of the main centres of the machine tool industry. During the 1970s and '80s, however, the city's service sector grew in size to rival the manufacturing sector.

The central focus of Birmingham is still Victoria Square, with the classical Town Hall (1834), the Renaissance-style Council House (1874–81), and the City of Birmingham Museum and Art Gallery, which is noted for its Pre-Raphaelite paintings and its English watercolours. St. Philip's Cathedral (1715), in its green churchyard, forms another focus, while the Georgian area around St. Paul's Church (1779) also has a character of its own. Other centres have formed around St. Chad's Cathedral (Roman Catholic), designed by A.W.N. Pugin (1841), and the elegant *Birmingham Post and Mail* building (1964).

Birmingham is the cultural centre for a wide area. The Birmingham Repertory Theatre, opened in 1913, has acquired national renown. The Midlands Arts Centre for Young People, built in the 1960s, houses theatres, a concert hall, an art gallery, and workshops and studios. The Birmingham and Midland Institute also has educational and artistic facilities. The city's symphony orchestra plays throughout the Midlands, and its Central Public Library is one of the largest municipal libraries in the nation. The University of Birmingham (1900) and Aston University (1966) are the chief institutions of higher education. The Selly Oak group of colleges and King Edward's School (founded 1552) are private institutions. Area city and metropolitan borough, 102 square miles (264 square km). Pop. (1998 est.) city and metropolitan borough, 1,013,400; metropolitan area, 2,628,200.

Birmingham, largest city in Alabama, U.S., located in the north-central part of the state. It is a leading industrial centre of the South. Birmingham is the seat (1873) of Jefferson county, a port of entry in the Mobile customs

district, and the focus of a large metropolitan area that includes the surrounding counties of Blount, St. Clair, and Shelby as well as such cities as Bessemer, Homewood, and Fairfield.

The site, in the narrow Jones Valley at the southern end of the Appalachian Mountain system, was settled about 1813, and Elyton (now part of Birmingham) became the county seat in 1821. In 1870 the east-west and north-south railroads met at this point; the city was founded there the following year by a land company backed by railroad officials. Named for Birmingham, Eng., it developed as the iron and steel centre of the South. The city's industrialization was based primarily on abundant local deposits of coal, limestone, and iron ore, essential for making steel. Dolomite, marble, barites, bauxite, pyrite, quartz, millstone, clays, sand, and gravel were also found in the area. Birmingham's most important products are iron, steel, and related manufactures. The city's industrial trend is toward diversification, and other products include aircraft parts, fire extinguishers, chemicals, paint, electronics, furniture, paper products, automotive parts, plastics, and textiles. Coal mining and high-technology industries also contribute to the economy. Education, government, banking, and health care are the chief service industries. From nearby Port Birmingham an inland waterway leads southward to the seaport of Mobile on the Gulf of Mexico.

The city is the seat of several institutions of higher education, the largest of which, the University of Alabama at Birmingham, is a unit (founded 1969) of the state university system. Birmingham-Southern College (Methodist) was created in 1918 by the consolidation of Birmingham College (1898) and Southern University, established at Greensboro in 1856. Samford University (Baptist; chartered in 1841 at Marion) moved to Birmingham in 1887, where it was operated as Howard College until 1965. Miles College, maintained by the Methodist Episcopal Church, was founded in 1905. Birmingham is also home to the Birmingham School of Law (1915) and Southeastern Bible College (1935) as well as several community colleges. The city's medical centre includes the medical and dental colleges of the University of Alabama and a number of specialized hospitals and clinics. The Southern Research Institute, founded in Birmingham in 1941, now has facilities in several other southern states.

The Birmingham Museum of Art houses the Samuel H. Kress Collection (Renaissance art). Other attractions include the Birmingham Civil Rights Institute, Sloss Furnaces National Historic Landmark, Barber Vintage Motorsports Museum, the Southern Museum of Flight, and the Alabama Jazz Hall of Fame. The city has an opera company, a symphony orchestra, and theatre and ballet groups. Annual events include the Festival of Arts in the spring and the Alabama State Fair in the fall. Arlington Antebellum Home and Gardens (c. 1845–50) is a restored antebellum home that was used as the headquarters of the Union general James H. Wilson toward the end of the American Civil War. A cast-iron statue of Vulcan, the Roman god of fire, stands 55 feet (17 m) tall atop a 124-foot (38-metre) pedestal on Red Mountain overlooking the city.

During the 1960s Birmingham was the scene of violence over racial segregation as well as civil-rights demonstrations and voter-registration drives led by the Reverend Martin Luther King, Jr., and others. A change in the form of city government (replacement of the commission form of government by a mayor-council form in 1963) helped improve race relations in the civil-rights struggle. In 1979 Richard Arrington, Jr., became the city's first African American mayor. In 1971 Birmingham became the first American city in which industrial plants were closed under federal law during an air-pollution crisis. Inc. 1871. Pop.

(2000) city, 242,820; Birmingham MSA, 921,106.

Birney, James Gillespie (b. Feb. 4, 1792, Danville, Ky., U.S.—d. Nov. 25, 1857, Eagleswood, N.J.), prominent opponent of slavery in the United States who was twice the presidential candidate of the Abolitionist Liberty Party.

James Birney, engraving

By courtesy of the Library of Congress, Washington, D.C.

Birney was trained in law and practiced in Danville. He won election to the Kentucky legislature in 1816, and in 1818 he moved to Alabama, where he was elected to the legislature in the following year. There he helped incorporate into the state constitution provisions that empowered the legislature to emancipate slaves and to prohibit selling slaves brought into the state.

In 1837 he was elected executive secretary of the American Anti-Slavery Society, which soon afterward split, one faction advocating the inflammatory approach of such Abolitionists as William Lloyd Garrison and the other, which became the Liberty Party, emphasizing electoral activity. The party nominated Birney as its presidential candidate in 1840 and again in 1844. In 1840 he was a vice president of the World Anti-Slavery Convention in England, where he wrote *The American Churches, the Bulwarks of American Slavery* (1840). Birney's career was ended by an injury that invalidated him in 1845.

Birnin Kebbi, town and capital of Kebbi state, northwestern Nigeria. It lies along the Sokoto (Kebbi) River at the intersection of roads from Argungu, Jega, and Bunza. An early settlement of the Kebbawa, a subgroup of the Hausa, it was captured about 1516 by Muhammadu Kanta, founder of the Kebbi kingdom; subsequently, it was incorporated into Kebbi, one of the *banza bakwai* (the seven illegitimate Hausa states), which extended over what is now northwestern Nigeria and southwestern Niger. Internal dissension led Tomo, the king of Kebbi, to move his capital from Surame, 60 miles (100 km) northeast, to Birnin Kebbi about 1700.

The town remained the capital of Kebbi until 1805, when it was burned in the Fulani jihad ("holy war") by Abdullahi dan Fodio, a brother of the jihad leader and later emir of Gwandu. After Birnin Kebbi was incorporated into the Fulani emirate of Gwandu, it was eclipsed in political importance by Gwandu (Gando) town, 30 miles (48 km) east, and as a caravan and riverside market centre by Jega, 20 miles (32 km) southeast, which lay at the head of navigation on the Zamfara River, a tributary of the Sokoto. Ironically, while Argungu (30 miles northeast) became the traditional seat of the king of Kebbi in 1827, Birnin Kebbi served as the Gwandu emirate headquarters after Emir Haliru was inaugurated there in 1906. Birnin Kebbi became the capital of the newly created Nigerian state of Kebbi in 1991.

Although Birnin Kebbi has declined as a river port because of silting as well as political conditions, it now serves as a collecting point for tobacco, peanuts (groundnuts), and rice and as

a major local market centre in millet, sorghum, rice, fish, goats, cattle, skins, and cotton. It is the site of a state polytechnic college and a government rice-research station. Its Hausa and Fulani inhabitants are Muslims. Pop. (1992 est.) 54,680.

Birnin Kudu, town, Jigawa state, northern Nigeria. It lies at the intersection of roads from Kano city, Gwaram, and Ningi. It is best known as the site of Dutsen Habude, a cave containing Neolithic paintings of cattle (which bear strong resemblance to some found in the central Sahara) and rock gongs believed to be more than 2,000 years old. It is a collecting point for peanuts (groundnuts), which are sent to Kano city 76 miles (122 km) west-northwest for export by rail, and is a market centre for millet, sorghum, peanuts, cowpeas, cotton, and livestock. Pop. (latest est.) 8,554.

Birobidzhan (region, Russia): see Yevreyskaya.

Birobidzhan, also spelled BIROBIDŽAN, city and administrative centre of Yevreyskaya autonomous *oblast* (province), Khabarovsk *kray* (region), in far eastern Russia. Situated on the Bira River, a tributary of the Amur, and on the Trans-Siberian Railroad, it was founded in 1928 as a railway station called Tikhonkaya. The *oblast* was formed in 1934, with Birobidzhan as its centre; it became a city in 1937. Industries include sawmilling and woodworking and a variety of light industries, mainly clothing and footwear. Tractor trailers are also produced. The city has an agricultural college. Pop. (2000 est.) 81,000.

Biron, BARONS AND DUKES OF, titled French nobility of the house of Gontaut, grouped below chronologically and indicated by the symbol •.

• **Biron, Armand de Gontaut, Baron de** (b. c. 1524—d. July 26, 1592, Épernay, France), soldier and marshal of France during the 16th-century Wars of Religion.

As a young page of Margaret, queen of Navarre, Biron attracted the attention of the Marshal de Brissac (Charles de Cossé), who took him to Piedmont. There he commanded the artillery but was lamed by a wound. He brought back to the royal army in France the professional spirit of the Italian soldiers and, in the battles of 1568–69, won the post of grand master of the artillery, held by Brissac before him. He took La Rochelle in 1573, commanded in Guicenne, and in 1577 was made marshal of France, with command in the south against Henry of Navarre. In 1581–83 he commanded the Duke d'Anjou's forces in Artois.

Having been a loyal friend of Henry III, he became in 1589 the chief commander of the army under Henry IV. The latter owed much to his sagacity at the battles of Arques and Ivry and in many sieges, but Biron was believed to be prolonging the war for his private advantage. He was killed at the siege of Épernay. There is an edition of his correspondence by E. de Barthélemy (1874).

• **Biron, Charles de Gontaut, Baron and Duke (duc) de** (b. 1562—d. July 31, 1602, Paris, France), son of Armand who won the favour of King Henry IV by his courage and enterprise at Arques and Ivry and was made admiral of France and Brittany in 1592 after his father's death. He was relieved of that post and made marshal in 1594 on the recovery of Paris, when he was sent to regain Burgundy, and in 1597 he ended the war in the north by the recapture of Amiens.

Biron was made duke and peer in 1598 but was discontented with the king's handling of his government of Burgundy. His mission to Brussels (1598) entangled him in intrigue with Spain, as his duties in Burgundy had with

Savoy. He commanded the force that gained Bourg in 1600; but his opponent, Charles Emmanuel I, Duke of Savoy, was secretly promising him his daughter in marriage. Henry could not decide to take any real action until 1601, when Biron was known to be working with the malcontents led by the Count d'Auvergne (see Angoulême, Charles de Valois, duc d'). Biron was arrested at Fontainebleau and found guilty of treason in sending the Duke of Savoy full particulars of the French army; he was beheaded in the Bastille.

• **Biron, Armand-Louis de Gontaut, duc de** (duke of), also called **DUC DE LAUZUN** (b. April 15, 1747, Paris, Fr.—d. Dec. 31, 1793, Paris), military commander with the French forces in the American Revolution, and one of the peers of France who supported the French Revolution, only to be sacrificed to the guillotine during the Reign of Terror.

In his youth, as Duke de Lauzun, he dissipated his fortune, traveling about Europe and earning notoriety for his gallantry and success with women. After inheriting his uncle's duchy of Biron in 1788, he began to realize his military ambitions. He had raised colonial troops and taken Senegal in 1779, fought in the American Revolution under the Count de Rochambeau, and put his signature to notes on invading England and other military topics. But he was nephew of the Choiseuls and friend of the Duke d'Orléans (Philippe Égalité), and he had no favour at court. Even after the Revolution of 1789, he was overshadowed by the Marquis de Lafayette.

His chance came with the war in 1792. From Rochambeau's staff he secretly devised with C.F. Dumouriez a plan that gave him the chief role in Belgium. He marched for Mons with 10,000 men who on April 29 fled from a much smaller force at Quiévrain. He was happy to escape from his own men, and this was his only action. Commanding on the Rhine River in July, transferred in 1793 to Italy, and sent, after Orléans was arrested, to command in the west, he was never present when there was actual fighting. He had accepted every political change, but, after 40 days in this last command, he was dismissed on July 11. Robespierre dared not risk the countercharge of leniency to a former peer, and Biron was guillotined. His *Mémoires* were published in 1822 (new ed., 1858).

Biron, Ernst Johann, Reichsgraf von (Imperial count of), Biron also spelled **BÜHREN** (b. Nov. 23 [Nov. 13, Old Style], 1690, Kalnciems, Courland [now in Latvia]—d. Dec. 29 [Dec. 18], 1772, Mitau [now Jelgava]), German adventurer who became Duke of Courland and chief adviser to the Russian empress Anna (reigned 1730–40); he exercised extraordinary influence over Russian affairs during a period that became known as *Bironovshchina*.

The grandson of a German groom who served Duke Jacob III of Courland (1642–82), Biron attended the academy of Königsberg (modern Kaliningrad), and, after being expelled for riotous conduct and unsuccessfully seeking his fortune in Russia (1714), he went to Mitau, in Courland, where he acquired a position in the court of Anna Ivanovna, Duchess of Courland. Having become Anna's lover in about 1727, Biron became her chief adviser and, despite his subsequent marriage to Fräulein B.G. Troita von Treiden, followed Anna to Moscow when she succeeded to the Russian throne (1730). Biron, made a count of the Holy Roman Empire, a chamberlain in the Russian court, and master of an estate at Wenden (Cesis, in modern Latvia), held no official administrative post in Russia. Nevertheless, he soon became the major figure in the Russian government, leading a group of German adventurers who, having gained favour

in Anna's court, managed the government, discriminated against the Russian nobility, exploited Russia's resources for their personal benefit, and suppressed their opponents by having them banished to Siberia or executed. As a result, Biron was generally despised by the Russian population.

In 1737 when the Kettler dynasty of Courland became extinct, Biron was elected Duke of Courland; in 1740 Anna named him regent for her infant heir Ivan VI, the son of her grandniece Anna Leopoldovna. Three weeks after Anna's death, however, Biron was seized (at midnight Nov. 19–20 [Nov. 8–9], 1740) by his rival Burkhard Christoph, Graf von Münnich, who had been in charge of the army during Anna's reign. Biron was exiled to Pelym in Siberia, but in 1742 he was allowed to settle in Yaroslavl; in 1762 he was granted an amnesty and reinstated at the Russian court. In 1763 Catherine II the Great (reigned 1762–96) used Russian troops to restore Biron to the ducal throne of Courland, which, during his exile, had been ruled by a ducal council and then by Charles of Saxony, the younger son of Augustus III of Poland. Biron abdicated in favour of his son Peter in 1769.

Birrell, Augustine (b. Jan. 19, 1850, Wavertree, Lancashire, Eng.—d. Nov. 20, 1933, London), politician and man of letters whose policies, as British chief secretary for Ireland (1907–16), contributed to the Easter Week rising of Irish nationalists in Dublin (1916).

A lawyer from 1875 and a Liberal member of the House of Commons (1889–99, 1906–18), Birrell became well known in British literary circles for two essay collections entitled *Obiter Dicta* (1884–87). After serving as president of the Board of Education (1905–07), he received the secretaryship for Ireland. In

Birrell; chalk drawing by Randolph Schwabe, 1927; in the National Portrait Gallery, London

By courtesy of the National Portrait Gallery, London

1908 he was successful in getting Parliament to create the National University of Ireland (with constituent colleges in Dublin, Cork, and Galway) and the independent Queen's University, Belfast. Although the new universities were legally nondenominational, under Birrell's plan the Irish Roman Catholic bishops were permitted a considerable degree of supervision.

Birrell's unconcerned attitude was unsuited to the passionate complexities of Irish affairs. In addition, he relied excessively on the advice of the Irish patriot leader John Redmond, who himself had lost touch with Irish problems. Despite the armed parading of nationalist groups in Dublin, as well as their staging of mock attacks as rehearsals, Birrell seemed unable to sense any peril and was shocked when the uprising of April 24–29, 1916, occurred. He resigned amid general condemnation, which was tempered by respect for his frank avowal of responsibility.

Birs, also called **BIRS NIMRUD** (Iraq): see **Borsippa**.

birth: see **parturition**.

birth control, the voluntary limiting of human reproduction, using such means as con-

traception, sexual abstinence, surgical sterilization, and induced abortion. The term was coined in 1914–15 by the American feminist Margaret Sanger.

A brief treatment of birth control follows. For full treatment, see **MACROPAEDIA: Birth Control**.

Contraception is used by couples both to limit the total number of offspring and to lengthen the interval between pregnancies. Medically, birth control is often advised in cases in which childbirth might endanger the physical or mental health of the prospective mother or in which a substantial risk exists of bearing a severely disabled child. Socially and economically, limitation of reproduction is frequently motivated by the desire to maintain or improve family living standards. Though these reasons for curbing family size might appear to be distinctly modern, most of them were operative thousands of years ago. Most religious leaders now generally agree that some form of fertility regulation is desirable, though the means is strongly debated.

Beyond these essentially personal and ethical reasons for birth control, there has arisen in recent decades a growing social motivation—the so-called population explosion. After World War II, the dramatic lowering of death rates through the advances of medical science resulted in the doubling of the growth rate of the world's population in about 15 years. The most rapid population increases have occurred mainly in the countries with the lowest per capita economic production and the least ability to keep up with population growth. India, to cite one example, struggles to raise the general standard of living, while at the same time daily providing for at least 35,000 new citizens.

Over history, there has been a general tendency in the curbing of family size to shift from deliberate action after birth (infanticide) to action before birth (abortion) or before conception (contraception). This shift has occurred in different parts of the world at different times and is far from complete.

While infanticide is on the wane, as late as the 18th century in European countries unwanted infants were disposed of by abandonment and exposure, a practice that prompted the establishment of the Foundling Hospital of London. Infanticide persists in semidisguised form as traditional practice among some primitive peoples and in more remote areas. Induced abortion, however, may still be the world's most widely practiced means of birth control.

Japan provides a dramatic example of the shift. In its feudal past, infanticide was common. Abortion was legalized in 1948 and quickly emerged as the primary means of fertility control. In the 1960s, the Japanese in growing numbers began to employ contraception in preference to abortion.

In Europe and North America, the 20th century has seen legal proscription against birth control give way to laws permitting contraception. In most Western nations, induced abortion has been legalized by either legislation or the interpretation of the courts, but there are almost universal restrictions. Much of the liberalization has been encouraged by the women's liberation movement.

Elsewhere, contraception and abortion are sanctioned in many former Soviet-bloc nations, and family planning has been adopted as government policy in many of the developing nations of Asia, Africa, and Latin America. This is especially true in China, where the one-child family is officially advocated.

For types of contraception, see **contraception**.

birth defect, genetic or trauma-induced abnormality that is present at birth. See **congenital disorder**.

birth rate, frequency of live births in a given population, conventionally calculated as the

annual number of live births per 1,000 inhabitants. See vital rates.

birthmark, an unusual mark or blemish on the skin at birth. See mole; nevus.

birthroot (plant): see Trillium.

birthstone, gemstone associated with the date of one's birth, the wearing of which is commonly thought to bring good luck or health. Supernatural powers have long been attributed by astrologers to certain gemstones.

The stones now associated with each month, as listed in the Table, have only slight relationship to the ancient beliefs, for the list is tempered by availability and cost. Before mineralogy had progressed to the point of chemical analysis, colour was of greater importance than some of the other physical characteristics, and little distinction was made between emerald and chrysoptase, for example, or between ruby and garnet, or between citrine and topaz. When it came to the ability to heal or bring good luck, the actual stone and the look-alikes were regarded as equally effective. Even the names used in ancient times do not necessarily refer to the stones that go by those names in the 20th century; the sapphire of the

Birthwort (*Aristolochia*)
A to Z Botanical Collection

The European birthwort bears pale yellow, trumpet-shaped flowers in clusters of two to eight. The plant has heart-shaped leaves with finely toothed edges and pear-shaped hanging fruits. The plant is poisonous, but an extract

al-Mas'ūdi ("The Mas'ūdi Canon"), a major work on astronomy, which he dedicated to Sultan Mas'ūd of Ghazna; *Tārīkh al-Hind* ("A History of India"); and *Kitāb as-Saydah*, a treatise on drugs used in medicine. In his works on astronomy, he discussed with approval the theory of the Earth's rotation on its axis and made accurate calculations of latitude and longitude. In those on physics, he explained natural springs by the laws of hydrostatics and determined with remarkable accuracy the specific weight of 18 precious stones and metals. In his works on geography, he advanced the daring view that the valley of the Indus had once been a sea basin.

Birzebbuga, also spelled BIRZEBBUGIA, village, southeastern Malta, on Marsaxlokk Bay, southeast of Valletta. The present village originated as a fishing settlement and is now a summer resort. Several churches and part of the old fortifications remain. Its environs are rich in prehistoric remains, notably the cave of Ghar Dalam, a megalithic temple, and a Bronze Age acropolis at Borg-in-Nadur. Pop. (1990 est.) 5,869.

BIS: see International Settlements, Bank for.

bis pole (South Pacific religion): see bisj pole.

Bisaya, also spelled BISAYAH, indigenous people of northwestern Borneo, in Malaysia, concentrated above the Padas River and below Beaufort in Sabah state, and in northern Sarawak state. They are of Malay stock and possibly related to the Visayan of the Philippines. The Bisaya speak Murut, leading some to believe they were once one of the branches of the Murut peoples. They numbered about 5,000 in the late 20th century. Their villages, comprising houses set on piles, are built along the banks of rivers. Traditionally slash-and-burn cultivators of dry rice, sago palms, vegetables, and rubber, they are increasingly growing wet rice. Bisaya kinship is organized in ranked ambilineal descent groups, in which the form of marriage ceremony determines whether the child is a member of the mother's or father's clan. Their religion is a mixture of traditional beliefs and Islam, and they also practice a form of black magic.

Bisayas (Philippines): see Visayas.

Bisbee, city, seat of Cochise county, southeastern Arizona, U.S., 8 miles (13 km) north of the Mexican border. It is built on steep canyon slopes (east of the Mule Mountains) and was for many years a major copper-producing centre. It began as a prospectors' camp after the discovery of copper in 1877 and was named for Judge DeWitt Bisbee, part owner of the Copper Queen Mine. During World War I, more than 1,000 striking miners were forcibly transported to Columbus, N.M. (the Bisbee Deportation, 1917). The Lavender Open-pit Mine stopped production in 1975 and has since been a tourist attraction. Tombstone city, the Coronado National Memorial, and segments of the Coronado National Forest are nearby. Inc. 1900. Pop. (1990) 6,288.

Biscay (Spain): see Vizcaya.

Biscay, Bay of, Spanish GOLFO DE VIZCAYA, French GOLFE DE GASCogne, wide inlet of the North Atlantic Ocean indenting the coast of western Europe. Forming a roughly triangular body with an area of about 86,000 square miles (223,000 square km), it is bounded on the east by the west coast of France and on the south by the north coast of Spain. Its maximum depth, a little south of its centre, is 15,525 feet (4,735 m). The principal rivers flowing into the bay are the Loire, the Adour, and the Dordogne and Garonne, which form the Gironde Estuary.

The continental shelf is up to about 100

Birthstones				
month	traditional gemstone	20th-century expansion	synthetic supplement: trade name	material of synthetic stone
January	garnet		garnet	dark red synthetic corundum
February	amethyst		amethyst	purple synthetic corundum
March	bloodstone	aquamarine	aquamarine	light blue synthetic spinel
April	diamond		white sapphire	colourless synthetic spinel or corundum
May	emerald		emerald	synthetic emerald or synthetic green spinel
June	pearl	alexandrite	cultured pearl, alexandrite	changeable synthetic corundum (synthetic spinel is rare)
July	ruby		ruby	red synthetic corundum
August	sardonyx	peridot	peridot	green synthetic spinel
September	sapphire		sapphire	blue synthetic spinel or corundum
October	opal	tourmaline (pink or green)	rozircon	pink synthetic corundum or spinel
November	topaz (precious)	topaz quartz (citrine)	topaz	yellow synthetic corundum
December	turquoise	zircon	zircon	medium blue synthetic spinel

Bible is much more likely to have been lapis lazuli than what is now known as sapphire, and adamas (diamond) was probably white sapphire or white topaz.

Originally, the stones were considered to be those of the breastplate (*hoshen*) of the Jewish high priest. In the 20th century the list was supplemented with a series of synthetic stones that were recommended as alternatives for some of the rarer, less-attractive, or less-durable natural stones. The natural-stone list was also expanded to make it more acceptable to both sexes.

birthwort, any plant of the family Aristolochiaceae (order Aristolochiales), which contains five genera of mostly tropical woody vines and a few temperate-zone species. The calyx (outer part of the flower) is three-lobed. The flowers of some species lack petals; those of others are large and foul smelling.

North American species of the family Aristolochiaceae include Canadian wild ginger (*Asarum canadense*), Virginia snakeroot (*Aristolochia serpentaria*), pelican flower (*Aristolochia grandiflora*), and Dutchman's-pipe (*q.v.*; *Aristolochia durior*). The European birthwort (*Aristolochia clematitis*) and asarabacca (*Asarum europaeum*), the European wild ginger, number among other common members of the family.

from it has been used in the past to facilitate childbirth (hence the name) and in the treatment of snakebite.

Birunga Mountains (Africa): see Virunga Mountains.

Birūnī, al-, in full ABŪ AR-RAYḤĀN MUḤAMMAD IBN AḤMAD AL-BĪRŪNĪ (b. September 973, Khwārezm, Khorāsān—d. Dec. 13, 1048, Ghazna, Ghaznavid Afghanistan [now Ghazni, Afg.]). Persian scholar and scientist, one of the most learned men of his age and an outstanding intellectual figure.

Possessing a profound and original mind of encyclopaedic scope, al-Birūnī was conversant with Turkish, Persian, Sanskrit, Hebrew, and Syriac in addition to the Arabic in which he wrote. He applied his talents in many fields of knowledge, excelling particularly in astronomy, mathematics, chronology, physics, medicine, and history. He corresponded with the great philosopher Ibn Sina (Avicenna). Some time after 1017 he went to India and made a comprehensive study of its culture. Later he settled at Ghazna in Afghanistan. In religion he was a Shī'ite Muslim, but with agnostic tendencies.

Al-Birūnī's most famous works are *Āthār al-bāqiyah* (*Chronology of Ancient Nations*); *at-Taḥṣīn* ("Elements of Astrology"); *al-Qanūn*

miles (160 km) wide off the coast of Brittany but narrows to less than 40 miles (65 km) off the Spanish shore. The edge of the shelf and the continental slope are dissected by numerous submarine canyons of which that of Cape Breton, in the southeastern corner of the bay, is one of the largest. Beyond the continental slope lies the Biscay Abyssal Plain, with depths of about 15,000 feet (4,550 m), which occupies about half the area of the bay. Much of it has a very flat topography.

The surface currents of the Bay of Biscay are influenced by the clockwise circulation in the North Atlantic that produces a clockwise circulation in the bay. The range of mean spring tides is about 20 feet (6 m) on the French coast at the northern end of the bay near Ouessant Island, decreasing southward to about 12 feet (3.5 m) in the southeastern angle near Biarritz. The Bay of Biscay is noted among sailors for its rough seas. Gales can be severe and may exceed 70 miles (113 km) per hour. Squalls are also a hazard to navigation and may occur at any time of year. The climate on shore is maritime, with mild winters and cool summers.

The principal ports along the Bay of Biscay are Brest, Nantes, La Rochelle, Bordeaux, and Bayonne in France, and Bilbao, Santander, Gijón, and Avilés in Spain; none is able to take large vessels. Resorts include La Baule, Biarritz, and Saint-Jean-de-Luz, all on the French coast. Fishing is a principal industry. Oyster culture is practiced in shallow lagoons and estuaries along the French coast.

Biscayne Bay, shallow inlet of the Atlantic Ocean, along southeastern Florida, U.S. It is about 40 miles (64 km) long and 2–10 miles (3–16 km) wide and forms a part of the Atlantic Intracoastal Waterway. The bay connects with the ocean mainly through Safety Valve Entrance and with Florida Bay (south) through a series of sounds. It is bordered by Miami on the northwest and by Miami Beach and several other islands on the northeast, with the Florida Keys lining the rest of the eastern portion of the bay. Tourism is the main economic activity. The bay was named for an early explorer called El Biscaino, who came from the province of Viscaya (Biscaya), Spain. In 1968 more than half (96,000 acres [39,000 hectares]) of the bay's water and reef, with a rich, varied tropical marine life, was declared a national monument; in 1980 it became a national park.

Biscayne National Park, national park off the southeastern coast of Florida, U.S., 20 miles (32 km) south of Miami. Authorized as Biscayne National Monument in 1968 (with a boundary change in 1974), it became a national park in 1980. It consists mostly of coral reef and water containing about 33 keys, or islands, that form a north-south chain separating Biscayne Bay from the Atlantic Ocean. Its area is 173,039 acres (70,026 hectares).

Bisceglie, ancient (Latin) *VIGILIAE*, town and episcopal see, Bari *provincia*, Puglia (Apulia) *regione*, southeastern Italy. It lies along the Adriatic Sea and is about 120 miles (190 km) east-northeast of Naples.

The Romans called the place *Vigiliae*, from the watchtowers that were used there in guarding the coast. The town was conquered by the Normans and was made a countship in the 11th century. After having various feudal rulers, Bisceglie became a free city in 1532 and later passed to the Kingdom of Naples; it was joined to the kingdom of Italy in 1861. There are remains of the castle, built by the Hohenstaufens (a German dynasty) on the site of a Norman castle and later enlarged and embellished by the Angevins (house of Anjou). Examples of 11th- and 12th-

century Romanesque-Apulian architecture include the cathedral and the Church of Santa Margherita. There are also several Renaissance and Baroque palaces.

Bisceglie is a fishing port and seaside resort and also produces wine, olive oil, and furniture. Pop. (1990 est.) mun., 48,314.

Bischof, Simon, Bischof also spelled *BISCOP* (Dutch theologian): see *Episcopius*, Simon.

Biscop Baducing (7th-century British abbot): see *Benedict Biscop*, Saint.

bisexuality, in biology, the condition of an organism capable of producing both male and female gametes (sex cells). In plants and microorganisms, this is often referred to as monoeism. In multicellular animals, bisexuality is usually called hermaphroditism (*q.v.*).

bisexuality, in human sexuality, sexual interest in and attraction to members of one's own and the opposite sex. A bisexual is thus a person with both heterosexual and homosexual desires. Some clinical surveys suggest that a significant number of persons experience bisexual desires and engage in bisexual activity. As the tolerance of homosexual behaviour increased in many societies in the late 20th century, the number of people identifying themselves as bisexual also increased. See also *homosexuality*.

Bishamon, also called *BISHAMONTEN*, in Japanese mythology, one of the *Shichi-fukujin* ("Seven Gods of Luck"). He is identified with the Buddhist guardian of the north, known as Kubera, or *Vaiśravaṇa*. Bishamon is always depicted as dressed in full armour, carrying a spear and a miniature pagoda. He is the protector of the righteous and is the Buddhist patron of warriors.

The temple city of Shigi near Ōji (west-central Honshu) is dedicated to him. It was founded, according to tradition, by Shōtoku Taishi (AD 573–621), who attributed a victory over an enemy of Buddhism to Bishamon's assistance. See also *Shichi-fukujin*.

Bishandās (fl. 17th century, India), one of the most skilled portrait painters of the 17th-century Jahāngīr school of Mughal painting. Almost nothing is known of his life, though his name indicates that he was a Hindu.

Bishandās was praised by the emperor Jahāngīr as "unequaled in his age for taking likenesses" and was sent with the embassy to Persia, where he remained from 1613 to 1620, to paint portraits of the shah and the chief members of his court. The portraits so pleased the emperor that Bishandās was honoured with the gift of an elephant. Some of the Mughal portraits of Persian noblemen may be assumed to be the work of Bishandās. He also contributed to the *Anwār-e Suhayli*, a book of fables (now in the British Museum), and several fine portraits in the albums made for the emperor.

Bishkek, formerly (1862–1926) *PISHPEK*, or *BISHKEK*, or (1926–91) *FRUNZE*, city and capital of Kyrgyzstan. It lies in the Chu River valley near the Kyrgyz Mountains at an elevation of 2,500–3,000 feet (750–900 m). Bishkek is situated along the Alaarcha and Alamedin rivers and is intersected in the north by the Bolshoy (Great) Chuysky Canal. In 1825 the Uzbek khanate of Kokand established on the site the fortress of Bishkek, which in 1862 was captured by the Russians, who mistakenly called it Pishpek (though, to local nationalities, it remained Bishkek). By 1913 the population was 14,000 (mainly Russians), but though it was the administrative centre of a district, it remained essentially a sprawling, dusty village. In 1924 it was chosen as the administrative centre of the new Kyrgyz autonomous oblast (province). When the latter became the Kirgiz (Kyrgyz) Autonomous Soviet Socialist Republic in 1926, Pishpek became its capital

and was renamed Frunze after the revolutionary and Red Army leader Mikhail Vasilyevich Frunze, who was born there in 1885. It developed rapidly into a modern city. In 1991 it was renamed Bishkek.

Bishkek is laid out on a grid, with wide, tree-lined streets. It has parks and many orchards, and permanently snow-capped mountains are visible to the south. Besides the various government buildings, there are theatres, the local Academy of Sciences (founded 1954), the Kyrgyz State University (1951), and agricultural, medical, polytechnic, and teacher-training institutes.

The city's industry developed in two stages: until 1941 emphasis was on the food and other light industries using local raw materials; but, after the evacuation of heavy industries from western Russia during World War II, an extensive machine-building and metalworking industry came into being. Development was particularly rapid in the 1960s. Pop. (1999 est.) urban agglomeration, 619,000.

Bishnupur, also spelled *VISHNUPUR*, historic town, central West Bengal state, northeastern India. It lies just south of the Dhaleswari (Dhalkisor) River. Bishnupur was the capital of the Hindu Mallabhūm kingdom, which was founded in the 8th century AD and was once the most important Hindu dynasty in Bengal.

Jor Bāngla Temple in Bishnupur, West Bengal, India
Kaypix—Shostal

The town is surrounded by old fortifications and has more than a dozen temples. The 16th-century Jor Bāngla and stepped Rās Mancha are excellent examples of brick temples of the Bengali style. The *dhṛūpad* school of Indian music was founded (16th–17th century) there under royal patronage.

Bishnupur was constituted a municipality in 1863 and has several colleges affiliated with the University of Burdwān. It has major Grand Trunk Road and rail connections and is an agricultural trade and silk-weaving centre. Pop. (1991) 56,128.

bishop, in some Christian churches, the chief pastor and overseer of a diocese, an area containing several congregations. The origins of the office are obscure, but it seems that the episcopacy (*q.v.*), or threefold ministry of bishops, priests, and deacons, was well established in the Christian church by the 2nd century AD. The Roman Catholic, Eastern Orthodox, and some other churches have maintained the view that bishops are the successors of the Apostles, a doctrine known as apostolic succession. Until Feb. 11, 1989, when Reverend Barbara Harris was ordained a bishop in the Protestant Episcopal church, the apostolic-succession churches had reserved the office only for men.

From the Roman Empire's recognition of Christianity in the 4th century AD until the Protestant Reformation in the 16th century, the bishop was the chief pastor, priest, administrator, and ruler of his Christian community. He was the chief liturgical minister; he baptized, celebrated the Eucharist, ordained,

absolved, controlled church finances, and settled matters of dispute.

In the course of the Reformation, some of the new Protestant churches repudiated the office of the bishop, partly because they believed the office to have acquired such broad temporal and civil powers during the European Middle Ages as to endanger its spiritual purity, and partly because they saw no basis for the institution in the New Testament. Thus, of the post-Reformation Christian communions, only the Roman Catholics, the Eastern Orthodox, Old Catholics, Anglicans, and a few others have maintained both the bishop's office and the belief that bishops have continued the apostolic succession. Some Lutheran churches (primarily in Scandinavia and Germany) have bishops, but, except for those in Sweden, they have not maintained the doctrine of apostolic succession. Most other Protestant churches do not have bishops. In the Methodist church in the United States, bishops function as superintendents of several congregations and have the power to ordain ministers.

Popes, cardinals, archbishops, patriarchs, and metropolitans are different gradations of bishops. A bishop is often assisted in the administration of his diocese by other, lesser bishops, who may be known as suffragans, assistants, auxiliaries, or coadjutor bishops. Bishops alone have the right to confirm and ordain members of the clergy, and their main duty is to supervise the clergy within their diocese. In the Roman Catholic church, the bishop is selected by the pope and receives confirmation in his office at the hands of an archbishop and two other bishops. In the Anglican and other churches, a bishop is chosen by the dean and chapter of the cathedral of a diocese. In the Methodist churches the bishop is chosen by a synod. Among the insignia traditional to a bishop are a mitre, pastoral staff, pectoral cross, ring, and *caligae* (i.e., stockings and sandals). See also ministry.

bishop, any of several small African birds belonging to the family Ploceidae (order Passeriformes) and constituting the genus *Euplectes*.

Red bishop (*Euplectes orix*)
Eric Hosking

The breeding males are black-bellied and reddish or yellow above, with rufflike head feathering and fluffy rump feathers nearly covering their stumpy tails. The male vigorously defends a bit of grassland or marsh, where his drab-streaked spouses—sometimes six or more—occupy globular nests. The 13-centimetre (5-inch) red bishop (*E. orix*), also called grenadier weaver, displays by flying about and clapping its wings. Red bishops have become established in southern Australia.

Bishop, Billy (Canadian fighter pilot): see Bishop, William Avery.

Bishop, Elizabeth (b. Feb. 8, 1911, Worcester, Mass., U.S.—d. Oct. 6, 1979, Boston, Mass.), American poet notable for her pol-

ished, witty verse. Her short stories appeared in *The New Yorker* and other magazines.

Bishop was reared by her maternal grandparents in Nova Scotia and an aunt in Boston. After graduating from Vassar College in 1934, she traveled abroad, settling in Key West, Fla. (1938–42), before moving on to Mexico (1943). During most of the 1950s and '60s she lived in Petrópolis, near the city of Rio de Janeiro, later dividing the year between Petrópolis and San Francisco. Her first book of poems, *North & South* (1946), which suggests the contrast between her New England origins and her love of hot countries, was reprinted (1955) with additions as *North & South: A Cold Spring*. Much of her work displays the dichotomy of warm and cold, a New England conscience in a tropic sphere. *Questions of Travel* (1965) contains powerful and rhythmically hypnotic verse. Bishop's *The Complete Poems* was published in 1969, and her *Geography III* appeared in 1977. She taught writing at Harvard University from 1970 to 1977. Posthumously published volumes include *The Complete Poems, 1927–1979* (1983) and *The Collected Prose* (1984). Bishop also wrote a travel book, *Brazil* (1962), and translated from the Portuguese Alice Brant's Brazilian classic, *The Diary of Helena Morley* (1957). She edited and translated *An Anthology of Twentieth-Century Brazilian Poetry* (1972).

Bishop, Sir Henry Rowley (b. Nov. 18, 1786, London, Eng.—d. April 30, 1855, London), English composer and conductor remembered for his songs "Home, Sweet Home" and "Lo, Here the Gentle Lark."

Bishop conducted at Covent Garden Theatre (1810), King's Theatre, Haymarket (1816–17), Drury Lane (from 1825), and Vauxhall Gardens (1830). He became professor of music successively at the Universities of Edinburgh (1841) and Oxford (1848) and was knighted in 1842. Bishop composed light operas and incidental music for plays and arranged operas by well-known composers. He wrote one opera with sung dialogue, *Aladdin* (1826). He also wrote oratorios, part-songs, and glees. His "Home, Sweet Home," with lyrics by John Howard Payne, was the theme song from his comic opera, a musical version of Payne's play *Clari, or The Maid of Milan*.

Sir Henry Rowley Bishop, detail of an oil painting by an unknown artist; in the National Portrait Gallery, London

Bishop, J(ohn) Michael (b. Feb. 22, 1936, York, Pa., U.S.), American virologist and co-winner (with Harold Varmus) of the Nobel Prize for Physiology or Medicine in 1989 for achievements in clarifying the origins of cancer.

Bishop graduated from Gettysburg (Pa.) College in 1957 and from Harvard Medical School with a medical degree in 1962. After spending two years in internship and residency at Massachusetts General Hospital, Boston, he became a researcher in virology at the National Institutes of Health, Bethesda, Md. In 1968 he joined the faculty of the University of California Medical Center in San Francisco, becoming a full professor in 1972. From 1981 he also served as director of the university's George F. Hooper Research Foundation.

In 1970 Bishop teamed up with Varmus, and they set out to test the theory that healthy body cells contain dormant viral oncogenes that, when triggered, cause cancer. Working with the Rous sarcoma virus, known to cause cancer in chickens, Bishop and Varmus found that a gene similar to the cancer-causing gene within the virus was also present in healthy cells. In 1976 Bishop and Varmus, together with two colleagues—Dominique Stehelin and Peter Vogt—published their findings, concluding that the virus had taken up the gene responsible for the cancer from a normal cell. After the virus had infected the cell and begun its usual process of replication, it incorporated the gene into its own genetic material. Subsequent research showed that such genes can cause cancer in several ways. Even without viral involvement, these genes can be converted by certain chemical carcinogens into a form that allows uncontrolled cellular growth.

Because the mechanism described by Bishop and Varmus seems common to all forms of cancer, their work proved invaluable to cancer research. By 1989 scientists had identified more than 40 genes having cancer-causing potential in animals.

Bishop, John Peale (b. May 21, 1892, Charles Town, W.Va., U.S.—d. April 4, 1944, Hyannis, Mass.), American poet, novelist, and critic, a member of the "lost generation" and a close associate of the American expatriate writers in Paris in the 1920s.

At Princeton University, from which he graduated in 1917, Bishop formed lifelong friendships with Edmund Wilson, the future critic, and with the novelist F. Scott Fitzgerald, who depicted Bishop as the highbrow writer Tom D'Inivilliers in *This Side of Paradise*. Bishop published his first volume of verse, *Green Fruit*, in 1917. After military service in World War I, he was an editor at *Vanity Fair* magazine in New York City from 1920 to 1922. Until 1933 he lived in France and acquired a deep admiration for French culture. His collection of stories about his native South, *Many Thousands Gone* (1931), was followed with a volume of poetry, *Now with His Love* (1933). *Act of Darkness*, a novel tracing the coming of age of a young man, and *Minute Particulars*, a collection of verse, both appeared in 1935. He became chief poetry reviewer for *The Nation* magazine in 1940. That year he published perhaps his finest poem, "The Hours," an elegy on the death of F. Scott Fitzgerald. His *Collected Poems* (1948) was edited by the poet Allen Tate and his *Collected Essays* (1948) by Edmund Wilson.

Bishop, William Avery, byname BILLY BISHOP (b. Feb. 8, 1894, Owen Sound, Ont., Can.—d. Sept 11, 1956, West Palm Beach, Fla., U.S.), Canadian fighter ace who shot down 72 German aircraft during World War I.

Bishop was educated at the Royal Military College, Kingston, and went overseas during World War I with the Canadian cavalry. In

1915 he transferred to the Royal Flying Corps, joining the 60th Squadron in France in 1917. He soon became highly skilled in aerial combat and shot down a total of 72 enemy aircraft, including 25 in one ten-day period. He was awarded the Victoria Cross and several other decorations, and in 1918 he was promoted to the rank of lieutenant colonel, assuming command of the 85th Squadron.

Bishop was appointed to the staff of the British Air Ministry in August 1918, and in this capacity he helped to form the Royal Canadian Air Force (RCAF) as a separate brigade. After the war he joined one of the first commercial aviation companies in Canada, and he eventually became a businessman. In 1936 he was appointed honorary air vice-marshal of the RCAF, and he became honorary air marshal during World War II. He was the author of *Winged Warfare* (1917) and *Flying Squad* (1926).

Bishop Hill, historic village, Henry county, northwestern Illinois, U.S. The settlement was established in 1846 by Swedish immigrants led by Erik Jansson, who had been influenced by the Pietist movement in Sweden. Fearing persecution, Jansson and his followers emigrated to America. They named their new home for Biskopskulla, Swed., Jansson's birthplace, in 1846. The colony prospered through farming, and new immigrants brought the population to about 1,500. All things were owned in common under Jansson's direct control until he was murdered in 1850 by John Root, his cousin's husband. Jonas Olson then became the leader of the community, which was incorporated in 1853. Economic problems and internal dissension caused the collapse of communal life, however, and the property was divided among the settlers in 1861 and 1862. Many residents left the community, and the remainder became members of other churches.

The settlers of Bishop Hill were superb carpenters and craftsmen, and several of the original buildings remain; some have been restored. Among these are the Old Colony Church, built in 1848 in the Greek Revival style, and the Steeple Building, constructed in 1854. Bishop Hill was designated a state historic site in 1946. The present village (inc. 1893) is in an agricultural and coal-mining area. Pop. (2000) 125.

Bishop Museum, in full BERNICE P. BISHOP MUSEUM, in Honolulu, research centre for the study of Hawaiian and Polynesian archaeology, natural history, and culture. It also exhibits Hawaiian and Polynesian arts, crafts, artifacts, and flora and fauna. Among items on display at Hawaiian Hall are royal jewelry, crowns and thrones, weapons, feather capes and cloaks, outrigger canoes, surfboards, artifacts of whalebone and tortoise shell, and a ceiling-mounted whale. The museum was founded in 1889 by the American husband, Charles R. Bishop, of Hawaiian princess Bernice Pauahi (d. 1884), the last direct descendant of Kamehameha the Great. In 1961 a planetarium and observatory were added to emphasize the role of astronomy in the cultural history of Pacific Island peoples.

Bishop Rock Lighthouse, 19th-century lighthouse, Scilly Islands, Cornwall. The 19th-century civil-engineering landmark takes perhaps the worst buffeting from heavy seas of any lighthouse in the world. The first tower, begun in 1847, was swept away before the lantern could be installed. The present tower, of interlocking granite blocks with a solid drum base, was completed in 1858. It was subsequently reinforced by iron tie bars in the inner walls and a granite encasement of the outer wall. The structure was improved and its elevation was increased by Sir James N.

Bishop Rock Lighthouse, Scilly Islands, England, 1858

F.E. Gibson

Douglass in 1883–87. The lantern is 146 feet above high-tide level.

Bishops, Synod of, in the Roman Catholic Church, the institution of periodic meetings of bishops established in 1965 by Pope Paul VI. According to the "Decree on the Bishops' Pastoral Office in the Church" issued by the second Vatican Council, the Synod is convoked by the pope with the intention of assisting the pope in church government and of demonstrating the responsibility of bishops as a body for the universal church in addition to their individual responsibility in their respective dioceses.

The pope determines its procedures and agenda and appoints no more than 15 percent of the bishops. The rest of the delegates are elected by their respective national episcopal conferences or are ex officio members. In the years after its institution, the Synod was convoked biennially, and the number of delegates averaged about 200. Issues discussed by the delegates included the nature of the priestly ministry, the putting into practice of the principle of collegiality (*q.v.*), the church's obligations in promoting social justice, and the revision of canon (ecclesiastical) law.

bishop's cap cactus (*Astrophytum*, or *Echinocactus myriostigma*), species of cactus, fam-

ily Cactaceae, native to central Mexico, with four or five distinct ribs that increase to eight or more with age. Spineless and globose, becoming cylindroid with age, it is covered with white flecks caused by scales.

All four species of *Astrophytum*, which is sometimes regarded as a subgenus of *Echinocactus*, are cultivated as potted plants, their yellow flowers appearing on summer days.

Fairly large, they are fragrant in at least some species or varieties.

Bishop's Stortford, town ("parish"), East Hertfordshire district, county of Hertfordshire, Eng. It lies along the River Stort on the north-east periphery of the metropolitan complex centred on London. In Norman times the manor was held by the bishop of London. The town developed only after the opening of the Stort Navigation in 1769, when it became a malting centre and grain depot. The town is largely residential, with a variety of schools and colleges. Cecil Rhodes was born at Netteswell House, now a memorial museum. Pop. (1991) 28,403.

Bishops' Wars (1639, 1640), in British history, two brief campaigns that were fought between Charles I and the Scots. The wars were the result of Charles's endeavour to enforce Anglican observances in the Scottish Church and of the determination of the Scots to abolish episcopacy. A riot in Edinburgh in 1637 quickly led to national resistance in Scotland; and, when in November 1638 the General Assembly at Glasgow set Charles's orders at defiance, he gathered an English force and marched toward the border in 1639. Lacking sufficient funds and lacking confidence in his troops, however, Charles agreed, by the Pacification of Berwick, to leave the Scots alone. The first Bishops' War thus ended without battle.

Misunderstandings broke out as to the interpretation of the pacification treaty; and Charles, having discovered that the Scots were intriguing with France, determined again on the use of force. To raise money he once more called a Parliament (April 1640). This Short Parliament, as it was called, insisted first on discussing grievances against the government and showed itself opposed to a renewal of the war against the Scots. Charles thereupon dissolved Parliament and raised a new expedition on his own. The subsequent military successes of the Scots in the second Bishops' War and their seizure of the whole of Northumberland and Durham made it necessary for Charles to summon the Long Parliament (November 1640), thus precipitating the English Civil War.

Bisitūn, also spelled BISOTŪN, historically BEHISTUN, village and precipitous rock situated at the foot of the Zagros Mountains in the Kermanshah region of Iran. In ancient times Bisitūn was on the old road from Ecbatana, capital of ancient Media, to Babylon, and it was on that scarp that the Achaemenid king Darius I the Great (reigned 522–486 BC) placed his famous trilingual inscription, the decipherment of which provided an important key for the study of the cuneiform script. The inscription and the accompanying bas-relief were carved in a difficult, though not inaccessible, rock face. Written in Babylonian, Old Persian, and Elamite, the inscription records the way in which Darius, after the death of Cambyses II (reigned 529–522 BC), killed the

Relief and inscription at Bisitūn, Iran, from *History of the Persian Empire* by A.T. Olmstead, 1948

© 1948 by the University of Chicago, photograph, Oriental Institute, the University of Chicago

usurper Gaumata, defeated the rebels, and assumed the throne. The organization of the Persian territories into satrapies or provinces is also recorded.

The inscriptions were first reached and copied (1835–47) by Henry Rawlinson, an officer in the East India Company working in Persia. Rawlinson published his findings in 1849 and virtually accomplished the task of deciphering the Old Persian cuneiform texts. Largely because of Rawlinson's success with the Old Persian text, the Babylonian and Elamite versions were also soon translated. Later efforts at Bisitūn by various archaeological groups have clarified some of Rawlinson's readings, more accurately measured gaps in the text, and helped to determine when the events took place (c. autumn 522–spring 520 BC).

bisj pole, also spelled **BIS POLE**, carved wooden pole used in religious rites of the South Pacific Islands. *Bisj* poles are occasionally found in North America, but they are more common in New Zealand, Vanuatu (formerly the New Hebrides), and especially the Asmat area in southwestern (Indonesian) New Guinea and along the Casuarinan coast. The design of the poles—which range from 12 to 26 feet (3.7 to 7.9 m) in height and consist of carved figures, thought to represent clan ancestors who were killed by enemies, placed one on top of the other—derives from the squatting figure motif, one of the germinal-figurative forms in Oceanic art. The complex series of figures terminates in an ornate, open-work ornament fashioned from a flat root projection left on the trunk when the tree is felled. The complex religious significance and symbolism associated with *bisj* poles is reflected in the ceremony surrounding their

Bisj poles from the coastal area of southwestern Irian Jaya (West New Guinea), Indonesia; in the Koninklijk Instituut voor de Tropen, Amsterdam
Holle Bildarchiv, Baden-Baden, W Ger

creation. In the Asmat area, for example, the mangrove tree, representing the enemy, is ceremonially stalked and cut down. As the bark is stripped from the trunk and red sap seeps from the white wood, the Asmat is reminded of the conquered warrior's blood.

The *bisj* pole has been interpreted as another

form of the "soul ship," a large ceremonial dugout canoe filled with carved figures said to possess special powers. The ships are intended to carry the souls of the recently dead away from the villages and to impart magical powers to novices during initiation rites. The rituals surrounding *bisj* poles show that they, too, are intended to harbour souls of the dead, keeping them away from the village; and in appearance they resemble an upended canoe with an exaggerated prow and a dwarfed shell. Like the soul ships, *bisj* poles are also used to transmit magical powers—in this case to the palms in the sago swamps, where they are disposed of after ceremonies associated with the ancestor cult.

Biskra, also called (after 1981) **BESKRA**, town, northeastern Algeria, on the northern edge of the Sahara. It is the centre of the Zab (Ziban)

Biskra, Alg.
Dominique Darbois

group of oases south of a wide, open depression between the Aurès Massif and the Tell Atlas.

On the site of Vescera, a fortified Roman post, Biskra prospered after Arab conquest in the 9th century. In the 1100s it was the semi-autonomous capital of the Zab region but later came under the influence of the Hafsids. The Turks occupied Biskra in 1552. It was garrisoned by the French in 1844.

Fort Saint-Germain (1849–51; built on the site of the former Turkish Casbah) became the nucleus of modern Biskra. Its location on the railway and road from Constantine to Tougourt, its airport, and its temperate climate (November to April) have made Biskra a winter resort of broad, tree-lined streets, hotels, shops, and public gardens. Hammam Salahine ("Bath of the Saints"), a well-known, modern health spa with hot sulfur springs, is located 3 miles (5 km) northwest of the town; the Romans called the sulfur springs Ad Piscinam and used them in the treatment of rheumatism and skin diseases. Scattered among the thousands of date palms and fruit trees are the sun-baked brick villages that make up Old Biskra. In the winter season, water collected in the Wadi Biskra Barrage (dam) irrigates fields of wheat and barley. The area was subjected to disastrous floods in 1969.

The surrounding region is arid, a result of the dumping of rain in the Aurès mountains

The *Bismarck* shortly after commissioning in 1940

to the north. Two large salt lakes, Melhrir and Merouane, lie almost entirely below sea level. Most of the region's population lives in the area of Biskra or Souf oases. The oases stretch southward along the right bank of the Wadi Biskra, covering an area of 3,250 acres (1,300 hectares). Dates (especially the prized Deglet Nur, grown mostly in the Tolga oasis) are the principal crop of the region, but figs, pomegranates, and apricots are also grown. Pop. (1987 prelim.) 129,611.

Bismarck, capital of North Dakota, U.S., and the seat (1873) of Burleigh county. The city is in the south-central part of the state, on the east bank of the Missouri River. It originated in the 1830s as a port called the "Crossing on the Missouri," and in 1872 Camp Greeley (later Camp Hancock), a military post, was established there to protect crews working on the Northern Pacific Railway. In 1873 the community was named in honour of the German chancellor Otto von Bismarck, in

The State Capitol, Bismarck, N.D.
Grant Heilman—EB Inc

the hope of attracting German investment in the railway. With the discovery of gold in the Black Hills (to the southwest), Bismarck became an outfitting centre for prospectors. In 1883 the capital of Dakota Territory was moved from Yankton (now in South Dakota) to Bismarck; when the territory was divided and the two states admitted to the Union in 1889, Bismarck became the capital of the northern state. It has grown steadily and has become the region's business, cultural, and financial centre. In the heart of spring-wheat country, it is a wholesale distributing point, mainly for grain and livestock. The state capitol (1932) is a 19-story skyscraper, and the governor's mansion and state museum are in its grounds. Bismarck Junior College opened in 1939 and Mary College in 1959. Across the river are the city of Mandan and Fort Lincoln State Park. Inc. city, 1875. Pop. (1990) city, 49,256; Bismarck MSA, 83,831.

Bismarck, German battleship of World War II that had a short but spectacular career. The

Bismarck was laid down in 1936 and launched in 1939. It displaced 52,600 tons, mounted eight 15-inch (38-centimetre) guns, and had a speed of 30 knots. Its sighting off Bergen, Nor., in May 1941 by a British reconnaissance aircraft sent practically the entire British Home Fleet into action to intercept it. Two cruisers made contact off the coast of Iceland, and the battleship *Prince of Wales* and battle cruiser *Hood* soon engaged it. After destroying the *Hood* with a shell that exploded in the magazine, the *Bismarck* escaped into the open sea. Sighted by aircraft 30 hours later (May 26), it was hit by a torpedo that crippled its steering gear, and the ship was bombarded throughout the night by battleships. On the morning of May 27 the *King George V* and the *Rodney*, in an hour-long attack, incapacitated the *Bismarck*, and an hour and a half later it was sunk by three torpedoes from the cruiser *Dorsetshire*.

Bismarck, Otto von, in full OTTO EDUARD LEOPOLD, PRINCE (Fürst) VON BISMARCK, COUNT (Graf) VON BISMARCK-SCHÖNHAUSEN, DUKE (Herzog) VON LAUENBURG (b. April 1, 1815, Schönhausen, Altmark, Prussia [Germany]—d. July 30, 1888, Friedrichsruh, near Hamburg), prime minister of Prussia (1862–73, 1873–90) and founder and first chancellor (1871–90) of the German Empire. A conservative and a temporizer in domestic affairs, he was at his greatest and most imaginative in foreign policy. After 1871 he built a system of important alliances and arranged a series of diplomatic actions to secure both the position of Germany and the peace of Europe.

A brief treatment of Otto von Bismarck follows. For full treatment, see MACROPAEDIA: Bismarck.

After studying law, Bismarck entered Prussian service and became a judicial administrator at Aachen. In 1847 he became a member of the Prussian United Diet. Bismarck gained prominence in 1851 when he was chosen to represent Prussia in the Federal Diet in Frankfurt am Main. In 1859 he was sent as ambassador to Russia, from which he was recalled in March 1862 to become ambassador to France. Finally, on Sept. 22, 1862, Bismarck returned to Berlin as Prussia's prime minister under King William I, and he devoted himself to the task of uniting the German states under Prussian leadership. In the war of 1866 he succeeded in defeating Austria and gaining Prussian control over the German states north of the Main River. When the French emperor Napoleon III, provoked by the Ems telegram, declared war on Prussia on July 19, 1870, the southern German states joined the north in the Franco-German War. German victory in 1871 led to political unification and the creation of the German Empire.

Bismarck was appointed imperial chancellor and created Prince von Bismarck (March 21, 1871). He initiated administrative reforms, developing a common currency, a central bank, and a single code of civil and criminal law for Germany. In foreign affairs, he presided over the Congress of Berlin (1878), and this seemed to symbolize his paramount position as mediator between the great powers. An alliance (1879) with Austria-Hungary marked a new period of conservatism in Bismarck's foreign policy, soon reflected at home in anti-socialist policies. But in order to defeat the Social Democrats, Bismarck also became the first statesman in Europe to devise a comprehensive scheme of social security, offering workers insurance against accident, sickness, and old age. But by 1890, his policies had begun to come under attack. On March 18, 1890, two years after William II's accession, Bismarck was forced to resign. His last years were devoted to composing his memoirs.

Bismarck Archipelago, island group in the Bismarck Sea, southwestern Pacific, that lies northeast of the island of New Guinea and is part of Papua New Guinea. The largest components of the archipelago, which has a total land area of about 18,600 square miles (48,200 square km), are New Britain, New Ireland, the Admiralty Islands, Lavongai (New Hanover), and the smaller Duke of York Group, St. Matthias Group, and the Witu (Vitu) Islands. The islands are generally volcanic or formed of raised coral limestone and are heavily forested.

Annexed by Germany in 1884, the archipelago was named after the German statesman Otto von Bismarck. It was occupied by Australia in 1914 and made a mandated territory of Australia in 1920. Seized by Japan during World War II and retaken by the Allies in 1944, the group was made part of the UN Trust Territory of New Guinea, administered by Australia. When Papua New Guinea attained independence in 1975, the group became part of that country.

The economic mainstay of the islands is copra, with some lumbering and, more recently, cocoa and oil palm. Yams, taro, bananas, and fish are the basic foods of the archipelago. Rabaul, on New Britain, is the chief town. See also Admiralty Islands; Duke of York Islands; New Britain; New Ireland; Witu Islands. Pop. (1989 est.) 371,400.

Bismarck Range, northeastern segment of the central highlands of eastern New Guinea, Papua New Guinea. The mountains reach 14,793 feet (4,509 m) at Mount Wilhelm, the highest peak in Papua New Guinea, and often have snow on their summits. The Ramu River has its source in the range, as do tributaries of the Sepik and Purari rivers. Visited in 1886 by the German explorer G.E. von Schleinitz, the mountains were named after Otto von Bismarck.

Bismarck Sea, section of the southwestern Pacific Ocean, bounded by the northeast coast of Papua New Guinea (southwest) and the Bismarck Archipelago including the Admiralty Islands (north), New Ireland (east), and

The volcanic island of Manam off the northeast coast of Papua New Guinea in the Bismarck Sea

New Britain (south). With a total surface area of about 15,000 square miles (40,000 square km), it opens to the Pacific on the north and to the Solomon Sea on the southeast through Vitiaz and Dampier straits and St. George's Channel. The basin, with a general depth of 6,600 feet (2,000 m) and maximum depths approaching 8,200 feet (2,500 m), is divided by a central ridge into the eastern New Ireland and western New Guinea sections. The sea

was under German control from about 1885 until 1914 and bears the name of the German statesman Otto von Bismarck.

Bismāyah (Iraq): see Adab.

bismuth (Bi), the most metallic and the least abundant of the elements in the nitrogen family (Group Va of the periodic table).

A brief treatment of bismuth follows. For full treatment, see MACROPAEDIA: Chemical Elements: Nitrogen group elements.

Bismuth is the most diamagnetic of all metals (*i.e.*, it exhibits the greatest opposition to being magnetized) and has the lowest thermal conductivity of all metals except mercury. It is hard, brittle, lustrous, and coarsely crystalline. It can be distinguished from all other metals by its colour—gray-white with a reddish tinge. Bismuth was first described in 1450 by Basil Valentine, a German monk.

Bismuth is often found free in nature. It also occurs in compounds: as the sulfide bismuthinite, or bismuth glance (Bi_2S_3); the oxide bismite (Bi_2O_3); and the carbonate bismutite ($\text{Bi}_2\text{O}_3\text{CO}_3$). Bismuth is frequently associated with ores of tin, lead, or copper, from which it is separated as a by-product during their refining. Pure bismuth can also be obtained by reducing the oxide with carbon or by roasting the sulfide in the presence of charcoal and metallic iron to remove the sulfur.

Although it does not tarnish in air at ordinary temperatures, bismuth forms an oxide coating when heated. The yellow colour of this oxide distinguishes it from those formed by other metals. At red heat, bismuth reacts with steam, but it is not affected by cold, air-free water; it unites directly with sulfur and with the halogens (fluorine, chlorine, bromine, iodine). The element is not attacked by hydrochloric acid, and only slightly by hot sulfuric acid, but it is rapidly dissolved by either dilute or concentrated nitric acid.

Like antimony and water, bismuth expands slightly upon solidifying, a property that renders bismuth alloys particularly suited to the manufacture of sharply detailed metal castings. Because the alloys have low melting points, they are used in special solders as well as in automatic sprinkler heads, fire-door release lines, fuses, safety plugs for compressed-gas cylinders, and many other fire-detection devices. Thermoelectric equipment for refrigeration uses bismuth telluride (Bi_2Te_3) and bismuth selenide (Bi_2Se_3). The principal chemical application of the element is in the form of bismuth phosphomolybdate ($\text{BiPMo}_{12}\text{O}_{40}$), a highly effective catalyst for the air oxidation of propylene and ammonia to acrylonitrile, which is used to manufacture acrylic fibres, plastics, and paints. Salts of bismuth frequently are used in soothing agents for the treatment of digestive disorders, in outlining the alimentary tract during X-ray examination, and in treating injuries and infections of the skin. The oxychloride BiOCl has been used to impart a pearlescent quality to lipstick, nail polish, and eye shadow. For comparative statistical data on bismuth production and reserves, see mining (table).

atomic number	83
atomic weight	208.980
melting point	271.3° C (520.3° F)
boiling point	1,560° C (2,840° F)
density	9.747 g/cc at 20° C (68° F)
oxidation states	+3, +5
electron config.	2-8-18-32-18-5 or $1s^2 2s^2 2p^6 3s^2 3p^6 3d^{10} 4s^2 4p^6$ $4d^{10} 4f^{14} 5s^2 5p^6 5d^{10} 6s^2 6p^3$

bismutite, a rather common mineral, bismuth subcarbonate (BiO) $_2\text{CO}_3$, that has been formed as an alteration product of primary bismuth minerals in the oxidized portions of metal veins. Well-known localities include Cornwall, Eng., and the Tazna district, Bolivia. For detailed physical properties, see carbonate mineral (table).

bison (*Bison bison*), oxlike grazing mammal, belonging to the family Bovidae, order Artiodactyla. The bison is larger than cattle and has a convex forehead and a pronounced shoulder hump. The coarse hair is especially long

American bison, or plains buffalo (*Bison bison*)

Alan G. Nelson—Root Resources

on the head, which is held low, and on the neck and shoulders. Both sexes bear heavy, curved horns, those of the cow being smaller. A mature bull stands about 2 metres (6½ feet) at the shoulder and weighs more than 900 kilograms (1,980 pounds). The coat is dark brown, although on rare occasions a white animal is born; these unusual animals were once especially honoured by American Indians.

The bison lives in herds that may remain in one place for several days or may move more or less constantly. The cow, which commonly breeds for 40 years, usually gives birth to a single calf in May after about nine months' gestation. In spite of its bulk, the bison is agile and fast. Unpredictable, it can sometimes be approached closely and at other times will stampede at the least provocation.

The European bison, or wisent, often called the species *B. bonasus*, is a woods dweller, rangier and slightly larger than the American bison, and has thicker, shorter, blunter horns. It became rare by the 16th century and in the late 20th century survived only in a few small, managed herds.

The American bison, commonly called buffalo, or plains buffalo, once roamed over most of North America in numbers estimated as high as 60,000,000 when Europeans arrived. It formed the mainstay of the economy of the Plains Indians, but with the westward movement of white civilization it was wantonly slaughtered—for meat, hides, sport, and sometimes only the tongue. One hunter, William F. Cody ("Buffalo Bill"), was renowned as a killer of buffalo. Much of the hostility between the Indians and the white men was caused by the depletion of the bison herds. Around 1900, as the animal neared extinction, concerted action by cattlemen and conservationists led to its protection on government preserves. The present managed herds now seem to ensure survival of the species, and indeed local herds often overpopulate their ranges and must be reduced by controlled hunting.

Bisotūn (Iran): see Bisitūn.

Bisrāmpur (India): see Surguja.

Bissagos Islands (Guinea-Bissau): see Bijagós Islands.

Bissau, port city and capital of Guinea-Bissau, West Africa. It originated in 1687 as a Portuguese fortified post and slave-trading centre. In 1941 it replaced Bolama as the capital and has since developed on a north-west-southeast axis by the Canal do Gêba, a channel that offers an excellent roadstead for the largest vessels; a wharf and pier have replaced the former outdated lighterage system. Recent port improvements have included enlargement of the harbour and the installation of refrigeration units. The city also has an international airport and is the site of a small

university and a research institute. Pop. (1999 est.) 274,000.

Bisschop, Simon (Dutch theologian): see Episcopius, Simon.

Bissell, Melville Reuben (b. Sept. 25, 1843, Hartwick, N.Y., U.S.—d. March 15, 1889, Grand Rapids, Mich.), U.S. inventor of the carpet sweeper.

After growing up in Berlin, Wis., Bissell joined his father in business at Kalamazoo, Mich., where they opened a grocery store. Selling crockery led the younger Bissell into the crockery business in Grand Rapids, where, by the time of the economic panic of 1873, he had made a fortune in industry and real estate. With business temporarily at a standstill, he turned his attention to the carpet sweeper and its large potential market. He soon patented (1876) a device with a central bearing brush; his device was made thoroughly practical by the addition of rubber tires and other improvements. Despite a disastrous fire (1884) in his first factory, he headed a highly successful business with worldwide production and marketing facilities.

Bissell, Richard (Pike) (b. June 27, 1913, Dubuque, Iowa, U.S.—d. May 4, 1977, Dubuque), U.S. novelist and playwright whose works provide fresh and witty images of Middle Western speech and folkways.

Bissell grew up in Dubuque, attended Phillips Exeter Academy, and graduated from Harvard in 1936. From his experiences as a mate and then a pilot on the Mississippi, Ohio, and Monongahela rivers came the novels *A Stretch on the River* (1950) and *The Monongahela* (1952). His first really successful novel was *7½ Cents* (1953; British title *A Gross of Pyjamas*), based on his experiences as a supervisor in a pajama factory in Dubuque. In collaboration with George Abbott, he turned *7½ Cents* into a musical, *The Pajama Game* (1954), which had a long run on Broadway and was made into a motion picture in 1957. From his experiences in the theatre he produced a novel, *Say, Darling* (1957), which he then wrote as a musical under the same title (1958), in collaboration with his wife, Marian Bissell, and Abe Burrows. Among his later books are the novels *Good Bye, Ava* (1960) and *Still Circling Moose Jaw* (1965). His last novel, *New Light on 1776 and All That* (1975), is a satire of the American Revolution.

Bisseni (Turkic people): see Pechenegs.

Bissorã, town, Oio region, northwestern Guinea-Bissau, West Africa. It lies on a tributary of the Rio Cacheu and is surrounded by the Casamance woodland, which provides hardwoods for export. A power station supplies the town's industry, which includes a sawmill. Subsistence agriculture predominates in the surrounding area, and corn (maize), sorghum, millet, sweet potatoes, cassava, and beans are the principal crops. Bissorã is connected by road with Bissau, the national capital. Pop. (1994/96 est.) mun., 156,089.

Bistam (Iran): see Bastām.

bistre, brown pigment made from boiling the soot of wood. Because bistre is transparent and has no body, it is frequently used in conjunction with pen and ink drawings as a wash, a liquid spread evenly to suggest shadows, and is especially associated with the appearance of the typical "old master drawing."

It was used to its greatest effect in the 17th and 18th centuries, when the bistre wash was especially favoured by such artists as Rembrandt, Claude Lorrain, Alexander Cozens,

"Young Woman at Her Toilette," by Rembrandt, pen and India ink with bistre and ink washes; in the Albertina, Vienna

By courtesy of the Albertina, Vienna

and Thomas Gainsborough. The pigment is also used by miniaturists.

Bistrița, town, capital of Bistrița-Năsăud *judet* (district), northern Romania. Settled in the 12th century by immigrant Germans, it acquired free-city status in 1353. Holding an annual fair, it developed extensive markets throughout Moldavia, and its craftsmen travelled extensively. In 1713 the Romanian population was expelled by the Saxon magistrates, but they returned later, and Bistrița was restored to Romania in 1918; it was part of Hungary from 1940 to 1945. Foodstuffs and building materials are important in the economy. The area around the town is noted for its timber and wines. Năsăud, a few miles northwest, is famous for its timber and fruit and for the fine embroidery on traditional peasant costumes. Pop. (1997 est.) 86,942.

Bistrița-Năsăud, *judet* (district), northern Romania, occupying an area of 2,048 sq mi (5,305 sq km). The forested Eastern Carpathian Mountains, including the Rodna and Căliman Massifs, rise above the settlement areas in intermontane valleys. The Căliman Massif (6,896 ft [2,096m]) is the largest one of volcanic origin in Romania. The Someșul Mare and its tributaries, including the Țibleș and Ilișua rivers, flow southwestward through the district. Bistrița is the district capital. Neolithic remains and Bronze Age tombs were found in Bistrița city, and remains of a Dacian citadel are in Sărățel town. Agricultural activities consist mostly of wine growing and livestock raising. Wood and pulp products are manufactured in Bistrița, Năsăud, and Ilva-Mică. Building materials are produced in Bistrița and Sîngeorz-Băi. Pyrite has been mined near Rodna since the 15th century. Rodna is a tourist centre for the picturesque Lake Lala, Vințului Valley, and Mount Ineu (7,809 ft). Birgăul village, the centre of a substantial folk-art community, is situated near the pyramid-shaped Mount Henuil Mare (5,289 ft). Coșbuc town is named for the poet Gheorghe Coșbuc (1866–1918), who was born there. Beclean, Năsăud, and Rodna towns are noted for the architecture of their churches. A museum in Năsăud contains medieval weapons, ceramics, and money; and Reteag town has a museum devoted to Ion Pop Reteag (1853–1905), a folk-tale chronicler and collector of folk art. Major highway and railway connec-

tions parallel the Someşul Mare and Bistrița rivers. Pop. (1997 est.) 326,539.

bit, in communication and information theory, a unit of information equivalent to the result of a choice between only two possible alternatives, as between 1 and 0 in the binary number system generally used in digital computers. The term is shortened from the words "binary digit." It is also applied to a unit of computer memory corresponding to the ability to store the result of a choice between two alternatives.

bit (hand tool): *see* brace and bit.

Bit-Adini, ancient Aramaean kingdom in Mesopotamia, located on both sides of the middle Euphrates. River south of Carchemish. Probably founded in the 10th century BC, it was conquered by the Assyrians under Shalmaneser III in 856. Its capital, Til Barsib (Til Barsip; modern Tall al-Ahmar), was renamed Kar-Shulmanashared (Quay of Shalmaneser) and was made an Assyrian provincial capital and garrison town. Til Barsib was later captured by the Chaldean king Nabopolassar in 611, and thereafter it never regained its former importance.

Biték, Okot (African writer): *see* p'Biték, Okot.

Bithūr, town, Uttar Pradesh state, northern India, northwest of Kānpur, on the Ganges River. Bājī Rāo, peshwa of the Marāṭhās, established his court at Bithūr after the British deposed him in 1818. In 1857 the British levelled the town and blew up the temple and palaces in retaliation for Bājī Rāo's adopted son's part in the Indian Mutiny. The town's ruins are an important Hindu holy place. The principal object of worship is a footmark believed to be that of the god Brahmā. The epic *Rāmāyana* is said to have been composed there. A large religious festival is held annually. Pop. (1991) 7,444.

Bithynia, ancient district in northwestern Anatolia, adjoining the Sea of Marmara, the

Bithynia

From W. Shepherd, *Historical Atlas*, Harper & Row, Publishers (Barnes & Noble Books), New York, revision copyright © 1964 by Barnes & Noble, Inc.

Bosporus, and the Black Sea, thus occupying an important and precarious position between East and West. Late in the 2nd millennium BC, Bithynia was occupied by warlike tribes of Thracian origin who harried Greek settlers and Persian envoys alike. Their remarkable pugnacity kept them from complete Persian domination after the 6th century; in addition, they never submitted to Alexander the Great or his Seleucid successors. By the 3rd century BC the small but powerful state had evolved from tribal government to Hellenistic kingship and reached the height of its power early in the 2nd century BC. There followed a century of inept leadership and rapid decline. Bithynia's last king, Nicomedes IV, little more than a Roman puppet, bequeathed his kingdom to the Romans in 74 BC.

biting louse: *see* chewing louse.

biting midge, the smallest bloodsucking insect (about 1 millimetre [0.04 inch] long), sometimes considered a member of the midge family (Chironomidae) but more recently

Biting midge (*Phasmodohelea wagneri*)
E. S. Ross

placed in the family Ceratopogonidae (order Diptera). Biting midges—often a serious pest along seashores, rivers, and lakes—may attack in great numbers and cause extreme discomfort. The nickname no-see-ums is descriptive, for, although its irritating bite is felt, the female midge is difficult to find.

The larvae live in fresh and brackish water, in moist soil, or under tree bark. The genera *Culicoides* and *Leptoconops*, also known as sand flies (*q.v.*), or punkies, attack humans but are not known to transmit any diseases to them. Many species attack other insects (*e.g.*, mantids, walking-sticks, and dragonflies).

Bitis, snake genus belonging to the poisonous viper family Viperidae, including the puff adders (*e.g.*, *Bitis arietans*; *see* adder), the Gaboon viper (*q.v.*; *B. gabonica*), and the rhinoceros viper (*q.v.*; *B. nasicornis*).

Bitlis, city, southeastern Turkey, southwest of Lake Van at 4,600 ft (1,400 m) above sea level. Strategically situated in the narrow valley of the Bitlis Çay, a tributary of the Tigris River, it commands the only route from the Van basin to the Mesopotamian plains. It was mentioned frequently, as Bagesh, in old Armenian sources. Taken by the Muslim Arabs during the reign of the caliph 'Umar (634–644), it changed hands intermittently among the Arab dynasties, the Armenians, the Byzantines, the Persian Il-Khans, and the Mongols until the establishment of a Kurdish dynasty

Ancient caravansary, Bitlis, Tur.

H. Knaus—Bavaria Verlag

in the 14th century. The Kurds at Bitlis, under Ottoman suzerainty, enjoyed considerable autonomy until 1847, when the town came under direct Ottoman administration. The Ar-

menian insurrections at the end of the 19th century and the Russian occupation during World War I hurt Bitlis, reducing its population and damaging its weaving and dyeing industries. Historical monuments include a partly ruined medieval castle and numerous mosques, theological schools, and inns that date from the early Seljuq and Ottoman periods.

The area in which Bitlis is situated includes the eastern corner of the Muş Plain, the plateau west of Lake Van, and the wild, mountainous country on both sides of the city of Bitlis. The climate in mountainous areas is harsh, with long winters and heavy snowfalls. Agricultural products include fruits, grain, and tobacco; industry is limited to leatherworking, the manufacture of tobacco products, and the weaving and dyeing of coarse cloth. Kurds form the majority of the population. Tatvan, on Lake Van, is a major port. Pop. (1997) 51,927.

Bitola, Serbo-Croatian BITOLJ, Turkish MONASTIR, southernmost city of Macedonia, 2,019 ft (615 m) in altitude on the Dragor River and at the western edge of the Bitola Plain, a few miles from the Greek frontier. Near the Greek-founded settlement Heraclea Lyncestis, later a Roman city, it was invaded by Slavic tribes in the 5th and 6th centuries, and thereafter declined. The Monastery of Obitelj (still visible) played an important role in the community until the city was taken by the Turks and became a thriving cosmopolitan city of commercial and military importance. There were 60 mosques in the city, of which 12 remain. In the Balkan Wars (1912–13) Bitola was taken by the Serbs, cutting off the city from a 500-year Muslim history. World War II brought a further decline in economic activity and in population; its Jewish community was wiped out.

After World War II, Bitola became an important Macedonian centre. It has good transportation links to Skopje and into Greece. The fertile plain supports cereals, industrial crops (notably tobacco), and animal husbandry. Industrial activity includes sugar refining, leather craft, and the manufacture of textiles, carpets, and refrigeration equipment. Construction was underway in the late 1970s on the Bitola thermal power plant, which will provide electricity for much of Macedonia, especially the resort areas of Lakes Ohrid and Prespa. Ten miles north of Bitola is the great circular necropolis of Vissovi, comparable to the ancient centre of Mycenae, in Crete. Pop. (1994) 75,386.

Biton and Cleobis, Biton also spelled BITO, in Greek legend, the sons of Cydippe, priestess of Hera, queen of the gods, at Argos, noted for their filial devotion and for their athletic prowess and strength. During an Argive festival honouring Hera, Cydippe was called to the temple. When her oxteam could not be found, the brothers took up the yoke of the ceremonial wagon and conveyed her there themselves.

Cydippe begged the goddess to grant them, as a reward for their piety, whatever was best for mortal men. They feasted and slept that night in the temple, waiting to take their mother home on the following day, but they never awakened.

Bitonto, town and episcopal see, Bari province, Puglia (Apulia) region, southeastern Italy, just west-southwest of Bari. Many coins have been found at Bitonto dating from the 6th to the 3rd century BC. A Roman municipality (Butuntum, Botontum, and other forms), the town early became part of the Norman Kingdom of Naples. It is noted for its fine Romanesque cathedral (1175–1200) and also has remains of medieval walls built by the Normans and Angevins (House of

Anjou), the church of S. Francesco d'Assisi, with a 1286 facade, and several Renaissance palaces, including the Palazzo Sylos Labini. Bitonto is the site of several agricultural institutes, and its economy is based primarily on wines, olives, and almonds. Pop. (1999 est.) mun., 56,747.

bitter apple, also called BITTER CUCUMBER; see colocyth.

Bitter Springs microfossils, assemblage of microscopic fossil structures uncovered in the Bitter Springs Formation, a rock layer about 800,000,000 years old exposed in central Australia. Collections first made in 1965 revealed at least four general groups of organisms that possibly inhabited shallow seas of central Australia in Late Precambrian times (ending about 570,000,000 years ago); these groups resemble bacteria, filamentous blue-green algae, green algae, and fungi. The demonstration of cell division in a fossil green alga named *Glenobotrydion* is evidence that an evolutionary stage that would later lead to sexual reproduction and genetic variation already had been attained.

bitterling (*Rhodeus*), any of several small, carplike fish of the family Cyprinidae noted

Male bitterling (*Rhodeus*) preparing to eject sperm
Lawrence E. Perkins

for their unusual manner of breeding. Native to clear, stony streams of central and southern Europe, the bitterling is a silvery fish of little economic value, about 5 to 7.5 centimetres (2 to 3 inches) long. It spawns between April and June. At this time, the male develops an orange belly and reddish fins, while the female develops a long, tubular ovipositor, which inserts into the incumbent respiratory siphon of a freshwater clam or mussel and by which she deposits her eggs in the gill chamber of the mollusk. There, they are fertilized by sperm ejected by the nearby male and drawn by the mollusk into the gill chamber along with water for respiration.

The eggs develop in the gill chamber of the mollusk, and the young bitterlings leave their host about a month later. The breeding periods of fish and mollusk coincide, and the mollusk in return throws off its larvae onto the bitterling, where they undergo part of their development encysted (buried) in the skin of the fish.

bittern, any of 12 species of solitary marsh birds of the subfamily Botaurinae, family Ardeidae (order Ciconiiformes), allied to the herons (subfamily Ardeinae) but with shorter neck and stouter body. Most bitterns bear a camouflage pattern—streaks of variegated brown and buff—which enables them to es-

cape detection by standing upright with bill pointed upward, imitating the reeds and grasses of their habitat. They feed upon fish, frogs, crayfish, and other small swamp and marsh animals, which they spear with their sharp-pointed bills. Bitterns occur almost worldwide. There are four species of *Botaurus* and eight species of *Ixobrychus*.

Bitterns of the genus *Botaurus*, occurring mainly in temperate regions, are large, and the sexes look alike. In spring the male utters booming calls audible for a considerable distance. The female undertakes nesting duties; assembling a crude mass of vegetation near water level, she lays four to six brownish eggs. The largest member of the genus is the Eurasian bittern (*B. stellaris*), to 75 centimetres (30 inches), ranging from the British Isles to southeastern Asia and occurring also in South Africa. The American bittern (*B. lentiginosus*), known locally as "stake driver" or "thunder pumper," is slightly smaller. Other forms are the Australian bittern (*B. poiciloptilus*) and the South American, or pinnated, bittern (*B. pinnatus*).

Bitterns of the genus *Ixobrychus* are small (30 to 40 cm, or about 12 to 16 in.). The sexes are unlike in appearance and share in the nesting duties. As many as 10 white, bluish, or greenish eggs are laid in a neat nest placed well above water level, sometimes in a tree. Superficially alike are the least bittern (*I. exilis*), of America; the little bittern (*I. minutus*), of Eurasia, Africa, and Australia; and the Chinese little, or yellow, bittern (*I. sinensis*). Rather similar are the variegated, or stripe-backed, bittern (*I. involucris*), of South America; the African dwarf bittern (*I. sturmi*); and, in southeastern Asia, Schrenk's little bittern (*I. eurhythmus*) and the cinnamon little, or chestnut, bittern (*I. cinnamomeus*). Somewhat larger is the black mangrove bittern (*I. flavicollis*), of southeastern Asia and Australia. This species shows plumelike development of

American bittern (*Botaurus lentiginosus*)
Ben Goldstein from Root Resources—EB Inc

the crown and neck feathers and is sometimes separated as *Dupetor*. For information on tiger bitterns, or tiger herons, see heron.

bittern, in chemistry, liquid remaining after sodium chloride (table salt) has been crystallized from brine. It is a commercial source of magnesium compounds—magnesium sulfate (Epsom salts), magnesium chloride, magnesium bromide—which it holds in solution. The chemical term is a modification of "bitter." See also brine.

bitterroot (*Lewisia rediviva*), ornamental succulent plant of the purslane family (Portulacaceae), native to western North America and cultivated in rock gardens. The main stem and root merge into a tuberous structure. The leaves are barely 2.5 centimetres (1 inch) long, and the flowering stalk with pink or white flowers is also very short. The starchy root,

resembling a forked radish, is edible in spring but acquires a bitter taste by summer. Other

Bitterroot (*Lewisia rediviva*)
C C. Wendle—Tom Stack and Associates

species of the genus also are cultivated as rock-garden plants for their attractive flowers.

Bitterroot Range, segment of the northern Rocky Mountains, U.S., extending southward for 300 mi (480 km) along the Idaho–Montana border. Peaks average about 9,000 ft (2,700 m), with Scott Peak, in Idaho, the highest (11,394 ft). Owing to the inaccessibility of the mountains from the east, the explorers Meriwether Lewis and William Clark in 1805 were forced to travel northward more than 100 mi before finding a westward route through Lolo Pass (5,236 ft). Bitterroot National Forest extends across the centre of the range, which also passes through several other national forests. The region is drained by tributaries of the Columbia and Missouri rivers on the east and the Clearwater and Salmon rivers on the west.

bitters, any of numerous aromatized and often alcoholic liquids containing bitter substances (chiefly alkaloids, glycosides, or complexes), used as tonics, liqueurs, appetizers, digestives, flavourings, and ingredients to add tang or smoothness to alcoholic drinks. Bitters are prepared according to secret recipes by several manufacturers using bitter herbs, leaves, fruits, seeds, or roots and sometimes alcohol or sugar. The taste is imparted by substances such as orange peel, gentian root, rhubarb root, hop flowers, quassia-wood chips, cascarilla, cinchona bark, and quinine. Aroma is provided by juniper, cinnamon, caraway, anise, nutmeg, camomile, cloves, and other flavouring agents. Bitters are usually named according to the ingredient giving the predominant flavour, such as orange bitters and peach bitters. The alcoholic strength varies but is generally about 40 percent by volume.

Medicinal bitters, few in number and of minor therapeutic value, include compound tinctures of absinthe and of aloes. Early Hebrew history records the addition of sweet-scented or bitter herbs to wine in order to improve and give variety to the flavour. The preparation of aromatic liqueurs originated in France around 1533, and their use spread quickly over the world.

bittersweet, any of several vines with colourful fruit. The genus *Celastrus*, in the staff tree family (Celastraceae), includes the American bittersweet, or staff vine (*C. scandens*), and the Oriental bittersweet (*C. orbiculatus*), woody vines grown as ornamentals. The flowers, in whitish clusters, are followed by yellow to orange capsules, which split to reveal yellow

to crimson arils enclosing the seeds. Oriental bittersweet is a more vigorous climber, reaching up to 12 metres (40 feet); the American

American bittersweet (*Celastrus scandens*)

Kenneth and Brenda Formanek—EB Inc

species, up to 7.5 m, often has many sterile individuals in its population. Both types climb by twining around supports. Another bittersweet, also called nightshade (*q.v.*) or woody nightshade (*Solanum dulcamara*), belongs to the family Solanaceae. It is an herbaceous vine, up to 4.5 m long; the violet and yellow star-shaped flowers are followed by shiny green berries that gradually turn bright red.

bitumen, any natural compound consisting of hydrogen and carbon, except coals and those in the gaseous state. In Great Britain and continental Europe the geologic terms bitumen and asphaltic bitumen are employed only with reference to the black or brown petroleum-like substances that are called asphalts in the United States. In its various forms, bitumen is one of the most widely distributed of substances. It occurs, in varying quantities, in nearly every part of the world and throughout the whole range of geological strata. In current terminology bitumen also may include synthetic hydrocarbon compounds.

The different forms of bitumen are listed in the table. Liquid petroleum, or crude oil, is a mixture of many kinds of hydrocarbon compounds that were formed by the gradual decomposition of organic matter. The solid or very dense, highly viscous bitumens, such as asphalts, probably have all been derived from liquid petroleum, either by evaporation of the lighter, more volatile fraction under atmospheric conditions or by metamorphism occurring deep within the Earth's crust. The solid and very dense bitumens are fusible and soluble in carbon disulfide. They are related to but quite different from pyrobitumens, which are infusible and insoluble hydrocarbons that occur in oil shale, peat, and the various coals, including the subbituminous and bituminous forms, and also from the asphaltites,

which probably formed from sapropelic coals. The pyrobitumens, however, produce or become bitumen-like compounds when they are heated. Both bitumens and these bitumen-like compounds are employed as fuels, as roofing and paving materials, and in many other products. *Compare* pyrobitumens.

bituminous coal, also called **SOFT COAL**, most abundant form of coal that is intermediate between subbituminous coal and anthracite in rank (*i.e.*, degree of coalification). In Europe some bituminous coal with higher heat value is labelled hard coal, the designation soft coal being restricted to bituminous coal with lower heat value, lignite, and brown coal.

Bituminous coal is dark brown to black and usually banded. It consists of more than 95 percent vitrinite, a maceral group derived from woody plant tissue. Bituminous coal contains between 15 and 35 percent volatile matter and usually has a moisture content of less than 3 percent; it thus has a relatively high calorific, or heat, value. Because of these properties and its abundance, bituminous coal has the broadest range of commercial uses among the coals. It has long been utilized for steam generation in electric power plants and industrial boiler plants. In addition, those varieties of bituminous coal that contain a fairly small amount of sulfur and caking easily are the only coals suited for making coke, a hard substance of almost pure carbon important for smelting iron ore. Coke is produced by heating bituminous coal to approximately 1,100° C (2,000° F) in specially designed airtight ovens. The coal does not burn, because of the absence of oxygen, but the intense heat drives off much of the volatile matter in the coal in the form of gases, leaving coke. Some of the gases released during the coke-making process, moreover, condense into coal tar and liquid ammonia.

One major problem associated with bituminous coal is air pollution. Burning large quantities of bituminous coals with medium to high sulfur content releases sulfur dioxide into the air. When moisture in the air reacts with this chemical compound, sulfuric acid is formed. This substance then falls to the Earth mixed with water droplets as acid rain, a pollutant that causes crop damage and water contamination. Because of such serious pollution problems, a growing number of coal-fuelled electric power plants in the United States have switched to subbituminous coal, which contains much less sulfur. *See also* subbituminous coal.

Bituriges, Celtic tribe that in about 600 BC was the most powerful in Gaul. By about 500 BC the tribe was divided into two groups: the Cubi, with a capital at Avaricum (modern Bourges) in the region later known as Berry; and the Vivisci, with a capital at the port of Burdigala (modern Bordeaux) on the shore of the Gironde Estuary. During the Gallic revolt of 52 BC, the Cubi defended Avaricum, but Julius Caesar destroyed the town and its inhabitants. Both groups were later included in the Roman administrative district of Aquitania (modern Aquitaine).

Bitzer, Billy, byname of GOTTFRIED WILHELM BITZER (b. April 21, 1874, Boston—d. April 29, 1944, Hollywood), U.S. motion-

picture cameraman who, in partnership with the pioneer director D.W. Griffith, developed camera techniques that set the standard for all future motion pictures and stimulated important experimentation in the field.

Bitzer achieved success in 1896 when his film of William McKinley being notified of the presidential nomination of his party was exhibited on the Biograph Company's first program. He filmed the Spanish-American War for the William Randolph Hearst organization, becoming the first motion-picture cameraman to cover a war. When Griffith joined Biograph, Bitzer became his cameraman. During the ensuing years, Bitzer successfully translated the director's creative visual concepts to the screen, especially in composition and the use of lighting to create mood. He photographed hundreds of Griffith's motion pictures, including *Judith of Bethulia* (1913), *The Birth of a Nation* (1915), *Intolerance* (1916), *Broken Blossoms* (1919), and *Way Down East* (1920).

Bitzer had been using lighting "effects," such as firelight, candlelight, or the morning sun, as early as 1909; he was the first cameraman to film completely under artificial lights, an innovation that eventually freed Hollywood technicians from dependence on natural light. Working with Griffith, he developed camera techniques that had a permanent influence on the industry—*e.g.*, soft-focus photography, using a light-diffusion screen in front of the camera lens; the fade-out, used to close a scene; and the iris shot, in which the frame either is gradually blacked out in a shrinking circle, thereby ending a scene, or gradually opened in a widening circle, beginning a scene. He refined methods of taking close-ups and long shots and was one of the first cinematographers to make effective use of perspective.

Bitzer left Griffith in 1924 but briefly rejoined him in 1928. He later was a cameraman for the Works Progress Administration and repaired old films for the New York Museum of Modern Art's film archive.

Bitzium, Albert (Swiss writer): *see* Gotthelf, Jeremias.

Biu, town, historic kingdom, and traditional emirate, Borno State, northeastern Nigeria. The town lies on the Biu Plateau and has road connections to Damaturu, Mubi, and Shani.

According to tradition, the Biu kingdom was founded by conquest in the mid-16th century by Yamta-ra-Wala (Yamta the Great; also called Yamta [Abdullahi] Ula). The defeated people, however, recovered much of their territory during the rule of Yamta's son; and not until *c.* 1670, in the reign of Mari Watila Tampta, did the kingdom become generally secure.

Buba Yero, the first ruler of Gombe emirate (to the west), brought the Fulani *jihad* (holy war) to the region in the early 19th century; but Biu's Mari Watirwa (reigned 1793–1838), whose capital was at Kogu, eventually defeated the Fulani forces. About 1870 Ari Paskur ordered Biu town, near Kogu, to be walled, and in 1878 his son, Mari Biya, became the first Bura (Pabir) king to rule from the town. Not until 1904, a year after the British established a military post in Gujba (64 mi [103 km] north-northwest), did Biu become the traditional capital. Biu division was created in 1918; and, in 1920, Mai Ari Dogo (King Ari I; title, Kuthli Viyu) was acknowledged as the first *amir* of Biu. The region is mainly inhabited by Bura, Tera, Margi (Marghi), Hina (Hinna), and Fulani Kitaku (Kitije Filane) peoples. Since 1957, when the former districts of Shani and Askira (the home of the Margi) were added to Biu emirate, the area has been known as the Biu federation.

Most inhabitants in the region keep cattle, goats, sheep, horses, and donkeys; and Biu town is the chief trade centre (sorghum, millet, peanuts [groundnuts]) on the plateau.

Bitumens

bitumens	liquid petroleum	{ paraffin base mixed base asphaltic base
	native mineral waxes	{ ozocerite (called ceresine when refined) montan wax (extracted from peat)
	native asphalts	{ vary from a pure solid bitumen to an impure bitumen containing a high percentage of sand, clay, etc.
	asphaltites	{ gilsonite } characterized by a higher { glance pitch } fusing point than the { grahamsite } asphalts

The town, site of the emir's palace, has several government health offices and a dispensary. The Church of the Brethren operates a teacher-training college at nearby Biu Waka. The crocodiles of Tila Lake, a crater lake in an extinct volcano measuring 1,800 feet (550 m), just southwest of the town, are sacred to Biu's traditional rulers. Pop. (1991 est.) town, 43,050.

Biu Plateau, highlands in northeastern Nigeria, covering an area of approximately 2,000 square miles (5,200 square km) with an average elevation of 2,300 feet (700 m). Its highest point is Wiga Hill (2,693 feet [821 m]), and its most prominent relief features are the many well-defined, extinct volcanic cones. Numerous tributaries of the Gongola River—including the Hawal, Ruhu, Gungeru, and Ndivana rivers—rise on the plateau and deeply dissect its surface. While Biu's southern and western sides are quite steep, the plateau slopes more gradually in the north onto the Bauchi Plains and the Chad Basin.

The Biu Plateau's thin soils, scarcity of water in the dry season, and relative inaccessibility have discouraged human settlement there. Most of its upland areas were first settled in the early 19th century by non-Muslim groups trying to escape the ravages of the Fulani jihad (holy war). The plateau's Bura (Pabir) inhabitants are almost entirely non-Muslim. The tsetse-free plateau has lured some Fulani cattle herders and has provided grazing ground for its local peoples' dwarf cattle, horses, donkeys, goats, and sheep. Sorghum and peanuts (groundnuts) are the chief crops cultivated by these subsistence farmers. Biu town is the plateau's largest settlement and its principal trade centre.

bivalve, class name BIVALVIA, member of a class of mollusks characterized by having a two-valved shell.

A brief treatment of bivalves follows. For full treatment, see MACROPAEDIA: Mollusks.

Bivalves include such mollusks as clams, cockles, mussels, oysters, razor shells, and shipworms. They are characterized by laterally compressed shells consisting of two halves, or valves, joined by an elastic ligament. The ligament opens the valves, which are closed by the action of one or two transverse adductor muscles that join the valves. The animal is generally totally enclosed by the shell and by two sheets of tissue called the mantle. Bivalves have no head, and most of their sense organs are concentrated in the mantle margins. Most species feed on suspended phytoplankton by using a large pair of specialized gills that lie on either side of the animal and are folded into lamellae (platelike structures) composed of filaments. Large volumes of water are pumped across the gills by ciliary action, and trapped food particles are transported toward the mouth by specialized cilia. The food is then further sorted by special organs called palps before it is ingested. Some other bivalves feed on organic material in sediment, and a few others are carnivores, subsisting on small crustaceans.

Many bivalves burrow into soft substrates; they penetrate the sediment by probing and anchoring with a muscular foot and then rapidly closing the valves, thus fluidizing the sediment. Most burrowing bivalves have inhalant and exhalant siphons through which water passes to and from the sediment surface. The siphons consist of muscular mantle tissue that has been fused into extensible tubelike structures, which in some bivalves (e.g., the geoduck) can extend more than 1 m (3 feet) in length. Other bivalves live on the substrate surface and are attached by tough, horny threads (the byssus), which are secreted by a gland in the foot. In oysters and a number of other bivalves, actual cementation of one valve to the substrates occurs. Several groups of bivalves can bore into hard substrates. These

include the date mussel (*Lithophaga*), which bores into limestone by chemical means, and the piddock and its relatives (*Pholadidae*), which penetrate rock by mechanical scraping. The shipworm (*Teredo*) bores into and digests wood. A few bivalves, such as certain scallops (*Pecten* and *Chlamys*) and file shells (*Lima*), are capable of swimming by rapidly flapping the valves together as an escape reaction to predators.

In most bivalves, male and female reproductive organs occur in separate individuals, but some are hermaphroditic (i.e., have the organs of both sexes in the same individual). Still others experience sex changes through life. Both the eggs and sperm are shed into the water, and larval development usually takes place in the open sea. Bivalve larvae drift among plankton for several weeks before settling to the sea bottom.

There are about 8,500 species of marine bivalves. They are found in most parts of the ocean from the intertidal zone to abyssal depths. The largest bivalve is the giant clam *Tridacna gigas*, which reaches 137 cm (about 55 inches) in length. The Unionacea, consisting of freshwater mussels, is particularly diverse and abundant in eastern North America, with many endemic species inhabiting individual river systems.

For more information on members of the bivalve group, see clam; cockle; mussel; oyster; scallop; shipworm.

biwa, a short-necked Japanese lute that is related to the Chinese *p'i-p'a* (*pipa*), an instrument known for about 2,000 years. The biwa has a graceful, pear-shaped body, with a shallow, rounded back and silken strings attached to slender lateral pegs. The usual number of strings is four, and they are tuned in fourths, with the melody almost solely appearing on the highest string.

Performers on the instrument frequently pluck two notes simultaneously, producing a variety of intervals, especially when the singer is silent. All biwa are played with a large wedge-shaped plectrum.

Biwa, Lake, Japanese BIWA-KO, largest freshwater lake in Japan, located in Shiga ken (prefecture), west-central Honshu. Approximately 40 miles (64 km) long from north to south, the lake covers an area of 259 square miles (672 square km). Its name refers to the biwa, a Japanese musical instrument that the lake resembles in shape. The lake occupies a structural depression and is fed by small rivers flowing from the encircling mountains. The sole outlet, the Yodo River, flows from Lake Biwa's southern tip, past Seto southwest to Osaka Bay. Deepest water of 338 feet (103

Pearl-oyster farmer on Lake Biwa, Japan
Imperial Press—FPG

m) is in the northwest corner, with depths of more than 200 feet (60 m) common along the west coast. The lake's surface rises as much as 10 feet (3 m) in spring because of melting snow and spring rains and in autumn because of typhoon rains. Lake Biwa is a breeding ground for freshwater fish, including trout, and for a pearl culture industry. It also serves as a reservoir for the cities of Kyōto and Ōtsu and is a valuable resource for nearby textile industries.

In early Japanese history, Lake Biwa was a principal avenue of movement between the Sea of Japan and the Inland Sea and later facilitated the economic development of the Hanshin (Osaka-Kōbe) Industrial Region. Known for its scenic beauty and for the temples atop Mount Hiei, Lake Biwa has been the subject of much Japanese poetry and is one of Japan's greatest tourist attractions.

Biyidi, Alexandre: see Beti, Mongo.

Biysk, also spelled BИСК, or BИСК, city, Altay kray (region), central Russia. The city is situated on the right bank of the Biya River, just above the latter's confluence with the Katun, which then forms the Ob. Biysk is located at the head of navigation on the Biya and is the terminus of a railway from Barnaul. The city is also linked by highway to Mongolia. It was founded in 1709 as a fortress and incorporated as a town in 1782. The modern city of Biysk has a range of engineering and consumer-goods industries. Pop. (1991 est.) 234,600.

Bizen ware, also called IMBE WARE, pottery manufactured at and near Imbe, Okayama ken (prefecture), on the Inland Sea of Japan, from at least the 6th century AD, in what was once Bizen province. Bizen ware has a dark gray stoneware body that generally fires to a brick-red, brown, or deep bronze colour. The surface of Bizen ware ranges from an unglazed matt to a glossy sheen; age has given some pieces a bronzelike patina and others the appearance of polished wood. A partial, splashed greenish gray glaze is found on some examples. Bizen ware is classified into several types: *aka-e* (red) Bizen is a bronzelike pottery

Glazed Bizen incense burner, c. 1670, Edo period; in the Victoria and Albert Museum, London

By courtesy of the Victoria and Albert Museum, London

that shades to a deep copper colour; *ao* (blue) Bizen is steely or slate blue and is rare because of the limited survival from the intense heat necessary to produce it; *ki* (yellow) Bizen is so named from its yellow glaze; *hidasuki* (fire stripe) Bizen has mottlings and reddish string-like marks, produced by wrapping the dried wares in straw rope before firing.

Production of Bizen ware flourished through-

out the Imbe region until the industry was confined to Imbe village in the 13th century. It is sometimes impossible to distinguish the wares by location, since the clay at each site was high in iron content, and construction techniques, forms, and kiln designs were identical. In addition, all samples transmit the same sense of strength and long tradition. Generally speaking, clays used at Imbe were very viscous, and another distinguishing feature was the lip section of a vessel, rolled back in a curve from the opening and called the *tama-buchi*, or round rim. On Kamakura-period (1192–1333) vessels, mouths are usually small in proportion to the size of the vessel. From the late Muromachi period (1338–1573), subterranean field clays were utilized that tended toward more urbane refinement, although the individual characteristics were preserved.

Much of the early ware is dated, and the names and marks of most of the artist-potters are known. Some of them were 17th-century Kyōto artists who were attracted by the unusually supple clay, which invited fantastic and inventive modelling. It is in the precise, detailed, and animated representation of Japanese sages, divinities, and actual or mythical creatures that Bizen acquired its unique reputation. Depictions of the badger, cock, stork, ox, quail, and hare appear in a wide range of useful and decorative pottery forms, including articles for tea ceremonies, censers, water jars, sake bottles, basins, trays, hanging vases, and even utilitarian tiles. Bizen's best period was the 18th century; subsequently, wares were adapted to the European market, and in the 20th century the predominant trade has been in bricks and drainpipes, for which the local clay is appropriate.

Bizerta, also spelled BIZERTE (Tunisia): see Banzart.

Bizet, Georges, original name ALEXANDRE-CÉSAR-LÉOPOLD BIZET (b. Oct. 25, 1838, Paris—d. June 3, 1875, Bougival, near Paris), French composer best remembered for his opera *Carmen* (1875). His realistic approach influenced the *verismo* school of opera at the end of the 19th century.

Bizet's father was a singing teacher and his mother a gifted amateur pianist, and his musical talents declared themselves so early and so unmistakably that he was admitted to the Paris Conservatoire before he had completed his 10th year. There, his teachers included the accomplished composers Charles Gounod and Fromental Halévy, and he quickly won a succession of prizes, culminating in the Prix

de Rome, awarded for his cantata *Clovis et Clotilde* in 1857. This prize carried with it a five-year state pension, two years of which musicians were bound to spend at the French Academy in Rome.

Bizet had already shown a gift for composition far superior to that of a merely precocious boy. His first stage work, the one-act operetta *Le Docteur miracle*, performed in Paris in 1857, is marked simply by high spirits and an easy mastery of the operetta idiom of the day. His *Symphony in C Major*, however, written in 1855 but subsequently lost and not discovered and performed until 1935, will bear easy comparison with any of the works written at the same age of 17 by either Mozart or Felix Mendelssohn. Flowing and resourceful counterpoint, orchestral expertise, and a happy blend of the Viennese classical style with French melody give the symphony a high place in Bizet's output.

The young composer was already aware of his gifts and of the danger inherent in his facility. "I want to do nothing *chic*," he wrote from Rome, "I want to have *ideas* before beginning a piece, and that is not how I worked in Paris." In Rome he set himself to study Robert Schumann, Carl Maria von Weber, Mendelssohn, and Gounod, who was regarded as more than half a German composer by the admirers of the fashionable French composer Daniel Auber.

Mozart's music affects me too deeply and makes me really unwell. Certain things by Rossini have the same effect; but oddly enough Beethoven and Meyerbeer never go so far as that. As for Haydn, he has sent me to sleep for some time past.

Instead of spending his statutory third year in Germany, he chose to stay on in Rome, where he collected impressions that were eventually collected to form a second C major symphony (*Roma*), first performed in 1869. An Italian-text opera, *Don Procopio*, written at this time, shows Donizetti's style, and the ode *Vasco de Gama* is largely modelled on Gounod and Meyerbeer.

When Bizet returned to Paris in the autumn of 1860, he was accompanied by his friend Ernest Guiraud, who was to be responsible for popularizing Bizet's work after his death. In spite of very decided opinions, Bizet was still immature in his outlook on life (youthfully cynical, for instance, in his attitude toward women) and was plagued by an artistic conscience that accused him of preferring the facilely charming in music to the truly great. He was even ashamed of his admiration for the operas of his Italian contemporary Giuseppe Verdi and longed for the faith and vision of the typical Romantic artist, which he could never achieve. "I should write better music," he wrote in October 1866 to his friend and pupil Edmond Galabert, "if I believed a lot of things which are not true." In fact the skepticism and materialism of the dominant Positivist philosophy persistently troubled Bizet; it may well have been an inability to reconcile his intelligence with his emotions that caused him to embark on so many operatic projects that he never brought to a conclusion. The kind of drama demanded by the French operatic public of the day could very seldom engage his whole personality. The weaknesses in the first two operas that he completed after his return to Paris are a result not so much of the composer's excessive regard for public taste as of his flagging interest in the drama. Neither *Les Pêcheurs de perles* (*The Pearl Fishers*; first performed 1863) nor *La Jolie Fille de Perth* (1867; *The Fair Maid of Perth*) had a libretto capable of eliciting or focussing the latent musical and dramatic powers that Bizet eventually proved to possess. The chief interest of *Les Pêcheurs de perles* lies in its exotic Oriental setting and the choral writing, which is more individual than that of the lyrical music, over which Gounod still

casts a long shadow. Although *La Jolie Fille de Perth* bears only a skeletal resemblance to Sir Walter Scott's novel, the characterization is stronger (the gypsy Mab and the "Danse bohémienne" anticipate *Carmen*), and even such conventional features as the night patrol, the drinking chorus, the ballroom scene, and the heroine's madness exhibit a freshness and elegance of language that raise the work unmistakably above the general level of French opera of the day.

Although warmly acknowledged by Berlioz, Gounod, Saint-Saëns, and Liszt, Bizet was still obliged during these years to undertake the musical hackwork that only the most successful French composers were able to avoid. Stories of his moodiness and readiness to pick a quarrel suggest a profound inner uncertainty, and the cynicism and vulnerability of adolescence hardly yielded to a mature emotional attitude of life until his marriage, on June 3, 1869, to Geneviève Halévy, the daughter of the composer of the opera *La Juive* (1835; *The Jewess*). Between his engagement in 1867 and his marriage, Bizet was himself aware of undergoing "an extraordinary change . . . both as artist and man. I am purifying myself and becoming better." Adverse criticism of certain features of *La Jolie Fille de Perth* prompted him to break once and for all with "the school of *flonflons*, trills and falsehoods" and to concentrate his attention on the two elements that had always been the strongest features of his music—the creation of exotic atmosphere and the concern with dramatic truth. The first of these was brilliantly exemplified in the one-act *Djamileh* (1872), original enough to be accused of "exceeding even Richard Wagner in bizarrerie and strangeness"; and the second in the incidental music for Alphonse Daudet's play *L'Arlésienne* (1872), which is marked by a delicacy and tenderness quite new to his music. Besides the happiness of his marriage, which was crowned by the birth of a son in July of this same year, his letters show that he was deeply stirred by the events of the Franco-Prussian War, and, during the siege of Paris, he served in the national guard.

It was in the first flush of this new emotional maturity, but with the ardour and enthusiasm of youth still unshadowed, that he wrote his masterpiece, *Carmen*, based on a story by the contemporary French author Prosper Mérimée. The realism of the work, which caused a scandal when it was first produced in 1875, was to inaugurate a new chapter in the history of opera; and the combination of brilliant local colour and directness of emotional impact with fastidious workmanship and a wealth of melody have made this opera a favourite with musicians and public alike. The philosopher Friedrich Nietzsche regarded it as the type of "Mediterranean" music that was the antidote to Wagner's Teutonic sound. The scandal caused by *Carmen* was only beginning to yield to enthusiastic admiration when Bizet suddenly died. (M. Du P.C.)

MAJOR WORKS. Operas. Eight published operas, including *Les Pêcheurs de perles* (first performed 1863); *Carmen* (1875).

Orchestral works. *Symphony in C major* (composed 1855); *Petite Suite*, arranged from *Jeux d'enfants* (1871); suite, *L'Arlésienne* (1872).

Incidental music. Incidental music for Daudet's *L'Arlésienne* (1872).

Piano music. *Jeux d'enfants*, 12 pieces for piano duet (1871); *Variations chromatiques de concert* (1868).

Songs. Thirty-seven published songs, including "Chanson d'avril" (1866?); "Berceuse" (1868).

BIBLIOGRAPHY. Winton B. Dean, *Bizet* (1948), a short but extremely thorough study of the composer and his work, with useful background information; Mina K. Curtiss, *Bizet and His World* (1959), a fascinating re-creation of Bizet as a man and of his position in his family and among his contemporaries, based on correspondence and documents that only became available after 1950.

Bizet
The Bellmann Archive

Bizzozero, Giulio (b. March 20, 1846, Varese, Piedmont, Italy—d. April 8, 1901, Turin), Italian pathologist who, as professor of general pathology at the University of Turin, made it one of the most important European centres of medical scholarship. Among those who studied or worked in his laboratory were Edoardo Bassini, the surgeon who perfected the operation for inguinal hernia (Bassini's operation); Carlo Forlanini, who introduced therapeutic pneumothorax in treating pulmonary tuberculosis; and Antonio Carle and Giorgio Rattone, who demonstrated the transmissibility of tetanus. Bizzozero also contributed to knowledge of histology and public health, emphasizing the control of malaria and tuberculosis.

Bjerknes, Jacob (Aall Bonnevie) (b. Nov. 2, 1897, Stockholm—d. July 7, 1975, Los Angeles), Norwegian-American meteorologist whose discovery that cyclones (low-pressure centres) originate as waves in sloping fronts that separate different air masses proved to be a major contribution to modern weather forecasting.

Jacob Bjerknes

By courtesy of Einar Holand, Oslo University

The work of his father, the Norwegian physicist and meteorologist Vilhelm F.K. Bjerknes, influenced Bjerknes in his choice of meteorology as a career. During World War I he assisted his father in establishing a network of weather observation stations throughout Norway. Data gathered by these stations gave rise to their theory of polar fronts, essential to understanding the dynamics of weather in the middle and high latitudes. During the 1920s and 1930s, in addition to his studies of cyclones, he gathered data on the structure of depressions and conducted research on the dynamics of atmospheric convection.

In 1939 Bjerknes moved to the United States and the next year became professor of meteorology at the University of California, Los Angeles. After World War II his studies chiefly concerned atmospheric circulation. In 1952 he utilized photographs taken by high-altitude research rockets for weather analysis and forecasting and was thus among those who initiated the use of space-age techniques for meteorological research. In later work he discovered relationships between Pacific Ocean temperatures and North American weather.

Bjerknes, Vilhelm F(riman) K(oren) (b. March 14, 1862, Christiania, Nor.—d. April 9, 1951, Oslo), Norwegian meteorologist and physicist, one of the founders of the modern science of weather forecasting.

As a youth Bjerknes assisted his father, a professor of mathematics at Christiania, with research in hydrodynamics. In 1890 he went to Germany and became an assistant to and scientific collaborator with the German physicist Heinrich Hertz. Bjerknes made a comprehensive study of electrical resonance that was decisive in the development of radio.

After two years as lecturer at the Högskola (School of Engineering), Stockholm, Bjerknes in 1895 became professor of applied mechan-

Vilhelm F.K. Bjerknes, oil painting by Erik Werenskiöld, 1932; in Det Kongelige Norske Videnskabers Selskab, Museet, Trondheim, Nor.

ics and mathematical physics at the University of Stockholm. Two years later he discovered the circulation theorems that led him to a synthesis of hydrodynamics and thermodynamics applicable to large-scale motions in the atmosphere and the ocean. This work ultimately resulted in the theory of air masses, which is essential to modern weather forecasting. In 1904 he presented a farsighted program for physical weather prediction. The Carnegie Foundation awarded him an annual stipend (1905–41) to support his research.

In 1907 Bjerknes returned to Norway and accepted a professorship at the university in Kristiania (so spelled from 1877 to 1925). Five years later he became professor of geophysics at the University of Leipzig, where he organized and directed the Leipzig Geophysical Institute. In 1917 he accepted a position with the museum in Bergen (now a part of Universitetet i Bergen), Norway, and there founded the Bergen Geophysical Institute. His most productive years were spent at Bergen; there he wrote *On the Dynamics of the Circular Vortex with Applications to the Atmosphere and to Atmospheric Vortex and Wave Motion* (1921). Now a classic, this work clearly details the most important aspects of his research. In 1926 he obtained a position with the university in Oslo, where he continued his studies until his retirement in 1932.

Björketorp Stone, well-preserved 7th-century monument in Blekinge, Swed. More

than 12 ft (3½ m) high, it bears a runic inscription, the exact interpretation of which has been much debated. The inscription is magical in nature and is obviously intended to protect a grave. One possible interpretation is: "I have here the secret meaning of powerful runes. He who destroys the monument will forever be tormented by evil witchcraft. He shall die a treacherous death. I prophesy ruin."

Björling, Jussi (Johan Jonaton) (b. Feb. 2, 1911, Stora Tuna, Swed.—d. Sept. 9, 1960, Siarö, near Stockholm), Swedish tenor, admired for the musicianship of his performances, particularly in the Italian and French repertory.

At the age of six Björling began singing under the guidance of his father, who then took him and his two brothers on tours in Scandinavia and the United States as a vocal quartet. At 17 he began his studies at the Royal Opera School in Stockholm, where he made his operatic debut in 1930 as Don Ottavio in Mozart's *Don Giovanni*. He appeared as guest performer in several opera houses in Europe before achieving a huge success at Covent Garden, London, in 1936. In the following year he gave his premiere performances in the United States, first on the radio, then on stage in Chicago.

In 1938 Björling made his Metropolitan Opera debut as Rodolfo in Puccini's *La Bohème*, a role he repeated in 1940 in San Francisco. He sang with the Metropolitan Opera from 1938 to 1941, and, after spending the war years in Sweden, he returned in 1946 to sing with the Metropolitan company until his death. He continued to perform in Sweden between seasons at the Metropolitan. His popular concerts and prolific recordings won him fame as a recitalist and soloist in symphonic choral works. His autobiography, *Med bagaget i strupen* ("With My Baggage in My Throat"), was published in 1945.

A list of the abbreviations used in the MICROPAEDIA will be found at the end of this volume

Bjørneboe, Jens (Ingvald) (b. Oct. 9, 1920, Kristiansand, Nor.—d. May 9, 1976, Væicland), Norwegian novelist, dramatist, essayist, and poet whose work was generally inspired by a fierce sense of outrage at the misuse of power in the modern world.

Bjørneboe began his literary career with *Dikt* (1951; "Poems"), and he subsequently published two more collections, *Ariadne* (1953; "Ariadne") and *Den store by* (1958; "The Big City"), all notable for their restraint and classical formality.

Bjørneboe's principal literary work was a trilogy of novels in which he traced "bestiality's history," i.e., recounted instances of increasing violence on the part of the state against the powerless: *Frihetens øyeblikk* (1966; *Moment of Freedom*), *Krutiårnet* (1969; "The Gun Powder Tower"), and *Stilheten* (1973; "The Silence"). His last novel, *Haiene* (1974; *The Sharks*), an allegorical sea novel, was one of his strongest.

As a dramatist, Bjørneboe criticized the Norwegian prison system in the satirical musical *Till lykke med dagen* (1965; "Happy Birthday"). In *Fuglelskerne* (1966; "The Bird Lovers"), he directed his attack against neo-Nazism. His last play, *Amputasjon* (1970; "Amputation") was wider in scope, an anarchic protest against power in general. Bjørneboe achieved some notoriety with a pornographic novel, *Uten en tråd* (1966; *Without a Stitch*), for which he was prosecuted and found guilty.

He was widely read as an essayist and journalist. An important collection of his political and newspaper articles is *Politi og anarki* (1972; "Police and Anarchy"). Another was the posthumously published *Om Brecht* (1977; "On Brecht"), about Bertolt Brecht, who strongly influenced Bjørneboe.

Bjørneborg (Finland): see Pori.

Bjørnson, Bjørnstjerne Martinius (b. Dec. 8, 1832, Kvikne, Nor.—d. April 26, 1910, Paris), poet, dramatist, novelist, journalist, editor, public speaker, theatre director, and one of the most prominent public figures in the Norway of his day. He is generally known, to-

Bjørnson

By courtesy of the Teaterhistorisk Museum, Copenhagen

gether with Henrik Ibsen, Alexander Kielland, and Jonas Lie, as one of "the four great ones" of 19th-century Norwegian literature. His poem "Ja, vi elsker dette landet" ("Yes, We Love This Land Forever") is the Norwegian national anthem.

Bjørnson, the son of a pastor, grew up in the small farming community of Romsdalen, which later became the scene of his country novels. From the start his writing was marked by clearly didactic intent; he sought to stimulate national pride in Norway's history and achievements and to present ideals. For the first 15 years of his literary career he drew his inspiration from the sagas and from his knowledge of contemporary rural Norway. He exploited these two fields in what he described as his system of "crop rotation": saga material was turned into plays, contemporary material into novels or peasant tales. Both stressed those links that bound the new Norway to the old; both served to raise the nation's morale. The early products of this system were the peasant tale *Synnove solbakken* (1857; *Trust and Trial, Love and Life in Norway*, and *Sunny Hill*), the one-act historical play *Mellem Slagene* (1857; "Between the Battles"), and the tales *Arne* (1859) and *En glad gutt* (1860; *The Happy Boy*) and the play *Halle-Hulda* (1858; "Lame Hulda").

In 1857–59 he was Ibsen's successor as artistic director at the Bergen Theatre. He married the actress Karoline Reimers in 1858 and also became the editor of the *Bergenposten*. Partly because of his activity with this paper, the Conservative representatives were defeated in 1859 and the path was cleared for the formation of the Liberal Party a short time later. After traveling abroad for three years, Bjørnson became director of the Christiania Theatre, and, from 1866 to 1871, he edited the *Norsk Folkeblad*. During this same time there also appeared the first edition of his *Digte og sange* (1870; *Poems and Songs*) and the epic poem *Arnjot Gelline* (1870). Bjørnson's political battles and literary feuds took up so much of his time that he left Norway in order to write. The two dramas that brought him an international reputation were thus written in self-imposed exile: *En fallit* (1875; *The Bankrupt*) and *Redaktøren* (1875; *The Editor*). Both fulfilled the then current demand on literature

(stipulated by the Danish writer and critic Georg Brandes) to debate problems, as did the two dramas that followed: *Kongen* (1877; *The King*) and *Det ny system* (1879; *The New System*). Of his later works, two novels are remembered, *Det flager i byen og på havnen* (1884; *The Heritage of the Kurts*) and *På Guds veje* (1889; *In God's Way*), as are a number of impressive dramas, including *Over Ævne I og II* (1883 and 1895; *Beyond Our Power* and *Beyond Human Might*). The first of the novels deals critically with Christianity and attacks the belief in miracles, whereas the second deals with social change and suggests that such change must begin in the schools. *Paul Lange og Tora Parsberg* (1898) is concerned with the theme of political intolerance. Later in life, Bjørnson came to think of himself as a Socialist, working tirelessly in behalf of peace and international understanding. Bjørnson enjoyed worldwide fame, his plays were influential in establishing social realism in Europe, and he was awarded the Nobel Prize for Literature in 1903. Nonetheless, his international reputation has diminished in comparison with that of Ibsen.

Björnsson, Sveinn (b. Feb. 27, 1881, Reykjavík, Ice.—d. Jan. 25, 1952, Reykjavík), statesman and diplomat who from 1944 to 1952 served as the first president of the Republic of Iceland.

Björnsson was a lawyer at the Supreme Court after 1907 and became a member of the Reykjavík town council in 1912, acting as its president (1918–20). A member of the Althing (parliament) in 1914–16 and 1920, he served as special envoy to the United States (1914) and Great Britain (1915), arranging the first British-Icelandic trade agreement. He acted as minister to Denmark (1920–24 and 1926–41) and was a delegate to several international conferences.

Although Iceland has been independent since 1918, its foreign affairs had been conducted by Denmark until the beginning of World War II. The German occupation of Denmark after May 1940, however, resulted in Iceland's autonomy, and Björnsson was elected regent three times in 1941–43, assuming all the prerogatives in Icelandic affairs previously held by the Danish king. In July 1941, U.S. troops entered Iceland on the invitation of Björnsson's government and remained, in reduced numbers, after the war; their continued presence provoked the leading controversy in the nation's postwar foreign policy. He was elected president on the inauguration of the Republic of Iceland in 1944 and, was reelected by acclamation in 1945 and 1949.

Bka'-brgyud-pa, also spelled KAGYUPA (Tibetan: "Transmitted Word"), third largest Buddhist sect in Tibet. Its members are followers of the 11th-century teacher Mar-pa, who distinguished himself as a translator of Buddhist texts while continuing to live the life of a householder. Mar-pa studied in India under the master yogin (spiritual adept, or ascetic) Nāropa, and the school stresses the more severe practices of Haṭha Yoga (Yoga of Force). Mar-pa's chief disciple was Mi-la ras-pa (Milarepa), who is revered as the greatest poet-saint in Tibetan history. Mi-la ras-pa in turn transmitted the teachings to Sgam-po-pa, whose own disciples established six separate schools of Bka'-brgyud-pa thought, known for the most part by the names of their monasteries but differing little in doctrine. Of these, the Karma-pa (also known by the nickname of a subject, the Red Hats) was, during the 15th to early 17th century, the chief rival of the now-predominant Dge-lugs-pa for the temporal authority of Tibet, while the 'Brug-pa became the main school of Buddhism in Bhutan.

Bka'-gyur (Tibetan: "Translation of the Buddha-Word"), also spelled BKAH-HGYUR, KAGYUR, KAN-GYUR, or KANJUR, the collec-

tion of Tibetan Buddhist sacred literature representing the "Word of the Buddha"—as distinct from the *Bstan-gyur* ("Translation of Teachings"), or collection of commentaries and miscellaneous works. This body of canonical literature contains more than 1,000 works, most of them Sanskrit in origin and most translated (with great care) after the 8th century. They were gathered together in the 13th century, and the collection has been published in 100 volumes.

The *Bka'-gyur* begins with a *vinaya* ("monastic discipline") section, the only group of works having much in common with the Pāli literature of southern Buddhism. Then follow a few hundred *sūtras*, mostly of the various Mahāyāna schools but including a number of Sarvāstivāda ("Doctrine That All Is Real") works, and several collections of *avadānas* (legends of "noble deeds"). Finally, there are several hundred *Tantras*, the special ritual and meditation texts of the Vajrayāna form of Buddhism characteristic of Tibet. These latter are divided into four groups, containing, respectively, worldly rites, religious rites, traditional yogic practices, and the esoteric forms of Tantric yoga.

BL Public Limited Company, historic British automotive corporation. It was formed through the 1968 merger of British Motor Holdings Ltd. and Leyland Motor Corp. Ltd. to create the entities known as British Leyland Motor Corporation, Ltd. (1968–75), and British Leyland Limited (1975–78). With headquarters in London, the company had interests in about 95 percent of the British automotive industry, and it manufactured vehicles ranging from commercial trucks and buses to private motorcars, construction equipment, and engines.

Leyland, initially the dominant partner in the merger, was the first British manufacturer to concentrate on commercial vehicles. James Sumner of Leyland, Lancashire, built his first steam-driven wagon in 1884; and in 1896 he allied with the wealthy Spurrier family to set up the Lancashire Steam Motor Company, renamed Leyland Motors Ltd. in 1907, after its first experiments with gasoline engines. Except briefly in 1920–23, the company did not produce automobiles until 1961, when it acquired Triumph Motor Co. Ltd. (Triumph had begun in 1903 as a motorcycle manufacturer and began making cars in 1923.) In 1966 Leyland merged with another car manufacturer, The Rover Co. Ltd. (founded 1904), and the combined companies became Leyland Motor Corp. Ltd. The first chairman of the new British Leyland in 1968, Donald Gresham Stokes, Baron Stokes, had also been the old Leyland's last chairman.

British Motor Holdings Ltd. had a much more complex history, but basically it grew out of three auto manufacturers: Morris, Austin, and Jaguar.

Early in the century William Richard Morris (later 1st Viscount Nuffield) founded a garage in Oxford, which after 1910 became known as Morris Garages Limited. In the 1920s, with Cecil Kimber as general manager, it began producing the popular M.G. cars, which were manufactured until 1980, when they were discontinued because of rising production costs. The M.G. Car Company was created in 1927 and was absorbed by another Morris car company, Morris Motors Ltd., in 1935. In that same year, another organization, Wolseley Motors Ltd. (founded in 1901 and taken over by Morris in 1927), was similarly absorbed.

In 1952 another venerable car manufacturer, Austin Motor Co. Ltd. (founded in 1905 by Herbert Austin), merged with Morris Motors to form British Motor Corporation Ltd. It continued to turn out Austin, Morris, M.G., and Wolseley cars and the highly successful "Mini" series. Although production of the Mini Cooper ended in 1971, the model was re-

launched in 1990 and by 2001 was selling internationally through parent company Bayerische Motoren Werke AG (BMW).

The first Jaguar car was produced in 1936 by S.S. Cars Ltd. (founded 1932 in Coventry), which was renamed Jaguar Cars Ltd. in 1945 both to avoid the accidental reminder of the German SS and to highlight the name of the make that had proved to be most successful. Jaguar in 1960 bought Daimler Co. Ltd. (founded 1893), makers of limousines and other prestige cars; and in 1961 it bought Guy Motors Ltd. (founded 1919).

BL began selling its interests in the 1980s, and by 1990 the Ford Motor Company had acquired full ownership of Jaguar.

BMW purchased Rover in 1994 but later sold the sport-utility vehicle brand to Ford, which continued to develop the Land Rover line as part of its Premier Automotive Group. As of 2002 that group also comprised Aston Martin, Jaguar, and Volvo.

Blaby, district, county of Leicestershire, south-central England. Its area is 50 square miles (130 square km) and covers the southern and western suburbs of the city of Leicester. It arcs around the city boundary from southeast to northwest and extends southward across the River Sence nearly to the county boundary with Warwickshire on the southwest. Blaby district is administered from Narborough. Important towns are Braunstone, Glenfields, and Kirby Muxloe. Pop. (1998 est.) 86,400.

Blache, Paul Vidal de La: see Vidal de La Blache, Paul.

Black, Davidson (b. July 25, 1884, Toronto, Ont., Can.—d. March 15, 1934, Peking, China), Canadian physician and physical anthropologist who first postulated the existence of a distinct form of early man, popularly known as Peking man.

A graduate of the University of Toronto, Black taught at Western Reserve University, Cleveland, Ohio, which he left to join the Canadian army medical corps in 1917. When he was studying comparative anatomy with G. Elliot Smith, at that time working on the Pilt-down material, Black became deeply interested in the problems of man's origin. After World War I and until his death, Black served in China as professor of embryology and neurology at the Peking Union Medical College. He first searched unsuccessfully for remains of early man in Jehol (North China), then in Thailand. Then in 1927, at Chou-k'ou-tien, near Peking, a hominid lower molar of unusual pattern was discovered. The phylogenetic importance of this fossil was immediately recognized by Black, who inferred from this single tooth the existence of a previously unknown hominid genus and species, which he named *Sinanthropus pekinensis*. In 1932 he pointed out the close relationship between Peking man and *Pithecanthropus erectus* from Java. Later discoveries of skulls and other fossil bones proved the accuracy of Black's judgment.

Black, Hugo (La Fayette) (b. Feb. 27, 1886, Clay county, Ala., U.S.—d. Sept. 25, 1971, Bethesda, Md.), lawyer, politician, and associate justice of the U.S. Supreme Court (1937–71), best known for his absolutist belief in the Bill of Rights as a guarantee of civil liberties. Perhaps his most important contribution to the American judicial tradition was his insistence that the Fourteenth Amendment made the Bill of Rights—originally adopted to limit the power of the national government—equally restrictive on the power of the states to curtail individual freedom.

During his first 40 years, Hugo Black's career was confined almost exclusively to his native Alabama. He attended law school at the state university at Tuscaloosa, and, after graduating and passing the bar in 1906, he practiced law in Birmingham.

It was not until 1926 that Black became a figure of national prominence. He was elected that year as a Democrat to a seat in the U.S. Senate, where he served until 1937. There he won considerable acclaim for his investigation of utility lobbyists. But, perhaps more importantly, he earned the gratitude of President Franklin D. Roosevelt for his unwavering support of New Deal legislation.

Roosevelt appointed Black to the Supreme Court in 1937. In the early part of his tenure, Black acted with a growing court majority in its reversal of previous court vetoes of New Deal legislation. Black combined this tolerance for increased federal powers of economic regulation with an activist stance on civil liberties. In the 1940s and '50s he frequently dissented from the court's majority in his absolutist position on freedom of speech, and he denounced governmental restrictions on liberties as unconstitutional and dangerous.

During the 1960s Black held a prominent position among the liberal majority on the court who struck down mandatory school prayer and who guaranteed the availability of legal counsel to suspected criminals. His last major opinion supported the right of *The New York Times* to publish the so-called Pentagon Papers in 1971 in the face of government attempts to restrict their publication.

Black, Sir James (Whyte) (b. June 14, 1924, Uddingston, Scot.), British pharmacologist who (along with George H. Hitchings and Gertrude B. Elion) received the Nobel Prize for Physiology or Medicine in 1988 for his development of two important drugs, propranolol and cimetidine.

Black earned a medical degree from the University of St. Andrews in Scotland in 1946. He taught at various universities for the next 10 years and then joined Imperial Chemical Industries as a senior pharmacologist in 1958. He became head of biological research at Smith Kline & French Laboratories in 1964, and he joined the Wellcome Research Laboratories as director of therapeutic research in 1978. He was knighted in 1981.

Black's drug discoveries arose out of his systematic research on the interactions between certain cell receptors in the body and chemicals in the bloodstream that attach to them. Black wanted to find a drug that would relieve angina pectoris, i.e., the spasms of intense pain felt in the chest when the heart is not receiving enough oxygen. It was known that beta receptors in the heart muscle, when stimulated by the hormones epinephrine and norepinephrine, cause the heartbeat to quicken and increase the strength of the heart's contractions, thus increasing that organ's oxygen requirement. Black developed a drug that would block the beta receptor sites, thus preventing epinephrine and norepinephrine from attaching to them. The resulting inhibition of the hormones' excitatory effects reduced the heart's demand for oxygen and could thus help relieve anginal pain. Other beta-blocking agents were subsequently developed to treat heart attacks, hypertension, migraines, and other conditions. Black used a similar approach to develop a drug treatment for stomach and duodenal ulcers, which are largely caused by the stomach's oversecretion of gastric acids. He developed a drug that could block the histamine receptors that stimulate the secretion of gastric acid in the stomach, and the new drug, cimetidine, revolutionized the treatment of gastric and duodenal ulcers.

Black, Jeremiah Sullivan (b. Jan. 10, 1810, Stony Creek, Pa., U.S.—d. Aug. 19, 1883, Brockie, Pa.), U.S. attorney general during President James Buchanan's administration who counseled a firm stand by the federal government against secession.

Primarily self-educated, Black served his legal apprenticeship in the offices of a prominent attorney, then in 1830 was himself admitted to

the bar. Although active in the ranks of the Democratic Party, Black devoted most of the next two decades to developing a lucrative law practice in Somerset, Pa. In 1842 the governor made him a district judge, and Black served until elected to the Pennsylvania Supreme Court in 1851. He was reelected in 1854 but left three years later, when his old friend James Buchanan appointed him attorney general of the United States.

As attorney general, Black launched a major investigation of land titles in California that eventually revealed systematic fraud. He was the leader of the administration's attacks on Senator Stephen Douglas and Douglas' notion of popular sovereignty as a solution to the slavery-expansion controversy. But Black distinguished himself most for his advocacy of sending troops, if necessary, to protect federal property in seceded states.

Black served as secretary of state in the last months of Buchanan's presidency. The president nominated him for a seat on the Supreme Court, but a coalition of Republicans, Douglas Democrats, and Southerners blocked confirmation. Following Abraham Lincoln's inauguration, Black resumed private law practice in York, Pa. He criticized the federal government's abrogation of constitutional rights during the American Civil War, and he played a prominent role in the *Ex parte Milligan* and *Ex parte McCordle* cases at the conclusion of the war. He advised President Andrew Johnson on the veto of the first Reconstruction Act in 1867 and—but for a quarrel with Johnson's other lawyers—would have assisted in the president's defense during the impeachment trial. Black lost the use of his right arm in an accident in 1869, but he retained his acute mental faculties to the end of his life.

Consult the INDEX first

Black, Joseph (b. April 16, 1728, Bordeaux, Fr.—d. Nov. 10, 1799, Edinburgh, Scot.), British chemist and physicist best known for the rediscovery of "fixed air" (carbon dioxide), the concept of latent heat, and the discovery of the bicarbonates.

Black was born at Bordeaux, Fr., where his father—a native of Belfast but of Scottish descent—was engaged in the wine trade. He was educated at Belfast and in medicine and natural sciences at Glasgow University. There he had William Cullen (1712–90) for his instructor in chemistry, and the relation between the two soon became that of professor and assistant rather than of master and pupil. In 1751 Black transferred to Edinburgh to complete his medical studies. In 1756 he succeeded Cullen as lecturer in chemistry at the University of Glasgow and was also appointed professor of anatomy, though he exchanged that post for the chair of medicine. He practiced as a physician, as well.

In his investigations of the heating of magnesia alba (magnesium carbonate), Black anticipated Lavoisier and modern chemistry by indicating the existence of a gas, carbon dioxide, distinct from common air. Black's account of his studies, published in 1756 as *Experiments Upon Magnesia Alba, Quicklime, and Some Other Alkaline Substances*, proved that the mild alkalies (carbonates) are causticized (become more alkaline) when they lose carbon dioxide and that absorption of this gas converts the caustic alkalies again to mild ones. Black found that carbon dioxide acts as an acid and is produced by fermentation, respiration, and the burning of charcoal, and he inferred its presence in the atmosphere.

At the University of Glasgow, Black's studies ultimately led to his doctrine of latent heat. He noticed that when ice melts it takes up

heat without undergoing any change of temperature, and he argued that this heat must have combined with the particles of ice and thus become latent. He verified this hypothesis quantitatively in 1761 and thereafter taught the doctrine. Although Black never published any detailed account of his work on latent heat, his friend James Watt doubtless was influenced by these ideas in his revolutionary construction of the condensing steam engine.

Joseph Black, detail of an engraving by J. Rogers after a portrait by Sir Henry Raeburn

BBC Hulton Picture Library

Black also noticed that different bodies in equal masses require different amounts of heat to raise them to the same temperature, and so founded the theory of specific heats.

Black's lectures were written out posthumously from his own notes, supplemented by those of his pupils, and published with a biographical preface by his friend and colleague John Robison in 1803 as *Lectures on the Elements of Chemistry, Delivered in the University of Edinburgh*.

BIBLIOGRAPHY. William Ramsay, *Life and Letters of Joseph Black* (1918); A.L. Donovan, *Philosophical Chemistry in the Scottish Enlightenment: The Doctrines and Discourses of William Cullen and Joseph Black* (1975).

Black, Max (b. Feb. 24, 1909, Baku, Russian Empire [now in Azerbaijan]—d. Aug. 27, 1988, Ithaca, N.Y., U.S.), American Analytical philosopher who was concerned with the nature of clarity and meaning in language.

Black studied at the Universities of Cambridge (B.A., 1930), Göttingen (1930–31), and London (Ph.D., 1939). He immigrated to the United States in 1940 and became a naturalized citizen in 1948. He taught philosophy at the University of Illinois from 1940 to 1946 and thereafter taught at Cornell University, becoming professor emeritus in 1977.

Black's early interest in mathematics resulted in *The Nature of Mathematics* (1933), a study of the various historical conceptions of that field. Black was heavily influenced by Ludwig Wittgenstein, and his interest in that philosopher's *Tractatus Logico-Philosophicus* bore fruit in the comprehensive and highly regarded study *A Companion to Wittgenstein's Tractatus* (1964). Black analyzed meaning in language in several volumes of essays, most notably *The Importance of Language* (1962).

Black, Shirley Temple: see Temple, Shirley.

Black and Tan, member of a British auxiliary police force employed in Ireland against the republicans from July 1920 to July 1921. Their popular name derived from their attire of khaki coats and dark green trousers and caps. When Irish nationalist agitation intensified after World War I, a large proportion of the Irish police resigned, to be replaced by these temporary English recruits, mostly jobless former soldiers, who were paid 10 shillings a day and dressed in a mixed "black and tan" outfit because of the shortage of police

uniforms. In seeking to thwart the terrorism of the Irish Republican Army, the Black and Tans themselves engaged in fierce reprisals. Notably, on "Bloody Sunday," Nov. 21, 1920, the IRA murdered 11 Englishmen suspected of being intelligence agents; and the Black and Tans took revenge the same afternoon, attacking spectators at a football (soccer) match in Croke Park, Dublin, killing 12 and wounding 60. The Black and Tans were withdrawn after the Anglo-Irish Treaty of December 1921.

Black Barty: see Roberts, Bartholomew.

black basalt (stoneware): see basalt ware.

black bass, any of about six species of elongated freshwater fishes that constitute the genus *Micropterus* of the sunfish family, Centrarchidae (order Perciformes). Black basses are found in eastern North America. Two of them, the largemouth and smallmouth black basses (*M. salmoides* and *M. dolomieu*), have been introduced in other countries and are prized by fishermen as hard-fighting game fishes.

The black basses, like the sunfishes, have the spiny and soft-rayed portions of the dorsal fin joined as a single fin. They are, however, larger and longer-bodied than the sunfishes, duller in colour, and more predatory in habit.

The largemouth black bass, growing to a maximum length and weight of about 80 cm

Largemouth black bass (*Micropterus salmoides*)

Appel Color Photography

(31.5 inches) and 10 kg (22 pounds), is characteristically an inhabitant of quiet, weedy lakes and streams. It can be distinguished from the smallmouth by the deep cleft in its dorsal fin and by its relatively larger mouth, with the upper jawbone extending beyond the eye. It varies in colour from green to blackish and is marked with a dark, horizontal stripe. Like other black basses, it feeds mainly on smaller fishes.

The smallmouth black bass is typically a fish of clear, cool lakes and running streams. It varies from green to brownish and is generally mottled with a darker colour. It usually grows to 2–3 kg (4.5–6.5 pounds) but can attain a length and weight of about 70 cm (27.5 inches) and 5.5 kg (12 pounds).

black bear, also called AMERICAN BEAR (*Ursus americanus*), forest-dwelling bear (family Ursidae) that has been reduced in population and range but is still the most common North American bear. The cinnamon bear and the blue-gray or blue-black glacier bear represent colour phases of this species. The American black bear probably constitutes only one species, rather than the more than 80 described "species," which are perhaps only subspecies' variants of the grizzly, or brown, bear.

The adult ranges from 150 to 180 cm (about 5 to 6 feet) in length and weighs 90–270 kg (200–600 pounds). Regardless of coat colour, it may be recognized by its brown face and, usually, a white chest mark.

Besides animal prey, including mammals and fish, the black bear eats a variety of vegetable matter, such as pine cones, berries, and roots, and it frequently raids campsites, seizing anything edible. The black bear may be tamed and taught various tricks, but it often

American black bear (*Ursus americanus*)

Leonard Lee Rue III

becomes dangerous when mature. A litter of one to four cubs, which often differ in colour, follows the gestation period of 100–215 days. The female breeds every second year. Compare Asiatic black bear; sloth bear.

Black Belt, physical region in Alabama and Mississippi, U.S., so named for its soil. The Black Belt is a fertile plain, generally 25–30 miles (40–50 km) wide and stretching approximately 300 miles (480 km) across central Alabama and northeastern Mississippi. A region of dark, calcareous soils, it was one of the South's most important agricultural areas before the American Civil War. Though corn (maize) was also grown, cotton was the most important crop until the destructive effects of the boll weevil encouraged agricultural diversification in the early years of the 20th century. Beef cattle and soybeans are now also raised in the area.

Though strictly the name of a physical region, the term Black Belt has been borrowed by social scientists to denote those areas of the South where the plantation system, with its large number of black slaves, predominated before the Civil War.

black birch: see sweet birch.

Black Canyon of the Gunnison National Monument, national monument, comprising a deep, narrow gorge in western Colorado, U.S., 11 miles (18 km) east of Montrose. Established in 1933, the national monument occupies an area of 32 square miles (83 square km). The canyon was cut by the Gunnison River (named for the army engineer John W. Gunnison) and its tributaries. At the section where its walls are steepest, it is 10 miles (16 km) long with depths ranging from 1,730 to 2,425 feet (525 to 750 m), while its rim width narrows to 1,300 feet (400 m) and its floor width to 40 feet (12 m).

The Black Canyon derives its name from its black-stained, lichen-covered walls, which accentuate the gloom of the chasm. Roads on the North and South rims, with overlooks and foot trails, reach 8,000 feet (2,400 m) above sea level. Block "islands" and pinnacles form the canyon's most striking features. The Black Canyon is the habitat of mule deer, coyotes, bobcats, foxes, rock squirrels, and a wide variety of birds, including the golden and bald eagles.

black cat: see fisher.

black code, in the United States, any of numerous laws enacted in the states of the former Confederacy after the American Civil War, in 1865 and 1866; the laws were designed to replace the social controls of slavery that had been removed by the Emancipation Proclamation and the Thirteenth Amendment to the Constitution, and were thus intended to assure continuance of white supremacy.

The black codes had their roots in the slave

codes that had formerly been in effect. The general philosophy supporting the institution of chattel slavery in America was based on the concept that slaves were property, not persons, and that the law must protect not only the property but also the property owner from the danger of violence. Slave rebellions were not unknown, and the possibility of uprisings was a constant source of anxiety in colonies and then states with large slave populations. (In Virginia during 1780–1864, 1,418 slaves were convicted of crimes; 91 of these convictions were for insurrection and 346 for murder.) Slaves also ran away. In the British possessions in the New World, the settlers were free to promulgate any regulations they saw fit to govern their labour supply. As early as the 17th century, a set of rules was in effect in Virginia and elsewhere; but the codes were constantly being altered to adapt to new needs, and they varied from one colony, and later one state, to another.

All the slave codes, however, had certain provisions in common. In all of them the colour line was firmly drawn, and any amount of "Negro" blood established the race of a person, whether slave or free, as "Negro." The status of the offspring followed that of the mother, so that the child of a free father and a slave mother was a slave. Slaves had few legal rights; in court their testimony was inadmissible in any litigation involving whites; they could make no contract, nor could they own property; even if attacked, they could not strike a white person. There were numerous restrictions to enforce social control: slaves could not be away from their owner's premises without permission; they could not assemble unless a white person was present; they could not own firearms; they could not be taught to read or write, or transmit or possess "inflammatory" literature; they were not permitted to marry.

Obedience to the slave codes was exacted in a variety of ways. Such punishments as whipping, branding, and imprisonment were commonly used, but death (which meant destruction of property) was rarely called for except in such extreme cases as the rape or murder of a white person. White patrols kept the slaves under surveillance, especially at night. Slave codes were not always strictly enforced, but whenever any signs of unrest were detected the appropriate machinery of the state would be alerted and the laws more strictly enforced.

The black codes enacted immediately after the American Civil War, though varying from state to state, were all intended to secure a steady supply of cheap labour, and all continued to assume the inferiority of the freed slaves. There were vagrancy laws that declared a black to be vagrant if unemployed and without permanent residence; a person so defined could be arrested, fined, and bound out for a term of labour if unable to pay the fine. Apprentice laws provided for the "hiring out" of orphans and other young dependents to whites, who often turned out to be their former owners. Some states limited the type of property blacks could own, and in others blacks were excluded from certain businesses or from the skilled trades. Former slaves were forbidden to carry firearms or to testify in court, except in cases concerning other blacks. Legal marriage between blacks was provided for, but interracial marriage was prohibited.

It was Northern reaction to the black codes (as well as to the bloody antiblack riots in Memphis and New Orleans in 1866) that helped produce Radical Reconstruction (see Reconstruction) and the Fourteenth and Fifteenth amendments. The Freedmen's Bureau was created in 1865 to help the former slaves. Reconstruction did away with the black codes, but, after Reconstruction was over, many of their provisions were reenacted in the Jim Crow laws, which were not finally done away with until passage of the Civil Rights Act of 1964.

black comedy: see black humour.

Black Country, industrial region closely corresponding to the small south Staffordshire coalfield in the Midlands region of England; its name derives from its pollution-coated industrial landscape. The Black Country extends immediately to the west of the city of Birmingham, which itself lies off the coalfield, and makes up the western part of the metropolitan area of West Midlands. The clusters of industrial towns that earned this appellation sprang up in the 18th century with the intense exploitation and local use of coal and iron-ore resources. Collieries, blast furnaces, and foundries filled the air with smoke and grime. The region remains industrial in character and has become even more urbanized, although few coal mines and furnaces survive; industrial activity has shifted from ironmaking to metal-using plants, which no longer give rise to such extreme pollution. The industrial past has left its imprint on the landscape, however, and much derelict land may still be seen.

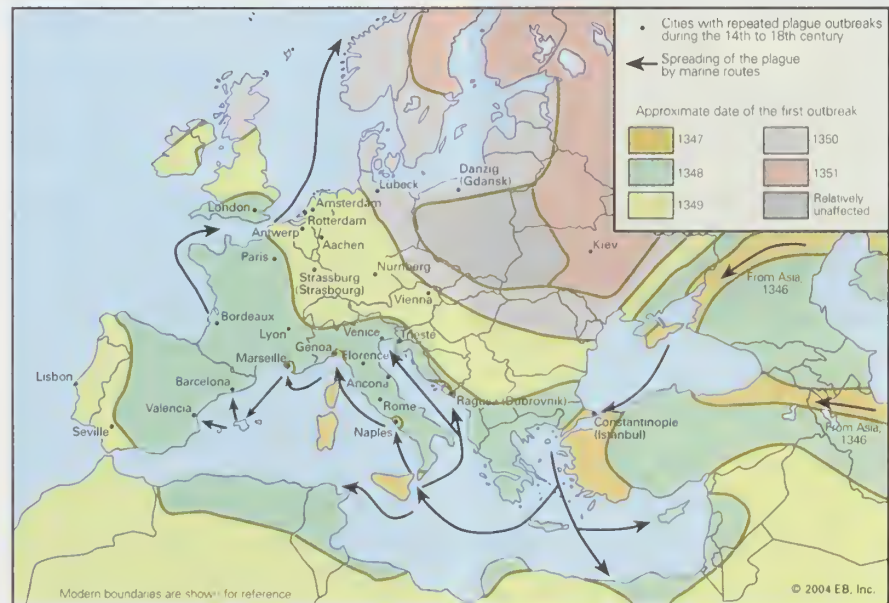

Black Death, pandemic of plague (*q.v.*), probably both bubonic and pneumonic, the first onset of which ravaged Europe between 1347 and 1351, taking a proportionately greater toll of life than any other known epidemic or war up to that time.

Originating in China and Inner Asia, the plague was transmitted to Europeans (1347) when a Kipchak army, besieging a Genoese trading post in the Crimea, catapulted plague-infested corpses into the town. The disease spread from the Mediterranean ports, affecting Sicily (1347); North Africa, mainland Italy, Spain, England, and France (1348); Austria, Hungary, Switzerland, Germany, and the Low

succumbed, and Joan, daughter of the English king Edward III, died at Bordeaux on the way to her wedding with Alfonso's son. Canterbury lost two successive archbishops, John de Stratford and Thomas Bradwardine; Petrarch lost not only Laura, who inspired so many of his poems, but also his patron, Giovanni Cardinal Colonna. The papal court at Avignon was reduced by one-fourth. Whole communities and families were sometimes annihilated.

The study of contemporary archives suggests a mortality varying in the different regions between one-eighth and two-thirds of the population, and the French chronicler Jean Froissart's statement that about one-third of Europe's population died in the epidemic may be fairly accurate. The population in England in 1400 was perhaps half what it had been 100 years earlier; in that country alone, the Black Death certainly caused the depopulation or total disappearance of about 1,000 villages. A rough estimate is that 25 million people in Europe died from plague during the Black Death. The population of western Europe did not again reach its pre-1348 level until the beginning of the 16th century.

The consequences of this violent catastrophe were many. A cessation of wars and a sudden slump in trade immediately followed but were only of short duration. A more lasting and serious consequence was the drastic reduction of the amount of land under cultivation due to the deaths of so many labourers. This proved to be the ruin of many landowners. The shortage of labour compelled them to substitute wages or money rents in place of

The second pandemic of the Black Death in Europe (1347–51)

Countries (1349); and Scandinavia and the Baltic lands (1350). There were recurrences of the plague in 1361–63, 1369–71, 1374–75, 1390, and 1400.

The rate of mortality from the Black Death varied from place to place: whereas some districts, such as the duchy of Milan, Flanders, and Béarn, seem to have escaped comparatively lightly, others, such as Tuscany, Aragon, Catalonia, and Languedoc, were very hard hit. Towns, where the danger of contagion was greater, were more affected than the countryside; and within the towns the monastic communities provided the highest incidence of victims. Even the great and powerful, who were more capable of flight, were struck down: among royalty, Eleanor, queen of Peter IV of Aragon, and King Alfonso XI of Castile

labour services in an effort to keep their tenants. There was also a general rise in wages for artisans and peasants. These changes brought a new fluidity to the hitherto rigid stratification of society. The psychological effects of the Black Death were reflected north of the Alps (not in Italy) by a preoccupation with death and the afterlife evinced in poetry, sculpture, and painting; in Italy the tentative start of Renaissance art was interrupted, and the state of society was captured in the opening pages of Boccaccio's *Decameron*.

black duck (*Anas rubripes*), highly prized game bird (family Anatidae) of eastern North America, inhabiting salt, brackish, and freshwater marshes, as well as lakes, rivers, and beaver ponds. These ducks winter from Nebraska to Texas and along the Atlantic coast

from Nova Scotia to Florida; their preference for seafoods such as periwinkles and mussels enables them to winter so far north. The sexes are similar in appearance—blackish brown bodies and tan heads—resembling a mallard hen but with reddish feet. The white underwing is conspicuous during flight.

The African black duck (*A. sparsa*), of sub-Saharan Africa, is not a close relative. It dives more than other dabbling ducks and is less social. Some authorities consider it a link with the perching duck group.

black earth: see chernozem.

black-eyed pea: see cowpea.

black-figure pottery, type of Greek pottery that originated in Corinth c. 700 bc and continued to be popular until the advent of red-figure pottery c. 530 bc. In black-figure painting, figures and ornamentation were drawn on the natural clay surface of a vase in glossy black pigment; the finishing details were incised into the black. The first significant use of

Dionysus and satyrs, amphora painted in the black-figure style by the Amasis Painter, c. 540 bc; in the Antikenmuseum, Basel, Switz.

the black-figure technique was on the Proto-Corinthian style pottery developed in Corinth in the first half of the 7th century bc. The Corinthian painter's primary ornamental device was the animal frieze. The Athenians, who began to use the technique at the end of the 7th century bc, retained the Corinthian use of animal friezes for decoration until c. 550 bc, when the great Attic painters, among them Exekias and the Amasis Painter, developed narrative scene decoration and perfected the black-figure style. Outside Corinth and Athens the most important studios producing black-figure ware were in Sparta and eastern Greece.

black fly, also called BUFFALO GNAT, or TURKEY GNAT, any member of the insect family Simuliidae (order Diptera), usually black or dark gray. About 300 species of worldwide distribution are known. The black fly is small and humpbacked, with gauzy wings, stout antennae and legs, and rather short mouthparts adapted for sucking blood. The females bite and are sometimes so abundant that they may kill chickens, birds, and other domestic animals. Some species carry worms capable of causing onchocerciasis, which may result in

Black fly (Simuliidae)

E S Ross

blindness or in nodules beneath the skin. The larvae and pupae live in flowing water. When fully developed the fly frees itself from its pupal case, rises to the water surface on a bubble of air, and flies away.

In the spring along the Mississippi River, *Cnephia pecuarum* is a serious livestock pest. There are records of this species killing horses and mules either with bloodsucking bites or by smothering, which may occur when the animals' nostrils become blocked by large numbers of gnats. Also appearing in the spring is *Simulium meridionale*, which attacks bird combs and wattles. Repellents and grease or oil smears are used for protection.

Black Forest, German SCHWARZWALD, mountain region, Baden-Württemberg Land (state), southwestern Germany, source of the Danube and Neckar rivers. It occupies an area of 2,320 sq mi (6,009 sq km) and extends toward the northeast for about 100 mi (160 km) from Säckingen on the Upper Rhine River (at the Swiss border) to Durlach (east of Karlsruhe). Its width varies from 10 to 25 mi. Structurally and topographically it forms the counterpart of the Vosges, which lies west of the Rhine Valley. The Black Forest drops abruptly to the Rhine plain but slopes more gently toward the Neckar and Nagold valleys to the east.

It is mainly a granite highland with rounded summits, although its northern part comprises forested sandstone; and it is bordered to the south by a narrow band of lower and more fertile limestone. Divided into two parts by the deep Kinzig Valley, its highest summits—Feldberg (4,897 ft [1,493 m]), Herzogenhorn, and Blössling—are to the south. Its northern half has an average height of 2,000 ft.

The raw climate of the higher districts supports only hardy grains, but the valleys are mild with good pastureland. Oak and beech woods clothe the lower slopes, while the extensive fir forests, which gave the range its name, climb to 4,000 ft. Lumbering, woodworking, and the manufacture of watches, cuckoo clocks, and mechanical toys are the principal industries. Tourism and winter sports are also prominent, and there are many mineral springs and watering places, such as Baden-Baden (*q.v.*) and Wildbad. Principal cities are Freiburg im Breisgau, Offenburg (*qq.v.*), Rastatt, and Lahr.

black fox: see fisher.

Black Friar: see Dominican.

Black Friday, in U.S. history, Sept. 24, 1869, when plummeting gold prices precipitated a securities market panic. The crash was a consequence of an attempt by financier Jay Gould and railway magnate James Fisk to corner the gold market and drive up the price. The scheme depended on keeping government gold off the market, which the manipulators arranged through political influence. When Pres. Ulysses S. Grant finally became aware of the scheme, he ordered \$4,000,000 of government gold sold on the market. This broke the corner and, in the ensuing panic, the rest of

the market as well. It hurt the economy and the reputation of the Grant administration.

Black Hand, byname of UJEDINJENJE ILI SMRT (Serbo-Croatian: Union or Death), secret Serbian society of the early 20th century that used terrorist methods to promote the liberation of Serbs outside Serbia from Habsburg or Ottoman rule and was instrumental in planning the assassination of the Austrian archduke Francis Ferdinand (1914), precipitating the outbreak of World War I. The society was formed (1911) and led by Col. Dragutin Dimitrijević; its members were primarily army officers with some government officials. Operating from Belgrade, it conducted propaganda campaigns, organized armed bands in Macedonia (before the Balkan Wars, 1912–13), and established a network of revolutionary cells throughout Bosnia. Within Serbia it dominated the army and wielded tremendous influence over the government by terrorizing officials; it became so powerful that its authority challenged that of the government. In order to eliminate this rival, Prince Alexander, commander in chief of the expatriate Serbian Army, brought the leaders of the Black Hand to trial on dubious charges at Salonika in 1917. Dimitrijević and two others were executed, and more than 200 were imprisoned.

Black Hand, Italian MANO NERA, any of several extortion rackets run by immigrant Sicilian and Italian gangsters in the Italian communities of New York City, Chicago, New Orleans, Kansas City, and other U.S. cities from about 1890 to 1920. It consisted of sending threatening notes to local merchants and other well-to-do persons—notes printed with black hands, daggers, or other menacing symbols and extorting money on pain of death or destruction of property. The Black Hand declined with the entry of Prohibition and big-money bootlegging.

Among the most notorious of Black Handers was Ignazio Saitta, known to residents of Manhattan's "Little Italy" as Lupo (the "Wolf"); in 1920 he was finally apprehended by federal authorities for counterfeiting and was sent to prison for 30 years. The most noted foe of the Black Hand was Lieut. Joseph Petrosino (1860–1909) of the New York Police Department, who had hundreds of gang members arrested, imprisoned, or deported before he was gunned down in Palermo on a visit to Sicily in 1909.

Black Hawk, Indian name MA-KA-TAI-ME-SHE-KIA-KIAK (b. 1767, Sauk Sautenuk, Virginia Colony—d. Oct. 3, 1838, village on the Des Moines River, Iowa), leader of a faction of Sauk and Fox Indians. Supported by part of the two tribes, Black Hawk contested the dis-

Black Hawk, oil painting by George Catlin, 1832; in the National Museum of American Art, Smithsonian Institution, Washington, D.C.

By courtesy of National Museum of American Art, Smithsonian Institution, Washington, D.C.

position of 50 million acres (20 million hectares) of territory that had supposedly been granted to the United States by tribal spokesmen in 1804. His decision to defy government orders to vacate tribal villages and fertile fields along the Rock River in Illinois resulted in the brief but tragic Black Hawk War of 1832.

Antagonistic to whites settling in his people's territory, Black Hawk joined the British in a number of engagements in the War of 1812. Thereafter U.S. officials cultivated Keokuk, a rival chief, and thus incensed Black Hawk and confirmed him in his opposition to them. For a time Keokuk's moderation prevailed, but as white men continued taking over the Indians' cornfields and lodges, dissident Sauk and Fox Indians looked to Black Hawk for leadership.

In 1832 Black Hawk, who had been driven into Iowa the year before, led his people back across the Mississippi to the disputed Illinois area to plant crops and to resist further white encroachments. That the band of 1,000 included old men, women, and children shows that the move was not warlike. But Governor John Reynolds called out the Illinois militia, and the U.S. government dispatched troops.

Black Hawk's band first caught the Illinois militia unawares and inflicted a stinging defeat on them. But the Indians' strength soon waned. Expected aid from other tribes did not materialize; food supplies were quickly exhausted; and desertions, malnutrition, and illness took their toll. Black Hawk retreated northward through the Rock River valley, and in the final battle, or massacre, at the Bad Axe River in Wisconsin, most of the Indians were slaughtered. Black Hawk escaped, but he was soon captured and taken, first to Jefferson Barracks, Missouri, and then to Fortress Monroe in Virginia. In 1833 he was returned as a hostage to Keokuk's charge, a final blow to his pride from which he never recovered. His own story is told in *Life of Ma-ka-tai-me-she-kia-kiak* (1833).

As a condition of peace, the United States dispossessed the Sauk and Fox of their land in Illinois and eastern Iowa, and the Winnebago of theirs in southern Wisconsin. The ruthlessness of the Black Hawk War so affected the Indians that by 1837 all surrounding tribes had fled to the far West, leaving most of the Northwest Territory to the white settlers.

Black Hills, isolated, eroded mountain region in western South Dakota and northeastern Wyoming, U.S., lying largely within the Black Hills National Forest. The hills lie between the Cheyenne and Belle Fourche rivers and rise about 3,000 feet (900 m) above the surrounding plains; they culminate in Harney Peak (7,242 feet [2,207 m]), the highest point in South Dakota. The Black Hills formed as a result of an upwarping of ancient rock, after which the removal of the higher portions of the mountain mass by stream erosion produced the present-day topography. From a distance the rounded hilltops, well-forested slopes, and deep valleys present a dark appearance, giving them their name.

The Black Hills were a hunting ground and sacred territory of the Western Sioux Indians, whose rights to the region were guaranteed by the Second Treaty of Fort Laramie in 1868. But after a U.S. military expedition under George A. Custer discovered gold in the Black Hills in 1874, thousands of white gold hunters and miners swarmed into the area the following year. Indian resistance to this influx led to the Black Hills War (1876), the high point of which was the Battle of the Little Bighorn. Despite that Indian victory, the U.S. government was able to force the Sioux to relinquish their treaty rights to the Black Hills in 1877, by which time the Homestake Mine had become the largest gold mine in the United States.

Besides the old mining town of Deadwood and the Mount Rushmore National Monument, the Black Hills' tourist attractions in-

clude Jewel Cave National Monument, Wind Cave National Park, and Custer State Park, all in South Dakota. Devil's Tower National Monument is located in Wyoming.

black hole, cosmic body of extremely intense gravity from which nothing, not even light, can escape. A black hole can be formed by the death of a massive star. When such a star has exhausted its internal thermonuclear fuels at the end of its life, it becomes unstable and gravitationally collapses inward upon itself. The crushing weight of constituent matter falling in from all sides compresses the dying star to a point of zero volume and infinite density called the singularity. Details of the structure of a black hole are calculated from Albert Einstein's general theory of relativity. The singularity constitutes the centre of a black hole and is hidden by the object's "surface," the event horizon. Inside the event horizon the escape velocity (*i.e.*, the velocity required for matter to escape from the gravitational field of a cosmic object) exceeds the speed of light, so that not even rays of light can escape into space. The radius of the event horizon is called the Schwarzschild radius, after the German astronomer Karl Schwarzschild, who in 1916 predicted the existence of collapsed stellar bodies that emit no radiation. The size of the Schwarzschild radius is thought to be proportional to the mass of the collapsing star. For a black hole with a mass 10 times as great as that of the Sun, the radius would be 30 km (18.6 miles).

Only the most massive stars—those of more than three solar masses—become black holes at the end of their lives. Stars with a smaller amount of mass evolve into less compressed bodies, either white dwarfs or neutron stars.

Black holes are difficult to observe on account of both their small size and the fact that they emit no light. They can be "observed," however, by the effects of their enormous gravitational fields on nearby matter. For example, if a black hole is a member of a binary star system, matter flowing into it from its companion becomes intensely heated and then radiates X rays copiously before entering the event horizon of the black hole and disappearing forever. Many investigators believe that one of the component stars of the binary X-ray system Cygnus X-1 is a black hole. Discovered in 1971 in the constellation Cygnus, this binary consists of a blue supergiant and an invisible companion star that revolve about one another in a period of 5.6 days.

Some black holes apparently have nonstellar origins. Various astronomers have speculated that large volumes of interstellar gas collect and collapse into supermassive black holes at the centres of quasars and peculiar galaxies (*e.g.*, galactic systems that appear to be exploding). A mass of gas falling rapidly into a black hole is estimated to give off more than 100 times as much energy as is released by the identical amount of mass through nuclear fusion. Accordingly, the collapse of millions or billions of solar masses of interstellar gas under gravitational force into a large black hole would account for the enormous energy output of quasars and certain galactic systems. In 1994 the Hubble Space Telescope provided conclusive evidence for the existence of a supermassive black hole at the centre of the M87 galaxy. It has a mass equal to two to three billion Suns but is no larger than the solar system. The black hole's existence can be strongly inferred from its energetic effects on an envelope of gas swirling around it at extremely high velocities.

The existence of another kind of nonstellar black hole has been proposed by the British astrophysicist Stephen Hawking. According to Hawking's theory, numerous tiny primordial black holes, possibly with a mass equal to that of an asteroid or less, might have been created during the big bang, a state of extremely high

temperatures and density in which the universe is thought to have originated roughly 10 billion years ago. These so-called mini black holes, unlike the more massive variety, lose mass over time and disappear. Subatomic particles such as protons and their antiparticles (*i.e.*, antiprotons) may be created very near a mini black hole. If a proton and an antiproton escape its gravitational attraction, they annihilate each other and in so doing generate energy—energy that they in effect drain from the black hole. If this process is repeated again and again, the black hole evaporates, having lost all of its energy and thereby its mass, since these are equivalent.

Black Hole of Calcutta, scene of an incident (June 20, 1756) in which the remaining European defenders of Calcutta were shut away and many died, following the capture of the city by the nawab Siraj-ud-Dawlah, of Bengal, and the surrender of the East India Company's garrison under a member of the council, John Z. Holwell. The incident became a cause célèbre in the idealization of British imperialism in India and a subject of controversy. The nawab attacked Calcutta because of the company's failure to stop fortifying the city as a defense against its rivals in anticipation of war (the Seven Years' War, 1756–63). Following his surrender, Holwell and the other Europeans were placed for the night in the company's local lockup for petty offenders, popularly known as the Black Hole. It was a room 18 feet (5.5 m) long and 14 feet 10 inches wide, and it had two small windows. According to Holwell, 146 people were shut up, and 23 emerged alive. The incident was held up as evidence of British heroism and the nawab's callousness.

In 1915 J.H. Little pointed out Holwell's unreliability as a witness and other discrepancies, and it became clear that the nawab's part was one of negligence only. The details of the incident were thus opened to doubt. A study in 1959 by Brijen Gupta suggests that the incident did occur but that the number of those entering the Black Hole was about 64 and the number of survivors was 21.

black humour, also called **BLACK COMEDY**, writing that juxtaposes morbid or ghastly elements with comical ones. Though in 1940 the French Surrealist André Breton published *Anthologie de l'humour noir* ("Anthology of Black Humour," frequently enlarged and reprinted), the term did not come into common use until the 1960s. Then it was applied to the works of the novelists Nathanael West, Vladimir Nabokov, and Joseph Heller. The latter's *Catch-22* (1961) is a notable example, in which Captain Yossarian battles the horrors of air warfare over the Mediterranean during World War II with hilarious irrationalities matching the stupidities of the military system. Other novelists who worked in the same vein included Kurt Vonnegut, particularly in *Slaughterhouse Five* (1969), and Thomas Pynchon, in *V* (1963) and *Gravity's Rainbow* (1973). A film exemplar is Stanley Kubrick's *Dr. Strangelove* (1963), a comedy of militaristic errors that ends in global nuclear destruction. The term black comedy has been applied to playwrights in the Theatre of the Absurd (*see* Absurd, Theatre of the), especially Eugène Ionesco, as in *Les Chaises* (produced 1952; *The Chairs*).

Antecedents to black humour include the comedies of Aristophanes (5th century BC), François Rabelais's *Pantagruel* (1532), parts of Jonathan Swift's *Gulliver's Travels* (1726), and Voltaire's *Candide* (1759).

Black Hundreds, Russian CHERNOSOTENTSY, reactionary, antirevolutionary, and anti-Semitic groups formed in Russia during

and after the Russian Revolution of 1905. The most important of these groups were the League of the Russian People (Soyuz Russkogo Naroda), League of the Archangel Michael (Soyuz Mikhaila Arkhangel), and Council of United Nobility (Soviet Obednennogo Dvoryanstva). The Black Hundreds were composed primarily of landowners, rich peasants, bureaucrats, merchants, police officials, and clergymen, who supported the principles of Orthodoxy, autocracy, and Russian nationalism. Particularly active from 1906 until 1914, they conducted raids (with the unofficial approval of the government) against various revolutionary groups and pogroms against the Jews.

black knot, disease of wild and cultivated plums, cherries, and apricots in North America caused by the fungus *Dibotryon morbosum*. Infected twigs, branches, and fruit show light brown swellings that turn velvety olive-green in late spring. By autumn, hard, rough, coal-black knots girdle and kill affected parts. Older knots, often riddled by insects, stunt and kill the tree. Black knot can be controlled by pruning infected parts during the winter (knots on large limbs are cut away, and the wound is treated), destroying nearby wild plums and cherries that may be affected, and spraying the opening buds with a fungicide. Japanese plums are less susceptible than most American and European varieties.

black lead, graphite (*q.v.*), though the term is a misnomer, since graphite does not contain any lead.

black letter, also called GOTHIC SCRIPT, or OLD ENGLISH SCRIPT, in calligraphy, style of alphabet that was used for handwriting throughout Latin Christendom for about 500 years, from the decline of the literary reforms under Charlemagne in the early 9th century to the humanistic revival of the Renaissance. It is distinguished by a uniform treatment of vertical strokes that end on the baseline, the use of angular lines instead of smooth curves and circles, and the overlapping of convex forms so that they lie back to back.

Venit ergo David ad baa

Black-letter type as used in the 42-line Bible, issued at Mainz, 1456 (actual size)

When printing by movable type was invented, typefaces were based on the handwriting styles of the time, and black letter, along with roman, was one of the two dominant letter shapes of medieval typography. Black-letter type was used in the only extant work known to have been printed by Johannes Gutenberg, the so-called 42-line Bible. Eventually, roman type, which was considered more suitable by humanists, superseded black letter throughout Europe, except in Germany (where it persisted until 1940, when Adolf Hitler ordered its discontinuance). Black letter persisted in the 20th century mainly in the Old English script used on diplomas, Christmas cards, and in some liturgical writings.

Several styles of medieval black letter are recognized by their French or Latin names. *Lettre de forme*, or *littera textualis formata*, has the sharpest angles and most contrast between light and heavy strokes; *lettre de somme* is rounder and was widely used in southern Europe. *Lettre françoise* is a cursive (connected) black-letter style of script that was used in France during the Middle Ages. During the Renaissance it became a printing type, cut by the Parisian artist Robert Granjon. It became known as *civilité* because it was used to print a popular children's book, *La Civilité puerile*,

written by Erasmus. During the 17th century, *lettre financière* became an officially approved script because it was a development from the old French national style, *lettre françoise*. Under the patronage of Louis XIV, this script became elegant, taking on dazzling Baroque line endings and flourishes.

Littera moderna was an ordinary black-letter script used in medieval Italy. *Littera antica* was an Italian script developed by the humanists during the Renaissance. *Littera a merchanti* was another Italian script—a late medieval style that was used in the commercial centres of Italy in the 16th century. *Cancelleresca corsiva* (*cancellaresca corsiva*), also called *littera da brevi*, was developed in the 15th century out of the *antica corsiva* script used by the papal chancery. It was a popular script that became the vehicle for the New Learning throughout Christendom in the 16th century. *Cancelleresca formata* developed from *cancelleresca corsiva*. *Lettre bâtarde*, or *littera bastarda*, is a slashing, cursive style developed by professional writing masters of the 16th century.

The most formal of the black-letter style is the German *Fraktur*. It has notably pointed and heavy-bodied letters. Typical examples were used in some of the earliest printing, including letters of indulgences printed in Mainz, Ger., in 1454. The style was taken into printing in its almost fully developed form and evolved little in succeeding years. *Schwabacher* was a less pointed, less heavy-bodied, rounded, and generally more informal typeface; it evolved slowly and was, for a brief time, the major black-letter form as a cursive, semi-italic. Some categories recognize a more informal cursive *Schwabacher* as a third form.

The black-letter scripts were called gothic by the "modernist" Lorenzo Valla and others in the mid-15th century. The modernists rejected the black-letter scripts because they associated them with the Middle Ages, which they considered a long intellectual deviation that separated their generation from the standards of the Classical age. The rejection of the scripts began with Petrarch and became calligraphically manifest with Coluccio Salutati, Poggio Bracciolini, and Niccolò Niccoli in Florence in the first quarter of the 15th century.

black lignite: see subbituminous coal.

black lung, also called BLACK-LUNG DISEASE, or COAL-WORKERS' PNEUMOCONIOSIS, respiratory disorder, a type of pneumoconiosis caused by repeated inhalation of coal dust over a period of years. The disease gets its name from a distinctive blue-black marbling of the lung caused by accumulation of the dust. Georgius Agricola, a German mineralogist, first described lung disease in coal miners in the 16th century, and it is now widely recognized. It may be the best known occupational illness in the United States.

The disease is most commonly found among miners of hard coal, but it also occurs in soft-coal miners and graphite workers. Onset of the disease is gradual; the symptoms usually appear only after 10–20 years of exposure to coal dust, and the extent of disease is clearly related to the total dust exposure. It is not clear, however, whether coal itself is solely responsible for the disease, as coal dust often is contaminated with silica, which causes similar symptoms. There is strong evidence that tobacco smoking aggravates the condition. The early stages of the disease (when it is called anthracosis) usually have no symptoms, but in its more advanced form it frequently is associated with pulmonary emphysema or chronic bronchitis and can be disabling; tuberculosis is also more common in victims of black lung.

black market, trading in violation of publicly imposed regulations such as rationing laws, laws against certain goods, and official rates of exchange among currencies. Rationing

is common in wartime in order to equalize the distribution of scarce goods and services; black-market activity may consist of charging more than the legal prices, stealing or counterfeiting ration currency, and making side payments in addition to the official rate to obtain a given amount of merchandise.

Black-market activity in foreign exchange is prevalent in countries in which convertible foreign exchange is scarce and strict control of foreign exchange exists. The black market often sets a price for foreign exchange several times the official one.

black mass, in the Roman Catholic church, a requiem mass during which the celebrant wears black vestments. The term is more commonly used, however, for a blasphemous and usually obscene burlesque of the true mass performed by satanic cults. The naked back of a woman often serves as an altar, and a validly consecrated host is generally used to intensify the mockery. The rite commonly incorporates other elements of satanic magic such as philtres or abortifacients.

Charges of satanism and celebration of the blasphemous black mass have been made against persons accused of heresy and witchcraft since early Christian times. Allegations were made against the Knights Templars in the 14th century and against the Freemasons in the 19th. Joris-Karl Huysmans' novel *Là-bas* (1891; *Down There*) describes a black mass celebrated in late 19th-century France. See also satanism.

black mica (silicate mineral): see biotite.

black mold (plant disease): see sooty mold.

black moss (plant): see Spanish moss.

Black Mountain poet, any of a loosely associated group of poets that formed an important part of the avant-garde of American poetry in the 1950s, publishing innovative yet disciplined verse in the *Black Mountain Review* (1954–57), which became a leading forum of experimental verse.

The group grew up around the poets Robert Creeley, Robert Duncan, and Charles Olson while they were teaching at Black Mountain College in North Carolina. Turning away from the poetic tradition espoused by T.S. Eliot, these poets emulated the freer style of William Carlos Williams. Charles Olson's essay "Projective Verse" (1950) became their manifesto. Olson emphasized the creative process, in which the poet's energy is transferred through the poem to the reader. Inherent in this new poetry was the reliance upon decidedly American conversational language.

Much of the group's early work was published in the magazine *Origin* (1951–56). Creeley edited the *Black Mountain Review*, which featured the work of William Carlos Williams, Paul Blackburn, Denise Levertov, Allen Ginsberg, Gary Snyder, and many others who later became significant poets.

Black Mountains, mountain range in Yancey county in western North Carolina, U.S., extending north from the Blue Ridge, part of the Appalachian Mountains. The mountains include Mount Mitchell (6,684 feet [2,037 m]), the highest point east of the Mississippi River. Since they were not subject to glaciation, their slopes are covered with soil to the top, except for rocky precipices, and are heavily wooded. They lie within the Pisgah National Forest.

Black Muslim movement: see Islam, Nation of.

black nationalism, political and social movement prominent in the 1960s and early '70s in the United States among some African Americans. The movement, which can be traced back to Marcus Garvey's Universal Negro Improvement Association of the 1920s, sought to acquire economic power and to infuse among

blacks a sense of community and group feeling. Many adherents to black nationalism assumed the eventual creation of a separate black nation by African Americans. As an alternative to being assimilated by the American nation, which is predominantly white, black nationalists sought to maintain and promote their separate identity as a people of black ancestry. With such slogans as "black power" and "black is beautiful," they also sought to inculcate a sense of pride among blacks.

black oak (*Quercus velutina*), North American timber tree belonging to the red oak group of the genus *Quercus* in the beech family (Fagaceae), distributed throughout the eastern United States. It usually grows to about 25 m (80-feet) tall and may grow to 45 m on rich soils; it is common on exposed slopes and ridges, as it cannot tolerate shade. The tree's blackish outer bark is ridged in irregular blocks; the orange-yellow inner bark is a source of tannin and quercitron, a yellow dye. The leaf buds are sharply pointed and covered with down. The leaves are usually seven-lobed and glossy dark green above, duller and sometimes fuzzy beneath, turning orange-crimson or brown in autumn.

The California black oak (*Q. kelloggii*), a deciduous tree native to western North America, is occasionally 30 m tall. It grows at altitudes as high as 2,440 m above sea level, where its size is reduced to that of a small shrub; it often has a crooked trunk.

Black Obelisk, Assyrian monument of King Salmeser III (reigned 858–824 BC). The most complete Assyrian obelisk yet discovered, it is decorated with cuneiform inscriptions and reliefs recording military campaigns

Black Obelisk of Salmeser III, 9th century BC; in the British Museum

By courtesy of the trustees of the British Museum

and other triumphs, including payment of tribute by King Jehu of Israel (reigned 842–815). The 6-foot (1.8-metre) black basalt piece was discovered in 1845 at ancient Kalhu (or Kalakh; biblical Calah; modern Nimrud), south of Mosul, Iraq, by Austen Henry Layard and is now in the British Museum.

Black Panther Party, original name BLACK PANTHER PARTY FOR SELF-DEFENSE, American black revolutionary party founded in 1966 in Oakland, Calif., by Huey Newton and Bobby Seale. The party's original purpose was to patrol black ghettos to protect residents from acts of police brutality. The Panthers eventually developed into a Marxist revolutionary group that called for the arming of all blacks, the exemption of blacks from the draft and from all sanctions of so-called white America, the release of all blacks from jail, and the payment of compensation to blacks for centuries of exploitation by white Americans. At its peak in the late 1960s, Panther

membership exceeded 2,000 and the organization operated chapters in several major cities.

Conflicts between Black Panthers and police in the late 1960s and early '70s led to shoot-outs in California, New York, and Chicago, one of which resulted in Newton's going to prison for the murder of a patrolman. While some members of the party were guilty of criminal acts, the group was subjected to police harassment that sometimes took the form of violent attacks, prompting congressional investigations of police activities in dealing with the Panthers. By the mid-1970s, having lost many members and having fallen out of favour with many American black leaders, who objected to the party's methods, the Panthers turned from violence to concentrate on conventional politics and on providing social services in black neighbourhoods. The party was effectively disbanded by the early 1980s.

black pepper, also called PEPPER (*Piper nigrum*), perennial climbing vine of the family Piperaceae indigenous to the Malabar Coast of India, or the hotly pungent spice made from its berries. One of the earliest spices known, pepper is probably the most widely used spice in the world today. It has a limited usage in medicine as a carminative and as a stimulant of gastric secretions.

In early historic times pepper was widely cultivated in the tropics of Southeast Asia, where it became highly regarded as a condiment. Pepper early became an important article of overland trade between India and Europe. It became a medium of exchange, and tributes were levied in pepper in ancient Greece and Rome. In the Middle Ages the Venetians and the Genoese became the main distributors, their virtual monopoly of the trade helping instigate the search for an eastern sea route.

The plant is widely cultivated throughout Indonesia. It has been introduced into tropical areas of Africa and of the Western Hemisphere. A woody climber, it may reach heights of 10 m (33 feet) by means of its aerial roots. Its broad, shiny green leaves are alternately arranged. The small flowers are in dense, slender spikes of about 50 blossoms each. The berrylike fruits, or peppercorns, are about 5 mm (0.2 inch) in diameter. They become yellowish red at maturity and bear a single seed. Their odour is penetrating and aromatic; the taste is hot, biting, and very pungent.

The plant requires a long rainy season, fairly high temperatures, and partial shade for best growth. Propagation is usually by stem cuttings, which are set out near a tree or a pole that will serve as a support. Pepper plants are sometimes interspersed in tea or coffee plantations. They begin bearing in 2 to 5 years and may produce for as long as 40 years.

Black pepper (*Piper nigrum*)
W H Hodge

The berries are picked when they begin to turn red. The collected berries are immersed in boiling water for about 10 minutes, which causes them to turn dark brown or black in an hour. Then they are spread out to dry in the sun for three or four days. The whole peppercorns, when ground, yield black pepper. White pepper is obtained by removing the outer part of the pericarp. The outer coating is softened either by keeping the berries in moist heaps for 2 or 3 days or by keeping them in sacks submerged in running water for 7 to 15 days, depending on the region. The softened outer coating is then removed by washing and rubbing or by trampling, and the berries are spread in the sun to dry. Whole white pepper can also be prepared by grinding off the outer coating mechanically. The flavour is less pungent than that of black pepper.

Pepper contains up to 3 percent essential oil that has the aromatic flavour of pepper but not the pungency. The pungent principles are contained in the oleoresin and consist of piperine, chavicine, piperidine, and piperettine.

Various plants called pepper, including the California pepper tree *Schinus molle*, the pepper vine *Ampelopsis arborea*, and the sweet pepper bush *Clethra alnifolia*, are grown as ornamental plants and are not used as spices. See also pepper.

black powder, first type of explosive mixture invented for use in firearms and for blasting (see gunpowder).

Black Prince, The: see Edward the Black Prince.

Black Prince's ruby, large red gem set in the Maltese cross in the front of the imperial state crown of England. It is not a ruby but is one of the world's largest gem-quality red spinels, a polished lump 5 cm (2 inches) long, pierced and partly filled with a small ruby. The stone was given to Edward the Black Prince by Pedro the Cruel, king of Castile, on the victory of Nájera in 1367. It narrowly escaped destruction when Henry V wore it at the Battle of Agincourt in 1415.

Black River, Vietnamese SONG DA, Chinese LI-HSIEN CHIANG, one of the chief tributaries of the Red River (Song Hong). Nearly 500 miles (800 km) long, it rises in central Yunnan province in southwestern China and flows southeastward into northern Vietnam parallel to the Red River, with which it unites about 35 miles (55 km) northwest of Hanoi. The Black River is broad and deep enough for navigation to Cho Bo, 45 miles (70 km) upstream from Hanoi, where rapids interrupt navigation; steamers can reach Viet Tri via the Red River. Beyond the rapids, the Black River again becomes navigable, and junks and sampans can reach Lai Chau.

Black River, river in southeastern Missouri and eastern Arkansas, U.S., rising in the Ozark Mountains in Reynolds county, Mo. It flows southeasterly to Poplar Bluff, Mo., and then continues southwest to enter the White River near Newport, Ark., after a course of 280 miles (450 km). Limited navigation is possible for shallow-draft vessels in the lower 15 miles (25 km) of its course. Its main tributary is the Current River, which it receives near Poca-hontas, Ark. Clearwater Dam, near Piedmont, Mo., was completed in 1948 on the Black River as a major flood-control project.

Black Rock Desert, arid region of lava beds and alkali flats, composing part of the Basin and Range Province and lying in Humboldt and Pershing counties of northwestern Nevada, U.S. With an area of about 1,000 square miles (2,600 square km), the desert is 70 miles (110 km) long and up to 20 miles wide. Once occupied by ancient Lake Lahontan, it

serves as the sink of the Quinn River and, at times, is largely covered with water only a few inches deep. After evaporation, the desert is left with a cover of hard clay, which is frequently encrusted with snowy-white saline matter. In Pershing county the desert is sometimes called the Granite Creek Desert, and a southwest extension lying north of Pyramid Lake is called the Smoke Creek Desert.

black sand, accumulation of fragments of durable heavy minerals (those with a density greater than that of quartz), usually of a dark colour. These accumulations are found in streambeds or on beaches where stream and wave energy was sufficient to carry away low-density material but not the heavy minerals. Thus, heavy minerals resistant to weathering and abrasion concentrate in these areas, though they may be only minor constituents of inland rocks. Placer mining of such deposits yields magnetite, cassiterite, and zircon and gold, platinum, and other rare metals.

Black Sea, Russian and Bulgarian CHERNOYE MORE, Ukrainian CHORNE MORE, Turkish KARADENİZ, Romanian MAREA NEAGRĂ, large inland sea situated at the southeastern extremity of Europe. It is bordered by Ukraine to the north, Russia to the northeast, Georgia to the east, Turkey to the south, and Bulgaria and Romania to the west.

A brief treatment of the Black Sea follows. For full treatment, see MACROPAEDIA: Atlantic Ocean.

The Black Sea is connected to the distant waters of the Atlantic Ocean by the succession of the Bosphorus (a strait at the Black Sea's southwestern corner), the Sea of Marmara, the Dardanelles, the Aegean Sea, and the Mediterranean Sea. The peninsula of Crimea extends into the sea from the north, and immediately to the east the narrow Kerch Strait opens onto the smaller Sea of Azov. The Black Sea's water-surface area is about 178,000 square miles (461,000 square km), and its maximum depth is more than 7,250 feet (2,210 m). The Black Sea has few coastal lowlands. The Danube, Dnieper, Dniester, and Don are the largest rivers emptying into the sea.

The Black Sea is a residual basin of the ancient Tethys Sea; its present form probably emerged about 58 million years ago when structural upheavals in Anatolia split off the Caspian basin from the Mediterranean. The newly formed Black Sea basin gradually became isolated from the ocean, its salinity was reduced, and it was slowly separated from the Caspian region. The salinity of the Black Sea is almost half that of the world's oceans.

An unusual feature of the Black Sea is that oxygen is dissolved only in the upper levels of its waters, which alone can support a rich sea life as a result. Below a depth of 230–330 feet (70–100 m) at the centre and 330–500 feet (100–150 m) near the sea's margins, there is no oxygen because the sea is permeated by a high concentration of dissolved hydrogen sulfide, forming a saturated, "dead" zone inhabitable only by specially adapted bacteria. Despite this anomaly, the Black Sea's uppermost waters supported abundant sturgeon, mackerel, and anchovy until the late 20th century, when the runoff of industrial and municipal wastes into the Danube, Dnieper, and other feeder rivers caused increasing levels of pollution and consequent reductions in fish populations.

The Black Sea remains an important shipping artery linking Ukraine, Bulgaria, Romania, and southwestern Russia with world markets. The sea's northern coast, particularly the Crimea, is a major recreational area for eastern European vacationers.

black shale, also called CARBONIFEROUS SHALE, variety of shale that contains abundant

organic matter, pyrite, and sometimes carbonate nodules or layers and, in some locations, concentrations of copper, nickel, uranium, and vanadium. Fossils are rare in the shale and either are replaced by pyrite or are preserved as a film of graphite. Black shales occur in thin beds in many areas at various depths. They were deposited under anaerobic conditions, but the exact mode of origin is debated. Some geologists hold that the conditions were produced at depth by a stable stratification of lighter, fresher water overlying and sealing off from the atmosphere a more saline, stagnant layer. Others hold that the stagnant conditions were produced in shallow seas or in lagoons.

Black shales are of interest both historically and commercially. The oldest-known shales are carboniferous varieties of the 3.2-billion-year-old Fig Tree Series of South Africa. The Green River formation, an oil-shale formation in Colorado, Utah, and Wyoming, is a potentially valuable source of synthetic crude oil. In eastern Germany and Poland the Kupferschiefer, a bituminous shale, is mined for copper, lead, and zinc.

black shark, either of two Asian species of river fishes. See *labeo*.

Black Sheep (Turkmen tribal federation); see Kara Koyunlu.

black snake, any of several species of snakes that are all black or nearly so. The black snake of Australian wetlands is *Pseudochis porphyriacus*, a small-headed member of the cobra family, Elapidae. It is blue-black, with a red belly; average length is about 1.5 m (5 feet). If annoyed, it expands its neck, cobra fashion. Its venom—more hemorrhagic than neurotoxic—is rarely fatal.

The spotted black snake (*P. guttatus*) of interior eastern Australia has pale spots and is bluish gray below. The mulga snake (*P. australis*) occurs across northern Australia and in dry parts of the southern interior. Occasionally 2.4 m long, it is reddish brown above and pinkish below. North American snakes called black snakes include the black racer, *Coluber constrictor*, and the pilot black snake, *Elaphe obsoleta*. See also racer; rat snake.

Black Sox Scandal, American baseball scandal centring on the charge that eight members of the Chicago White Sox had been bribed to lose the 1919 World Series to the Cincinnati Reds. The accused players were pitchers Eddie Cicotte and Claude ("Lefty") Williams, first baseman Charles ("Chick") Gandil, shortstop Charles ("Swede") Risberg, third baseman George ("Buck") Weaver, outfielders Joe ("Shoeless Joe") Jackson and Oscar ("Happy") Felsch, and pinch hitter Fred McMullin. Court records suggest that the eight players received \$70,000 to \$100,000 for losing five games to three.

Suspensions of a conspiracy were aired immediately after the World Series ended, principally by Hugh Fullerton and other sportswriters, but controversy over the allegations had died down by the beginning of the 1920 season. Then, in September, a grand jury was called to investigate various allegations of gamblers invading baseball. On Sept. 28, 1920, after Cicotte, Williams, Jackson, and Felsch admitted to the grand jury that they had thrown the 1919 series in return for a bribe, Charles Comiskey, owner of the White Sox, suspended seven of the players. (Gandil was already on suspension in a salary dispute.) The indicted players stood trial in the summer of 1921 but on August 3 were acquitted on insufficient evidence—largely because key evidence, including the original confessions of the players, had disappeared from the grand jury files. (They probably were stolen.) On August 4 the new baseball commissioner, Judge Kenesaw Mountain Landis, banned the eight players from the game for life.

Few of the alleged gamblers testified at the

trial, and none were themselves ever brought to trial for the White Sox bribery, though the notorious New York racketeer Arnold Rothstein was mentioned in hearings as the probable banker of the bribery scheme.

BIBLIOGRAPHY. Eliot Asinof, *Eight Men Out* (1963, reprinted 1987).

black spot, also spelled BLACKSPOT, common disease of several plants that is caused by species of *Pseudomonas* bacteria or by many fungus species in the plant genera *Asterina*, *Asterinella*, *Asteroma*, *Diplothea*, *Glomerella*, *Gnomonia*, *Microthyriella*, *Placosphaeria*, and *Stigmea*. Infections occur during damp periods and appear as round to irregular black leaf spots, sometimes on petioles, stems, and flower parts.

Commonly, the term is used to mean black spot of roses, a serious worldwide disease, except in arid regions, caused by the fungus *Diplocarpon rosae*. On rose plants, the spots are roundish and more than 1 cm (up to 0.5 inch) in diameter with fringed margins.

Black spot on rose leaves

W. H. Hodge

Leaves on susceptible varieties turn yellow and drop early. Affected plants may defoliate twice in a season, are greatly weakened, produce fewer and inferior blooms, and are subject to canker diseases and winterkill. Large numbers of spores are formed in speck-size fruiting structures (acervuli) and disseminated by splashing rain, dew, overhead sprinkling, and gardeners working among wet plants. The spores germinate and penetrate rose tissue in 9 to 18 hours or longer; new leaf spots appear in 3 to 16 days and spores in 10 to 18 days. The cycle may be repeated throughout the growing season. Black spot may be controlled through adequate spraying or dusting.

black state, formerly BANTU HOMELAND, or BANTUSTAN, any of 10 former territories that were designated by the white-dominated government of South Africa as national homelands for the country's black population. The black states were a major administrative device for the complete exclusion of blacks from the South African political system under the policy of apartheid, or racial separation. The states were organized on the basis of ethnic and linguistic groupings; e.g., KwaZulu was the designated homeland of the Zulu people, Transkei and Ciskei were designated for the Xhosa people, and so on. No foreign government accorded diplomatic recognition to any of the states.

Land acts enacted in 1913 and 1936 defined a number of scattered areas as reserved for blacks. Some expansion, consolidation, and relocation of these occurred in the following decades. In 1959 a black self-government scheme, recognizing specific ethnic groups in designated areas, or "homelands," was enacted. A homelands citizenship act of 1970 defined blacks living throughout South Africa as legal citizens of the homelands designated for their ethnic groups, thereby stripping them of their South African citizenship and their remaining civil and political rights.

The South African government went on to declare four of the black states "inde-

pendent": Transkei in 1976, Bophuthatswana in 1977, Venda in 1979, and Ciskei in 1981. Six other black states remained self-governing but nonindependent: Gazankulu, KwaZulu, Lebowa, KwaNdebele, KaNgwane, and Qwaqwa. Only two of the black states (Ciskei and Qwaqwa) had a totally coterminous land area; each of the others consisted of anywhere from 2 to 30 scattered blocks of land, some of them widely dispersed.

All of the black states had some self-government—e.g., in education, health, law enforcement, and roads. The states' governing cabinets were nominally responsible to legislative assemblies that were partly elected, but internal coups brought military regimes to power in some. The black states were rural, under-industrialized, and overly reliant on both subsistence farming and on their citizens' temporary labour in South Africa's cities, towns, mines, and farms. They were also heavily dependent on financial aid supplied by the South African government. Only about one-third of South Africa's total black population lived in the six self-governing black states, and another one-fourth lived in the four nominally independent states of Transkei, Bophuthatswana, Venda, and Ciskei (qq.v.).

As South African whites' support for apartheid began to waver in the late 1980s, their government abandoned its intention to make the remaining six black states independent. South Africa subsequently adopted a constitution that abolished apartheid, and in 1994 all 10 black states were reincorporated into South Africa, with full citizenship for their residents. The black states themselves were abolished and merged into a reorganized system of South African provinces.

Black Stone of Mecca, Arabic AL-HAJAR AL-ASWAD, Muslim object of veneration, built into the eastern wall of the Ka'bah (small shrine within the Great Mosque of Mecca) and probably dating from the pre-Islamic religion of the Arabs. It now consists of three large pieces and some fragments, surrounded by a stone ring and held together with a silver band. According to popular Islamic legend, the stone was given to Adam on his fall from paradise and was originally white but has become black by absorbing the sins of the thousands of pilgrims who have kissed and touched it. In 930 it was carried away by the fanatics of the Qarmatian sect and held for ransom for about 20 years.

black-tailed deer, Pacific Northwest subspecies of the mule deer (q.v.).

black theatre, in the United States, dramatic movement encompassing plays written by, for, and about blacks. The first known play by an American black was James Brown's *King Shotaway* (1823). William Wells Brown's *Escape, or a Leap for Freedom* (1858), was the first black play published, but the first real success of a black dramatist was Angelina W. Grimké's *Rachel* (1916).

Black theatre flourished during the Harlem Renaissance of the 1920s and '30s. Experimental groups and black theatre companies emerged in Chicago, New York City, and Washington, D.C. Among these was the Ethiopian Art Theatre, which established Paul Robeson as America's foremost black actor. Garland Anderson's play *Appearances* (1925) was the first play of black authorship to be produced on Broadway, but black theatre did not create a Broadway hit until Langston Hughes's *Mulatto* (1935) won wide acclaim. In that same year the Federal Theater Project was founded, providing a training ground for blacks. In the late 1930s, black community theatres began to appear, revealing talents such as those of Ossie Davis and Ruby Dee. By 1940 black theatre was firmly grounded in the American Negro Theater and the Negro Playwrights' Company.

After World War II black theatre grew more progressive, more radical, and more militant, reflecting the ideals of black revolution and seeking to establish a mythology and symbolism apart from white culture. Councils were organized to abolish the use of racial stereotypes in theatre and to integrate black playwrights into the mainstream of American dramaturgy. Lorraine Hansberry's *Raisin in the Sun* (1959) and other successful black plays of the 1950s portrayed the difficulty of blacks maintaining an identity in a society that degraded them.

The 1960s saw the emergence of a new black theatre, angrier and more defiant than its predecessors, with Imamu Amiri Baraka (originally LeRoi Jones) as its strongest proponent. Baraka's plays, including the award-winning *Dutchman* (1964), depicted whites' exploitation of blacks. He established the Black Arts Repertory Theatre in Harlem in 1965 and inspired playwright Ed Bullins and others seeking to create a strong "black aesthetic" in American theatre. The powerful and prolific dramatist August Wilson was the most important creator of black theatre in the 1980s.

black titi: see buckwheat tree.

black varnish, also called JAPAN, any of a class of oil varnishes in which bitumen (a mixture of asphaltlike hydrocarbons) replaces the natural gums or resins used as hardeners in clear varnish. Black varnish is widely used as a protective coating for interior and exterior ironwork such as pipework, tanks, stoves, roofing, and marine accessories. The bitumen forms a protective barrier against atmospheric corrosion. Bitumens used include petroleum bitumen; natural asphalts, such as untaite; and pitches, as from coal tar.

The cheapest black varnish is Brunswick black, a solution of bitumen in white spirit. In coachbuilders' black japan, only the purest grades of asphalt or pitch are used, together with a hard gum, such as copal. Berlin black has a matte or eggshell finish, achieved by incorporating a proportion of vegetable or other carbon black. See also japaning.

Black Volta River, French VOLTA NOIRE, also called (in Burkina Faso) MOUHOUN, river in Burkina Faso (formerly Upper Volta), Ghana, and Côte d'Ivoire (Ivory Coast), headstream of the Volta River in western Africa. It rises as the Baoulé in low hills in southwestern Burkina Faso near Bobo Dioulasso, and at the end of its course it empties into Lake Volta (in Ghana), a large artificial reservoir created by the Volta River Project and stretching to just above the former confluence of the Black Volta and White Volta rivers.

From its source in Burkina Faso the Black Volta flows roughly north and east for about 200 miles (320 km) and then turns to flow south for 340 miles (550 km), forming the border between Ghana and Burkina Faso and then between Ghana and Côte d'Ivoire. At Bamboi, Ghana, it turns again, first north and then east, and approximately 80 miles (130 km) farther east it empties into Lake Volta, after a course of about 720 miles (1,160 km). Its gradient is relatively gentle (about 2 feet per mile [40 cm per km]), and the rainfall in its river valley is likewise small (for that part of the world). The Black Volta may stop flowing in the height of the dry season, but between Bamboi and the Côte d'Ivoire border the river's regime has permitted construction of a dam. The principal riparian town is Lawra in Ghana; there is a ferry at Bamboi.

black walnut (*Juglans nigra*), tall tree, native to eastern North America, valued for its decorative wood. See walnut.

Black War (1804–30), period of continuing hostilities between Aborigines and European soldiers and settlers on the Australian island of Tasmania (then called Van Diemen's Land),

which resulted in the virtual extermination of the Aboriginal population of the island. The term is often applied only to the last year of hostilities. The "war" began in May 1804, when a military detachment opened fire on an Aboriginal hunting party. The bitterness of the Aborigines increased in the next few years as white settlers occupied choice hunting areas of the island for sheep raising and, when other food ran short, took to hunting kangaroos, greatly depleting this staple of the Aborigines' life. In the course of the next generation, white settlers continually harassed the natives; kidnapping, rape, and murder were common. Unable to meet the European terror in force, the Aborigines resorted to attacks on isolated individuals and small groups.

In the autumn of 1830, the lieutenant governor, George Arthur, decided to segregate the Aborigines on the southeastern peninsula of the island. Several thousand settlers were formed into a Black Line to drive the Aborigines out of the bush. The campaign was a failure—only a woman and a boy were found. Between 1831 and 1835, however, a humanitarian, George A. Robinson, persuaded most of the elusive natives (approximately 200) to resettle on the Bass Strait island of Flinders. There, their number rapidly dwindled; by the second half of the 19th century, they had virtually disappeared as a separate group.

Black Warrior River, river in western Alabama, U.S. It is formed by the Locust and Mulberry forks about 20 miles (30 km) west of Birmingham and flows 178 miles (286 km) southwest to join the Tombigbee River near Demopolis. The river is navigable, and with the Tombigbee it forms an inland waterway between Mobile and Birmingham. The name is a translation of *tuscaloosa*, a Choctaw word. Between Demopolis and Tuscaloosa, the river is sometimes known as the Warrior.

black widow, any member of a genus (*Latrodectus*) of spiders of the family Theridiidae (order Araneida), especially the species *L. mactans*. Other species, found around the world, are known variously as widow spiders, or black widow spiders, or by other names. About six species are known. All are venomous, but their bite is rarely fatal to humans.

Latrodectus geometricus is found in Africa; *L. curacaviensis* in the Americas; *L. hystrix*, *L. dahli*, and *L. pallidus* in southern Europe, northern Africa, and southwestern Asia; and *L. mactans* in most warm areas of the world. *L. mactans*, *L. curacaviensis*, and *L. geometricus* are found in the United States.

Black widow (*Latrodectus mactans*), with egg case
Ann Moreton

In the northern part of its range, *L. mactans* is found most often in trash and near dwellings; *L. curacaviensis* lives under logs and stones and in woods and fields. In the southeastern United States *L. curacaviensis* lives in trees and shrubs above the ground; *L. mactans* lives on the ground.

The female of *L. mactans*, the most com-

mon North American species, is shiny black, usually with a reddish hourglass-shaped design on the underside of the spherical abdomen. Sometimes two small spots, instead of an hourglass, are present. The body is about 2.5 centimetres (1 inch) long. The male, seldom seen because it is often killed and eaten by the female after mating, is about one fourth the size of the female. In addition to the hourglass design the male often has four pairs of reddish stripes on the sides of the abdomen.

The large web of black widows has a funnel-shaped centre. The female may lay several masses of eggs during one summer. The egg case, suspended in the web, is white or tan, papery in texture, and up to 12 millimetres (1/2 inch) in diameter. It contains 250–750 eggs. The young spiders, which are orange and white, emerge in 14 to 30 days. Females may live for more than 1 1/2 years.

Like most spiders, the black widow preys on insects. It makes small punctures in the victim's body and sucks the liquid contents. It, in turn, is attacked by mud-dauber wasps and other insect parasites and predators.

The bite of the black widow often produces severe pain, nausea, and mild paralysis of the diaphragm. Most bite victims, however, recover without serious complications.

Blackbeard (pirate): see Teach, Edward.

blackberry, usually prickly, fruit-bearing bush of the genus *Rubus* (family Rosaceae), native chiefly to the north temperate regions of the Old and New World; the thornless blackberry is a modern development. The blackberry is particularly abundant in eastern North America and on the Pacific coast; in the British Isles and western Europe it is a

Blackberry (*Rubus*)
Derek Fell

common copse and hedge plant. The bush is characterized by its usually biennial, prickly, erect, semi-erect, or trailing stems; leaves with usually three or five oval, coarsely toothed, stalked leaflets, many of which persist through the winter; white, pink, or red flowers in terminal clusters; and black or red-purple fruits, each consisting of numerous drupelets adhering to a juicy core. The several trailing species of *Rubus*, which lack woody fibre in the stem, are commonly called dewberries.

In modern times there are tens of thousands of blackberry hybrids and segregates of various types. In the U.S. there are about 10,000 acres (4,000 hectares) under blackberry cultivation; in the U.K., about 1,000.

Blackberries are a fairly good source of iron and vitamin C. They are eaten fresh; in preserves, conserves, jams, or jellies; and in baked goods, particularly cobblers and pies.

blackberry lily, also called LEOPARD LILY (*Belamcanda chinensis*), with orange-spotted

(Top) flower and (bottom) seed pods of blackberry lily (*Belamcanda chinensis*)
A to Z Botanical Collection—EB Inc

red flowers, a popular garden flower. It is native to East Asia and is naturalized in some parts of North America.

It is a member of the iris family (Iridaceae) and has branching stems, lower, grassy foliage, a stout rootstalk, and blackberry-like seeds. The flowers have the six petallike segments. Shorter, with light-yellow flowers, *B. flabellata* is another East Asian ornamental of the same genus.

blackbird, in the New World, any of several species belonging to the family Icteridae (order Passeriformes); also, an Old World thrush (*Turdus merula*). The Old World blackbird

Male red-winged blackbird (*Agelaius phoeniceus*)
Kirtley-Perkins—The National Audubon Society Collection/Photo Researchers

is 25 centimetres (10 inches) long; males are black and females brown, with orange bill and eye-rims. Common in woods and gardens throughout temperate Eurasia and established also in Australia and New Zealand, it resembles the American robin in general behaviour.

The best known icterid of this name is the red-winged blackbird (*Agelaius phoeniceus*), ranging from Canada to the West Indies and Central America. It is 20 cm long, and the male's black plumage is set off by red shoulder patches. All-black icterids in North America are the rusty blackbird (*Euphagus carolinus*) and Brewer's blackbird (*E. cyanocephalus*). The red-breasted blackbird (*Leistes militaris*), common over most of South America, is one of the so-called military blackbirds (also called, erroneously, starlings), or marshbirds. For species also grouped with them, see meadowlark. For crow-blackbird, see grackle.

blackbirding, the 19th- and early 20th-century practice of enslaving (often by force and deception) South Pacific islanders on the cotton and sugar plantations of Queensland, Australia (as well as those of the Fiji and Samoan islands). The kidnapped islanders were known collectively as Kanakas (see Kanaka). Blackbirding was especially prevalent between 1847 and 1904. The Queensland government's first attempt to control it came only in 1868 with the Polynesian Labourers Act, which provided for the regulation of the treatment of Kanaka labourers—who theoretically worked of their own free will for a specified period—and the licensing of "recruiters." Because the Queensland government lacked constitutional power outside its own borders, the regulations could not be enforced; moreover, the fact that notorious and brutal blackbirders were able to retain their licenses seemed to indicate that the government was not seriously trying to end the practice. British government acts of the 1870s—especially the 1872 Pacific Islanders Protection Act (the Kidnapping Act)—provided for agents on British recruiting vessels, stricter licensing procedures, and patrol of British-controlled islands; these measures reduced the incidence of blackbirding by British subjects. Because of the continuing heavy demand for labour in Queensland, however, the practice continued to flourish. Blackbirding died out only in 1904 as a result of a law, enacted in 1901 by the Australian commonwealth, calling for the deportation of all Kanakas after 1906.

blackbody, in physics, a surface that absorbs all radiant energy falling on it. The term arises because incident visible light will be absorbed rather than reflected, and therefore the surface will appear black. The concept of such a perfect absorber of energy is extremely useful in the study of radiation phenomena.

The best practical blackbody is a small hole in a box with a blackened interior, because practically none of the radiation entering such a hole could escape again, and it would be absorbed inside. A surface covered with lamp-black will absorb about 97 percent of the incident light and, for most purposes, can be considered a blackbody. Polished metal surfaces, on the other hand, absorb only about 6 percent of the incident radiation, reflecting the rest.

blackbuck (*Antelope cervicapra*), swift, keen-sighted antelope, family Bovidae (order Artiodactyla), found in herds in grasslands of India. The male stands about 80 centimetres (32 inches) at the shoulder and has long, ringed, spirally twisted horns. Its coat is brown, deepening with age to black; the underparts, inner sides of the legs, and an area around each eye are pure white. The female is

Blackbuck (*Antelope cervicapra*)

Wolf Suschitzky

usually hornless and yellowish brown, though similarly patterned with white.

Blackburn with Darwin, unitary authority, geographic and historic county of Lancashire, England, 23 miles (37 km) northwest of Manchester. The famous weaving tradition of the town of Blackburn had its beginnings in the 13th-century wool trade. By the reign of Elizabeth I, Blackburn was a flourishing market town of 2,000 people, with Irish flax being utilized in the production of fabrics. The introduction of the spinning jenny and other textile machinery speeded cotton spinning, while the Leeds and Liverpool Canal (completed 1816) aided transport. The abundance of coal, lime, and building materials also helped expansion. Textiles remain important, but there is now a wide diversity of industry, including electronics, engineering, and brewing. The Lewis Textile Museum records the development of the textile industry.

Darwin developed especially after the Industrial Revolution, with cotton spinning and weaving, coal mining, and paper manufacturing. Wallpaper is important, and engineering and paint and plastics manufacturing have been developed.

The unitary authority encompasses an area of open moorland and forest south of Darwin. In this area stands Turton Tower, a mansion completed in the 16th-century, which includes a museum of furniture and weapons. Area 53 square miles (137 square km). Pop. (1998 est.) 140,000.

Blackburn, Gideon (b. Aug. 27, 1772, Augusta County, Va.—d. Aug. 23, 1838, near Carlinville, Ill., U.S.), Presbyterian clergyman, educator, and missionary to the Cherokee Indians.

He became a Presbyterian minister about 1794 and was stationed at the military post that later became Maryville, Tenn. He was active in the second Great Awakening (1800–03), an evangelical religious movement in the southeastern U.S. After the revival he argued before the General Assembly of the Presbyterian Church in favour of evangelical work among the Cherokee Indians. He opened a school for Indian children in 1804 and for the next seven years worked with the Cherokees preaching, teaching, and introducing new agricultural methods. When his health began to fail, he left missionary work for a position as a schoolteacher near Nashville, Tenn. In 1827 he became president of Centre College, Danville, Ky. Invited in 1833 to Illinois, he raised funds for Illinois College at Jacksonville and later bought land for a theological school near Carlinville. Opened in 1857, it was known as Blackburn Theological Seminary until the theological curriculum was discontinued, and it was renamed Blackburn College.

Blackburn, Helen (b. May 25, 1842, Valentia Island, Ire.—d. Jan. 11, 1903, London), early leader of the British movement for the emancipation of women.

In 1859, when her family moved to London,

she became interested in the cause of woman suffrage. In 1874 she became secretary of the National Society for Women's Suffrage, which had been formed in 1867. She wrote *Women's Suffrage: A Record of the Movement in the British Isles* (1902). One of the first to recognize the significance of women in industry, Blackburn wrote important studies of *The Condition of Working Women and the Factory Acts* (1896) and *Women Under the Factory Acts* (1903). She edited *The Englishwoman's Review* from 1881 to 1890.

Blackburn, Joseph, also called JONATHAN B. BLACKBURN (b. c. 1730, England—d. after 1774, Eng.), itinerant portrait painter who, working in Bermuda (c. 1752–53) and later in New England (c. 1753–64), introduced the decorative tradition of English Rococo portraiture to the American colonies. Blackburn's services were eagerly sought by wealthy American colonials.

In an occasional portrait, such as that of Theodore Atkinson (Worcester Art Museum, Worcester, Mass.), Blackburn achieved some degree of individuality in the features; but most of his works, particularly his likenesses of women, emphasize pose and costume at the expense of characterization. Blackburn frequently repeated a composition, even to details of clothing and jewelry. His posing of his subjects and compositional arrangements briefly exerted an influence on the youthful John Singleton Copley. In about 1764 Black-

"The Winslow Family," oil on canvas by Joseph Blackburn, 1755; in the Museum of Fine Arts, Boston

By courtesy of the Museum of Fine Arts, Boston

burn returned to England. His career after that is obscure, but there is a record of a payment made in 1774 for two portraits painted by him in England.

Blackburn, Thomas (b. Feb. 10, 1916, Hensingham, Cumberland, Eng.—d. Aug. 13, 1977, Wales), English poet and critic whose early work exhibited to a degree the influence of William Butler Yeats, but whose later poetry is rhythmically looser and more conversational.

The son of a clergyman, Blackburn was educated at the University of Durham. In his autobiographical novel, *A Clip of Steel* (1969), he depicts a childhood tormented by a tense and repressive father, his own breakdown in his early twenties, and his successful psychoanalysis.

Blackburn's first notable volume of verse was *The Holy Stone* (1954). Later verse includes *A Snell of Burning* (1961), *A Breathing Space* (1964), and *Selected Poems* (1976). Among his prose works are *Robert Browning* (1967); a collection of criticism, *The Price of an Eye* (1961); and a musical drama, *The Judas Tree* (1967).

Blackburn was an inspiring teacher, first at Marylebone Grammar School in London, then at the University of Leeds, for many years at the College of St. Mark and St. John in Chelsea, London, and finally at Whitelands College in London.

blackcap (*Sylvia atricapilla*), common warbler from Europe and northwestern Africa to central Asia. It belongs to the family Sylvi-

idae (order Passeriformes). It is 14 centimetres (5½ inches) long, with brownish upperparts, gray underparts and face, and black (male) or reddish-brown (female) crown. Common in

Male (bottom) and female blackcaps (*Sylvia atricapilla*)

Hans Reinhard—Bruce Coleman Ltd

woodland border and rough hedges, it has a rich song.

Blackett, Patrick M(aynard) S(tuart), BARON BLACKETT OF CHELSEA (b. Nov. 18, 1897, London—d. July 13, 1974, London), winner of the Nobel Prize for Physics in 1948 for his discoveries in the field of cosmic radiation, which he accomplished primarily with cloud-chamber photographs that revealed the way in which a stable atomic nucleus can be disintegrated by bombarding it with alpha particles (helium nuclei). Although such nuclear disintegration had been observed previously, his data explained this phenomenon for the first time and were useful in explaining disintegration by other means.

After graduating from Cambridge University in 1921, he spent ten years as a research worker in the Cavendish Laboratory. There he began to develop the Wilson cloud chamber—a device that detects the path of ionizing particles—into an automatic instrument for the study of cosmic radiation. He received the Nobel Prize for his interpretation of the data he obtained from this device. Blackett became professor of physics at the University of London in 1933 and Langworthy professor of physics at the University of Manchester in 1937. He established a school of cosmic-ray research and stimulated the development of other research interests, which led to the creation of the first chair of radio astronomy, at the University of Manchester, and to the building of the Jodrell Bank Experimental Station for Radio Astronomy. In 1953 he was appointed professor and head of the physics department of the Imperial College of Science and Technology in London, where he became senior research fellow in 1965. He was created a life peer in 1969.

blackfish, name given to various dark-coloured fishes, including the tautog (*see* wrasse), bowfin, Alaska blackfish (*qq.v.*), and black sea bass (*see* sea bass). Also known as blackfish are the pilot whale (*q.v.*), a mammal; *Orthodon microlepidotus*, a California minnow; the black ruff (*Centrolophus niger*), a European deep-sea rudderfish; and several Australian food fishes.

Blackfoot, group of three closely related Algonkian-speaking Indian tribes in Alberta and Montana, comprising the Pikuni, or Piegan, the Kainah, or Blood, and the Siksika, or Blackfoot proper (often referred to as the

In a Piegan lodge, photograph by Edward S. Curtis, 1910; from *The North American Indian*

Courtesy of the Edward E. Ayer Collection, The Newberry Library, Chicago

Northern Blackfoot). They were among the first Algonkians in the westward movement from timberland to open grassland and probably migrated on foot using wooden travois drawn by dogs to transport their goods. In the early 18th century these tribes were pedestrian buffalo hunters living in the Saskatchewan Valley about 400 miles east of the Rockies. They acquired horses and firearms before 1750. Driving weaker tribes before them, they pushed westward to the Rockies and southward into present Montana. At the height of their power, in the first half of the 19th century, the Blackfoot held a vast territory extending from northern Saskatchewan to the southernmost headwaters of the Missouri.

The Blackfoot were known as the strongest and most aggressive military power on the northwestern plains. For a quarter of a century after 1806, they prevented white men, whom they regarded as poachers on Indian land, from trapping in the rich beaver country of the upper tributaries of the Missouri. At the same time they warred upon neighbouring tribes, capturing horses and taking scalps.

Each Blackfoot tribe was divided into several hunting bands led by one or more chiefs. These bands wintered separately in sheltered river valleys. In summer the scattered bands gathered in a great encampment to observe the Sun Dance, the principal tribal religious ceremony. Many individuals owned elaborate medicine bundles, which they believed would bring success in war and hunting and protection against sickness and misfortune.

For three decades after their first treaty with the United States in 1855, the Blackfoot declined to forsake hunting in favour of farming. When the buffalo were almost exterminated in the early 1880s, nearly one-quarter of the Piegan died of starvation. Thereafter the Blackfoot made some progress as farmers and cattlemen. In the late 20th century more than 6,000 Indians (mostly of Piegan descent) lived on the Blackfeet Indian Reservation in Montana. Fewer than 20 percent of them were full bloods. In addition, there were 2,600 Indians on the Blackfoot, Blood, and Piegan reserves in Alberta.

Blackfoot, city, seat (1885) of Bingham county, southeastern Idaho, U.S., near the

confluence of the Snake and Blackfoot rivers. Founded on the Utah Northern Railroad in 1878, at the northern edge of Fort Hall Indian Reservation (1869), it evolved as the centre of an irrigated agricultural (chiefly potato-growing) area. Development was stimulated by the establishment in 1949 of the National Reactor Testing Station (now Idaho National

rallying ground of two historic English popular rebellions, under Wat Tyler (died 1381) and Jack Cade (died 1450). It is reputed to be the site of England's first game of golf (by James I of Great Britain [1566–1625]), was a notorious haunt of highwaymen, and now serves as a recreational common of 267 acres (108 hectares).

Blackjack, also called B.J., TWENTY-ONE, VINGT-ET-UN, VAN JOHN, and PONTOON, the most popular bank card game. Its origin is disputed, but it is certainly related to the French Ferme and Chemin de Fer and the Italian Seven and a Half. Players hope to get a total card value of 21 or to come closer to it, without going over, than the dealer, against whom all betting is done.

In the noncasino private game, a 52-card deck is used. The dealer, who may be chosen in several ways in a preliminary round of play, declares his limit on bets. Aces count as 1 or 11, at the option of the holder; face (court) cards count 10 each; all others take their number value. The dealer shuffles the deck, and any other player has the right to cut it. The deck is then placed upon an upturned joker, which serves as an indicator card, or, if no joker is available, the dealer exposes the top card and "burns" it by placing it face up at the bottom of the deck; if the top card is an ace, he reshuffles and tries again. Depending on the version of private play, bets may be placed before the deal; after each player has been dealt one card face down; or after each player has received two cards face down and the dealer has exposed one of his cards. If a player's first two cards total 21 (one must be an ace, the other a 10 or face card), he has a natural, or blackjack, and wins double his bet. If the dealer has a blackjack, he collects the bets, or in some cases double the bets, of every player, except a player with another blackjack, who usually has his bet returned but in some versions of the game must also pay the dealer.

After settling any natural blackjack bets, the dealer offers additional cards to each other player in turn. If a player stands, it means he wants no more cards. If he says "hit me," he receives cards one at a time until he stands or he goes over 21. If the latter occurs, the player loses and pays the dealer immediately.

The dealer, who plays last, also stands or draws additional cards. If he goes over 21, all remaining players are paid their bets. If the dealer stands on, say, 18, he announces "pay 19," because the dealer wins on ties as well as on hands that total less than his. Bets are settled; the collected cards go face up at the bottom of the deck; and a new hand is dealt. The deal passes to the first player not the dealer to receive a blackjack.

Because of the betting advantage in having the deal, casinos assign a permanent dealer to each table, and the players oppose the house. Casino rules differ from those described above: players place bets before receiving cards, blackjacks are paid one and a half times the bet, ties are a standoff, and the dealer stands on counts of 17 or more and draws on 16 or less. The players receive two cards face down; the dealer may use a single deck from the hand or two or four decks from a holder called a shoe.

Blackmore, Sir Richard (b. 1654, Corsham, Wiltshire, Eng.—d. 1729, Boxted, Essex), English physician and writer, physician in ordinary to King William III (who knighted him in 1697 for professional services) and Queen Anne. Though he regarded poetry as merely the entertainment of his idle hours, he wrote four epics in 10 or more books, *Prince Arthur* (1695), *King Arthur* (1697), *Eliza* (1705), and *Alfred* (1723).

To each poem he wrote a preface censuring the lewdness and impiety of modern wits, a subject also treated in his verse *Satyr Against*

Engineering Laboratory), 32 miles (51 km) northwest. Nearby is the site of the original Ft. Hall trading post built in 1834 by the Hudson's Bay Company. Inc. 1907. Pop. (1990) 9,646.

Blackfriars Theatre, either of two separate theatres, the second famed as the winter quarters (after 1608) of the King's Men, the company of actors for whom Shakespeare served as chief playwright and also as a performer. The name of the theatres derives from their location on the site of a 13th-century Dominican (the Black Friars) priory lying within the City of London between the River Thames and Ludgate Hill. The estates of the priory were split up in 1538 at the suppression of the English monasteries under Henry VIII, and in 1576, under Elizabeth I, Richard Farrant, Master of the Children of the Chapel (see children's company), leased part of the buildings along the western side of the priory cloisters so that the Children could present their plays in this "private" theatre before performing them at court. Other children's companies also acted there, until 1584, when the buildings reverted to their owner.

In 1596 another part of the old monastery was bought by James Burbage, who converted it into a theatre. Opposition to the scheme forced him to lease it to children's companies. Richard Burbage, principal actor with the Chamberlain's Company (or Chamberlain's Men, who acted at the Globe Theatre), inherited the second Blackfriars Theatre in 1597, and in 1608 he formed a company of "owners" (called housekeepers) along the lines of that operating at the Globe Theatre. His company of players (by now called the King's Men) played at the Blackfriars during the winter seasons. Shakespeare's later plays were performed there, as were works by Beaumont and Fletcher. The Blackfriars was forced to close on the outbreak of Civil War in 1642. It was demolished in 1655. Its site is today commemorated by Playhouse Yard.

Blackheath, open common and residential area mainly in the Greater London boroughs of Lewisham and Greenwich, about 6 miles (10 km) southeast of the centre of London. Formerly a heath crossed by the Roman Watling Street (now Shooter's Hill), it was the

Wit (1700). These and other writings in prose provoked retorts from Alexander Pope and his friends and earned Blackmore his reputation as “father of the Bathos, and indeed the Homer of it.”

Blackmore, Richard Doddridge (b. June 7, 1825, Longworth, Berkshire, Eng.—d. Jan. 20, 1900, Teddington), English Victorian novelist whose novel *Lorna Doone* (1869) won a secure place among English historical romances.

Educated at Blundell's School, Tiverton, and at Exeter College, Oxford, Blackmore was called to the bar but withdrew because of ill health. He married in 1852 and taught classics for five years. Then, upon receiving a legacy, he bought a property at Teddington and settled down to fruit growing and novel writing. After publishing some poems, Blackmore produced *Clara Vaughan*, a first and fairly successful novel, in 1864 and *Cradock Nowell* in 1866. *Lorna Doone* (1869) was his third. Its popularity grew slowly, until the qualities of this imaginative and exciting tale of Exmoor eventually brought it fame. Blackmore himself, a shy, reserved, but kindly man who was prouder of his peach orchard than of his 14 novels, preferred his *Maid of Sker* (1872).

Blackmun, Harry Andrew (b. Nov. 12, 1908, Nashville, Ill., U.S.—d. March 4, 1999, Arlington, Va.), associate justice of the United States Supreme Court from 1970 to 1994.

Blackmun graduated in mathematics from Harvard University in 1929 and received his law degree from that institution in 1932. He joined a Minneapolis, Minn., law firm in 1934, and while advancing to general partner in the firm he also taught at the St. Paul College of Law (1935–41). In 1950 he became resident counsel for the Mayo Clinic in Rochester, Minn., and held this post until 1959, when he was appointed a judge of the U.S. Court of Appeals by President Dwight D. Eisenhower.

In 1970, after two of his previous nominees had been rejected by the Senate as unqualified, President Richard M. Nixon named Blackmun to the Supreme Court. Blackmun was unanimously confirmed by the Senate and took his seat in June 1970. On the court he joined his close friend from childhood, Chief Justice Warren E. Burger.

Blackmun was most often characterized as a moderate who leaned slightly toward conservatism on some issues. He wrote the court's majority decision in *Roe v. Wade*, the landmark 1973 case in which a woman's right to choose to terminate an unwanted pregnancy was guaranteed under the constitutional right to privacy. The decision established women's right to have abortions without undue restrictive interference from the government.

blackpoll warbler, species of woodwarbler (*q.v.*).

Blackpool, town and unitary authority, geographic and historic county of Lancashire, England, on the Irish Sea coast. It is the largest and most popular resort in the country.

Blackpool's growth has been fairly rapid since the late 18th century, when it was transformed from a small hamlet clustered around a “black pool” into a fashionable sea-bathing centre. Its early popularity is ascribed to the British scientific writer William Hutton, who popularized the health-giving properties of seawater. Its proximity to the Lancashire industrial towns and the introduction of fast railway services spurred Blackpool's rapid 19th-century growth. About 7 miles (11 km) of seafront were laid out along the famous sandy beach. Further attractions included building (1895) the 520-foot (158-metre) Blackpool Tower, a regional landmark modeled on the Eiffel Tower in Paris, and decorating seafront buildings by complicated sets of coloured lights and tableaux.

Piers, golf courses, swimming pools, an ice

The tower (modeled after the Eiffel Tower in Paris) and the beach at Blackpool, Lancashire

rink, a zoological park, and extensive amusement parks help to attract millions of visitors to Blackpool annually, many of them members of working-class families from the industrial regions of the North of England. The borough has also developed as a major British conference and convention centre. Area 17 square miles (43 square km). Pop. (1998 preliminary) 150,500.

Blackrock, Irish CARRAIG DUBH, southeastern suburb of Dublin, Ire., and an administrative part of Dun Laoghaire borough, on Dublin Bay. Blackrock grew substantially in the 18th century as a fashionable bathing resort; it developed further with the opening of the Dublin-Kingstown railway in 1834. Blackrock is now a popular seaside resort. Reminders of its former elegance are the 18th-century Maretimo and Frescati houses. Blackrock College, a boys' school, was founded in 1860. Pop. (1996) Blackrock electoral area, 27,971.

Blackshirt, Italian CAMICIA NERA, plural CAMICIE NERE, member of any of the armed squads of Italian Fascists under Benito Mussolini, who wore black shirts as part of their uniform.

The first squads—each of which was called Squadre d'Azione (“Action Squad”)—were organized in March 1919 to destroy the political and economic organizations of the socialists. By the end of 1920 the Blackshirts were attacking and destroying the organizations not only of socialists but also of communists, republicans, and others, and hundreds of people were killed as the Fascist squads expanded in number. A Fascist convention in Naples on Oct. 24, 1922, provided the pretext for the concentration of armed Blackshirts from all over the country for the famous March on Rome that put Mussolini into power.

Early the next year, on Feb. 1, 1923, the private Blackshirts were officially transformed into a national militia, the Voluntary Fascist Militia for National Security. The black shirt was worn not only by these military Fascists but often also by other Fascists and their sympathizers, especially on patriotic occasions. With the fall of Mussolini in 1943, however, the black shirt and the Blackshirts fell in disgrace.

Blackshirt, a member of the elite corps of the Nazi Party, the SS (*q.v.*).

blacksmith, also called SMITH, or FARRIER, craftsman who fits iron shoes to horses or other hoofed animals, and who fabricates other objects out of iron by hot and cold forging on an anvil or with a power hammer, or by welding and other means. The term blacksmith derives from iron, formerly called “black metal,” and farrier from the Latin *ferrum*, “iron.” The craft has been dying out with a decline in the use of horses for agriculture and transport.

In horseshoeing, the blacksmith first cleans and shapes the sole and rim of the horse's hoof

with rasps and knives, a process painless to the animal owing to the tough, horny, and nerveless character of the hoof. He then selects a U-shaped iron shoe of appropriate size from his stock and, heating it red-hot in a forge, modifies its shape to fit the hoof, cools it by quenching it in water, and affixes it to the hoof with nails.

Blacksmiths also came to be general-purpose repairers of farm equipment and other machinery. The smithy, or blacksmith shop, with its clangour and sparks and neighing hobbled horses, in 19th-century America and later, became a place of fascination for children to visit, as reflected in Henry Wadsworth Longfellow's “The Village Blacksmith.”

Blackstone, Sir William (b. July 10, 1723, London, Eng.—d. Feb. 14, 1780, Wallingford, Oxfordshire), English jurist who was the author of *Commentaries on the Laws of England*, 4 vol. (1765–69), the best known description of the doctrines of English law. The work became the basis of university legal education in England and North America. He was knighted in 1770.

Blackstone, oil painting attributed to Sir Joshua Reynolds; in the National Portrait Gallery, London

By courtesy of the National Portrait Gallery, London

Early life. Blackstone was the fourth and posthumous son of Charles Blackstone, a silk merchant of moderate means. His mother died when Blackstone was 12. He was educated by his uncle Thomas Bigg, a London surgeon, first at the Charterhouse (1730–38) and then at Pembroke College, Oxford, where he read not only the classics but also logic and mathematics. Everything that he wrote shows a wide knowledge of literature and an allusive and elegant literary style.

In 1741 he became a student at the Middle Temple (Inn of Court). In 1743 he was elected a member of All Souls College, Oxford; a year later he became a fellow, and by 1746 he had become a barrister. His practice was not very successful, but in college affairs he at once proved himself an active and efficient man of business, zealous for order and improvement.

In 1750 Blackstone took the degree of Doctor of Civil Law. In July 1753 he decided to retire from his practice and concentrate on the teaching of academic law and legal work in and around Oxford. He had been recorder of Wallingford since 1749 and assessor (that is, judge) of the Chancellor's Court since 1751.

Blackstone had developed a great interest in common law, and in 1753 he began to lecture in that subject. These were the first lectures on English law ever delivered in a university. His listeners were captivated by the lucidity and charm of his style and by the simplicity with

which he presented the subject. Blackstone blurred the difficulties and contradictions of English law. He gave the whole subject an air of completeness and mutual interdependence as if it were a uniform logical system, suppressing or ignoring its archaic aspects and instead acclaiming English law as the embodiment of 18th-century wisdom. He stated his aims in a notice of his lectures dated June 23, 1753:

It is proposed to lay down a general and comprehensive Plan of the Laws of England; to deduce their History; to enforce and illustrate their leading Rules and fundamental Principles; and to compare them with the Laws of Nature and of other Nations.

In 1756 he published *An Analysis of the Laws of England*, a synopsis of his lectures for the guidance of his pupils. In October 1758 Blackstone was elected the first holder of a chair (the Vinerian professorship) of common law. His lectures formed the basis of his *Commentaries*, which were published in four successive volumes between 1765 and 1769.

Public life. For several years Blackstone combined academic life in Oxford with an increasingly active public life in London. In 1759 he resigned the office of assessor of the Chancellor's Court and in 1761 became a bencher (lecturer and supervisor) of the Middle Temple. In March 1761 he was elected member of Parliament for Hindon, in Wiltshire, but with no great enthusiasm on his own part. In May 1761 he married Sarah, daughter of James Clitherow of Boston House, Brentford, and bought Priory Place, Wallingford. In July 1761 he was appointed principal of New Inn Hall, and in 1763 he became solicitor general to the queen. Blackstone decided to leave academic life after his proposal to convert New Inn Hall into a specialized college of common law was rejected. In 1766 he resigned both his chair and his headship of the hall.

Blackstone sat in the House of Commons for nine years as member of Parliament for Hindon (1761–68) and for Westbury (1768–70). He was not a zealous politician. He described himself as “amid the Rage of contending Parties, a Man of Moderation.” He was not a particularly successful politician, and he spoke mainly on legal and constitutional questions. The most conspicuous of these was the Middlesex election of 1769, when he supported the expulsion of the political reformer John Wilkes from the House of Commons. His opinion on this controversy was attacked as being inconsistent with the legal principles he enunciated in his *Commentaries*.

In 1770 Blackstone refused the office of solicitor general but accepted that of judge of the Common Pleas. In the 10 years of his judgeship he administered the law satisfactorily but attained no special distinction. Toward the end of the 1770s his health failed; he died in February 1780 and was buried, by his wish, in St. Peter's Church.

Assessment. Blackstone was a good judge but a better commentator. The *Commentaries* is a systematic, clear, and elegant description of the state of English law in the middle of the 18th century. It had an immediate and outstanding success. In England and America the *Commentaries* became the basis of university legal education.

Blackstone was by no means a scientific jurist. He had only the vaguest possible grasp of the elementary conceptions of law. He evidently regarded the law of England as the rules of action or conduct imposed by a superior power on its subjects. He propounds the doctrine that municipal laws derive their validity from their conformity to the so-called law of nature, or law of God. “No human laws,” he says, “are of any validity if contrary

to this.” His fundamental distinction between the rights of persons and the rights of things, implying as it did that things as well as persons have rights, is attributable to a misunderstanding of the technical terms of the Roman law. In distinguishing between private and public wrongs (civil injuries and crimes) he fails to understand the true principle of the division. By his tendency to substitute loose literary phrases for precise and closely defined terms he falls occasionally into irreconcilable contradictions. Even in discussing a subject of such immense importance as equity, he hardly discriminates between the legal and popular senses of the word, and, from the small place which equity jurisprudence occupies in his arrangement, he would scarcely seem to have realized its true position in the law of England. Subject, however, to these strictures, the completeness of the treatise, its serviceable if not scientific order, and its powerful and lucid exposition demand recognition. Blackstone's defects as a jurist are more conspicuous in his treatment of the underlying principles and fundamental divisions of the law than in his account of its substantive principles.

Blackstone did not confine himself to the work of a legal commentator. It was his business, especially when he touched on the framework of society, to find a basis in history and reason for all the most characteristic English institutions. There is not much either of philosophy or fairness in this part of his work, and Blackstone generally shows himself to be a specious defender of the existing political and social order.

Contemporary criticism of the *Commentaries* was directed not against the book as a whole but against particular points. Blackstone's view that dissent, in law, remained a crime was particularly criticized. The most damaging criticism came near the end of Blackstone's life and had its greatest effect after his death. This was the philosopher Jeremy Bentham's attack on him as an “enemy of reformation,” an attack which was basically that of a dogmatic legal reformer upon a historical expositor of the law. But Blackstone was not necessarily a defender either of the status quo or of vested interests. He certainly believed that the constitution was “wisely contrived,” but he was aware that it had faults. Passages in the *Commentaries* could well have been quoted in favour of parliamentary reform—the statement that there might be “a more complete representation of the people,” and the disapproval of influence and of rotten boroughs, for example.

But it would be absurd to expect the *Commentaries* to be primarily a plea for reform. Its purpose, like that of the lectures it is based on, is to explain and describe. Blackstone's description of the law as it existed was accurate and comprehensive and was of great use to those who wished to reform it. His description of the constitution was much more in keeping with the facts than some of his critics allowed; his statement of the sovereignty of Parliament and his recognition of the implications of sovereignty went beyond those of all predecessors. Having said this, it is still undeniable that the *Commentaries'* merit as a work of literature easily outweighs its value as a treatise on government. It is written in an allusive and elegant style and its language is simple and clear. Whether because of its literary qualities or its flattery of public prejudices, the influence of the book in England was extraordinary. It was accepted as an authoritative revelation of the law, and it performed for the educated classes in England much the same service as was rendered to the people of Rome by the publication of their previously unknown laws. It is more correct to regard it as a handbook of the law for laymen than as a legal treatise; and as the first book of the kind in England it was received with somewhat indiscriminating reverence. To this day Blackstone's criticism

of the English constitution probably expresses the most profound political convictions of the majority of the English people.

The fame of Blackstone in the 19th century was greater in the United States than in Blackstone's native land. After the American Revolution the *Commentaries* was the chief source of the knowledge of English law in the American republic. A book that in the old country was a textbook became in the new an oracle of law. The results of this transposition were not always good, but, fortunately, living law in America was being shaped through local institutions, and the country's legislators and judges were practical men in spite of the *Commentaries*. By the later 19th century American legal scholars had begun to escape from Blackstone's influence, and by the mid-20th century few Americans had read Blackstone even as a classic. Nevertheless, Blackstone is a symbol American lawyers remember.

BIBLIOGRAPHY. James Clitherow, preface to *Reports of Cases Determined in the Several Courts of Westminster-Hall from 1746 to 1779, Taken and Compiled by Sir W. Blackstone*, 2 vol. (1781), the basic account of Blackstone's life, written by his brother-in-law; William S. Holdsworth, *A History of English Law*, vol. 12 (1938), a full account of Blackstone's career and an assessment of the *Commentaries*; Harold G. Hanbury, *The Vinerian Chair and Legal Education* (1958), contains chapters on Blackstone, the *Commentaries*, and minor works; W. R. Ward, *Georgian Oxford: University Politics in the Eighteenth Century* (1958), gives an account of Blackstone's part in Oxford politics; for references to Blackstone's constitutional ideas, see B. Kemp, *King and Commons, 1660–1832* (1957).

Blackstone River, river rising in south central Worcester County, Mass., U.S., and flowing generally southeast past Worcester city and Northbridge, Mass.; it continues across the northeast corner of Rhode Island, past Woonsocket, Central Falls, and Pawtucket, where it becomes the Seekonk River (*q.v.*). In its course of about 50 mi (80 km), the Blackstone furnishes power to a highly industrialized region. It was named for William Blackstone, first white settler in what is now Cumberland, R.I.

blackthorn, also called SLOE (*Prunus spinosa*), spiny shrub, of the rose family (Rosaceae), native to Europe but cultivated in other regions. The name is also applied to *Crataegus calopendron* (or *C. tomentosa*), commonly called pear haw, another shrub or

Blackthorn (*Prunus spinosa*)
G. R. Roberts

small tree of the rose family. *P. spinosa* usually grows less than 3.6 metres (12 feet) tall and has numerous, small leaves. Its dense growth makes it suitable for hedges. The white flowers, about 2 centimetres (0.8 inch) in diameter, appear before the leaves. The bluish-black, tart-flavoured fruit is about 2 cm in diameter and is used to flavour sloe gin.

blacktip shark, any of several shark species in the family Carcharhinidae. See carcharhinid.

Blackton, J(ames) Stuart (b. Jan. 5, 1875, Sheffield, Yorkshire, Eng.—d. Aug. 13, 1941, Hollywood), British-born U.S. film director and producer who introduced animation and other important film techniques that helped

shape and stimulate the development of cinematic art.

While interviewing Thomas A. Edison in 1895, Blackton's interest in films was so aroused that in the following year he and Albert E. Smith established Vitagraph; in 1899 they were joined by William T. Rock. Their first film, *The Burglar on the Roof* (1897), was followed by a long series of film successes that made Blackton a millionaire. He left Vitagraph for a while but returned to work for the company until it was sold in 1926 to Warner Brothers.

Blackton's motion-picture adaptations of Shakespeare's dramas were the first such produced in the United States. Many other of his films were centred on such well-known characters as Sherlock Holmes, Oliver Twist, Salome, Richelieu, Moses, and Saul and David. After losing his fortune in the economic depression of 1929, Blackton supported himself by exhibiting his old films at sideshows.

Blackwater, town, central Queensland, Australia. It lies along the Capricorn Highway, 100 miles (160 km) west of Rockhampton. The explorer Ludwig Leichhardt noted the presence of coal in the area in 1844-45; the town was laid out in 1886 and given its name because of the dark colour of the local waterholes, but until 1962 its population remained at about 25. In that year, the first of several seams of coking coal was discovered, and the Utah Development Company commenced mining about 15 miles (24 km) south of the town. Beef cattle are also grazed in the area. Pop. (1996) 5,931.

Blackwater, River, Irish AN ABHAINN MHÓR, river rising in the uplands on the border of Counties Cork and Kerry, Ireland, and flowing 104 miles (167 km) to the sea at Youghal, County Cork. In its upper course the Blackwater flows between uplands and a sandstone ridge with summits above 2,200 feet (670 m). East-west lines of hills mark the entire upper course of the Blackwater, and so for most of its

River Blackwater near Youghal, County Cork
Claude Jacoby

length the river flows west to east; but at Cappoquin, County Waterford, it suddenly turns southward and flows for the last 15 miles (24 km) of its course across the Drum Hills and the Youghal and Clashmore anticlines. Above Cappoquin the river's broad valley is characterized by pastures, woodlands, and large estates. Below Cappoquin the river cuts across the grain of the land in a series of gorges and depressions. The Blackwater is noted for its trout and salmon fishing.

Blackwater, River, Irish AN ABHAINN MHÓR, river in Northern Ireland, rising in the up-

lands near the Dungannon Fermanagh district boundaries and fed by a network of small streams northeast of a drainage divide near Fivemiletown. The river flows northeast through southern Dungannon district and then turns southeast, forming part of the border with the Republic of Ireland. West of Tynan it turns northeast again and flows across the Moy-Caledon lowland and the central lowland to enter Lough (lake) Neagh, after a course of 50 miles (80 km). Immediately south of Lough Neagh, drumlins (oval mounds of glacial till) provide the only sites that are normally dry in an area subject to flooding.

blackwater fever, also called MALARIAL HEMOGLOBINURIA, one of the most dangerous complications of malaria. It occurs almost exclusively with infection from the parasite *Plasmodium falciparum*. Blackwater fever has a high mortality. Its symptoms include a rapid pulse, high fever and chills, extreme prostration, a rapidly developing anemia, and the passage of urine that is black or dark red in colour (hence the disease's name). The distinctive colour of the urine is due to the presence of large amounts of hemoglobin, released during the extensive destruction of the patient's red blood cells by malarial parasites. Patients frequently develop anemia because of the low numbers of red blood cells. The presence of blood pigments in the blood serum usually produces jaundice early in the course of the disease.

Blackwater fever is one of the less-common complications of malaria; it is most prevalent in Africa and the Far and Middle East. Non-immune immigrants in heavily endemic areas are frequent sufferers from the complication. Blackwater fever seldom appears until a person has had at least four attacks of malaria and has been in an endemic area for six months. Blackwater fever is treated by whole-blood transfusions and complete bed rest, but even with these measures the mortality remains about 25 to 50 percent.

Blackwell, Alice Stone (b. Sept. 14, 1857, Orange, N.J., U.S.—d. March 15, 1950, Cambridge, Mass.), suffragist and editor of the leading American women's rights newspaper.

Blackwell was the only child of Henry Blackwell and Lucy Stone, noted Abolitionists and

women's rights advocates, and was also the niece of the feminist leaders Elizabeth Blackwell and Antoinette Brown Blackwell. Alice Blackwell graduated from Boston University in 1881. From 1882 to 1917, she was an editor of the *Woman's Journal*, the major newspaper of the suffragist movement. She is credited with the merging of the two rival suffrage organizations—the National and the American Woman Suffrage associations—into one unified group in 1890. She then served for nearly 20 years as secretary of the National American Woman Suffrage Association.

Her publications include, with Anna Howard

Shaw and Lucy E. Anthony, *The Yellow Ribbon Speaker* (1890), *Lucy Stone, Pioneer in Women's Rights* (1930), and translations of poems into English from 10 languages, including Armenian, Russian, and Yiddish.

Blackwell, Antoinette Brown, née BROWN (b. May 20, 1825, Henrietta, N.Y., U.S.—d. Nov. 5, 1921, Elizabeth, N.J.), first woman to be ordained a minister of a recognized denomination in the United States.

Antoinette Brown studied theology at Oberlin College (Ohio) and, while there, organized, with Lucy Stone, the first debating society for college women. Although she completed her courses in 1850, she was not allowed to graduate officially because of her sex. In 1853 she was ordained minister of a Congregational church in Wayne County, N.Y., becoming the first woman minister in America and eliciting nationwide controversy. The next year, however, she resigned her pulpit because of theological differences with the congregation; she later became a Unitarian minister and served a church in Elizabeth, N.J.

Brown also was known as a lecturer on topics of abolition, temperance, and women's rights. In 1856 she married Samuel Charles Blackwell, a businessman who supported her activities. She was a prolific writer, contributing to the *Woman's Journal*, a suffrage periodical, and writing several books on evolution, feminism, and religion. Her works include *Shadows of Our Social System* (1855), *The Sexes Throughout Nature* (1875), and *The Making of the Universe* (1914).

Blackwell, Elizabeth (b. Feb. 3, 1821, Counterslip, Bristol, Gloucestershire, Eng.—d. May 31, 1910, Hastings, Sussex), Anglo-American physician who is considered the first female doctor of medicine in modern times. She was the first woman to gain the M.D. degree from a medical school in the United States, graduating in 1849 from the Geneva (N.Y.) Medical College (forerunner of Hobart College).

The Blackwell family immigrated to New York in 1832. When her father died in 1838, she and her sister helped to support the family by establishing a boarding school for girls. She began her medical education by reading medical books and later had private instruction from Samuel H. Dickson, of the Charleston (S.C.) Medical College. Medical schools in New York and Pennsylvania rejected her applications for formal study until, in 1847, she was accepted at the Geneva Medical College. Although she suffered social ostracism by her fellow students and the public, she graduated at the head of her class in 1849.

After graduate studies at St. Bartholomew's Hospital, London, and on the Continent, she practiced in New York City, where in 1857, in spite of much opposition, she established the New York Infirmary, a hospital staffed entirely by women. Later she founded a full course of medical education for women there. In 1869 Blackwell moved to England, where she was a founder of the London School of Medicine for Women.

Blackwell, John, pseudonym ALUN (b. 1797, Mold, Flintshire, Wales—d. May 19, 1840, Cardigan, Cardiganshire), poet and prose writer, regarded as the father of the modern Welsh secular lyric.

While an apprentice shoemaker, he began attending meetings of the Cymreigyddion, an organization of Welshmen in London dedicated to preserving ancient Welsh literature, and he competed at eisteddfodau (poetic assemblies). With financial help from friends he attended the University of Oxford, graduating in 1828, in which year his elegy to Bishop Heber won the prize at the Denbigh eisteddfod. In 1833 Blackwell became rector of Maenordeifi, Pem-

brokeshire, and in 1834–35 he was editor of a Welsh magazine, *Y Cylchgrawn*. His collected works were published as *Ceinion Alun* (1851).

Blackwood, Algernon Henry (b. March 14, 1869, Shooters Hill, Kent, Eng.—d. Dec. 10, 1951, London), British writer of tales of mystery and the supernatural.

After farming in Canada, operating a hotel, mining in the Alaskan goldfields, and working as a newspaper reporter in New York City, experiences that he recalled in *Episodes Before*

Algernon Blackwood, 1948
Tom Blau from Camera Press

Thirty (1923), Blackwood returned to England in 1899. Seven years later he published his first book of short stories, *The Empty House* (1906), and became a full-time fiction writer. Later collections include *John Silence* (1908), stories about a detective sensitive to extrasensory phenomena, and *Tales of the Uncanny and Supernatural* (1951), 22 stories selected from his nine other books of short stories.

In his later years Blackwood achieved a wide audience as a teller of ghost tales on British radio and television.

Blackwood, Frederick Temple Hamilton-Temple-: see Dufferin and Ava, Frederick Temple Hamilton-Temple-Blackwood, 1st marquess of.

Blackwood, William (b. Nov. 20, 1776, Edinburgh—d. Sept. 16, 1834, Edinburgh), Scottish bookseller and publisher, founder of the publishing firm of William Blackwood and Sons, Ltd.

William Blackwood, detail of an oil painting by Sir William Allan; in a private collection

By courtesy of William Blackwood & Sons Ltd.

After learning antiquarian bookselling, Blackwood set up a business in Edinburgh in 1804. By 1810 he was acting in Scotland for

several London publishers and publishing on his own account. In 1816 he brought out Walter Scott's *Tales of My Landlord*. In 1817 he founded the *Edinburgh Monthly Magazine*, later called *Blackwood's Edinburgh Magazine*, and from 1905 called *Blackwood's Magazine*. Established as a Tory counterweight to the Whiggish *Edinburgh Review*, it quickly gained notoriety with its satire on the Edinburgh Whigs and attacks on the Cockney school of poets, as it chose to designate Leigh Hunt and his circle; it also gained circulation by publishing stories, poems, and serialized novels. Later the magazine became less controversial and exercised a wide and steady literary influence. Scott, James Hogg, and Thomas De Quincey were among its early contributors.

Blackwood was succeeded by his sons Alexander (1806–45), Robert (1808–52), and John (1818–79). They added a London office to the business in 1840 and an Edinburgh printing office in 1847. After them the conduct of the firm passed, in turn, to William Blackwood (1836–1912), George Blackwood (1876–1942), James Blackwood (1878–1951), and George Douglas Blackwood (b. 1909), great-great-grandson of the founder. After the mid-19th century, the magazine published serially and then in book form works by George Eliot, Edward Bulwer-Lytton, Charles Lever, Anthony Trollope, and Joseph Conrad.

bladder, membranous sac in animals that serves as the receptacle of a fluid or gas. *See* gallbladder; swim bladder; urinary bladder.

bladder cancer, disease characterized by the growth of malignant cells within the urinary bladder, the organ responsible for storing urine prior to elimination. Bladder cancer can be associated with cancer of the kidneys, ureters, or urethra.

Over 90 percent of bladder cancers are transitional cell carcinomas, or cancers of the cells lining the bladder, ureters, and urethra. The exact causes are largely unknown, but both genetic and environmental factors are responsible. In the United States bladder cancer is three times as likely to affect men as women, and whites are twice as likely to be affected as blacks. The most significant risk factor associated with bladder cancer is smoking; carcinogens (cancer-causing agents) are absorbed through the lungs into the bloodstream, where they are filtered out by the kidneys and enter the urinary tract. An environmental risk is presented by a class of organic chemicals called arylamines. People who work in the leather, rubber, printing, and textiles industries or with large quantities of paint are often exposed to these chemicals and should exercise caution in their use.

As with many cancers, advanced age is a risk factor, and most bladder cancers are diagnosed after the age of 60. Chronic bladder inflammation, such as that caused by recurrent bladder infections, is a risk factor, as are rare, inherited birth defects related to the development of the bladder.

The symptoms of bladder cancer are nearly identical to those of urinary tract infections and other diseases of the urogenital system. These symptoms include blood in the urine, difficulty urinating, excessive urination, or, more rarely, painful urination. In cases of suspected cancer, a urine sample or bladder washing is examined for the presence of abnormal cells, and the bladder can be examined visually, using a flexible tube called a cystoscope. The cystoscope is also used to take biopsy samples from the bladder or urethra for laboratory analysis. Enhanced X-ray imaging may also be used. In order to determine the degree of metastasis, or spread of the cancer, several imaging methods may be used, such as traditional X rays, computed tomography (CT) scans, or magnetic resonance imaging (MRI).

Once bladder cancer has been diagnosed, its stage is then determined to indicate how far the cancer has progressed. Stage 0 bladder cancer, also called carcinoma in situ, is localized to the inner layer of the urinary bladder. Stage I cancers have spread into the connective tissue beneath the lining, and stage II cancers have progressed into the underlying muscle layer. Stage III bladder cancer has spread completely through the bladder wall and perhaps to nearby reproductive organs such as the uterus or prostate. Stage IV cancer extends to the abdominal wall and has usually spread to nearby lymph nodes; it may also have spread to other organs such as the lungs, liver, stomach, or bone.

When detected early, bladder cancers have a very high five-year patient-survival rate, but the rate is only about 50 percent for those with local metastases. Bladder cancers that are detected late and have spread to distant regions of the body have a very low five-year survival rate.

Surgery is often the first method of treatment. When detected early, small regions of cancerous tissue may be surgically removed through the urethra, using a cystoscope in a procedure called transurethral resection. If the cancer has spread to a large region of the bladder, a cystectomy, or removal of either bladder tissue or the entire bladder, is necessary. In men radical cystectomy usually includes removal of the prostate gland and seminal vesicles, and in women the ovaries, fallopian tubes, and uterus are usually removed.

Bladder cancer may be treated with radiation, using either external beams or surgically implanted radioactive rods or pellets. The side effects of radiation treatment may include vomiting, diarrhea, fatigue, or skin irritations resembling a sunburn. Chemotherapy may also be indicated for treatment of bladder cancers. If the cancer remains localized to the bladder, chemotherapeutic agents may be administered directly through a urinary catheter. If the cancer has spread, systemic chemotherapy will be required, and several side effects of it resemble those of radiation therapy.

Bladder cancer cannot be completely prevented, but the risk of developing the disease can be greatly reduced by not smoking and by avoiding or reducing exposure to arylamines. People with uncontrollable risk factors such as advanced age or a personal history of bladder cancer should be aware of the early symptoms and see their physicians regularly.

Blaenau Gwent, county borough, southeastern Wales. It covers an area of deep valleys and plateau uplands on the eastern rim of the historic South Wales coalfield. Blaenau Gwent lies almost entirely within the historic county of Monmouthshire, but the community of Brynmawr in the northeast belongs to the historic county of Brecknockshire.

Situated on the western edge of the gateway region between England and Wales, the area experienced significant Norman influence during the 11th and 12th centuries, and many castles with characteristics similar to those of the nearby Welsh Marches (border country) were erected. In 1839 Chartists (agitators for parliamentary reform) held a secret meeting at Nantyglo in the north and decided to march on nearby Newport. The attack was poorly planned; the Chartists walked into a trap and their leaders were arrested.

Blaenau Gwent, traditionally a coal-mining and steel-working region, has suffered serious economic decline in the mid-20th century as funds and industry were diverted south to the coastal areas fronting the Bristol Channel. Ebbw Vale, the administrative centre of the county borough, first developed as a coal-

mining centre in the 18th century and subsequently turned to steel. The faltering steelworks were subsidized by the government in 1935 to retain jobs but closed down in 1978. The town of Abertillery likewise experienced the growth and decline of the coal trade and since the 1930s has received economic aid from the government. Newer industries include the manufacture of nylon, textiles, electronics, and foodstuffs. Brecon Beacons National Park provides varied recreation opportunities. Area 42 square miles (109 square km). Pop. (1998 est.) 72,000.

Blagoevgrad, town, southwestern Bulgaria, in the Struma River valley. An ancient Thracian settlement, Scaptopara, existed around its warm mineral springs, which still serve as a spa. During the Turkish occupation (1396–1878), the town was called Dzhumaya (Džumaja), later Gorna Džumaya; it was renamed in 1950 for Dimitŭr Blagoev, founder of the Bulgarian Communist Party. The chief centre of Bulgarian Macedonia, it trades mostly in Oriental tobacco. Pop. (2001) 71,361.

Blagoveshchensk, also spelled BLAGOVESHČENSK, city and administrative centre, Amur oblast (province), far eastern Russia. It lies at the confluence of the Amur and Zeya rivers. Founded in 1856 as a fort, Blagoveshchensk has become a major centre of the Russian Far East, with good communications by the navigable Amur River, a connection to the Trans-Siberian Railroad, and several motor roads. Industries include food processing, timber working, and the making of gold-mining machinery, electrical apparatus, and woollens. Pop. (1999 est.) 220,900.

Blaine, James G., in full JAMES GILLESPIE BLAINE (b. Jan. 31, 1830, West Brownsville, Pa., U.S.—d. Jan. 27, 1893, Washington, D.C.), Republican politician and diplomat for 25 years (1868–93), who was influential in launching the Pan-American Movement.

James G. Blaine, photograph by Mathew Brady
By courtesy of the Library of Congress, Washington, D.C.

Blaine graduated from Washington (now Washington and Jefferson) College in Washington, Pa., in 1847 and then taught school for the next six years. He moved to Augusta, Maine, in 1854 to become editor and part owner of the *Kennebec Journal*, a crusading Republican newspaper. In 1856 he attended the first national convention of the newly organized Republican Party. He was elected to the U.S. House of Representatives in 1862. After the Civil War, he favoured a moderate Reconstruction policy, although he was a strong advocate of African-American suffrage.

In 1868 Blaine was elected speaker of the House, where his eloquence and leadership won him a devoted body of followers. His name was offered for nomination at the National Republican Convention of 1876, but he lost to Rutherford B. Hayes.

Immediately after the election Blaine was appointed to the Senate to fill a vacancy, and he soon won election to a full term. In 1880 he again lost a bid for the presidential nomina-

tion, and, on the election of James A. Garfield (*q.v.*), he resigned his Senate seat to become secretary of state. In this office he envisaged a system of inter-American arbitration to relieve tensions and strengthen the Monroe Doctrine, and in 1881 he revived the idea—conceived earlier in the century—of calling an inter-American conference to consider an arbitration plan designed to prevent wars in the Western Hemisphere. This idea marked the beginning of the Pan-American Movement. The assassination of President Garfield (1881), however, brought Blaine's resignation, and his Pan-American Conference was shelved.

Blaine finally won nomination for the presidency in 1884, only to lose by an extremely narrow margin to the Democratic candidate, Grover Cleveland (*q.v.*), after an especially virulent campaign. By 1889 the Republicans were back in power, and Blaine again became secretary of state. As such, he assumed the chairmanship of the first Pan-American Conference, which had been authorized by Congress the previous year. The recommendation of separately negotiated reciprocity treaties was the only positive action of the conference. He resigned as secretary of state in June 1892.

Blair, Bonnie, in full BONNIE KATHLEEN BLAIR (b. March 18, 1964, Cornwall, N.Y., U.S.), speed skater who became the most successful American woman athlete in Olympic competition. She dominated the sprint events at three Olympic Games (1988, 1992, and 1994), winning five gold medals and one bronze.

Blair came from a family of avid skaters and began racing when she was four years old. She first gained acclaim by winning the world short-track title in 1986 at Chamonix, Fr. She won the world sprint championship in 1989 and 1994 and captured the World Cup 500- and 1,000-metre titles in 1994 and 1995. After failing to win a medal at the 1984 Games in Sarajevo, Yugos. (now in Bosnia and Herzegovina), Blair earned a gold in the 500-metre event and a bronze in the 1,000-metre event at the 1988 Games in Calgary, Alta., Can. At the 1992 Games in Albertville, Fr., she won gold medals in the 500- and 1,000-metre competitions, a feat that she repeated at the 1994 Games in Lillehammer, Nor.

©Allsport USA/Vandystadt/Yann Guichaoua

Blair was small for a speed skater, and her technique was nearly flawless. She was an exceptionally consistent skater, able to maintain an accentuated crouch and a smooth rhythm throughout a race.

Blair, Francis P., in full FRANCIS PRESTON BLAIR (b. April 12, 1791, Abingdon, Va.,

U.S.—d. Oct. 18, 1876, Silver Spring, Md.), journalist and Democratic politician who helped form the Republican Party in the 1850s in an effort to stem the expansion of slavery.

A loyal supporter of the Democratic leader Andrew Jackson, Blair established in 1830 the Washington *Globe*, a party organ, and also published the *Congressional Globe*. He was a political journalist of the first rank and a member of the "Kitchen Cabinet" during Jackson's presidency (1829–37). Although a slaveholder, as an expansionist, he opposed the extension of slavery and in 1848 supported the Free-Soil presidential candidate, Martin Van Buren. One of the founders of the Republican Party, he assisted materially in Abraham Lincoln's nomination in 1860 and became an influential adviser in Lincoln's administration. The president approved Blair's unofficial and unsuccessful mission to negotiate peace at a conference at Hampton Roads, Va., in February 1865. After the war Blair supported President Andrew Johnson's Reconstruction measures, opposed the Radical Republicans, and rejoined the Democratic Party.

Blair, Francis Preston, Jr. (b. Feb. 19, 1821, Lexington, Ky., U.S.—d. July 9, 1875, St. Louis, Mo.), Missouri politician of the antebellum, Civil War, and Reconstruction eras who opposed slavery and secession but later came out against Radical Reconstruction and Negro suffrage.

Francis Preston Blair, Jr.

By courtesy of the Library of Congress, Washington, D.C.

The son of the political journalist of the same name, Blair grew up in Washington, D.C., graduated from Princeton in 1841, and attended law school at Transylvania University, Lexington, Ky. By 1842 he was practicing law with his brother Montgomery in St. Louis.

Blair established the *Barnburner*, the official newspaper of the Free-Soil Party in Missouri. Although a slaveowner himself, he opposed the extension of slavery into the territories on economic as well as moral grounds. He was twice elected to the Missouri legislature and in 1856 won a seat in Congress, the only Free-Soiler from a slave state to do so.

With the onset of the Civil War, Blair was instrumental in preventing Missouri from joining the Confederacy. In 1862 he recruited seven regiments in Missouri and was appointed to the rank of brigadier general.

Back in Congress in 1864, Blair criticized the Radical Republicans and opposed giving blacks the vote, disfranchising Southern whites, and imposing military governments on the states of the defeated Confederacy. After failing to wrest control of the Republican Party in Missouri from Radicals, he switched to the Democratic Party. In 1868 he was the Democratic candidate for vice president.

Blair returned to Missouri where he helped to oust the Radicals from control of the state government. He was chosen to fill an unexpired term in the U.S. Senate (1870–72).

Blair, James (b. 1656, probably Edinburgh, Scot.—d. April 18, 1743), clergyman and founder (1693) of the College of William and Mary, Williamsburg, Va., the second oldest institution of higher learning in the United States.

As first president of the college, Blair proved to be a canny and expert fund raiser, extracting money from people of all ranks and persuasions. He served for 50 years, one of the longest tenures of any university president.

Blair, John (b. 1732, Williamsburg, Va. [U.S.]—d. Aug. 31, 1800, Williamsburg, Va., U.S.), associate justice of the United States Supreme Court (1790–96).

A member of one of Virginia's most prominent landed families and a close friend of George Washington, Blair studied law at the Middle Temple in London and, in 1766, was elected to the Virginia House of Burgesses. He served in the Burgesses until 1770, and then for five years he was clerk of the royal governor's Council.

In 1776 he took part in the convention to frame a constitution for the new commonwealth of Virginia and was elected to the state Privy Council. In 1778 he was elected to the state General Court and later became its chief justice. He subsequently served as a judge of the High Court of Chancery and was a judge of the Court of Appeals when it heard the case of *Commonwealth of Virginia v. Catton* in 1782. He sided with the majority when it laid down the principle that a court can annul a law deemed to conflict with the constitution. Blair took part in the Constitutional Convention of 1787 and, in 1789, was appointed by President Washington to the U.S. Supreme Court (taking his oath of office the following year). He was a judicial conservative and served on the court until his retirement in 1796.

Blair, Robert (b. 1699, Edinburgh, Scot.—d. Feb. 4, 1746, Athelstaneford, East Lothian), Scottish poet remembered for a single poem, *The Grave*, which was influential in giving rise to the graveyard school (*q.v.*) of poetry.

The Grave (1743), a long, uneven poem in blank verse, is a reflection on human mortality in mortuary imagery. Though it appeared a year after Edward Young's *The Complaint: Or, Night-Thoughts on Life, Death, & Immortality*, it is apparently uninfluenced by that work but reflects the general tendency to exploit sensibility and pathos that coexisted peacefully with 18th-century Rationalism.

Blair, Tony, in full ANTHONY CHARLES LYNTON BLAIR (b. May 6, 1953, Edinburgh, Scot.), British Labour Party leader who became prime minister in 1997.

Blair graduated from St. John's College of the University of Oxford in 1975 and was called to the bar the following year. He became increasingly involved in Labour Party politics and in 1983 was elected to the House of Commons.

Entering Labour's shadow cabinet in 1988, Blair became the most outspoken of those party leaders calling for Labour to move to the political centre and to deemphasize its traditional advocacy of state control and public ownership of certain sectors of the economy. In 1992 Blair was appointed shadow home secretary. In May 1994 Blair was elected the new leader of the Labour Party. By mid-1995 he had overcome opposition from traditional and left-wing members to obtain unprecedented changes in the party's platform, including commitments to free enterprise, anti-inflationary policies, aggressive crime prevention, and support for Britain's integration into the European Union. Under his leadership, "New Labour," as Blair described the reformed party, won a landslide victory over the Con-

servatives in the general election of May 1997. Blair enjoyed a 179-seat majority in the House of Commons—the largest majority of any party since 1935. He became the youngest prime minister since 1812.

His government carried out several reforms that had been promised in the party's manifesto but also accepted some Conservative policies that had been implemented in the previous 18 years. His first major initiative granted the Bank of England the power to determine interest rates without government consultation—a policy that had not appeared in the party's platform. His government also immediately signed the Social Chapter of the Treaty on European Union and turned its attention to brokering a peace agreement between republicans and unionists in Northern Ireland. Blair initiated reforms in the House of Commons, modernizing the format of "Prime Minister's question time," during which the prime minister answers questions from members of Parliament. During his first year in office, he organized referenda that created devolved assemblies in Scotland and Wales and developed a joint committee to coordinate constitutional and other policies with the opposition Liberal Democrats.

In May 1998 Blair led a successful referendum campaign to create a new assembly for London and to establish the city's first directly elected mayor. That year he also helped to negotiate the Belfast Agreement, which was ratified overwhelmingly in both Ireland and Northern Ireland and which created an elected devolved power-sharing assembly in Northern Ireland for the first time since 1972. Blair eliminated all but 92 of the House of Lords' hereditary members as a prelude to more extensive reforms of that chamber. In 2001 he led the Labour Party to a 167-seat majority in the House of Commons—the largest ever second-term majority in British history.

After the September 11 attacks (*q.v.*) on the United States in 2001, Blair committed the military forces of the United Kingdom to a U.S.-led war on the Taliban regime of Afghanistan, which harboured the terrorist network responsible for the attacks. In early 2003, as United Nations weapons inspectors hunted for suspected weapons of mass destruction in Iraq, Blair and U.S. President George W. Bush tried without success to persuade other Security Council members to support a resolution authorizing the disarmament of Iraq by military force. Despite deep divisions within the Labour Party and strong opposition of the British public, Blair, with Bush, led a military coalition that attacked Iraq in March 2003. When military inspectors failed to uncover weapons of mass destruction in the country after the coalition's victory, the Blair government was accused of distorting intelligence on which it had based its claim that Iraq was an imminent threat. Notwithstanding lingering public dissatisfaction with Blair's Iraq policy, he led Labour to its third successive general election victory in May 2005.

Blaise, SAINT, Latin BLASIVS, also called BLAZEY (b. Sebastia, Cappadocia, Asia Minor [now Sivas, Tur.]—d. c. 316, Sebastia?; feast day, Western church, February 3; Eastern church, February 11), early Christian bishop and martyr, one of the most popular medieval saints, solemnly venerated as the patron saint of sufferers from throat diseases.

According to tradition, Blaise was of noble birth and, after being educated in the Christian faith, was made bishop of Sebastia. Although Christianity had been adopted about 300 as the state religion in Armenia, the Roman emperor Licinius began a persecution of the Christians, and Blaise was discovered and apprehended. While imprisoned he miraculously cured a boy from fatally choking. After being torn with wool combers' irons, Blaise was beheaded.

Subsequent legends, notably the apocryphal *Acts of St. Blaise*, claim that before Blaise was made bishop he was a physician possessed of wonderful healing power. Numerous miracles were also attributed to him, including the cure of diseased beasts during his refuge, thus accounting for his also being the patron saint of wild animals. He was venerated as the patron of sufferers from throat diseases in the East by the 6th century and in the West by the 9th century. Devotion to Blaise spread throughout Christendom from the 8th century.

Begun in the 16th century, the Blessing of St. Blaise is a ceremony still practiced and celebrated on his feast day. In the rite a priest will consecrate two candles and either cross them and hold them over the heads of the congregation or touch them against the throats of those present. Sometimes a wick, dipped in consecrated oil, is touched to the throats of the faithful.

Blake, Eubie, byname of JAMES HUBERT BLAKE (b. Feb. 7, 1883, Baltimore, Md., U.S.—d. Feb. 12, 1983, Brooklyn, N.Y.), American pianist and composer of ragtime music and show tunes.

Blake early exhibited a natural aptitude for the keyboard. As a teenager, he played piano in cafés and brothels, and in 1899 he played his first rag, "Sounds of Africa," published in 1919 as "Charleston Rag." His meeting with the lyricist and vocalist Noble Sissle in 1915 resulted in a long association between the two entertainers. They were among the first black performers to appear onstage without minstrel makeup. Their show *Shuffle Along* (1921) was among the first musicals to be written, produced, and directed by blacks. It featured Blake's best remembered song, "I'm Just Wild About Harry," and introduced three entertainers whose later careers would be notable: Paul Robeson, Florence Mills, and Josephine Baker. After Blake and Sissle broke up in 1925, he teamed with lyricist Andy Razaf to write the score to *Blackbirds of 1930*, which contained the popular song "Memories of You."

Blake continued his career as an entertainer, making both piano rolls and records and appearing in concerts. He retired in 1946 but came out of retirement in 1969 to record an album. From then on he resumed performing, giving his last public concert in 1982. *Eubie*, a musical based on his songs, opened on Broadway in 1978. In 1981 Blake was awarded the Medal of Freedom.

Blake, Eugene Carson (b. Nov. 7, 1906, St. Louis, Mo., U.S.—d. July 31, 1985, Stamford, Conn.), churchman and ecumenical leader who was a major figure in American Protestantism during the 1950s and '60s.

Blake was educated at Princeton University (B.A., 1928) and Princeton Theological Seminary (Th.B., 1932). He held Presbyterian pastorates in New York City, in Pasadena, Calif., and elsewhere from 1932 to 1950. Blake served as president of the National Council of Churches from 1954 to 1957. He was stated clerk, or executive director, of the General Assembly of the Presbyterian Church in the U.S.A. and its successor group, the United Presbyterian Church in the U.S.A., from 1951 to 1966. He served as general secretary of the World Council of Churches from 1966 to 1972.

Blake was a talented administrator and organizer, but he was best known for his controversial and progressive stands on major church issues. He was a major advocate of church unity, and in 1960 he called for the unification of several major Protestant denominations into a single Protestant church. He also helped win acceptance of the Russian Orthodox church and several other Eastern Orthodox denominations into the World Council of Churches.

Blake, Robert (b. August 1599, Bridgewater, Somerset, Eng.—d. Aug. 7, 1657, at sea off Plymouth, Devon), admiral who, as commander of the navy of Oliver Cromwell's Commonwealth, became one of the most renowned seamen in English history.

The son of a well-to-do merchant, Blake graduated from Oxford University in 1625

Robert Blake, portrait miniature by Samuel Cooper; in the National Maritime Museum, Greenwich, Eng. By courtesy of the National Maritime Museum, Greenwich, Eng.

and in 1640 was elected to the Short Parliament. His staunch Puritanism led him to join the Parliamentary cause against King Charles I at the outbreak of the Civil War in 1642. Soon he won fame as a general by brilliantly defending Lyme, Dorset, in 1644 and by holding Taunton, Somerset, from its besiegers for more than a year (1644–45).

In February 1649 Blake was appointed one of three "generals at sea" to command the navy. Two months later he set out to annihilate the small Royalist fleet of Prince Rupert. When Rupert took refuge with the Portuguese at Lisbon, Blake retaliated by seizing several Portuguese ships. He then pursued Rupert into the Mediterranean Sea and destroyed the Royalist squadron at Cartagena, Spain, in November 1650. The following May, Blake captured the Scilly Isles, off southwestern England, from the Royalists. Shortly thereafter he began to serve on the Council of State. On the outbreak of war between England and the Netherlands in 1652, Blake took command of the fleet in the English Channel, losing only one of the four major engagements he fought with the Dutch admiral Maarten Tromp between May 1652 and June 1653. After peace was concluded with the Dutch in 1654, Cromwell instructed Blake to make English naval power felt in the Mediterranean. Accordingly, the admiral destroyed a fleet of the Barbary pirates at Porto Farina, on the Gulf of Tunis, in April 1655. War broke out between England and Spain a year later, and in April 1657 Blake attacked a Spanish treasure fleet in the bay of Santa Cruz de Tenerife, in the Canary Islands. He totally destroyed the Spanish vessels and the coastal defenses while losing not a single ship. Ill health compelled him to leave for home before the end of the summer. He died one hour before his victorious fleet entered Plymouth Sound.

Blake's "Fighting Instructions" for the improvement of naval operations described in detail the type of battle tactics that were used throughout the next century; he also was responsible for introducing the Articles of War, which became the basis of naval discipline. Biographies include C.D. Curtis, *Blake, Captain at Sea* (1934), and R. Beadon, *Robert Blake* (1935).

Blake, William (b. Nov. 28, 1757, London—d. Aug. 12, 1827, London), English poet, painter, engraver, and visionary mystic whose hand-illustrated series of lyrical and epic poems, beginning with *Songs of Innocence* (1789) and *Songs of Experience* (1794),

form one of the most strikingly original and independent bodies of work in the Western cultural tradition. Blake is now regarded as one of the earliest and greatest figures of Romanticism. Yet he was ignored by the public of his day and was called mad because he was single-minded and unworldly; he lived on the edge of poverty and died in neglect.

Education and early career. Blake was the second of five children; his father was a hosier. William grew up in London and later described the visionary experiences he had as a child in the surrounding countryside, when he saw angels in a tree at Peckham Rye and the prophet Ezekiel in a field. He wanted to be an artist and in 1767, at age 10, started to attend the drawing school of Henry Pars in the Strand. He educated himself by wide reading and the study of engravings from paintings by the great Renaissance masters. In 1772 he was apprenticed to an engraver, James Basire, who taught him his craft very thoroughly. Basire sent him to make drawings of the sculptures in Westminster Abbey, and thus awakened his interest in Gothic art.

On completion of his apprenticeship in 1779 Blake entered the Royal Academy as an engraving student. His period of study there seems to have been stormy. He took a violent dislike to Sir Joshua Reynolds, then president of the Royal Academy, and felt that his talents were being wasted. While still at the Academy he was earning his living by engraving for publishers and was also producing independent watercolours. At this time his friends included a group of brilliant young artists, among them the sculptor John Flaxman and the painter Thomas Stothard. He also came into contact with the painter Henry Fuseli.

On Aug. 18, 1782, Blake married a poor, illiterate girl, Catherine Boucher, who was to make a perfect companion for him. Flaxman introduced him to the Rev. Anthony S. Mathew and his wife, and for a time Blake was one of the chief attractions at their literary parties. Flaxman and Mathew paid for the printing of a collection of verses by their young friend, *Poetical Sketches*. By W.B. (1783). A preface provides the information that the verses were written between Blake's 12th and 20th years. This is a remarkable first volume of poetry, and some of the poems contained in it have a freshness, a purity of vision, and a lyric intensity unequaled in English poetry since the 17th century.

Blake's visits to the Mathews' eventually became less frequent and finally ceased. Nevertheless, in the 1780s he was one of a group of progressive-minded people that met at the house of Blake's employer, the Radical bookseller Joseph Johnson. In about 1787 he wrote the fragment of a prose fantasy called *An Island in the Moon*, in which members of this group are satirized. In 1784, after his father's death, Blake started a print shop in London and took his younger brother Robert to live with him as assistant and pupil. Early in 1787 Robert fell ill and in February he died; and William, who had nursed him devotedly, later said that he had seen Robert's soul joyfully rising through the ceiling. He also said that Robert had appeared to him in a vision and revealed a method of engraving the text and illustrations of his books without having recourse to a printer. This method was Blake's invention of what he called "illuminated printing," in which, by a special technique of relief etching, each page of the book was printed in monochrome from an engraved plate containing both text and illustration: an invention foreshadowed by his friend, George Cumberland. The pages were then usually coloured with watercolour or printed in colour by Blake and his wife, bound together in paper covers, and sold for prices ranging from a few shillings to 10 guineas. Most of Blake's works after the *Poetical Sketches* were engraved and "published" in this way, and so reached only

a limited public during his lifetime; today these "illuminated books," with their dynamic designs and glowing colours, are among the world's art treasures.

The first books in which Blake made use of his new printing method were two little tracts, *There is No Natural Religion* and *All Religions are One*, engraved about 1788. They contain the seeds of practically all the subsequent development of his thought. In them he boldly challenges accepted contemporary theories of the human mind derived from Locke and the prevailing rationalistic-materialistic philosophy and proclaims the superiority of the imagination over other "organs of perception," since it is the means of perceiving "the Infinite," or God. Immediately following these tracts came Blake's first masterpieces, in an astonishing outburst of creative activity: *Songs of Innocence* and *The Book of Thel* (both engraved 1789), *The French Revolution* (1791), *The Marriage of Heaven and Hell* and *Visions of the Daughters of Albion* (both engraved 1793), and *Songs of Innocence and Experience* (1794). The production of these works coincided with the outbreak of the French Revolution, of which Blake, like the other members of the group that met at Johnson's shop, was at first an enthusiastic supporter. Blake significantly differed from other English revolutionaries, however, in his hatred of deism, atheism, and materialism, and his profound, though undogmatic, religious sense.

William Blake, watercolour portrait by John Linnell; in the National Portrait Gallery, London.

Songs of Innocence and Experience. *Songs of Innocence* is Blake's first masterpiece of "illuminated printing." In it the fragile and flowerlike beauty of the lyrics harmonizes with the delicacy and rhythmical subtlety of the designs. *Songs of Innocence* differs radically from the rather derivative pastoral mode of the *Poetical Sketches*; in the *Songs*, Blake took as his models the popular street ballads and rhymes for children of his own time, transmuting these forms by his genius into some of the purest lyric poetry in the English language.

In 1794 he finished a slightly rearranged version of *Songs of Innocence* with the addition of *Songs of Experience*; the double collection, in Blake's own words in the subtitle, "shewing the two contrary states of the human soul." The "two contrary states" are innocence, when the child's imagination has simply the function of completing its own growth; and experience, when it is faced with the world of law, morality, and repression. *Songs of Experience* provides a kind of ironic answer to *Songs of Innocence*. The earlier collection's celebration of a beneficent God is countered by the image of him in *Experience*, in which he becomes the

tyrannous God of repression. The key symbol of *Innocence* is the Lamb; the corresponding image in *Experience* is the Tyger, the subject of the famous poem that stands at the peak of Blake's lyrical achievement:

Tyger! Tyger! burning bright
In the forests of the night;
What immortal hand or eye
Could frame thy fearful symmetry?

The Tyger in this poem is the incarnation of energy, strength, lust, and cruelty, and the tragic dilemma of mankind is poignantly summarized in the final question, "Did he who made the Lamb make thee?" Blake also viewed the larger society, in the form of contemporary London, with agonized doubt in *Experience*, in contrast to his happy visions of the city in *Innocence*. The great poem "London" in *Experience* is an especially powerful indictment of the new "acquisitive society" then coming into being, and the poem's naked simplicity of language is the perfect medium for conveying Blake's anguished vision of a society dominated by money.

Early narrative poems. Blake was experimenting in narrative as well as lyrical poetry at this time. *Tiriel*, a first attempt, was never engraved. *The Book of Thel*, with its lovely flowing designs, is an idyll akin to *Songs of Innocence* in its flowerlike delicacy and transparency. In *Tiriel* and *The Book of Thel* Blake uses for the first time the long unrhymed line of 14 syllables, which was to become the staple metre of his narrative poetry. The fragment called *The French Revolution* is a heroic attempt to make epic poetry out of contemporary history. In *The Marriage of Heaven and Hell* satire, prophecy, humour, poetry, and philosophy are mingled in a way that has few parallels. Written mainly in terse, sinewy prose, it may be described as a satire on institutional religion and conventional morality. In it Blake defines the ideal use of sensuality: "If the doors of perception were cleansed every thing would appear to man as it is, infinite." Blake reverses the tenets of conventional Christianity, equating the good with reason and repression and regarding evil as the natural expression of a fundamental psychic energy. The book includes a famous criticism of Milton and the "Proverbs of Hell," 70 pithy aphorisms that are notable for their praise of heroic energy and their sense of creative vitality. *The Marriage* culminates in the "Song of Liberty," a hymn of faith in revolution, ending with the affirmation that "everything that lives is Holy." In *Visions of the Daughters of Albion* Blake develops the theme of sexual freedom suggested in several of the *Songs of Experience*. The central figure in the poem, Oothoon, finds that she has attained to a new purity through sexual delight and regeneration. In this poem the repressive god of abstract morality is first called Urizen.

Lambeth. All Blake's works of the revolutionary period were produced at a house in Soho in London, where he and his wife went to live shortly after Robert's death. In 1793 they moved south of the Thames to Lambeth. They lived there for seven years, and this, the period of Blake's greatest worldly prosperity, was also that of his deepest spiritual uncertainty. Blake's poetry of this period appears in the so-called "Prophetic books": *America, A Prophecy* (1793), *Europe, A Prophecy* (1794), *The Book of Urizen* (1794), and *The Book of Ahania, The Book of Los, and The Song of Los* (all 1795). In these works Blake elaborates a series of cosmic myths and epics through which he sets forth a complex and intricate philosophical scheme. A principal symbolic figure in these books is Urizen, a spurned and outcast immortal who embodies both Jehovah and the forces of reason and law that Blake

viewed as restricting and suppressing the natural energies of the human soul.

The Prophetic books describe a series of epic battles fought out in the cosmos, in history, and in the human soul, between entities symbolizing the conflicting forces of reason (Urizen), imagination (Los), and the spirit of rebellion (Orc). *America*, illustrated with brilliantly coloured designs, is a powerful short narrative poem giving a visionary interpretation of the American Revolution as the uprising of Orc, the spirit of rebellion. *Europe* shows the coming of Christ and the French Revolution of the late 18th century as part of the same manifestation of the spirit of rebellion. *The Book of Urizen* is Blake's version—or parody—of the biblical Book of Genesis. Here the Creator is not a beneficent, righteous Jehovah, but Urizen, a "dark power" whose rebellion against the primeval unity leads to his entrapment in the material world. The poetry of *The Book of Urizen*, written in short unrhymed lines of three accents, has a gloomy power, but is inferior in effect to the magnificent accompanying designs, which have an energy and monumental grandeur anticipating the quality of those of *Jerusalem*, Blake's most splendid illuminated book. Blake's saga of myths is continued in *The Book of Ahania*, a kind of Exodus following the Genesis of *Urizen*, and in *The Book of Los*. In *The Song of Los* Blake returns to the cosmic theme and brings the story of humanity down to his own time. By this time Blake seems to have reached his spiritual nadir, and his poetry peters out in the last of the Prophetic books. He had lost faith in the French Revolution as an apocalyptic and regenerating force, and was finding his attempt at a synthesis based on the "contraries" of good and evil inadequate as an answer to the complexities of human existence.

Major epics. With *The Song of Los* the experimental period of his poetic career ended: he engraved no more books for nearly 10 years. In 1795 he had been commissioned by a bookseller to make designs for an edition of Edward Young's *Night Thoughts*. He worked on this until 1797, producing 537 watercolour drawings. It seems to have been while he was working on these illustrations that a fresh creative impulse led to the beginning of his first full-scale epic poem. The first draft of the epic, called *Vala*, was begun in 1795. He worked on it for about nine years, during which period he rewrote it under the title of *The Four Zoas*, but never engraved it. It remains a magnificent torso, but the quality of this work's poetry and its thought are obscured by its overly complicated mythological scheme. In spite of the grandeur of individual passages and of the major conception, *The Four Zoas* remains fragmentary and lacking in coherence. It provided the materials out of which Blake constructed his later epics, *Milton* and *Jerusalem*.

In 1800, at the invitation of William Hayley, a Sussex squire, Blake and his wife went to live in a cottage provided by Hayley at Felpham on the Sussex coast. This well-meaning, obtuse dilettante, who had employed Blake to make engravings, regarded his imaginative works with contempt and tried to turn him into a miniature painter and tame poet on his estate. At first Blake was delighted with life in Sussex, but he soon found the patronizing Hayley intolerable. The cottage was damp and Mrs. Blake's health suffered, and in 1803 the Blakes returned to London. Toward the end of his stay at Felpham, Blake was accused by a soldier called Schofield of having uttered seditious words when he had ejected him from his cottage garden. He was tried at the quarter sessions at Chichester, denied the charges, and was acquitted. Hayley gave bail for Blake and employed counsel to defend him. This experience became part of the mythology underlying *Jerusalem* and *Milton*.

It was also probably at Felpham that Blake wrote the most notable of his later lyrical poems, including "Auguries of Innocence," with its memorable opening stanza:

To see a World in a Grain of Sand
And a Heaven in a Wild Flower,
Hold Infinity in the palm of your hand
And Eternity in an hour.

It was at Felpham, too, that he wrote some of his finest letters, many of them addressed to Thomas Butts, a government clerk who was for years a generous and loyal supporter and patron of Blake and who commissioned almost his total output of paintings and watercolours at this period.

In 1804–08 Blake engraved *Milton*. This poem is a comparatively brief epic which deals with a contest between the hero (Milton) and Satan; it too is couched in the prophetic grandeur and obscurity of Blake's invented mythology. Milton's struggle with evil in the poem is a reflection of Blake's own conflicts with the domineering patronage of William Hayley.

Jerusalem is Blake's third major epic and his longest poem. Begun about 1804, and written and engraved soon after the completion of *Milton*, it is also the most richly decorated of Blake's illuminated books, and only a few of its 100 plates are without illustration. Although the details are complex and present many difficulties, the poem's main outlines are simple. At the opening of the poem the giant Albion (who represents both England and humanity) is shown plunged into the "Sleep of Ulro," or the hell of abstract materialism. The core of the poem describes his awakening and regeneration through the agency of Los, the archetypal craftsman or creative man. The poem's consummation is the reunion of Albion with Jerusalem (his lost soul) and with God through his acceptance of Jesus' doctrine of universal brotherhood.

Last years. Blake's life during the period from 1803 to about 1820 was one of worldly failure. He found it difficult to get work, and the engravings that can be identified as his from this period are often hack jobs. In 1809 he made a last effort to put his work before the public and held an exhibition of 16 paintings and watercolour drawings. He wrote a thoughtful *Descriptive Catalogue* for the exhibition, but only a few people attended. But after this long period of obscurity, Blake found in 1819 a new and generous patron in the painter John Linnell, who introduced him to a group of young artists among whom was Samuel Palmer. In his last years Blake became the centre of this group, whose members shared Blake's religious seriousness and revered him as their master.

The most notable poetry Blake wrote after *Jerusalem* is to be found in *The Everlasting Gospel* (1818?), a fragmentary and unfinished work containing a challenging reinterpretation of the character and teaching of Christ. But Blake's last years were devoted mainly to pictorial art. In 1821 Linnell commissioned him to make a series of 22 watercolours inspired by the Book of Job; these include some of his best known pictures. Linnell also commissioned Blake's designs for Dante's *Divine Comedy*, begun in 1825 and left unfinished at his death. These consist of 102 watercolours notable for their brilliant colour. Blake thus found in his 60s a following and support for the imaginative work he had longed to do all his life. As a result, it was in his last years that he produced his most technically assured and beautiful designs. Toward the end of his life Blake still coloured copies of his books while resting in bed, and that is how he died in a room off the Strand in his 70th year. He was buried in an unmarked grave in Bunhill Fields.

Pictorial work. In his painting, as in his poetry, Blake seemed to most of his contem-

poraries to be completely out of the artistic mainstream of their time. But his paintings belong to a recognizable artistic tradition, that of English figurative painting of the later 18th century. Blake was initially influenced by the engravings he studied of the works of Michelangelo and Raphael. He then became deeply impressed with the work of such contemporary figurative painters as James Barry, John Mortimer, and Henry Fuseli, who, like Blake, depicted dramatically posed nude figures with strongly rhythmic, linear contours. Fuseli's extravagant pictorial fantasies in particular freed Blake to distort his figures to express his inner vision.

Throughout his life Blake stressed the pre-eminence of line, or drawing, over colour, commending the "hard wirey line of rectitude." He condemned everything that he felt made painting indefinite in contour, such as painterly brushwork and shadowing. Finally, Blake stressed the primacy of art created from the imagination over that drawn from the observation of nature.

The figures in Blake's many prints and water-colour and tempera paintings are notable for the rhythmic vitality of their undulating contours, the monumental simplicity of their stylized forms, and the dramatic effectiveness and originality of their gestures. Blake's favourite subjects were episodes from the Bible, along with episodes found in the works of Milton and Dante. He also showed himself a daring and unusually subtle colourist in many of his works. His illustrations for the *Book of Job* were done late in life, and they mark the summit of his achievement in the visual arts.

Blakelock, Ralph Albert (b. Oct. 15, 1847, New York, N.Y., U.S.—d. Aug. 9, 1919, near Elizabethtown, N.Y.), American painter

"Moonlight," oil on canvas by R.A. Blakelock, c. 1885; in the Brooklyn Museum, New York
By courtesy of the Brooklyn Museum, Dick S. Ramsay Fund

whose luminous impasto paintings of moonlit scenes convey a mysterious romanticism.

Blakelock graduated from the College of the City of New York in 1867 and was basically self-taught as an artist. He developed a highly original and subjective style of landscape painting as his career progressed. His subjects were almost always forests, often harbouring the Indian encampments that Blakelock had observed during a trip he took to the West in

1869. These forest scenes are notable for the moody interplay of their nocturnal lighting and strangely dappled representations of tree branches and foliage.

Blakelock was neglected by the public throughout his career and was often forced to dispose of his paintings for humiliatingly small sums. Under the strain of continual failure, with his large family in a condition of poverty, Blakelock suffered a breakdown in 1899. He ceased to paint and spent most of the remainder of his life in an asylum. During his confinement his fame burgeoned, and his paintings began to bring high prices. Blakelock's work was extensively forged as his popularity continued to rise throughout the early 20th century.

Blakeslee, Albert Francis (b. Nov. 9, 1874, Geneseo, N.Y., U.S.—d. Nov. 16, 1954, Northampton, Mass.), prominent American botanist and geneticist who achieved world renown for his research on plants.

The son of a Methodist minister, Blakeslee was awarded a B.A., cum laude, from Wesleyan University, Middletown, Conn. (1896). After three years of teaching mathematics and science in a preparatory school, he entered Harvard University (1899) for graduate work. In 1900 he received his M.A. and in 1904 his Ph.D. His doctoral thesis, which was published the same year and entitled "Sexual Reproduction in the Mucorineae," brought him immediate distinction because of his discovery and elucidation of sexuality in the lower fungi.

Until 1914 Blakeslee served as professor of botany at the Connecticut Agricultural College at Storrs, where he continued his experimental work, but with higher plants rather than fungi. In 1915 he took a position as resident investigator in plant genetics at the Carnegie Institution experimental laboratories at Cold Spring Harbor, Long Island, N.Y.; by 1936 he had become director. On his retirement from the Carnegie Institution (1941), Blakeslee was appointed professor of botany at Smith College, Northampton, Mass., where he established the Genetics Experimental Station. His joint work with graduate students and research associates resulted in the publication of a long series of papers on the genetics and cytology of *Datura stramonium*, the jimsonweed. Among other important discoveries, Blakeslee used colchicine to achieve an increase in the number of chromosomes and thus opened up a new field of artificially produced polyploids.

Blakey, Art, also called ABDULLAH IBN BUHAINA (b. Oct. 11, 1919, Pittsburgh, Pa., U.S.—d. Oct. 16, 1990, New York, N.Y.), American drummer and bandleader noted for his extraordinary drum solos, which helped define the offshoot of bebop known as "hard bop" and gave the drums a significant solo status. His style was characterized by thunderous press rolls, cross beats, and drum rolls that began as quiet tremblings and grew into frenzied explosions.

Blakey taught himself to play the piano while he was a teenager and performed on piano (and later drums) in jazz clubs in the evenings while working in the steel mills by day. Beginning in 1939, as a drummer, he performed with several bands, most notably (1944–47) with that of Billy Eckstine. Among the artists he met and performed with during that period were Dizzy Gillespie, Sarah Vaughan, Charlie Parker, Dexter Gordon, and Billie Holiday.

When Eckstine's band broke up, Blakey traveled to Africa, a trip that led to his conversion to Islām. Upon his return to the United States he was hired to play drums on several Blue Note Records recordings with jazz pianist Thelonious Monk. With Horace Silver, Blakey founded the Jazz Messengers (1954), toured Europe, and recorded (1955–61) a brilliant string of records for the Blue Note label. By encouraging young musicians to become

members of the Jazz Messengers, Blakey gave them valuable experience as jazz performers; over the years the ensemble included such notable jazzmen as Clifford Brown, Donald Byrd, Benny Golson, Johnny Griffin, Jackie McLean, Lee Morgan, and Wayne Shorter.

Blakistone Island: see Saint Clement's Island.

Blalock, Alfred (b. April 5, 1899, Culloden, Ga., U.S.—d. Sept. 15, 1964, Baltimore, Md.), American surgeon who, with pediatric cardiologist Helen B. Taussig, devised a surgical treatment for infants born with the condition known as the tetralogy of Fallot, or "blue baby" syndrome.

After graduating from the University of Georgia in 1918 Blalock entered the Johns Hopkins University School of Medicine, from which he received his M.D. degree in 1922. From 1925 to 1941 he was a resident in surgery in the school of medicine of Vanderbilt University. During that time he conducted research on traumatic and hemorrhagic shock; his conclusion that the effects of shock were due to loss of blood volume led to the volume-replacement treatment that was credited with saving countless lives during World War II.

Blalock returned to Johns Hopkins in 1941 as professor and head of the department of surgery in the school of medicine and as surgeon-in-chief of the Johns Hopkins Hospital. In collaboration with Taussig, Blalock devised a procedure known as subclavian-pulmonary artery anastomosis, by which the congenital heart defect that produced the "blue baby" syndrome could be corrected and the patient enabled to lead a nearly normal life. The first such operation was performed by Blalock in 1944.

Blanc, Louis, in full JEAN-JOSEPH-CHARLES-LOUIS BLANC (b. Oct. 29, 1811, Madrid, Spain—d. Dec. 6, 1882, Cannes, Fr.), French utopian socialist, noted for his theory of worker-controlled "social workshops."

Early life. Louis Blanc was born while his father was serving as inspector general of finances in the Spanish regime of Joseph Bonaparte. When that regime collapsed in 1813, the Blancs returned to France. Louis studied at schools in Rodez and Paris. While working as a tutor in northern France, he came in contact with liberal political circles and found employment on a Republican newspaper. In 1837 he became a member of a committee for electoral reform directed by leaders of the opposition to King Louis-Philippe. In 1839 he founded the *Revue du Progrès*. It was in this newspaper that his most important work, *L'Organisation du travail* ("The Organization of Labour"), appeared serially in 1839. The

Blanc
H. Roger Viollet

principles laid down in that essay, which first brought him to public attention, formed the basis of his subsequent career.

Theory of socialism. Blanc believed that the competitive capitalism then developing in France tended to stunt the human personality, pitting one man against another and driving the weaker to the wall. The first step toward a better society would be to guarantee work for everyone by establishing "social workshops" financed by the state. These workshops, controlled by the workers themselves, would gradually take over most production until a socialist society would come into being. Blanc did not believe in human equality. But he did not agree with the followers of the socialist Henri de Saint-Simon, who held that workers should be paid according to their performance; he argued that justice would be satisfied only "when each one in accordance with the law written in some shape in his organization by God Himself, produces according to his faculties and consumes according to his wants."

Politics. In 1843 Blanc joined the committee of *La Réforme*, the journal of the extreme left-wing Republicans. In 1847 he became prominent in the so-called banquets campaign for electoral reform, holding large audiences with his oratory. The culminating banquet, arranged to take place in Paris on Feb. 22, 1848, was banned, but a riot on the following day led to an insurrection and the fall of the monarchy. Blanc became a member of the provisional government of the Second Republic. On Feb. 25, 1848, following a motion by Blanc, the government undertook "to guarantee the livelihood of the workers by work" and "to guarantee work for every citizen." But the government was divided. For the majority the revolution represented a political change in which a monarchy with a restricted franchise was to be replaced by a free democratic republic based upon universal suffrage; for the minority, including Blanc, it also heralded a social and economic transformation.

Although Blanc and his friends were a minority in the government, they had many supporters in the streets; and their colleagues made important concessions to their ideas by reducing working hours, proclaiming the right to work, appointing Blanc chairman of a permanent commission to investigate labour problems, and establishing national workshops to relieve the more acute unemployment. The national workshops were a travesty of those envisaged by Blanc; they were established by his opponents to discredit him and became little more than a gigantic system of outdoor relief. Meanwhile, unemployment grew from 6,100 on March 7 to 118,310 on June 15. The celebrated Luxembourg Commission, of which Blanc had been made chairman, became an arbiter in trade disputes and a centre of socialist propaganda; it was unable, however, to win acceptance of its recommendations for the reorganization of labour and industry.

Exile. Blanc was forced to flee to England after the workers unsuccessfully revolted in June 1848. He did not return to France until the fall of the Second Empire of Napoleon III in 1870. He supported himself during his exile by teaching and lecturing; he wrote a history of the Revolution of 1848 and a history of the French Revolution as well and also a series of books on British political and social conditions.

When he returned to France after 22 years, he was still a famous man and was elected a deputy to the National Assembly. He refused to join in the revolutionary commune that seized control of Paris in the spring of 1871, but after the commune was crushed he sought to obtain a political amnesty for the communards. He remained a man of the left,

although without much following. One of his last speeches in 1881 was in support of a proposal to reduce the length of the working day. (J.Vi.)

BIBLIOGRAPHY. Louis Blanc's principal works are *Histoire de dix ans, 1830-1840*, 5 vol. (1841-44); *The History of Ten Years, 1830-1840*, 2 vol., 1844-45, reprinted 1969), an attack on the government and person of King Louis-Philippe; and *Histoire de la Révolution française*, 12 vol. (1847-62), a political, economic, and social interpretation. Leo A. Loubère, *Louis Blanc: His Life and His Contribution to French Jacobin-Socialism* (1961, reprinted 1980), is a good study combining the biography with a history of socialism in France.

Blanc, Mel, byname of MELVIN JEROME BLANC (b. May 30, 1908, San Francisco, Calif., U.S.—d. July 10, 1989, Los Angeles, Calif.), American entertainer, who created more than 400 unique voices and much of the character of a number of popular radio, television, and motion-picture characters, including voices for the cartoon characters Porky Pig, Woody Woodpecker, Daffy Duck, Yosemite Sam, Tweety Pie, Sylvester the Cat, the French skunk Pepé le Pew, and Bugs Bunny (noted for the catch phrase "What's up, Doc?").

Blanc was interested in music at an early age and became proficient on the bass, the violin, and the sousaphone. In 1933 he joined a daily radio program and used several voices to "provide a cast" for the show. After moving to Los Angeles, Blanc joined Leon Schlesinger Productions, a cartoon workshop that later developed Warner Brothers' Looney Tunes and Merrie Melodies. Blanc's first Warner Brothers voice was that of a drunken bull in 1936. The following year he became the voices of Porky Pig and Daffy Duck, and in 1940 Bugs Bunny (first named Happy Rabbit) made his debut.

During more than 50 years in show business, Blanc provided voices for some 3,000 animated cartoons, and during the 1940s and '50s he was responsible for the voices of 90 percent of the Warner Brothers cartoon stable. In the 1960s he was coproducer of "The Bugs Bunny Show," a Saturday morning television program featuring Looney Tunes characters, and he also provided the voices for Barney Rubble and Fred Flintstone's pet dinosaur, Dino, on "The Flintstones," the first animated situation comedy created for television. In 1988 he resurrected the voices of Bugs Bunny, Daffy Duck, Porky Pig, and others in his repertoire for the animation-live action film *Who Framed Roger Rabbit?* That same year his autobiography, *That's Not All, Folks: My Life in the Golden Age of Cartoons and Radio*, was published.

Blanc, Mont, Italian MONTE BIANCO, mountain massif and highest peak (15,771 feet

[4,807 m]) in Europe. Located in the Alps, the massif lies along the French-Italian border and reaches into Switzerland. It extends southward from Martigny, Switz., for about 25 miles (40 km) and has a maximum width of 10 miles (16 km). The summit is in French territory. Surrounding the massif are the Graian Alps (south), the Chamonix Valley and Savoy Alps (west), the Pennine Alps (north-east), and the Valley of Courmayeur (east). Other principal peaks within the massif include Mont Blanc du Tacul, Mont Maudit, Aiguille ("Peak") du Géant, Les Grandes Jorasses, Mont Dolent, and Aiguille du Midi.

Glaciers cover approximately 40 square miles (100 square km) of Mont Blanc (whence its name, meaning "white mountain"). Ice streams stretch from the central ice dome down to below 4,900 feet (1,490 m). The Mer de Glace (*q.v.*), second longest glacier in the Alps, reached the elevation of 4,100 feet (1,250 m) in 1930. At the beginning of the 17th century, glaciers advanced to the bottom of the Chamonix Valley, destroying or burying cultivated land and dwellings. Since that time, the glaciers have periodically advanced and retreated.

Scientists P. Martel in 1742, Jean A. Deluc in 1770, and, later, Horace Bénédict de Saussure first drew attention to Mont Blanc's distinction as western Europe's highest mountain. That designation stirred adventurers to climb the peak. The summit was conquered in 1786 by Michel-Gabriel Paccard, a doctor from Chamonix, together with Jacques Balmat, his porter. Paccard's achievement, one of the most important in the history of mountaineering, was overshadowed by de Saussure's ascent the year after. Through Marc-Théodore Bourrit, who failed the ascent and, out of jealousy, published a biased account of the first ascent, the myth was started that all credit for the climb was due to the peasant Balmat.

In addition to mountaineers, the number of visitors to Chamonix increased steadily; but until about 1870, when an improved road was opened, it remained an exclusive resort. The region has come to form the largest Alpine tourist centre, with aerial tramways and facilities for winter sports, and its traditional pastoral economy has been completely eclipsed.

Blanchard, Jean-Pierre-François (b. July 4, 1753, Les Andelys, Fr.—d. March 7, 1809, Paris), French balloonist who, with the American physician John Jeffries, made the first aerial crossing of the English Channel. He was also the first to make balloon flights in England, North America, Germany, Belgium, and Poland.

During the 1770s Blanchard worked on the design of heavier-than-air flying machines, notably one based upon a theory of rowing in

Mont Blanc from the Italian side

Ray Manley—Shostal/EB Inc

the air currents with oars and tiller. Following the demonstrations of hot-air-balloon flying by the Montgolfier brothers in Annonay, France, in 1783, Blanchard took up ballooning.

J.-P.-F. Blanchard, engraving by James Newton, 1785, after an oil painting by Richard Livesay
By courtesy of the Library of Congress, Washington, D.C

On March 2, 1784, in Paris, Blanchard made his first ascent. On Jan. 7, 1785, he and Jeffries ascended over Dover, Eng. The two aviators were compelled to heave all cargo overboard except the package of the first international airmail, delivered successfully upon their safe landing in the Felmores Forest, France.

Ever the showman, Blanchard tossed a dog equipped with an experimental parachute over the side of a balloon and later tried parachute jumping himself. He also unsuccessfully tried using sails to add maneuverability and facilitate propulsion in balloons.

After making a number of exhibition flights in Europe, Blanchard made the first balloon flight in North America, on Jan. 9, 1793, when he ascended from the Washington Prison Yard in Philadelphia and landed in Gloucester county, N.J. This flight, observed by President George Washington, spurred interest in ballooning in the United States. Blanchard returned to Europe and, with his wife, Marie, who had also learned to fly balloons, performed many other exhibitions.

Blanchard suffered a heart attack on a flight over The Hague in February 1808 and fell more than 50 feet; he never recovered from the fall. His widow continued flying in balloons, but in 1819 she fell to her death when her hydrogen balloon was ignited during a fireworks display in Paris.

Blanchard, Thomas (b. June 24, 1788, Sutton, Mass., U.S.—d. April 16, 1864, Boston, Mass.), American inventor who made major contributions to the development of machine tools.

Blanchard began as a self-taught tinkerer. As a boy he invented an apple parer and a tack-making machine for his brother's factory. Later he designed a lathe capable of turning both the regular and irregular sections of gun barrels. In 1818, as an employee of the Springfield (Mass.) Arsenal, he invented the lathe that duplicated the form of a pattern object by transmitting to the cutting tool the motion of a friction wheel rolling over the pattern. His lathe was an essential step in the development of mass-production techniques. The success of his device led to piracy of his design, however, and Blanchard spent several years fighting for Congressional renewal of his patent. In 1825 he designed a steam carriage, and later he became interested in railroads but received no encouragement. He then turned to designing shallow-draft steamboats and produced several successful designs.

Blanche of Castile, French **Blanche de Castille**, Spanish **Blanca de Castilla** (b. 1188, Palencia, Castile [Spain]—d. Nov. 12, 1252, Paris, France), wife of Louis VIII of France, mother of Louis IX (St. Louis), and twice regent of France (1226–34, 1248–52),

who by wars and marital alliances did much to secure and unify French territories.

Blanche was the daughter of Alfonso VIII of Castile and Eleanor, who was the daughter of Henry II of England. Her grandmother Eleanor of Aquitaine, queen of England, traveled to Spain to take the 11-year-old Blanche to France, where a marriage treaty was concluded with Louis, the young son of King Philip II Augustus. This politically motivated marriage had been arranged by Blanche's uncle, King John of England, and was celebrated in 1200 at Portsmouth, Hampshire. It represented only a brief truce in the struggle between England and France for control over certain French territories.

Blanche, who became French through marriage, was gradually to become French in spirit as well. Although she did not cease to be concerned for her family, among them her uncle John and his allies, her brother-in-law Ferrand of Portugal, and her cousin Otto of Brunswick (later Holy Roman emperor Otto IV), she rejoiced at the French victory over Otto and the English at Bouvines in 1214, marking the first stage of French unification, a goal for which she was constantly to strive. In the same year, she gave birth to Louis, the future king of France. Upon John of England's death, Blanche boldly tried to seize the English throne: in 1216 Louis of France invaded England on her behalf. The English stood firm against him, and John's nine-year-old son was finally crowned Henry III.

A devout Roman Catholic, Blanche soon became involved in what she sincerely believed to be a holy war against the heretical Cathari, a sect founded on the belief that good and evil had two separate creators, which was flourishing throughout southern France. Her husband, who became Louis VIII in 1223, took part in a crusade against the Cathari but suffered a fatal attack of dysentery upon returning to the north of France in 1226. In accordance with her husband's will, Blanche became both guardian of the 12-year-old Louis and regent of France. She zealously pressed to have Louis crowned immediately, and the coronation took place at Reims three weeks after Louis VIII's death.

Her most pressing problem was to deal with a rebellion of the great barons, organized by Philip Hurepel, the illegitimate son of King Philip II Augustus, and supported by King Henry III of England. In the face of such adversity, Blanche showed herself by turns a delicate diplomat, a clever negotiator, and a strong leader. Dressed in white, on a white palfrey draped in the same colour, she rode into battle at the head of her troops. After an attempted abduction of the young king, Blanche did not hesitate to replace rebel noble associates with commoners if she thought it necessary. She also created local militias. Blanche was gradually able to subdue the revolt, establish a new truce with England, and, in 1229, pacify the south of France by signing the Treaty of Paris with Raymond VII, count of Toulouse. France then entered an era of domestic stability, which saw the construction of many cathedrals throughout the country.

On only one occasion did Blanche fail to exhibit diplomatic conduct. In 1229 a dispute between an innkeeper and some students took place in the Latin Quarter in Paris. The police were summoned, and the students were beaten and thrown into the Seine; such intervention in the Latin Quarter, however, was contrary to the prerogatives granted to the university, and the faculty and students threatened to strike if the university's privileges were not respected. Badly advised, Blanche held firm, but the university closed its doors, and the faculty and students left Paris for the provinces and abroad. It was to take four years and the intervention of the pope before the university would return to Paris with new prerogatives, this time granted by Blanche herself.

Although Louis IX came of age on April 25, 1236, Blanche remained at his side as his most loyal and steadfast supporter. She lacked tact, however, with regard to her son's private life. Although Blanche herself had selected Margaret of Provence to be Louis's wife, she treated Margaret with considerable severity. In 1244, after Louis recovered from a serious illness, he and his wife, much against Blanche's wishes, made a vow to go on a crusade against the Muslims. They embarked in 1248, and once again the kingdom was entrusted to Blanche. Informed of Louis's defeat at Al-Manşūrah, Egypt, and his subsequent imprisonment, Blanche herself went to seek his ransom and that of the French army. She petitioned her parents, her allies, and the pope for funds and supplies, but interest in the crusade had dwindled.

Although weakened by a heart ailment, Blanche did not neglect her obligations as a regent. Continuing to preside over council meetings, she signed laws and watched over the poor of Paris. When some of the poor were mistreated by the cathedral chapter, she herself rode, as formerly, to open the gates to their prison. On her way to the Abbey of the Lys, one of her favourite retreats, Blanche suffered an attack of the heart ailment that was to take her life. She was returned to the palace of the Louvre, dressed in a nun's habit, and laid on a bed of hay. There, after begging forgiveness of all and having received the last sacraments, she died. She was buried at Maubuisson Abbey and her heart taken to the Abbey of the Lys. Louis IX was in Jaffa when he learned of his mother's death. The news distressed him greatly, for he was aware that he had lost not only an incomparable parent but also the strongest supporter of his kingship. (Y.J.)

BIBLIOGRAPHY. Régine Pernoud, *Blanche of Castile* (1975), is the only biography in English.

Blanchet family, family of French instrument makers, settled in Paris. François-Etienne Blanchet (François the Elder; b. c. 1700, Paris, France—d. 1761, Paris) was one of the finest harpsichord builders of the Baroque era (c. 1600–1750).

Nicolas Blanchet (b. c. 1660, Rheims, France—d. 1731, Paris) was the first of the line of instrument makers of the Blanchet family; after 1722 Nicolas and his son François the Elder worked as partners, producing instruments based largely on models of the Ruckers family, the great Flemish harpsichord makers. François's son, François the Younger (b. c. 1730, Paris, France—d. 1766, Paris), succeeded his father. He died at an early age, leaving a widow who later married Pascal Taskin the Elder (b. 1723, Theux, France—d. 1793, Paris), another excellent builder, who continued the family business.

A number of inventories of the Blanchet concern are extant, providing valuable information about the technique of French harpsichord building. A large part of their business was devoted to rebuilding and enlarging earlier instruments, particularly those of the Ruckers. In addition, the Blanchets and Taskins made important improvements in harpsichord construction, so that their workshop flourished. The great-grandson of François the Elder, Nicolas Blanchet, engaged in making pianos to accommodate the demand of the 19th century; he was succeeded in 1855 by his son P.-A.-C. Blanchet. The harpsichord revival of the mid-20th century saw Blanchet and Taskin instruments used as models for new instruments made by leading builders catering to a demand for authenticity and superior tone quality.

Blanding's turtle, also called SEMIBOX TURTLE (*Emys blandingi*), freshwater turtle, family Emydidae, found in southern Canada and the north-central to northeastern United States. The upper shell of Blanding's turtle averages about 20 cm (8 inches) in length; it is smooth, rounded, and elongate with yellow markings on a blackish ground colour. The chin of the turtle is bright yellow; the lower shell is hinged in the centre and can be drawn up to protect the head, legs, and tail.

Blanding's turtle is usually found in ponds, quiet streams, and other shallow bodies of water. Although well adapted to aquatic life, it frequently leaves the water and travels about on land. The diet consists of animals, such as insects and crustaceans, and some vegetation.

Blane, Sir Gilbert, 1ST BARONET (b. August 1749, Blanefield, Ayr, Scot.—d. June 26, 1834, London, Eng.), physician known for his reforms in naval hygiene and medicine, including the use of citrus fruits to prevent scurvy.

Blane studied medicine at the University of Edinburgh and took his M.D. degree at Glasgow in 1778. He then became private physician to Admiral (later Lord) Rodney, whom he accompanied to the West Indies in 1779. On the expedition, Blane enforced the use of lemon juice and other fresh foods in the diet.

Blane received a baronetcy in 1812. He wrote *Observations on the Diseases of Seamen* (1785) and *Elements of Medical Logick* (1819).

blank verse, unrhymed iambic pentameter, the preeminent dramatic and narrative verse form in English and also the standard form for dramatic verse in Italian and German. Its richness and versatility depend on the skill of the poet in varying the stresses and the position of the caesura (pause) in each line, in catching the shifting tonal qualities and emotional overtones of the language, and in arranging lines into thought groups and paragraphs.

Adapted from unrhymed Greek and Latin heroic verse, blank verse was introduced in 16th-century Italy along with other classical metres. The Italian humanist Francesco Maria Molza attempted the writing of consecutive unrhymed verse in 1514 in his translation of Virgil's *Aeneid*. Other experiments in 16th-century Italy were the tragedy of *Sofonisba* (written 1514–15) by Gian Giorgio Trissino and the didactic poem *Le api* (1539) by Giovanni Rucellai. Rucellai was the first to use the term *versi sciolti*, which became translated as "blank verse." It soon became the standard metre of Italian Renaissance drama, used in such major works as the comedies of Ludovico Ariosto, *L'Aminta* of Torquato Tasso, and *Il pastor fido* of Battista Guarini.

Henry Howard, Earl of Surrey, introduced the measure, along with the sonnet and other Italian humanist verse forms, to England in the early 16th century. Thomas Sackville and Thomas Norton used blank verse for the first English tragic drama, *Gorboduc* (first performed 1561), and Christopher Marlowe developed its musical qualities and emotional power in *Tamburlaine*, *Doctor Faustus*, and *Edward II*. William Shakespeare transformed the line and the instrument of blank verse into the vehicle for the greatest English dramatic poetry. In his early plays, he combined it with prose and a 10-syllable rhymed couplet; he later employed a blank verse dependent on stress rather than on syllabic length. Shakespeare's poetic expression in his later plays, such as *Hamlet*, *King Lear*, *Othello*, and *Macbeth*, is supple, approximating the rhythms of speech, yet capable of conveying the subtlest human delight, grief, or perplexity.

After a period of debasement, blank verse was restored to its former grandeur by John Milton in *Paradise Lost* (1667). Milton's verse is intellectually complex, yet flexible, using inversions, Latinized words, and all manner of stress, line length, variation of pause, and paragraphing to gain descriptive and dramatic effect. In the 18th century, James Thomson used blank verse in his long descriptive poem *The Seasons*. Later, William Wordsworth wrote his autobiography of the poetic spirit, *The Prelude* (completed 1805; published 1850), in blank verse; Percy Bysshe Shelley used it in his drama *The Cenci* (1819), as did John Keats in *Hyperion* (1820). The extreme flexibility of blank verse can be seen in its range from the high tragedy of Shakespeare to the low-keyed, conversational tone of Robert Frost in *A Masque of Reason* (1945). It is still used to voice the moods of modern man in a rhythm linking him to the past.

Blank verse was established in German drama by Gotthold Lessing's *Nathan der Weise* (1779). Examples of its use are found in the writings of Johann Wolfgang von Goethe, Friedrich von Schiller, and Gerhart Hauptmann. It was also used extensively in Swedish, Russian, and Polish dramatic verse.

Blankers-Koen, Fanny, née FRANCINA ELSJE KOEN (b. April 26, 1918, Baarn, Neth.—d. Jan. 25, 2004, Amsterdam), versatile Dutch track-and-field athlete, who was the first woman to win four gold medals in a single Olympics. She also set world records in seven events.

Blankers-Koen first achieved success as a teenager, winning a Dutch national championship in the 800-metre run in 1935; the next year she competed in the 4 × 100-metre relay at the 1936 Olympics in Berlin. She married her coach, Jan Blankers, in 1940. In 1942 and 1943 she set world records in the 80-metre hurdles (11.0 sec), high jump (1.71 m [5.61 feet]), and long jump (6.25 m [20.5 feet]).

Prior to the 1948 Olympics in London, some experts thought Blankers-Koen was too old to compete, and others denounced her for not attending to her duties as a wife and mother of two. Olympic rules limited Blankers-Koen to participating in only three individual events at the Games, and, despite her jumping records, track events were her preference. She won the 100- and 200-metre sprints and the 80-metre hurdles and anchored the Dutch team in its 4 × 100-metre victory. She later set records of 10.8 sec in the 100-yard dash (1948) and 24.2 sec in the 220-yard dash (1950). In 1951 Blankers-Koen set the first modern pentathlon record, with 4,692 points.

In 1999 she was named the top female athlete of the 20th century by the International Amateur Athletic Federation (IAAF; later called the International Association of Athletics Federations).

Blanqui, (Louis-)Auguste (b. Feb. 1, 1805, Puget-Théniers, Fr.—d. Jan. 1, 1881, Paris), revolutionary socialist, a martyr-figure of French radicalism, imprisoned in all for more than 33 years. His disciples, the Blanquists, played an important role in the history of the workers' movement even after his death.

Blanqui's father was a subprefect in the little town of Puget-Théniers in the French Maritime Alps. In 1818 Blanqui joined his elder brother, Adolphe, the future liberal economist, in Paris and studied both law and medicine until 1824. From 1827 he began taking part in the student demonstrations against the restored Bourbon monarchy, but he was disappointed by the Revolution of July 1830, which established the bourgeois monarchy of Louis-Philippe. Blanqui then began his true political career. A member of the Société des Amis du Peuple ("Society of the Friends of the People"), he was pursued and twice imprisoned (1831 and 1836). In these years he was much influenced by the doctrines of Filippo Buonar-

Auguste Blanqui, lithograph by Menut Alophe, 1849

roti, who in 1796 had been involved in the abortive rising against the Directory government by François Noël (Gracchus) Babeuf's Société des Égaux ("Society of Equals"). He studied the popular insurrections of the French Revolutionary period and became increasingly convinced of the inevitability of class struggle, in which he regarded the rich as the aggressors. Blanqui was thereafter convinced that in order to establish a popular government it was absolutely necessary first to build up heavily disciplined groups of conspirators. His taste for secret societies stemmed from this conviction; he organized first the Société des Familles ("Society of Families") and then the Société des Saisons ("Society of the Seasons"). The latter society's disastrous attempt at insurrection on May 12, 1839, was the classic prototype of the Blanquist surprise attack. Five hundred armed revolutionaries took the Hôtel de Ville ("City Hall") of Paris, but, isolated from the rest of the population, they were easily defeated after two days of fighting. Blanqui escaped but was later arrested. His death sentence was commuted to life imprisonment, and he was sent to the island of Mont-Saint-Michel off the Normandy coast. After four years of solitary confinement, he was believed to be dying and was granted a formal pardon; but he was not able to leave the prison hospital at Tours until just before the Revolution of 1848.

This revolution was a decisive experience for Blanqui. Returning to Paris, he founded the Société Républicaine Centrale ("Central Republican Society") and urged the provisional government that had formed after Louis-Philippe's fall to pursue more socialistic policies. Although he took an active part in the organization of workers' demonstrations, he was convinced that the people were not ready for the universal suffrage that the provisional government proposed, and he demanded the postponement of the impending elections. The election results confirmed Blanqui's apprehensions: the conservatives constituted the majority of the Constituent Assembly. Blanqui was sentenced to 10 years' imprisonment for having participated, on May 15, in a popular demonstration of which he had, in fact, disapproved. Released in 1859, he again organized secret societies and was rearrested in 1861, remaining in prison until he escaped to Belgium in 1865. Great changes occurred in France while the man they had begun to call *l'enfermé* ("the locked-up one") was able to take no part in events. The Parisian workers were defeated on the barricades of June 1848. Louis-Napoleon executed his coup d'état of Dec. 2, 1851, and became, as Napoleon III,

hereditary emperor of the French the following year. An unprecedented industrial growth created conditions suited for the development of a modern workers' movement. Consideration of these changes led Blanqui to study and write about political economy and Socialism; most of these works were published after his death under the title *Critique sociale*. After 1865 Blanqui often went clandestinely from Brussels to Paris, where the first Blanquist groups were being organized among students and, later, among workers. He also wrote *Instruction pour une prise d'armes* (1867–68; "Instruction for a Taking Up of Arms"), a kind of manual for urban guerrilla warfare. When the first defeats of the French Army in the Franco-German War of 1870 began to threaten Napoléon III's position, Blanqui returned to Paris.

On Sept. 4, 1870, two days after Napoleon III's surrender to the Germans, there was a bloodless revolution in Paris, as a result of which the Third Republic was proclaimed and a provisional government was formed. In this action the Blanquist groups took some part. With the German armies advancing on Paris, Blanqui showed himself a patriot as well as a revolutionary, founding both a club and a newspaper of the same extremely Jacobin name: *La Patrie en danger* ("Our Country in Danger"). He invited Parisians to unite against Germany and support the government, and he showed considerable military skill in indicating what measures should be taken for the defense of Paris. He very soon became convinced that the provisional government, fearing the populace, was failing to take adequate defense measures. Consequently, the Blanquists twice unsuccessfully attempted to overthrow the government (Oct. 31, 1870; Jan. 22, 1871). After the capitulation of Paris and the elections of Feb. 8, 1871, which were won by conservatives, Blanqui retired to the country, where he was arrested on March 17 for his part in the revolt of October 31.

The day after Blanqui's arrest the insurrection called the Paris Commune occurred, and the Blanquists played a very important role in it. Blanqui himself was elected president of the Commune, but the government of Adolphe Thiers refused to release him from prison. Eventually the Commune capitulated, and, in the struggle for amnesty for its adherents, Blanqui became a kind of symbol. Still in prison, he was elected deputy for Bordeaux in April 1879. His election was invalidated, but he was pardoned and set free. For two years, in spite of his advanced age, he continued as a journalist and an ardent campaign speaker in favour of Socialism. On the eve of a meeting, he was struck by apoplexy and died a few days later. Shortly afterward, a rapprochement between the Marxists and the Blanquists resulted in the founding in 1881 of the Comité Révolutionnaire Central (Central Revolutionary Committee) and in 1898 of the Parti Socialiste Révolutionnaire (Revolutionary Socialist Party).

In relation to other Socialists, Blanqui cannot be considered either an economist or a philosopher. He was essentially a theoretician of revolution and a practitioner of insurrection. He thought that the taking of power could be the act only of a small minority. Blanqui's main idea was that there could be no Socialist transformation of society without a temporary dictatorship that would first disarm the bourgeoisie, confiscate the wealth of the church and of the large property holders, and bring the great industrial and commercial enterprises under state control. The next stage would be to establish industrial and agricultural-production associations and develop education so as to render the people capable of organizing the country's economy to their own benefit. (J.Bru.)

Blantyre, largest city in Malaŵi, administrative headquarters of the Southern Region. In the Shire Highlands in Blantyre District (1,612 sq mi [4,175 sq km]), Blantyre is at an altitude (3,409 ft [1,039 m]) that moderates the tropical climate. It has a rainy season (December to March), a cool season (April to August), and a hot season (September to November). It was founded (1876) as a Church of Scotland mission station and was named after David Livingstone's Scottish birthplace. It became a British consular post in 1883 and attained municipal status in 1895, making it Malaŵi's oldest municipality. Its colonial trade in ivory laid the communications foundation for its present importance as a major commercial and distribution centre. In 1956 Blantyre was united with Limbe, 7 mi east, a town (founded 1909) that had grown around the headquarters of the Malaŵi (then Nyasaland) Railways, with branch lines to Beira, Mozambique, and Harare (formerly Salisbury), Zimbabwe. The amalgamated city is sometimes called Blantyre/Limbe. It has two cathedrals and the Polytechnic campus of the University of Malaŵi. Light industries at the Chichiri industrial estate include shoe manufacture, corn (maize) milling, brewing, soft drinks production, baking, printing, and tobacco manufacture. While Blantyre acts as the regional shopping and administrative centre, Limbe is the centre for wholesale commerce, conducted mainly by the Indian community, and the headquarters of Malaŵi's tobacco auctions. Pop. (1998 prelim.) city, 478,155; district, 809,397.

Blarney, Irish AN BHLARNA, village, County Cork, Ireland, 5 mi (8 km) northwest of Cork city, famous for Blarney Castle (c. 1446). Below the battlements on the southern wall of the castle is the Blarney Stone, reputed to confer eloquence on those who kiss it; this feat can be achieved only by hanging head downward. "Blarney," as an expression of dubiousness,

Blarney Castle, County Cork
G.F. Allen—Bruce Coleman

is attributed to Elizabeth I of England, who used it when impugning the worth of Lord Blarney's promises. Blarney lies in wooded country. Tweed is manufactured there, as also are polypropylene sacks. Pop. (1991) 2,043.

Blaschka glass, glass models, primarily of natural history specimens, made by Leopold Blaschka (died 1895) and his son Rudolph (died 1939). The Blaschkas were Bohemian, or Czech, by birth but worked in Germany. Their most famous production was a collection of several thousand models of flora, made at Dresden between 1887 and 1936. In their minute representational accuracy, they fulfill their original purpose of botanical study; moreover, technically and artistically they are among the finest glass objects ever made. The Blaschkas also made models of marine life for the Museum of Comparative Zoology at Harvard.

Consult the INDEX first

Blaschke, Wilhelm Johann Eugen (b. Sept. 13, 1885, Graz, Austria-Hungary—d. March 17, 1962, Hamburg), German mathematician whose major contributions to geometry concerned kinematics and differential and integral geometry.

Blaschke became extraordinary professor of mathematics at the Deutsche Technische Hochschule (German Technical University), Prague, in 1913 and two years later accepted a post at the University of Leipzig. In 1917 he was appointed professor of mathematics at the University of Königsberg. He accepted a professorial post with the University of Hamburg in 1919.

Blaschke discovered kinematic mapping, which later became important to the axiomatic foundations of various geometries, and established it as a fundamental technique in kinematics. He also originated topological differential geometry, the study of invariant differentiable mappings. His more important works include *Kreis und Kugel* (1916; "Circle and Sphere"); *Vorlesungen über Differentialgeometrie*, 3 vol. (1921–29; "Lectures on Differential Geometry"); *Vorlesungen über Integralgeometrie*, 2 vol. (1935–37; "Lectures on Integral Geometry"); *Grundlagen von Einsteins Relativitätstheorie* (1921–23; "Foundations of Einstein's Theory of Relativity"); and *Analytische Geometrie* (1948; "Analytical Geometry").

Blasco Ibáñez, Vicente (b. Jan. 29, 1867, Valencia, Spain—d. Jan. 28, 1928, Menton, Fr.), Spanish writer and politician, who achieved world renown for his novels dealing with World War I, the most famous of which, *Los cuatro jinetes del Apocalipsis* (1916; *The Four Horsemen of the Apocalypse*, 1918), was used as the basis for two U.S. films. He was associated with the Generation of '98 (*q.v.*).

At the age of 18, while studying law at Madrid and contributing articles to political journals, Blasco Ibáñez wrote an anti-monarchist poem for which he was sent to prison—the first of many such punishments for his political beliefs. He founded the republican journal *El Pueblo* in 1891 and was first elected to the Cortes (parliament) in 1901, to which he was returned seven times before he voluntarily exiled himself in 1923 and settled on the Riviera. He did so because of his opposition to the military dictatorship of Miguel Primo de Rivera.

Blasco Ibáñez' early work, composed mainly of regional novels such as *Flor de mayo* (1895; *Mayflower*, 1921), *La barraca* (1899; *The Cabin*, 1917), and *Cañas y barro* (1902; *Reeds and Mud*, 1966), is marked by a vigorous and intense realism and considerable dramatic force in the depiction of the life of Valencia. Later novels, such as *La bodega* (1906; *The Fruit of the Vine*, 1919), are held to have suffered from a heavy ideological treatment of serious social problems. More popular novels, *Sangre y arena* (1909; *Blood and Sand*, 1922);

La maja desnuda (1906; *Woman Triumphant*); his best known, *Los cuatro jinetes del Apocalipsis*; and others, brought him fame but cost

Blasco Ibáñez
Archo Mas, Barcelona

him critical approval because of their sensational nature. He became a member of the French Legion of Honour in 1906.

Blasis, Carlo (b. Nov. 4, 1803, Naples, Kingdom of Naples [Italy]—d. Jan. 15, 1878, Cernobbio, Italy). Italian ballet teacher and writer on the technique, history, and theory of dancing. He was the first to codify and publish an analysis of the classic ballet technique in his

Blasis, engraving by Adolfo Bignami after a portrait by Innocent-Louis Goubaud

By courtesy of the Bibliothèque de l'Opéra, Paris, photograph, Pic

Traité élémentaire, théorique, et pratique de l'art de la danse (1820; *An Elementary Treatise upon the Theory and Practice of the Art of Dancing*).

A student of Jean Dauberval, Blasis danced briefly at the Paris Opéra, appeared in Salvatore Viganò's ballets at La Scala in Milan, and performed and choreographed at the King's Theatre in London. In 1837 he was appointed director of the ballet school at La Scala, where he trained many of the 19th century's most brilliant dancers. Carlotta Grisi and Fanny Cerrito studied with him as established stars.

Blasis is credited with creating the position of *attitude* with inspiration from Giambologna's statue of Mercury; in this, the dancer's working leg is raised and extended to the back but bent at the knee. He also discovered the technique for preventing dizziness while turning, called *spotting*, by which the dancer can snap his head around more quickly than the rest of his body, and so be able to maintain a focus on one "spot" and not become dizzy. Many of Blasis' traditions and innovations, which were recorded in his second book, *The Code of Terpsichore* (1830), still form the basis of classic dance training.

Blasko, Béla (actor): *see* Lugosi, Bela.

Blaskowitz, Johannes (b. July 10, 1883, Peterswalde, Ger.—d. Feb. 5, 1948, Nürnberg). German field marshal, a tank specialist who commanded German military forces on several fronts during World War II and who deplored and protested Nazi atrocities.

A professional soldier who served in World War I, Blaskowitz rose rapidly during the Third Reich, acting as a field commander in the invasion of Austria and the Czech Sudetenland and becoming commander in chief of the 8th Army in the Polish campaign. On Oct. 22, 1939, he was made military governor of the German occupying forces in Poland. There he directed two memoranda to higher authorities documenting cases of rape, murder, and looting of Jewish and Polish shops by the SS and other nonmilitary Nazi police and complaining that they operated outside the law and that he had no control over them. Adolf Hitler, infuriated at such statements, dismissed him from several army commands.

Blaskowitz was eventually returned to command and served on several fronts. In 1944 he was an army group commander under General Gerd von Rundstedt and helped prepare a defense against the expected Allied invasion of northern France. In early 1945 he commanded German troops in The Netherlands, where he surrendered to the Allies. A defendant in one of the war crimes trials, he apparently committed suicide, leaping to his death in the Nürnberg prison. (There were claims that he was pushed to his death by agents of the SS.)

blasphemy, irreverence toward a deity or deities and, by extension, the use of profanity.

In Christianity, blasphemy has points in common with heresy but is differentiated from it in that heresy consists of holding a belief contrary to the orthodox one. Thus, it is not blasphemous to deny the existence of God or to question the established tenets of the Christian faith unless this is done in a mocking and derisive spirit. In the Christian religion, blasphemy has been regarded as a sin by moral theologians; St. Thomas Aquinas described it as a sin against faith. For the Muslim it is blasphemy to speak contemptuously not only of God but also of Muḥammad.

In many societies blasphemy in some form or another has been an offense punishable by law. The Mosaic Law decreed death by stoning as the penalty for the blasphemer. Under the Byzantine emperor Justinian I (reigned 527–565) the death penalty was decreed for blasphemy. In the United States many states have legislation aimed at the offense. In Scotland until the 18th century it was punishable by death, and in England it is both a statutory and a common-law offense. It was recognized as the latter in the 17th century; the underlying idea apparently was that an attack on religion is necessarily an attack on the state. This idea probably has been the reason why penalties have been laid down for blasphemy in some secular legal codes.

Blass, Bill, byname of WILLIAM RALPH BLASS (b. June 22, 1922, Fort Wayne, Ind., U.S.—d. June 12, 2002, New Preston, Conn.), American designer who helped define the relaxed, pared-down elegance that would characterize American fashion in the late 20th century.

Blass left home at age 17 to attend the Parsons School of Design in New York City. He served over three years in the U.S. Army during World War II, and then, about 1946, at a time when American fashion began to receive the international attention that was once only afforded to French design, he joined the fashion house of Anna Miller and Co. in New York. In 1959, after the company had merged with Maurice Rentner, Ltd., Blass became the head designer of Rentner. His work became popular among high-society women in New York, and he quickly became part of a fashionable postwar scene that included Diana

Vreeland, then a fashion editor at *Harper's Bazaar* and later the influential editor of *American Vogue*.

Building upon the innovations of European designers such as Coco Chanel, Blass made clothes that allowed women a modern sense of ease and comfort. He made sportswear, but he glamorized the concept by making clothes that possessed a new American casual chic sensibility, which he achieved by merging simple styles with luxurious materials. Classic Blass designs included a pea coat he fashioned from white mink in 1966, a strapless gray flannel day dress that he paired with a cashmere sweater tied over the shoulders, and a simple yet sharply cut dress that he transformed with feminine ruffles (his signature style). In a sense, Blass became his own best model: he featured himself and a female model wearing matching houndstooth-checked suits in a 1965 advertisement. Two decades later, designers Ralph Lauren and Calvin Klein would similarly feature themselves in their own ads and would similarly market their brands around the image of a sophisticated, modern American lifestyle.

In 1970 Blass became owner of Rentner, which he renamed after himself. Blass was a pioneer in employing the business strategy of licensing his designs and name to a huge array of fashion accessories, including home furnishings, jeans, eyewear, and luggage. As his business expanded, his name became synonymous with classic good taste. Throughout his long career, his clients—including socialites and prominent figures such as Katherine Graham and Nancy Reagan—remained devoted customers. Blass sold his company in 1999 and retired the following year; Bill Blass Ltd. continued under the leadership of new designers.

One of the founders of the Council of Fashion Designers of America, Blass served as its honorary president from 1979 to 1981. He was appointed to the President's Committee on the Arts and Humanities in 1987.

blast furnace, a vertical shaft furnace that produces liquid metals by the reaction of a flow of air introduced under pressure into the bottom of the furnace with a mixture of

Cross section of a modern blast furnace

metallic ore, coke, and flux fed into the top. Blast furnaces are used to produce pig iron from iron ore for subsequent processing into steel, and they are also employed in processing lead, copper, and other metals. Rapid combustion is maintained by the current of air under pressure.

Blast furnaces produce pig iron from iron ore by the reducing action of carbon (supplied as coke) at a high temperature in the presence of a fluxing agent such as limestone. Ironmaking blast furnaces consist of several zones: a crucible-shaped hearth at the bottom of the furnace; an intermediate zone called a bosh between the hearth and the stack; a vertical shaft (the stack) that extends from the bosh to the top of the furnace; and the furnace top, which contains a mechanism for charging the furnace. The furnace charge, or burden, of iron-bearing materials (for example, iron-ore pellets and sinter), coke, and flux (such as limestone) descends through the shaft, where it is preheated and reacts with ascending reducing gases to produce liquid iron and slag that accumulate in the hearth. Air that has been preheated to temperatures from 900° to 1,250° C (1,650° and 2,300° F), together with injected fuel such as oil or natural gas, is blown into the furnace through multiple tuyeres (nozzles) located around the circumference of the furnace near the top of the hearth; these nozzles may number from 12 to as many as 40 on large furnaces. The preheated air is, in turn, supplied from a bustle pipe, a large-diameter pipe encircling the furnace. The preheated air reacts vigorously with the preheated coke, resulting in both the formation of the reducing gas (carbon monoxide) that rises through the furnace, and a very high temperature of about 1,650° C (3,000° F) that produces the liquid iron and slag.

The bosh is the hottest part of the furnace because of its close proximity to the reaction between air and coke. Molten iron accumulates in the hearth, which has a taphole to draw off the molten iron and, higher up, a slag hole to remove the mixture of impurities and flux. The hearth and bosh are thick-walled structures lined with carbon-type refractory blocks, while the stack is lined with high-quality fire-clay brick to protect the furnace shell. To keep these refractory materials from burning out, plates, staves, or sprays for circulating cool water are built into them.

The stack is kept full with alternating layers of coke, ore, and limestone admitted at the top during continuous operation. Coke is ignited at the bottom and burned rapidly with the forced air from the tuyeres. The iron oxides in the ore are chemically reduced to molten iron by carbon and carbon monoxide from the coke. The slag formed consists of the limestone flux, ash from the coke, and substances formed by the reaction of impurities in the ore with the flux; it floats in a molten state on the top of the molten iron. Hot gases rise from the combustion zone, heating fresh material in the stack and then passing out through ducts near the top of the furnace.

Blast furnaces may have the following ancillary facilities: a stock house where the furnace burden is prepared prior to being elevated to the furnace top by skip cars or a belt conveyor system; a top-charging system consisting of a vertical set of double bells (cones) or rotating chutes to prevent the release of furnace gas during charging; stoves that utilize the furnace off-gases to preheat the air delivered to the tuyeres; and a cast house, consisting of troughs that distribute liquid iron and slag to appropriate ladles for transfer to steelmaking furnaces and slag-reclamation areas.

In Europe, the blast furnace developed gradually over the centuries from small furnaces operated by the Romans, in which charcoal was used for reducing ore to a semisolid mass of iron containing a relatively small amount of carbon and slag. The iron mass was then ham-

mered to remove the slag, yielding wrought iron. Increases in the height of the furnace, coupled with mechanical bellows for introducing greater amounts of air into it, allowed the higher temperatures needed to produce a high-carbon iron known as cast, or pig, iron. This mode of production was used in central Europe by the mid-14th century and was introduced into England about 1500. Charcoal was the only furnace fuel until the 17th century, when the depletion of forests that provided the charcoal in England led to experiments with coke, which is produced from coal. Coke had been widely adopted for use in blast furnaces by the mid-18th century, and the principle of heating air before it entered the furnace was introduced in the early 19th century.

Modern blast furnaces range in size from 20 to 35 m (70 to 120 feet), have hearth diameters of 6 to 14 m (20 to 45 feet), and can produce from 1,000 to almost 10,000 tons of pig iron daily.

Blastares, Matthew (fl. 14th century), Greek Orthodox monk, theological writer, and Byzantine legal authority whose systematizing of church and civil law influenced the development of later Slavic legal codes.

A priest-monk of the Esaias monastery at Thessalonica, Greece, Blastares in 1335 compiled the *Syntagma alphabeticum* ("Alphabetical Arrangement"), a handbook of Byzantine church and civil laws that synthesized material from previous collections. It was almost immediately translated into Slavonic at the behest of King Stefan Dušan of Serbia and appeared in a Bulgarian version during the 15th century and in a Russian edition in the early 16th century. By the 18th century it was recognized as the standard expression of Eastern Orthodox canon law. The *Syntagma* helped to establish Slavic customs relating to the rules of legal procedure and laws regulating state protection of the poor and persecuted. Moreover, it transmitted the principle of a political realm transcending the interests of individuals and classes, ruled by a sovereign himself and subject to the laws he had promulgated.

Blastares also wrote controversial tracts against Latin sacramental doctrine. Other works include treatises on divine grace, political verse on the officials of Constantinople's court, and liturgical essays and hymns.

blastema, also called REGENERATION BUD, in zoology, a mass of undifferentiated cells that has the capability to develop into an organ or an appendage. In lower vertebrates the blastema is particularly important in the regeneration of severed limbs. In the salamander, for example, tissues in the stump of a limb dedifferentiate—that is, they lose their individual characteristics—and revert to an embryonic appearance. Under the influence of regenerating nerve fibres, they will form a blastema, a mound of cells resembling the original limb bud, from which the replacement limb gradually emerges.

In some invertebrates, such as flatworms, reserve cells scattered throughout the body supply the cells of blastemas. In vertebrates, dedifferentiated skin and muscle cells at the site of a wound constitute the developing blastema. If for any reason the regenerating nerve fibres are damaged or destroyed, the blastema will fail to develop and scar tissue will form instead.

blasting, process of reducing a solid body, such as rock, to fragments. An explosive or, occasionally, compressed air may be used. Conventional blasting operations include (1) drilling holes in a converging pattern, (2) placing a charge and detonator in each hole, (3) tamping and stemming the charge to compact the explosive, and filling the remainder of the hole with clay or rock, (4) igniting or detonating the charge, and (5) clearing away the broken material.

blastocyst, a distinctive stage of a mammalian embryo. It is a form of blastula that develops from a berrylike cluster of cells, the morula. A cavity appears in the morula between the cells of the inner cell mass and the enveloping layer. This cavity becomes filled with fluid. The blastocyst differs from the blastula in that it is composed of two already differentiated cell types, the inner cell mass and the enveloping layer.

Further differentiation produces a thin layer of cells, called the hypoblast, between the inner cell mass and the cavity. These cells contribute to the formation of the embryonic endoderm, from which derive the respiratory and digestive tracts.

The enveloping layer is now referred to as the trophoblast. It does not contribute directly to the formation of the embryo but rather serves to establish a connection with the maternal uterus. It is a precursor of the placenta.

blastoid, any member of an extinct class (Blastoidea) of echinoderms, animals related to the modern starfish and sea lilies, that existed from the Middle Ordovician to the Late Permian periods (from 478 to 245 million years ago). Blastoids were sedentary animals anchored to the seafloor by a stemlike column of circular plates. Unlike other echinoderms, blastoids were characterized by a regularity of structure; the blastoid body region consisted of 13 plates of calcium carbonate, an external framework, or skeleton, arranged in 3 circles about the body.

Some blastoids are useful as index, or guide, fossils that allow the correlation of rock units; the genus *Pentremites* is especially well known and common.

blastomycosis, infection of the skin and viscera caused by fungal organisms of the genus *Blastomyces*. There are two major types of blastomycosis: the North American, caused by *B. dermatitidis*, and the South American, caused by *B. brasiliensis*. In North American blastomycosis, skin and lung lesions are most common: pulmonary lesions vary in size from granulomatous nodules to confluent, diffuse areas of pus-forming inflammation involving the entire lobe of the lung. In the skin, microabscesses lie just beneath the epidermis, the outermost layer of the skin, and are associated with a granulomatous appearance of the surrounding skin.

In South American blastomycosis, the portal of entry is usually the nasopharynx (the part of the alimentary canal between the cavity of the mouth and the esophagus that is continuous with the nasal passages); swelling and ulceration of the mouth or nose may cause the infection to spread to the nearby lymph nodes; primary lesions may also occur in the lymphoid tissues in the lower abdomen. In both North and South American varieties, the infection may spread not only to the lymph nodes but also to such organs as the brain, bones, liver, spleen, and adrenals.

Treatment includes the use of antibiotics, antifungal agents, and sulfonamide drugs. See also chromoblastomycosis; cryptococcosis.

blastopore, the opening by which the cavity of the gastrula, an embryonic stage in animal development, communicates with the exterior. During maturation of some animals it evolves into the anus or the mouth; in others it is covered over and contributes to the canal joining the primitive gut with the cavity of the neural tube, the primitive nervous system.

blastula, hollow sphere of cells, or blastomeres, produced during the development of an embryo by repeated cleavage of a fertilized egg. The cells of the blastula form an epithelial (covering) layer, called the blastoderm, enclosing a fluid-filled cavity, the blastocoel.

After the blastula develops, it undergoes transition to the gastrula (*q.v.*), a process called gastrulation. In organisms such as mammals, the earlier morula (*q.v.*), a berrylike cluster of cells, develops into a somewhat different form of blastula, the blastocyst (*q.v.*).

Blatch, Harriot Eaton Stanton, née STANTON (b. Jan. 20, 1856, Seneca Falls, N.Y., U.S.—d. Nov. 20, 1940, Greenwich, Conn.), leader in the woman suffrage movement in the United States.

The daughter of the suffragist Elizabeth Cady Stanton and the abolitionist Henry Brewster Stanton, Blatch graduated from Vassar College in 1878. She contributed a large chapter to the *History of Woman Suffrage* (1881–87), a monumental work jointly edited by her mother, Susan B. Anthony, and Matilda J. Gage. She was married to William Henry Blatch, an English businessman, in 1882 and spent most of the next 20 years in England, where she worked for educational and social reform and participated in the British suffragette movement.

Blatch returned to the United States in 1902 and is credited with helping at that time to revitalize the moribund suffrage campaign. She also organized the first suffrage parades in the United States (1910), as well as open-air meetings. She later joined the militant Congressional Union (later the National Woman's Party) and worked for the passage of a federal equal rights amendment. Blatch subsequently headed the U.S. Food Administration's Speaker's Bureau, and during World War I she directed the Women's Land Army, an organization promoting farm labour. She wrote four books, including an analysis of war, *A Woman's Point of View, Some Roads to Peace* (1920), and, with Alma Lutz, her memoirs, *Challenging Years* (1940).

Blatchford, Samuel (b. March 9, 1820, New York City—d. July 7, 1893, Newport, R.I., U.S.), associate justice of the United States Supreme Court (1882–93).

Blatchford graduated from Columbia College (later Columbia University) in 1837 and served as private secretary to William H. Seward until attaining his majority. In 1842 he was admitted to the bar and began to practice with his father. He later practiced with Seward and subsequently started his own firm in New York City, becoming a noted authority on international and maritime law.

In 1867 he was appointed district judge of the southern district in New York and five years later was made a circuit judge for the second judicial district. He was elevated to the U.S. Supreme Court by Pres. Chester A. Arthur in 1882 and gained a reputation as one of the most hardworking justices, giving opinions in 430 cases. He notably gave the opinion of the majority in *Cunningham v. Neagle*, a case that extended federal authority. Moreover, Blatchford's decisions on the status of design patents and his rulings regarding the infringement of design formed the basis for legislation passed by Congress in 1887 to provide remedies for patent infringement.

Blauë Reiter, Der, English THE BLUE RIDER, organization of artists, formed in December 1911 in Munich, that contributed greatly to the development of abstract art. Its founding members, Franz Marc and Wassily Kandinsky, co-edited a volume of essays on aesthetics entitled *Der Blaue Reiter*, a name that they had derived from a painting by Kandinsky and that, in turn, became the name of the group. Neither a movement nor a school and having no definite program, Der Blaue Reiter was a loosely knit organization of numerous artists who exhibited their works together between 1911 and 1914.

"Deer in Forest II," oil painting by Franz Marc, one of the members of Der Blaue Reiter, 1913–14; in the Staatliche Kunsthalle, Karlsruhe, Ger.

By courtesy of the Moderne Galerie, Munich

Der Blaue Reiter artists were expressionistically oriented, as was the earlier German organization Die Brücke; but, unlike that of Die Brücke, their expressionism took the form of lyrical abstraction and did not exhibit as many common stylistic characteristics. Wishing to give form to mystical feelings, they wanted to imbue their art with deep spiritual content. Der Blaue Reiter painters were variously influenced by the Jugendstil group, Cubist and Futurist painting styles, and naïve folk art.

The first exhibition of Der Blaue Reiter, held December 1911 to January 1912, at the Moderne Galerie Tannhäuser, Munich, included among its participants the following artists: Henri Rousseau, David and Vladimir Burlyuk, Albert Bloch, August Macke, and founders Marc and Kandinsky. Although not officially a member of Der Blaue Reiter, the Russian painter Alexey von Jawlensky supported its aims. The Swiss painter Paul Klee became associated with the group in 1912, when he joined in a graphic-art exhibition held in Munich. Among others included in this show were André Derain, Jean Arp, Georges Braque, Maurice de Vlaminck, Mikhail Larionov, Natalya Goncharova, and Pablo Picasso.

The final exhibition of Der Blaue Reiter took place at the famous Galerie Der Sturm (see Sturm, Der) in Berlin, where they were included in an exhibition called the "First German Autumn Salon," held in 1913; at this time the German-American artist Lyonel Feininger also became affiliated with the group. With the outbreak of World War I, Der Blaue Reiter dispersed.

After the war, in 1924, Feininger, Kandinsky, Klee (all of whom were teaching at the Weimar Bauhaus at the time), and Jawlensky formed a successor group, Die Blaue Vier (The Blue Four). Members of the group were united by a desire to exhibit together, which they did between 1925 and 1934, rather than by similarity of style.

Blavatsky, Helena Petrovna, née HAHN (b. Aug. 12 [July 31, old style], 1831, Yekaterinoslav, Ukraine, Russian Empire—d. May 8, 1891, London), Russian spiritualist, author, and co-founder of the Theosophical Society to promote Theosophy, a pantheistic philosophical-religious system.

At the age of 17, Helena Hahn married Nikifor V. Blavatsky, a Russian military officer and provincial vice governor, but they separated after a few months. She became interested in occultism and spiritualism and for many years travelled extensively throughout Asia, Europe, and the United States; she also claimed to have spent several years in India and Tibet studying under Hindu mahatmas.

In 1873 she went to New York City, where she met and became a close companion of H.S. Olcott, and in 1875 they and several other prominent persons founded the Theosophical Society.

In 1877 her first major work, *Isis Unveiled*, was published. In this book she criticized the science and religion of her day and asserted that mystical experience and doctrine were the means to attain true spiritual insight and authority. Although *Isis Unveiled* attracted attention, the society dwindled. In 1879 Mme Blavatsky and Olcott went to India; three years later they established a Theosophical headquarters at Adyar, near Madras, and began publication of the society's journal, *The Theosophist*, which Mme Blavatsky edited from 1879 to 1888. The society soon developed a strong following in India.

Asserting that she possessed extraordinary psychic powers, Blavatsky, during journeys to Paris and London, was accused by the Indian press late in 1884 of concocting fictitious spiritualist phenomena. Protesting her innocence while on a tour of Germany, she returned to India in 1884 and met with an enthusiastic reception. After an investigation in 1885 by the London Society for Psychical Research, however, she was declared a fraud; she left India in failing health, never to return. She lived quietly in Germany, Belgium, and finally in London, working on her small, meditative

Helena Blavatsky, detail of an oil painting by Hermann Schmiechen, 1884; in a private collection

classic *The Voice of Silence* (1889) and her most important work, *The Secret Doctrine* (1888), which was an overview of Theosophical teachings. It was followed in 1889 by her *Key to Theosophy*.

At least 14 volumes of Blavatsky's *Complete Writings* were published by the early 1980s. Her life has been described in several biographies, including Marion Meade's *Madame Blavatsky* (1980).

Blazey, SAINT: see Blaise, Saint.

bleach, solid or liquid chemical used to whiten or remove the natural colour of fibres, yarns, paper, and textile fabrics; in textile finishing the bleaching process is used to produce white cloth, to prepare fabrics for other finishes, or to remove discoloration that has occurred in other processes. Chlorine, sodium hypochlorite, calcium hypochlorite, and hydrogen peroxide are commonly used as bleaches.

Sunlight was the chief bleaching agent up to the discovery of chlorine in 1774 by the Swedish chemist Karl Wilhelm Scheele and the demonstration of its bleaching properties in 1785 by the French chemist Claude Berthollet. Bleaching powder, a solid combination of chlorine and slaked lime, introduced in 1799 by the Scottish chemist Charles Tennant, was thereafter produced in large quantity to bleach cloth and paper. It had the same effect as chlorine and could be more easily handled and shipped, but it was unstable and contained a large proportion of inert material. It remained the standard bleaching agent until

the 1920s, but then it was gradually replaced by liquefied chlorine and solutions of sodium hypochlorite.

In the production of bleaching powder, slaked lime spread on the floors of large rectangular chambers of lead or concrete is exposed to chlorine gas; or lime is propelled through horizontal tubes that are fed with the gas.

Hydrogen peroxide is now most commonly used to bleach cotton cloth, with sodium chlorite and sodium hypochlorite as alternatives. Wood and animal fibres are bleached by acidic reducing agents such as sulfur dioxide. In the pulp and paper industry chlorine dioxide, hydrogen peroxide, sodium peroxide, sulfur dioxide, sodium bisulfite, and sodium hydrosulfite are commonly used. Synthetic fibres are bleached with either oxidizing or reducing agents, depending on their chemical composition. Optical bleaches, fluorescent white chemicals giving off a bluish-white light, are not true bleaches.

bleak (*Alburnus alburnus*), small, slender fish of the carp family, Cyprinidae, found in rivers and lakes of England and Europe. A silvery-green fish, it grows to a maximum length of about 20 centimetres (8 inches). It lives in schools, usually near the surface, and eats

Bleak (*Alburnus alburnus*)

Painted especially for *Encyclopaedia Britannica* by Tom Dolan, under the supervision of Loren P. Woods, Chicago Natural History Museum

aquatic invertebrates. The bleak is edible but bony. Its scales are used in eastern Europe for the manufacture of artificial pearls.

Bled, Lake, Serbo-Croatian BLEDSKO JEZERO, glacial lake in the extreme northwestern region of Slovenia, situated northwest of Ljubljana. A summer health and holiday resort and a winter sports centre at the foot of the Julian Alps, 1,558 ft (475 m) above sea level, it has good road and rail connections and summer air service. Nearby is Triglav National Park and other mountains in the Julian Alps and Karavanke. The mild sub-alpine climate affords a long summer season for bathing.

The town of Bled has historic landmarks. On a small island in the lake is the Church of St. Maria, on which a Slavic pagan shrine stood until the 11th century. Bled castle stands atop a 460-ft cliff on the lakeshore.

Where the same name may denote a person, place, or thing, the articles will be found in that order

bleeding heart, any of several species of *Dicentra*, a genus of herbaceous flowering plants

Bleeding heart (*Dicentra spectabilis*)

Grant Heilman

of the fumitory family (Fumariaceae). The old garden favourite is the Japanese *D. spectabilis*, widespread for its small rosy-red and white, heart-shaped flowers dangling from arching stems about 60 centimetres (2 feet) tall. There is also a white form, *D. spectabilis alba*. The deeply cut leaf segments are larger than those of other cultivated species of *Dicentra*, such as the shorter eastern, or wild, bleeding heart (*D. eximia*), which produces sprays of small pink flowers from April to September in the Allegheny mountain region of eastern North America. The Pacific, or western, bleeding heart (*D. formosa*) of mountain woods, which ranges from California to British Columbia, has several varieties of garden interest.

Bleeding Kansas (1854–59), small civil war in the United States, fought between proslavery and antislavery advocates for control of the new territory of Kansas under the doctrine of popular sovereignty (*q.v.*). Sponsors of the Kansas–Nebraska Act (May 30, 1854) expected its provisions for territorial self-government to arrest the “torrent of fanaticism” that had been dividing the nation regarding the slavery issue. Instead, free-soil forces from the North formed armed emigrant associations to populate Kansas, while proslavery advocates poured over the border from Missouri. Regulating associations and guerrilla bands were formed by each side, and only the intervention of the Governor prevented violence in the Wakarusa War, launched in December 1855 over the murder of an antislavery settler. “Bleeding Kansas” became a fact with the Sack of Lawrence (May 21, 1856), in which a proslavery mob swarmed into the town of Lawrence and wrecked and burned the hotel and newspaper office in an effort to wipe out this “hotbed of abolitionism.” Three days later, an antislavery band led by John Brown retaliated in the Pottawatomie Massacre (*q.v.*). Periodic bloodshed along the border followed as the two factions fought battles, captured towns, and set prisoners free. A political struggle to determine the future state’s position on slavery ensued, centred on the Lecompton Constitution (*q.v.*) proposed in 1857. The question was finally settled when Kansas was admitted as a free state in January 1861, but, meanwhile, “Bleeding Kansas” had furnished the newly formed Republican Party with a much needed antislavery issue in the national election of 1860. Claims for \$400,000 in damages sustained in the border war were later approved by territorial commissioners.

Bleek, Wilhelm (Heinrich Immanuel) (b. March 8, 1827, Berlin—d. Aug. 17, 1875, Cape Town), comparative linguist known for his pioneer studies of South African languages as the “Father of Bantu Philology.”

In his doctoral dissertation at the University of Bonn (1851), Bleek attempted to prove a North African origin of the Hottentot language. In about 1855 he went to Natal to study the language and customs of the Xhosa. Before going to Cape Town, he wrote *The Languages of Mosambique* (1856). The following year he was appointed interpreter to the British governor of Cape Colony, Sir George Grey, and, from about 1860, served as librarian of a valuable collection of books presented to the colony by Grey. Bleek wrote a number of works, including *Handbook of African, Australian and Polynesian Philology*, 3 vol. (1858–63); *A Comparative Grammar of South African Languages* (1862–69); and *Reynard the Fox in South Africa; or, Hottentot Fables and Tales* (1864).

Blegen, Carl (William) (b. Jan. 27, 1887, Minneapolis, Minn., U.S.—d. Aug. 24, 1971, Athens), archaeologist who found striking evidence to substantiate and date the sack of Troy described in Homer’s *Iliad*. He also discovered, in 1939, clay tablets inscribed with

one of the earliest known European scripts and dating from about 1250 bc.

While associated with the American School of Classical Studies, Athens (1913–27), Blegen excavated a number of sites, notably in the northeastern Peloponnese, of great importance for reconstructing the prehistory of Greece. With the British archaeologist A.J.B. Wace, he published a major advance in the method of dating pre-Mycenaean culture from pottery remains (1916–18). Blegen was professor of classical archaeology at the University of Cincinnati, Ohio (1927–57); he directed the university’s excavation of the mound of Hisarlik, Tur., the site of Troy, from 1932 to 1938. There he and his staff found that the previously identified nine major periods of Troy’s construction, destruction, and rebuilding each represented two or more phases. His team’s stratigraphic study disclosed a total of 46 such phases. Moreover, Blegen suggested that the remains of King Priam’s Troy dated from the major period VIIa (c. 1250 bc), which offered evidence of large-scale human violence as well as fiery devastation. The research was described in *Troy: Excavations Conducted by the University of Cincinnati, 1932–38*, 4 vol. (1950–58), which he edited. Blegen published a popular account of his findings in *Troy and the Trojans* (1963).

Continuing to investigate sites described by Homer, Blegen returned to Greece in 1939 and sought to locate the Pylos of King Nestor. He decided upon Epáno Englianos, a hilltop in Messenia, five miles north of the Bay of Navarino, as the probable site of Nestor’s palace. Excavation revealed the remains of a large structure or complex of structures. His most significant findings were the first examples of Greek writing, similar to the Linear B script found earlier in Crete. With continued excavation from 1952, more than 1,000 inscribed tablets were found at Pylos, and a fine 13th-century-bc Mycenaean palace was revealed. Remaining at Pylos until 1964, he also excavated a number of tombs that yielded exceptionally rich finds. Blegen and Marion Rawson edited *The Palace of Nestor at Pylos in Western Messinia*, 3 vol. (1966–73).

Blekinge, län (county) and *landskap* (province), southern Sweden, between the *landskapen* (provinces) of Småland and Skåne and the Baltic Sea. With a land area of 1,127 sq mi (2,919 sq km), it is the second smallest Swedish *landskap*, after Öland. The coast is much indented, and the low, undulating interior slopes up toward the Småland Plateau, where it ends in a forest belt of birch, pine, and beech. Blekinge was ceded to Sweden by Denmark under the Peace of Roskilde (1658). Intensively cultivated, it is known as “the garden of Sweden.” Potatoes, a leading crop, are used as a source of starch and alcohol as well as for food. Steel and textile milling, stone quarrying, and the manufacture of industrial and home equipment are important industries. Karlshamn is the chief commercial and industrial centre, but Karlskrona, a Swedish naval base since 1680, is the administrative capital of the län. Pop. (1991 est.) 150,564.

blende (mineral): see sphalerite.

blended whiskey, mixture of straight whiskey (that distilled from mash of a single grain) and mixed-grain whiskey or neutral spirits. Blended straight whiskey is a mixture of straight whiskeys only. Whiskeys are blended in order to achieve a uniform product with a balanced character and, generally, a lighter, somewhat less pronounced taste than that of straight whiskey. See whiskey.

blending, in yarn production, process of combining fibres of different origins, length, thickness, or colour to make yarn. Blending

is accomplished before spinning and is performed to impart such desirable characteristics as strength or durability, to reduce cost by combining expensive fibres with less costly types, or to achieve special colour or texture effects. Fabrics made from such fibres are called blends. Blending also refers to the process of combining small amounts of the same fibre taken from different lots to achieve a uniform result.

Blenheim, town, Marlborough unitary authority, northeastern South Island, New Zealand, on the Wairau Plain at the confluence of the Omaka and Opawa rivers. About 1830 the entire plain was sold by the local Maoris to a whaling captain. First settled in 1847, it grew rapidly following the discovery of gold (1864) and was made capital of Marlborough province (1865-76). It was proclaimed a town in 1866. It was named after the European Battle of Blenheim (1704), in which the Duke of Marlborough defeated the French. A junction of several major highways and of the South Island Main Trunk Railway, Blenheim uses the port of Picton (17 miles [27 km] north). Serving an area of sheep, dairy, seed-crop, and cereal farming, the town has light-engineering, motor-body, food-processing, furniture, flax-milling, and animal-feed plants. Pop. (1992 est.) 23,800.

Blenheim, Battle of (Aug. 13, 1704), the most famous victory of John Churchill, 1st Duke of Marlborough, and Eugene of Savoy in the War of the Spanish Succession. The first major defeat that the French army suffered in over 50 years, it saved Vienna from a threatening Franco-Bavarian army, preserved the alliance of England, Austria, and the United Provinces against France, and knocked Bavaria out of the war.

The battle was fought at Blenheim (now Blindheim) on the Danube River, 10 miles (16 km) southwest of Donauwörth in Bavaria, and engaged about 52,000 English and Austrian troops under Marlborough and Eugene and about 60,000 French and Bavarian troops under the French marshal Camille, Count de Tallart. Marlborough and Eugene joined forces on August 12 and the next day attacked the surprised and unprepared French. The French were drawn up behind a stream (the Nebelbach) in two sections, with their centre weakly held by almost unsupported cavalry. The initial Allied attacks forced Tallart to commit his reserves to both flanks, further weakening his centre. Marlborough then launched the main attack across the Nebelbach and its marshes, beating off French efforts to turn back the

attack and finally smashing through Tallart's centre. Tallart was captured, and many of his troops were drowned in the Danube. Maximilian II Emanuel, the elector of Bavaria, managed to withdraw his troops from the battle, but on the French right wing all the infantry around Blenheim surrendered. At a cost of 12,000 casualties, the Allies captured 13,000 Franco-Bavarian troops and killed, wounded, or caused to be drowned approximately 18,000 more.

Blenheim Palace, residence near Woodstock, Oxfordshire, Eng., built (1705-24) by the English Parliament as a national gift to John

when present, that are placed near the throat and contain one spine and two to four rays. The habitats of blennies range from rocky pools to sandy beaches, reefs, and beds of kelp. Many live in shallow water, but some range to depths of about 450 m (1,500 feet). Some are mainly herbivorous; the others are partially to wholly carnivorous. Blennies are generally unobtrusive, bottom-dwelling fishes. They are of little economic importance.

Taxonomically, blennies comprise a number of families. The two largest are Clinidae, or clinids, with about 180 species, and Blenniidae, or blenniids, with about 300. The clin-

Churchill, 1st Duke of Marlborough, for his victory in Germany in 1704 over the French and Bavarians at the Battle of Blenheim during the War of the Spanish Succession. The palace was designed by Sir John Vanbrugh and is regarded as the finest example of truly Baroque architecture in Great Britain.

In the early 18th century Queen Anne's gardener, Henry Wise, designed the grounds of the palace in the formal style of André Le Nôtre's famed gardens for Vaux-le-Vicomte and Versailles in France. Little remains of Wise's landscaping, however, because tastes changed in the mid-18th century, and Lancelot Brown was asked to redesign the grounds in his pastoral style of informal or seemingly natural landscapes of woods, lawns, and waterways. Sir Winston Churchill was born at Blenheim Palace.

blenny, any of the numerous and diverse fishes of the suborder Blennioidei (order Perciformes). Blennies are mostly small, usually marine fishes found from tropical to cold seas. They are slim, ranging in form from moderately elongated, as in some of the tropical species, to very long and eel-like, as in the gunnel and wolffish (*qq.v.*) of northern waters. As a group, however, they are united by such features as a long dorsal fin and pelvic fins,

ids, or scaled blennies, are carnivorous fishes, usually less than 30 cm (12 inches) long. They have a long, many-spined dorsal fin and usually a rather pointed nose. Many have fringed tentacles on their heads and snouts. The blenniids, or combtooth blennies, are small, blunt-nosed, scaleless blennies of warm and temperate seas. They have a single, sometimes notched, dorsal fin and slim, comblike teeth. The rockskipper (*Istiblennius zebra*) is a small Hawaiian blenny representative of several that live along shores and can hop about on land.

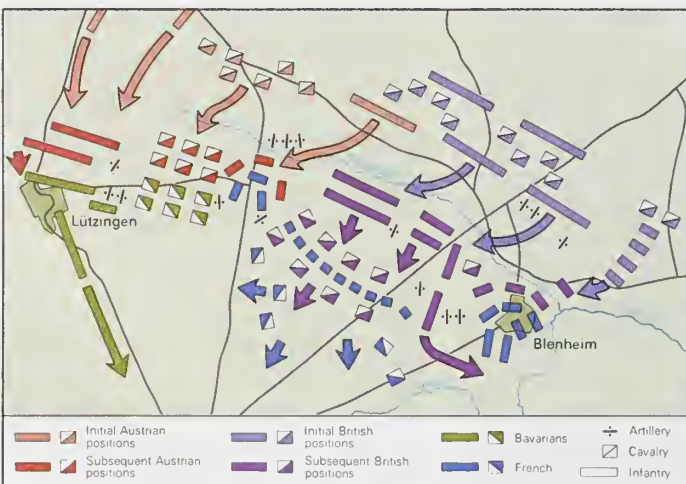

Shanny (*Blennius pholis*), a common European blenny

The Hawaiian *Rumula goslinei* and the Pacific *R. tapeinosoma*, both of which are small, are noted for nipping at swimmers.

blepharitis, inflammation of the eyelids, most commonly occurring in association with seborrhea, a skin disorder arising from overactivity of the sebaceous glands. In sebaceous blepharitis, also called squamous blepharitis, the margins of the lids are red and irritated, with greasy scales clinging to the bases of the eyelashes. The inflammation extends onto the lining of the lids. The condition is remedied by treating the underlying disorder. In allergic blepharitis the eyelid skin is thickened and red, and the tissues of the lids are swollen with abnormal quantities of fluid. This type of lid inflammation may be caused by reaction to nail polish, soap, hair spray, or medications used in the eyes. Allergic blepharitis may closely resemble the early stages of exophthalmic goitre. In another type of blepharitis

The Battle of Blenheim, Aug. 13, 1704

From David Chandler (ed.), *A Guide to the Battlefields of Europe*, vol. 2, copyright © 1965 by Hugh Evelyn, Ltd., published by Dimension Books, Denville, New Jersey

the inflammation is caused by infection with staphylococcus organisms. The eyelid margins may be ulcerated, and there are dry scales in the eyelashes at their bases. The infection is treated with antibiotic or sulfonamide ointments.

blepharochalasis, sagging of the skin of the upper eyelid down over the eye, so that vision may be obstructed. The condition sometimes develops in elderly persons. It results from changes in the two fibrous proteins, elastin and collagen, that form the supporting framework of the skin: the quantity of elastin decreases, and the attachments between collagen fibres increase in number. Blepharochalasis is also a feature of a strange, probably inherited, disorder, Ascher's syndrome, in which the eyelid abnormality is coupled with goitre and with a swelling that makes the upper lip seem double.

Blériot, Louis (b. July 1, 1872, Cambrai, Fr.—d. Aug. 2, 1936, Paris), aviator who made the world's first over-the-ocean flight in a heavier-than-air craft.

Blériot had amassed a modest fortune as an inventor of automobile lights and accessories and had taken an early interest in aviation. He experimented first with towed gliders on the Seine River. Then, as lightweight engines became available, he developed a series of airplanes of various configurations ranging from box-kite biplanes to a tail-first (canard) monoplane. By 1909 he had settled on more conventional designs; on July 25 of that year he piloted the Blériot XI, a monoplane with a 28-horsepower engine, across the English Channel from Calais to Dover. This feat won him lasting fame and a prize of £1,000 offered by the London *Daily Mail*.

Blériot
H. Roger-Viollet

Blériot was active in building aircraft for the French government during World War I, first producing trainers of his own designs, then associating with the makers of the famous Spad fighter. After the war he formed his own company for the development of commercial aircraft.

blesmol, any of certain mole rat species. *See* mole rat.

Blessing Way, central ritual of a complex system of ceremonies performed by the Navajo to restore equilibrium to the cosmos.

Of the many rituals classified by the Navajo according to their purpose, the largest group is the Chant Ways, which are concerned with curing and are divided into three groups. The first group are the Holy Way chants—including the Blessing Way, parts of which are found throughout most of the rituals, and the Wind Ways—all of which are used to cure diseases that can be traced to some violation by humans of the supernatural provinces of the Holy People, or supernatural beings. These rituals are further classified into Peaceful Ways, which invoke the beneficence of the Holy People, and Injury Ways, which are primarily exorcistic.

A second subdivision is that of the Ghost

Way, or Evil Way, chants—the best known being the Upward-Reaching-Way—that are practiced for exorcism and the curing of illnesses caused by ghosts and witches.

A third subdivision is the Life Ways, which are concerned with healing accidental injuries—the most notable being the Flint Way.

In addition to the Chant Ways, other prominent groups are concerned with success in war (the Enemy Ways) and hunting (the Game Ways), but these groups have mostly become obsolete.

Set apart from all these specifically oriented ways is the Blessing Way, a comparatively short (taking only two days to perform) and simple ritual. Performed for the general well-being of the community, rather than for specific curative purposes, it contains none of the typical features of curing rituals (e.g., sand paintings, prayer sticks, medicine songs, and herbs). To invoke good fortune—such as during childbirth, in blessing a new hogan (home), and in a girl's puberty ceremony—the traditional Navajo family would have the Blessing Way sung at least twice a year. Parts of the Blessing Way are incorporated into almost all other Chant Ways.

The story of the Blessing Way contains various details of the mythical events that occurred after the legendary emergence of the Navajo from the earth at creation. These events provide the prototypes for the organization of the cosmos, important Navajo ceremonies, and their central cultural institutions.

Blessington, Marguerite Gardiner, Countess of, née POWER (b. Sept. 1, 1789, Knockbrit near Clonmel, County Tipperary, Ire.—d. June 4, 1849, Paris, Fr.), Irish writer chiefly remembered for her *Conversations of Lord Byron* and for her London salon.

Her father sold her into marriage at 15 to Captain Maurice St. Leger Farmer, a sadist from whom she fled after three months. He died in a drunken brawl in 1817, after which Marguerite married Charles Gardiner, Viscount Mountjoy and Earl of Blessington. Of rare beauty, generosity, and wit, Lady Blessington had been painted at 18 by Thomas Lawrence. She formed a brilliant salon and began to write essays and sketches of London life.

In 1822 the Blessingtons went abroad, accompanied by the young Count d'Orsay, who married the earl's daughter by his first wife. They spent two months in Genoa with Byron and lived in Italy and then in France until the earl's death in May 1829. Their extravagant tastes had drained his fortune, and the countess, returning to London accompanied by d'Orsay, whose marriage had broken up and who remained with her all the rest of

Countess of Blessington, portrait after A.E. Chalon; in the National Portrait Gallery, London
By courtesy of the National Portrait Gallery, London

her life regardless of scandal, began to support herself by writing. Her first novel, *Grace Cassidy*, or, *The Repealers* (1833), was a success. Her journals furnished material for *Conversations of Lord Byron* (1834), *The Idler in Italy* (1839–40), and *The Idler in France* (1841). She wrote several other novels and edited two annuals, *The Book of Beauty* and *The Keepsake*, to which she contributed.

In spite of her literary success, Lady Blessington could not stay out of debt, and in April 1849, to avoid ruin, she and d'Orsay fled to Paris, where they remained until their deaths.

Blest Gana, Alberto (b. May 4, 1830, Santiago, Chile—d. Nov. 9/11, 1920, Paris, Fr.), novelist who founded the Chilean social novel.

Blest Gana began his education at the Santiago military academy, and, while studying military engineering in France, he came under the influence of the French realists, especially Honoré de Balzac. He returned to Chile in 1852 and taught mathematics in military academies. The fame he achieved through his literary work led to political appointments, and Blest Gana spent the last 50 years of his life serving as Chile's ambassador to England and France.

His early novels, such as *La aritmética en el amor* (1860; "Arithmetic in Love"), *Martín Rivas* (1862), and *El ideal de una calavera* (1863; "A Foolish Ideal"), realistically depict the lives of the middle and upper classes of Santiago. These novels are generally of a stiff nature, character and plot often suffering at the hands of the author's concern for the evils of materialism. After a period of more than 30 years, during which he published no new works, he wrote what are considered to be his best novels. *Durante la Reconquista* (1897; "During the Reconquest") and *Los transplantados* (1905; "The Uprooted"), both laden with moralistic overtones, are held to be his masterpieces.

Bleuler, Eugen (b. April 30, 1857, Zollikon, Switz.—d. July 15, 1939, Zollikon), one of the most influential psychiatrists of his time, best known today for his introduction of the term schizophrenia to describe the disorder previously known as dementia praecox and for his studies of schizophrenics.

Bleuler
By courtesy of IBA, Zürich/Oberengstringen

Bleuler studied medicine at the University of Bern and later was appointed professor of psychiatry at the University of Zürich and director of the Burghölzli Asylum in Zürich, where he served from 1898 to 1927. He first advanced the term schizophrenia in 1908 in a paper based on a study of 647 Burghölzli patients. He then expanded on his paper of 1908 in *Dementia Praecox oder Gruppe der Schizophrenien* (1911; *Dementia Praecox; or the Group of Schizophrenias*). He argued in this monograph that dementia praecox was not a single disease, was not invariably incurable, and did not always progress to full dementia. Each of these conclusions was at odds with the

accepted wisdom of the time. He described a group of diseases, the schizophrenias, the basic symptoms of which were a disordered train of mental associations and splitting or fragmentation of the personality. He believed that a large number of cases were latent (not fully expressed) and suggested that schizophrenics could in some cases have derangements of thought processes on specific questions rather than generally in all circumstances.

Bleuler is credited with the introduction of two concepts fundamental to the analysis of schizophrenia: autism, denoting the loss of contact with reality, frequently through indulgence in bizarre fantasy, and ambivalence, denoting the coexistence of mutually exclusive contradictions within the psyche.

Bleuler was an early proponent of the theories of Sigmund Freud, and he attempted to show how the various mechanisms Freud had found in neurotic patients could also be recognized in psychotic patients. Bleuler challenged the prevailing belief that psychosis was the result of organic brain damage, insisting instead that it could have psychological causes.

Bleuler's *Lehrbuch der Psychiatrie* (1916; *Textbook of Psychiatry*) became a standard text and went through many editions. During the early 1900s Bleuler's assistant was Carl Gustav Jung, and the two men were early members with Freud in the Vienna Psycho-Analytical Society.

Blicher, Steen Steensen (b. Oct. 11, 1782, Vium, Jutland, Den.—d. March 26, 1848, Spentrup, Jutland), Danish poet and short-story writer who portrayed the people of Jutland with humour and irony and with a realism well in advance of his time.

Blicher, detail of a drawing in pencil and India ink by E.-D. Baerentzen; in the National History Museum, Frederiksborg Castle, Hillerød, Den.

By courtesy of the Nationalhistoriske Museum på Frederiksborg, Denmark

An unhappily married, impoverished country parson, Blicher led an outdoor life, walking, shooting game, and talking to peasants, gypsies, farmers, and squires. Thus, he acquired an impressive command of the Jutland dialect and the materials for his short stories. His first volume of original poems appeared in 1814, and his subsequent poetry expressed both humour and a melancholy acceptance of life. In the "Prelude" to *Trækfuglene* (1838; "Birds of Passage"), his finest collection of poems, he presents a self-portrait of a caged bird longing for freedom. As his private life worsened, Blicher took to drink.

Blicher's fame rests primarily on his short stories and short novels. His best-known work, the novella *Brudstykket af en landshydegns dagbog* (1824; "Fragments of the Journal of a Parish Clerk"), is written in masterful prose and shows Blicher's psychological insight into the Jutlanders' character. In his stories he ranges from resignation to humour to irony. The general feeling of his narrative style is realistic; life is seen as the great shatterer of

illusions since it never keeps its promises. An English translation by H.A. Larsen of 12 of Blicher's stories appeared in 1945.

Blida, also called (after 1981) **EL-BOULAIDA**, town, northern Algeria. It lies on the southern edge of the Mitidja plain at the base of the Tell Atlas and is about 30 miles (48 km) southwest of Algiers. French in character, the town is surrounded by orchards, trades in oranges and flour, and has light manufacturing. The Wadi el-Kebir, an affluent of the Wadi Chiffa, supplies water for fountains and gardens in the town and is a source for hydropower.

Blida (*boleida*, diminutive of the Arabic *balad*, "city") occupies the site of a Roman military station. Formerly walled with six gates, the present town was founded in 1553 by Moorish refugees from Andalusia. A mosque was built in the town by order of Khayr ad-Din (Barbarossa). Blida was severely damaged by earthquakes in 1825 and 1867. It is overlooked (south) by the ruined Fort Mimich. Mount el-Mergueb (5,344 feet [1,629 m]), Chiffa Gorge, and Chrea mountain and ski resort are nearby. Crops grown in adjacent areas of the Mitidja plain include wheat, barley, citrus fruits, vegetables, tobacco, and olives. There are also vineyards in the area. Pop. (1987) 170,935.

INDEX
first

Bligh, William (b. Sept. 9, 1754, County of Cornwall, Eng.—d. Dec. 7, 1817, London), English admiral who commanded HMS *Bounty* at the time of the celebrated mutiny on that ship.

Bligh first went to sea as a cabin boy at the age of seven and joined the Royal Navy in 1770. He was sailing master of the *Resolution* on Captain James Cook's third and final voyage in 1776–80. He was appointed to the command of the 215-ton *Bounty* in 1787, when the vessel was being used in a scheme for taking breadfruit trees from Tahiti for replanting in the West Indies. The ship duly sailed to Tahiti, picked up breadfruit trees, and had sailed as far as the Friendly Islands (Tonga) on the voyage to Jamaica when it was suddenly seized by Fletcher Christian, the master's mate, on April 28, 1789. Bligh and 18 members of the crew who were loyal to him were turned adrift in the *Bounty's* longboat. The causes of the mutiny have been much discussed. Bligh's opponents charged him with tyranny, and it is true that Bligh had insulted many of his officers. Bligh himself imputed the mutiny to purely opportunistic motives, claiming that the crew "had assured themselves of a more happy life among the Otaheitans than they could possibly have in England, which, joined to some female connections, has most likely been the leading cause of the whole business."

In a remarkable feat of seamanship, Bligh eventually reached Timor in the East Indies on June 14, 1789, after a voyage of about 3,600 miles (5,800 km) in the open longboat. Christian and eight others took the *Bounty* to Pitcairn Island, where the small colony that they founded was undiscovered until 1808 and where their descendants still reside. Of the mutineers who later went to Tahiti, three were taken to England and hanged.

The mutiny made little difference to Bligh's career. He visited Tahiti again and successfully transported more breadfruit trees to the West Indies (1792). As captain of the *Director*, he was put ashore when his crew joined the mutiny of *The Nore* (1797). He commanded this ship with distinction at the Battle of Camperdown that year, however, as he did the *Glutton* at Copenhagen (1801). He was sent to New South Wales as governor in 1805. Again,

Bligh, pencil drawing by George Dance, 1794; in the National Portrait Gallery, London

By courtesy of the National Portrait Gallery, London

complaints of his "oppressive behaviour" led in 1808 to a mutiny, this time under the acting head of the New South Wales Corps in Sydney, Major George Johnston, who put Bligh under arrest. The mutineers were subsequently found guilty of conspiracy. Bligh was later promoted to rear admiral (1811) and vice admiral (1814).

Bligh's character has been variously interpreted. He does not seem to have been unduly tyrannical, but his abusive tongue and his overbearing manner made him unpopular as a commander. He possessed undoubted courage in battle and great skill as a navigator.

blight, any of various plant diseases whose symptoms include sudden and severe yellowing, browning, spotting, withering, or dying of leaves, flowers, fruit, stems, or the entire plant. Usually the shoots and other young, rapidly growing tissues of a plant are attacked. Most blights are caused by bacterial or fungal infestations, but they can also occur from drought. Fungal and bacterial blights are most apt to occur under cool, moist conditions. Most economically important plants are susceptible to one or more blights.

Measures for controlling and preventing blight typically involve the destruction of the infected plant parts; use of disease-free seed or stock and resistant varieties; crop rotation; pruning and spacing of plants for better air circulation; controlling pests that carry the fungus from plant to plant; avoidance of overhead watering and working among wet plants; and, where needed, the application of fungicide or antibiotics. Sanitation to stop the spread of the infestation is the cardinal measure. For bacterial blights (e.g., fire blight), fixed copper or streptomycin is an effective antibiotic when applied weekly during damp weather when leaves and shoots are expanding. See also botrytis blight; chestnut blight; fire blight; late blight.

Blijdorp Zoo: see Royal Rotterdam Zoological Garden Foundation.

blimp, nonrigid or semirigid airship dependent on internal gas pressure to maintain its form. The origin of the name *blimp* is uncertain, but the most common explanation is that it derives from "British Class B airship" plus "limp"—i.e., nonrigid. Blimps

U.S. Navy ZPG-3W airships

By courtesy of the Goodyear Aerospace Corporation

were used by navies during World War I in convoy and antisubmarine patrol duty, became attractions at fairs and expositions, and later carried advertising messages.

The U.S. Navy's ZPG-3W airship—403 feet (150 metres) long, 85 feet in diameter, with a capacity of more than 1,500,000 cubic feet (42,450 cubic metres)—was the world's largest nonrigid blimp. Four of them were commissioned in 1958. One exploded and crashed two years later, and the Navy retired the others by 1962.

blind fish, any of various eyeless fishes, among them several unrelated cave-dwelling species of the families Amblyopsidae, Characidae, and others. *See* cave fish.

Blind Harry: *see* Harry the Minstrel.

blind snake, any of about 150 species of small, burrowing snakes that make up the family Typhlopidae. Their vestigial eyes are buried under the head scales. Most are of the genus *Typhlops*, which ranges over most tropical areas. Blind snakes feed on small invertebrates, mainly ants and termites. Some of these snakes grow to about 75 centimetres (30 inches) long, but most are less than 20 cm (8 in.).

Blunt-headed, shiny, smooth, and cylindrical, blind snakes also have bluntly rounded tails, usually ending in a short spine. The teeth are small and are usually present only in the upper jaw. The name worm snake is sometimes applied to the Typhlopidae but seems better reserved for certain colubrids (*see* worm snake).

The closely related thread snakes, or slender blind snakes, are African and tropical American snakes that total more than 60 species of

blindman's buff, children's game played as early as 2,000 years ago in Greece. The game is variously known in Europe: Italy, *mosca cieca* ("blind fly"); Germany, *Blinderkuh* ("blind cow"); Sweden, *blindbock* ("blind buck"); Spain, *gallina ciepa* ("blind hen"); and France, *colin-maillard* (named for a medieval French lord who kept laying about him with his sword after he had been blinded in battle).

One player is carefully blindfolded and then disoriented by being spun around several times. The other players, who are not blindfolded, amuse themselves by calling out to the "blind man" and dodging away from him. In the Middle Ages it was an adult game, and the blindfolded player was usually struck and buffeted as well, hence "buff." A player touched or caught by the blind man takes on the blindfold, although sometimes the blind man must guess the identity of his captive before the blindfold is removed (if the guess is wrong, the captive is released and the game continues).

The game has been popular at later times among adults: the English diarist Samuel Pepys reported a game played by his wife and some friends in 1664, and the English poet laureate Alfred, Lord Tennyson, is said to have played it in 1855.

blindness, transient or continuing inability to see with one or both eyes. Transient blindness, in this instance called blackout, affects such persons as aviators or astronauts if they undergo acceleration that exerts its force on them in the direction from head to foot and if the force reaches five or six times the force of gravity. Transient blindness may also be a feature of kidney disease (glomerulonephritis). Continuing blindness may arise from injury or disease that affects any of the structures or substances that light passes through on its way to the retina, the layer of light-sensitive tissue that lines the back and sides of the eye, or the causes of the blindness may lie in injuries or disease of the retina itself, of the optic nerve, or of the visual centres of the brain.

A number of infectious diseases, including the venereal diseases, can cause blindness. Gonorrhea organisms in the pregnant woman, for example, caused blindness in infants until the practice of routinely putting silver nitrate drops in infants' eyes at birth was instituted. Untreated syphilis in the pregnant woman can cause imperfect development of infants' eyes, with resultant blindness, as can German measles in the pregnant woman during the first three months of pregnancy. Trachoma and leprosy frequently cause blindness in those parts of the world in which the diseases are prevalent. Other infections that can be the cause of blindness include tuberculosis, meningitis, measles, diphtheria, and scarlet fever. Onchocerciasis, or infestation with the roundworm *Onchocerca volvulus*, occasionally results in blindness if the worms invade the eyes.

Certain noninfectious systemic diseases may cause blindness. Diabetes mellitus, for example, an endocrine disease arising from insufficient secretion or utilization of insulin, may damage the retina or cause cataracts—opacity of the crystalline lens—which prevent light from reaching the retina. Atherosclerosis, the form of arteriosclerosis (hardening of the arteries) in which fatty plaques form in the linings of blood vessels, may, by blocking the blood supply, cause atrophy of retinal tissue and the optic nerve. Diseases springing from nutritional deficiencies may cause blindness by making the cornea—the normally transparent section of the globe in front of the pupil and iris—soft and cloudy.

Diseases of the eye itself that may bring blindness include cataract (*q.v.*)—opacity of the crystalline lens—and glaucoma (*q.v.*), the effect of intraocular pressure upon the optic nerve. *See also* visual-field defect.

blindworm, also called SLOWWORM (*Anguis fragilis*), a legless lizard of the family Anguillidae. It lives in grassy areas and open woodlands in Great Britain and throughout Europe eastward to the Caucasus Mountains. The adult is about 30 centimetres (1 foot) long, but some specimens grow to 50 cm. They are usually brown, chestnut, gray, bronze, brick red, or coppery. The female's underside is usually black.

The lizard eats snails and slugs and other soft animals, using pointed, fanglike teeth. Internal pelvic girdles are the only vestiges of legs.

Bliss, Sir Arthur (Edward Drummond) (b. Aug. 2, 1891, London—d. March 27, 1975, London), one of the leading English composers

Sir Arthur Bliss, 1953

Keystone

of the first half of the 20th century, noted both for his early, experimental works and for his later, more subjective compositions.

Bliss studied under Ralph Vaughan Williams and Gustav Holst. Up to the early 1920s, his music was frequently experimental, *e.g.*, *Rhapsody* (1919), for solo voices and chamber ensemble, in which the voice plays an instrumental role, singing vocalises (meaningless syllables), and *A Colour Symphony* (1922, revised 1932), whose four movements are intended to suggest the colours purple, red, blue, and green. Later, although he never abandoned experimentation, he began composing in classical forms, *e.g.*, the quintets for oboe and strings and for clarinet and strings, the *Piano Concerto*, and the *Conversations* for chamber orchestra. He composed the scores for three films, including *Things to Come* (1935; after H.G. Wells). Other works include the television opera *Tobias and the Angel* (1960) and his choral symphony *Morning Heroes* (1930). His ballets are *Checkmate* (1937; choreographed by Ninette de Valois), *Miracle in the Gorbals* (1944; choreographed by Robert Helpmann), and *Adam Zero* (1946; Helpmann). His last composition, a choral work called *Shield of Faith*, was performed initially a few weeks after his death, at the 500th anniversary celebration at St. George's Chapel, Windsor. Bliss was knighted in 1950 and in 1953 became Master of the Queen's Music.

Bliss, Gilbert Ames (b. May 9, 1876, Chicago—d. May 8, 1951, Harvey, Ill.), U.S. mathematician and educator known for his work on the calculus of variations.

He received his B.S. degree in 1897 from the University of Chicago and remained to study mathematical astronomy under F.R. Moulton. He received his M.S. degree in 1898 and two years later his doctorate. Bliss immediately went into teaching as an assistant professor of mathematics at the University of Minnesota from 1900 to 1902, followed by a two-year assistantship at the University of Chicago, a

Thread snake, or slender blind snake (*Leptotyphlops*)

Robert H. Wright—The National Audubon Society Collection/Photo Researchers

the family Leptotyphlopidae. Thread snakes have a well-developed pelvis and an internal thighbone; some have external claws on either side of the anus. The largest species, the Venezuelan *Leptotyphlops macrolepis*, reaches a length of 30 cm (12 in.); most are 10–17 cm (4–7 in.). Thread snakes feed on insect larvae, primarily those of ants and termites; some lay their eggs in termite nests, which provide protection for the eggs and food for the young.

blind spot, also called OPTIC DISK, the place on the retina of the eye from which the optic nerve emerges. This spot is insensitive to light. In binocular vision it is not noticed, because the part of the visual field covered by the blind spot of one eye is covered by a sensitive area in the other. *See also* visual-field defect.

blind staggers, symptom of several unrelated animal diseases, in which the affected animal walks with an unsteady, staggering gait and seems to be blind. The many possible causes include poisoning from ingesting plants containing a high level of selenium or from ingesting grasses infected with the fungal disease known as ergot. Magnesium or calcium deficiency may also cause blind staggers, as may inflammation of the brain (encephalitis) or of the brain coverings (meningitis).

year at the University of Missouri, and three years (1905–1908) as preceptor at Princeton University—a period in which he also served as an editor of the *Annals of Mathematics*. In 1908 Bliss returned to the faculty at the University of Chicago as an associate professor; he was named professor five years later. He became department chairman in 1927 and served until his retirement in 1941.

Bliss applied his knowledge of calculus to the field of ballistics during the latter days of World War I, when he designed an improved set of firing tables for artillery. His book *Mathematics for Exterior Ballistics* (1944) was based on this work. His research in algebraic functions led to his paper "Algebraic Functions and Their Divisors," and Bliss expanded on this work in his book *Algebraic Functions* (1933). Bliss's extensive study of the calculations of extreme values of an integral or function culminated in 1946 in his major work, *Lectures on the Calculus of Variations*. Bliss served as president of the American Mathematical Society from 1921 to 1922.

Bliss, Tasker Howard (b. Dec. 31, 1853, Lewisburg, Pa., U.S.—d. Nov. 9, 1930, Washington, D.C.), U.S. military commander and statesman who directed the mobilization effort upon the United States' entry into World War I.

After graduating from the U.S. Military Academy at West Point in 1875, Bliss served in various military assignments, including that of instructor at West Point and military attaché at the U.S. legation in Madrid. During the Spanish-American War (1898), Bliss was chief of staff under General James H. Wilson in Puerto Rico and later served in Cuba. Promoted to the rank of brigadier general, he negotiated the U.S.–Cuban reciprocity treaty (1902). After service as commandant of the Army War College (1903–05) and in the Philippines (1905–09), he drew various staff assignments and in 1915 was promoted to major general.

With the United States' entry into World War I in 1917, Bliss was made general and chief of staff. In that position he promptly expanded and upgraded the Army to battle-readiness and resisted attempts to divide the U.S. force among the various Allied commands. At the appointment of President Woodrow Wilson, he sat on the Allied Supreme War Council and was a delegate to the peace conference at Versailles. An ardent supporter of Wilson's worldview, Bliss promoted the Fourteen Points, American participation in the League of Nations, and international arms control.

Bliss, William D(wight) P(orter) (b. Aug. 20, 1856, Constantinople [now Istanbul]—d. Oct. 8, 1926, New York City), social reformer and organizer of Christian Socialist societies in the United States.

The son of American missionaries in Turkey, Bliss was educated at the Hartford Theological Seminary (Hartford, Conn.). First as a Congregationalist and later as an Episcopalian, he held several pastorates following his graduation from Hartford in 1882.

In the late 1880s Bliss became deeply interested in Christian Socialism, a movement intent upon applying the teachings of Jesus to the social dislocations caused by industrialization and urbanization. Bliss organized the first U.S. Christian Socialist Society in 1889 and edited its publication, *The Dawn*. Bliss traveled extensively, lecturing on the problems of labour and social reform. He compiled and edited many books, the best known being the *Encyclopedia of Social Reform* (1897). He unsuccessfully ran for lieutenant governor of Massachusetts in 1887 on the Labor Party ticket, and he also served as an investigator for the Bureau of Labor. He did educational

work among French and Belgian soldiers interned in Switzerland during World War I. He returned to the United States after the war and preached in New York City until his death.

Bliss Classification, also called BIBLIOGRAPHIC CLASSIFICATION (BC), bibliographic system devised by Henry Evelyn Bliss, of the College of the City of New York, and published in 1935 under the title *A System of Bibliographic Classification*; the full, second edition appeared in 1940–53. The system is utilized most extensively in British libraries. Characterized by liberal cross-references, it is primarily a bibliographic tool that aids in the organization of special subject fields. Arranged into 35 main classes, consisting of 9 numerical and 26 alphabetical classes, it has a notation system utilizing uppercase and lowercase roman letters, with Arabic numerals for major fixed categories or common subdivisions. Commas and apostrophes separate adjacent letters or groups of letters that, when combined into a single class mark, might be read as a single unit; they also avoid confusion of letters for numbers (e.g., 5 for s, 2 for z).

blister, a rounded elevation of the skin containing clear fluid, caused by a separation either between layers of the epidermis or between the epidermis and the dermis. Blisters are classified as vesicles if they are 0.5 cm (0.2 inch) or less in diameter and as bullae if they are larger. Blisters can commonly result from pressure and friction on sites such as the palms or soles; they are produced when friction causes an upper skin layer to move back and forth over an underlying skin layer. A small gap opens up between them and becomes filled with fluid. Blisters may also occur as symptoms of contact dermatitis, viral infection, or an autoimmune disease, in which case they can appear anywhere on the body.

Blistering usually takes place within the uppermost layer of the skin (epidermis), producing fragile, easily broken blisters; subepidermal blisters are tenser and are more difficult to break. In either case, the blister fluid is usually clear and colourless; yellowish fluid is a sign that it contains pus and red that it contains blood. Friction blisters generally heal spontaneously, sometimes leaving a thickened callus; disease blisters may leave scars, particularly when they are located deep in the epidermis.

blister beetle, any of the approximately 2,000 species of the insect family Meloidae (order Coleoptera). These beetles secrete an irritating substance, cantharidin, which is collected mainly from *Mylabris* and the European species *Lytta vesicatoria*, commonly called Spanish fly. Cantharidin is used medically as a topical skin irritant to remove warts. In the past, when inducing blisters was a common remedy for many ailments, cantharidin was commonly used for this purpose. It was also a major ingredient in so-called love potions. Blister beetles are both helpful and harmful to humans. The larvae eat grasshopper eggs, but the adults destroy crops.

Adult blister beetles are often brightly coloured, the need for camouflage being elim-

inated by their ability to secrete cantharidin. They range between 3 and 20 mm (0.1 to 0.8 inch) in length, with the majority between 10 and 15 mm (0.4 and 0.6 inch). Their long, slender, leathery bodies are covered by metallic green or blue wing covers, often marked with bands or stripes.

Oil beetle (*Meloe proscarabaeus*)

S. C. Bissert—Bruce Coleman Ltd

The female lays between about 3,000 and 4,000 eggs; only a few of the young survive, however, because of their complicated and haphazard life history (hypermetamorphosis). The female of *Sitaris muralis* deposits masses of eggs near solitary bees' nests. The larvae hatch from the eggs and remain dormant throughout the winter. In the spring tiny active forms (triungulins), sometimes known as bee lice, attach themselves to a bee. They feed on eggs and stored food in the bee nest as they pass through several more developmental stages, changing from a larva to a legless grub. When the pupal stage is complete, the newly emerged adult drops to the ground and begins feeding on cultivated plants.

The female of some blister beetles (e.g., *Epicauta vittata*) deposits masses of eggs either on or in the ground. The triungulin feeds on grasshopper eggs, undergoes a series of molts (periodic shedding of skin), and spends the winter in a pupallike stage. After passing through several more larval stages and a true pupal stage, the adult blister beetle emerges.

The members of the subfamily Meloidae are sometimes known as oil beetles. They do not have hindwings as do most blister beetles, nor do their wing covers meet in the middle of the back; rather, the covers are much shorter and overlap. Oil beetles secrete an oily substance that protects them from predators because of its bad taste. In some species the forcepslike antennae of the male are used to hold the female during mating. An oil beetle genus common in both Europe and North America is *Meloe*.

Blitar, city and *kabupaten* (regency), Jawa Timur *propinsi* (East Java province), Java, Indonesia. It is located 70 miles (113 km) southwest of Surabaya, the provincial capital. The city lies at an elevation of 528 feet (161 m) above sea level. Linked by road and railway with Malang to the east and with Tulungagung to the west, it has a rural character because of the ancient temples and historical sites located in and around the city. Blitar is a trade and transshipment centre for commodities including coffee, rice, sugar, rubber, peanuts (groundnuts), and cassava. Its industries produce iron and copper ware, woodwork, tiles and slates, processed rubber, footwear, tires, and textiles. The population is mainly Javanese. The graves of Sukarno, Indonesia's disgraced revolutionary hero and first president, and of his mother are located in the vicinity of Blitar. To the south of the city are the Gedo and Arju temples; along the highway from Wlinge to Malang are the remains of the Salaraja temple; 37 miles (60 km) south is the Pautai Serang beach; and 7 miles (11 km) south is

blitzkrieg (German: "lightning war"), military tactic calculated to create psychological shock and resultant disorganization in enemy forces through the employment of surprise, speed, and superiority in matériel or firepower. Tested by the Germans during the Spanish Civil War in 1938 and against Poland in 1939, the blitzkrieg proved to be a formidable combination of land and air action. The essence of blitzkrieg is the use of mobility, shock, and locally concentrated firepower in a skillfully coordinated attack to paralyze an adversary's capacity to coordinate his own defenses, rather than attempting to physically overcome them, and then to exploit this paralysis by penetrating to his rear areas and disrupting his whole system of communications and administration. The tactics, as employed by the Germans, consisted of a splitting thrust on a narrow front by combat groups using tanks, dive-bombers, and motorized artillery to disrupt the main enemy battle position at the point of attack. Wide sweeps by armoured vehicles followed, creating large pockets of trapped and immobilized enemy forces. These tactics were remarkably economical of both lives and matériel, primarily for the attackers but also, because of the speed and short duration of the campaign, among the victims.

Blitzkrieg tactics were used in the successful German invasions of Belgium, The Netherlands, and France in 1940. They were used by the German commander Erwin Rommel during the desert campaigns in North Africa and by U.S. General George Patton in the European operations of 1944. More recent manifestations of blitzkrieg were the combined air and ground attacks by Israeli forces on Syria and Egypt in June 1967 and the Israeli counterattacks and final counteroffensive against the same adversaries in October 1973.

Blitzstein, Marc (b. March 2, 1905, Philadelphia, Pa., U.S.—d. Jan. 22, 1964, Fort-de-France, Martinique), American pianist, playwright, and composer known for his unorthodox operas and plays.

Blitzstein was a musical prodigy, performing at age 5, composing at 7, and at 15 being introduced as a soloist with the Philadelphia Orchestra. In the 1920s he studied piano with Nadia Boulanger in Paris and Arnold Schönberg in Berlin. His first opera, *The Cradle Will Rock* (1937), is the story of a capitalist's resistance to unionization. Controversy surrounded much of Blitzstein's work, which is experimental in subject matter and characterized by unexpected tonalities. Blitzstein believed fascism should be fought with art, and he had a gift for composing music that was dramatic and meaningful. He wrote *Regina* (1949), an opera based on Lillian Hellman's *The Little Foxes*, and is best known for his translation and musical adaptation of *The Threepenny Opera* (first performed in 1952) by Kurt Weill and Bertolt Brecht.

Blixen, Karen, BARONESSE (Baroness) BLIXEN-FINECKE (Danish writer); see Dinesen, Isak.

blizzard, severe weather condition that is distinguished by low temperatures, strong winds, and large quantities of snow. The U.S. Weather Service defines a blizzard as a storm with winds of more than 51 km (32 miles) per hour and enough snow to limit visibility to 150 m (500 feet) or less. A severe blizzard has winds of over 72 km/h, visibility near zero, and temperatures of -12°C (10°F) or lower.

The name originated in the central United States, where blizzards are brought by northwesterly winds following winter depressions, or low-pressure systems. In the United States and in England, the term is commonly used for any strong, heavy snowstorm. In Antarctica, blizzards are associated with winds spilling

over the edge of the ice plateau at an average velocity of 160 km/h.

Blobel, Günter (b. May 21, 1936, Waltersdorf, Silesia, Ger. [now Niegoslawice, Pol.]), German-born cellular and molecular biologist who was awarded the Nobel Prize for Physiology or Medicine in 1999 for his discovery that proteins have signals that govern their movement and position in a cell.

Blobel received a medical degree (1960) from Eberhard-Karl University in Tübingen, Ger., and earned a Ph.D. (1967) in oncology from the University of Wisconsin. In 1967 he joined the protein lab at Rockefeller University, where he began studying the transport and localization of proteins, two critical and not fully understood details of protein processing. By 1980 he had established the general principles by which proteins are targeted to specific organelles within a cell. With other research groups, Blobel conducted a series of experiments that showed that each protein carries an address code within its molecular structure. The address code specifies whether the protein will pass through the membrane of a specific organelle, become integrated into the membrane, or be exported out of the cell. Blobel also concluded that proteins enter the organelles through a porelike channel that opens in the organelle's outer membrane when the correct protein arrives at the organelle. Blobel's work shed light on such hereditary diseases as cystic fibrosis and provided the basis for bioengineered drugs, including insulin.

Bloc Québécois, English QUEBEC BLOC, Canadian regional political party that supports the independence of predominantly French-speaking Quebec. It has informal ties with the provincial Parti Québécois (*q.v.*) and represents the interests of French-speaking Quebecers at the federal level.

The Bloc Québécois was organized in 1990 by Lucien Bouchard to contest federal elections after the defeat in a national referendum of an accord that would have recognized Quebec as a distinct society and given it veto power over most constitutional changes. The party won 54 seats in the federal House of Commons in 1993, enabling it to become the official opposition. Its support in federal elections declined after the defeat of a 1995 provincial referendum on independence. In 1997 the Bloc Québécois lost its status as the official opposition, and in 2000 it won only 38 seats. In 2004 and 2006 the party's support rebounded, with the Bloc Québécois winning more than 50 seats in the House of Commons at each election.

Bloch, Ernest (b. July 24, 1880, Geneva, Switz.—d. July 15, 1959, Portland, Ore., U.S.), composer whose music reflects Jewish

Ernest Bloch

By courtesy of the Cleveland Institute of Music

cultural and liturgical themes as well as European Postromantic traditions. His students included Roger Sessions and Elliott Carter.

Bloch studied with the noted Swiss composer Émile Jaques-Daleroze and in Belgium with the violinist Eugène Ysaÿe. From 1911 to 1915 he taught at the Geneva Conservatory.

After settling in the United States, he was director of the Cleveland Institute of Music (1920–25) and the San Francisco Conservatory (1925–30). In 1930 he went to Switzerland, but he returned to the United States in 1939.

Bloch's music reflects many Postromantic influences, among them the styles of Claude Debussy, Gustav Mahler, and Richard Strauss. His interest in Impressionism appears in the tone poem *Hiver-Printemps* (1905; *Winter-Spring*). He composed a significant group of works on Jewish themes, among them the *Israel Symphony* (1916), *Trois poèmes juifs* (1913; *Three Jewish Poems*) for orchestra, the tone poem *Schelomo* (1916; *Solomon*) for cello and orchestra, and the suite *Baal Shem* (1923) for violin and piano (or orchestra). His sacred service *Avodath Hakodesh*, for baritone, chorus, and orchestra, represents the full maturity of his use of music appropriate to Jewish themes and liturgy. Many of Bloch's works show a strong neoclassical trend, combining musical forms of the past with 20th-century techniques. Examples include his first *Concerto Grosso* (1925) and his *Quintet for Piano and Strings* (1923), which utilizes quarter tones to colour and heighten the emotional intensity of the music.

Bloch, Ernst (b. July 8, 1885, Ludwigshafen, Ger.—d. Aug. 4, 1977, Stuttgart), German Marxist philosopher whose *Philosophie der Hoffnung* ("Philosophy of Hope") was intended to complete what he considered Marxism's partial outlook on reality.

Having begun his career at the University of Leipzig (1918), Bloch fled from Nazi Germany to Switzerland (1933), then went to the United States, where he wrote the first two volumes of his major work, *Das Prinzip Hoffnung*, 3 vol. (1954–59; "The Hope Principle"). He returned to the University of Leipzig in 1948. He had, however, become critical of the development of Marxist thought and provoked the disapproval of the ruling Communist Party officials; the journal *Deutsche Zeitschrift für Philosophie*, which he edited from 1953, was suppressed, he was forbidden to publish, and in 1957 his works were condemned. In 1961 he defected to West Germany and taught at the University of Tübingen.

Bloch, Felix (b. Oct. 23, 1905, Zürich, Switz.—d. Sept. 10, 1983, Zürich), Swiss-born American physicist, who shared (with E.M. Purcell) the Nobel Prize for Physics in 1952 for developing the nuclear magnetic resonance method of measuring the magnetic field of atomic nuclei. Bloch's doctoral dissertation (University of Leipzig, 1928) promulgated a quantum theory of solids that still provides the basis for the present understanding of electrical conduction.

Bloch taught at the University of Leipzig until 1933; when Adolf Hitler came to power he emigrated to the United States and was naturalized in 1939. After joining the faculty of Stanford University, Palo Alto, Calif., in 1934, he proposed a method for splitting a beam of neutrons into two components that corresponded to the two possible orientations of a neutron in a magnetic field. In 1939, using this method, he and Luis Alvarez (winner of the Nobel Prize for Physics in 1968) measured the magnetic moment of the neutron (a property of its magnetic field). Bloch worked on atomic energy at Los Alamos, N.M., and radar countermeasures at Harvard University during World War II and returned to Stanford in 1945 to develop, with physicists W.W. Hansen and M.E. Packard, the principle of nuclear magnetic resonance, which helped establish the relationship between nuclear magnetic fields and the crystalline and magnetic properties of various materials. It later became useful in determining the composition and structure

of molecules. Nuclear magnetic resonance techniques have become increasingly important in diagnostic medicine.

Bloch was the first director general of the European Organization for Nuclear Research (1954–55; CERN).

Bloch, Joseph Samuel (b. Nov. 20, 1850, Dukla, Galicia, Austrian Empire [now in Poland]—d. Oct. 1, 1923, Vienna [Austria]), Austrian rabbi, politician, journalist, and crusader against anti-Semitism, particularly the so-called blood accusation, or blood libel—the allegation that Jews use the blood of Christians in the Passover ritual.

After serving as a rabbi in several small communities, Bloch settled in Florisdorf, a suburb of Vienna. At the time, anti-Semitism was gaining momentum in Austria. It culminated in the notorious trial, in 1882, of 15 Jews living in Tiszaeszlár who were accused of murdering a 14-year-old girl named Esther Solymosi to use her blood for the coming Passover ceremonies. When August Rohling, of the Roman Catholic theological faculty at the University of Prague, claimed that he could prove under oath the actuality of the blood ritual, Bloch retaliated. In a series of articles, he accused Rohling of ignorance and deceit, and Rohling sued for libel. He withdrew his suit, however. Nevertheless, Bloch published a compendium of the expert evidence he had prepared for the trial in his work *Israel und die Voelker* (1922; *Israel and the Nations*).

Bloch left the rabbinate and from 1884 to 1921 published *Österreichische Wochenschrift* ("Austrian Weekly"), financed by a Christian, Baron Scher, in which anti-Semitism was uncompromisingly attacked. Bloch carried on the fight in the Austrian parliament, of which he was a member three times during the years 1883–85 and 1891–95. In 1893 he instituted criminal proceedings against three men who had accused a group of rabbis of the blood ritual. The men were found guilty of conspiracy and imprisoned.

Bloch, Konrad (Emil) (b. Jan. 21, 1912, Neisse, Ger. [now Nysa, Pol.]—d. Oct. 15, 2000, Burlington, Mass., U.S.), German-born American biochemist who shared the 1964 Nobel Prize for Physiology or Medicine with Feodor Lynen for their discoveries concerning the natural synthesis of cholesterol and fatty acids.

After receiving a chemical engineering degree at the Technische Hochschule, Munich, in 1934, Bloch went to Switzerland and then to the United States. At Columbia University (Ph.D., 1938) he became a research associate of Rudolf Schoenheimer in the isotopic analysis of cell metabolism. After teaching at the University of Chicago (1946–54), Bloch became professor of biochemistry at Harvard, continuing his research on lipids, especially the unsaturated fatty acid components; he was named emeritus professor in 1982.

In 1942 Bloch and David Rittenberg discovered that the two-carbon compound, acetic acid, was the major building block in the 30 or more steps in the biosynthesis (natural formation) of cholesterol, a waxlike alcohol found in animal cells. In his search to determine how acetic acid molecules combine in this process, Bloch was also joined by Feodor Lynen and his collaborators in Munich and J.W. Cornforth and G. Popjak in England. Their discovery facilitated medical research on the relation of blood cholesterol levels to atherosclerosis; research in physiology; and research on the chemistry of terpenes, rubber, and other isoprene derivatives.

Bloch, Marc (Léopold Benjamin) (b. July 6, 1886, Lyon, Fr.—d. June 16, 1944, near Lyon), French historian whose wide-ranging,

interdisciplinary approach to history revolutionized 20th-century historiography.

Bloch was the son of a professor of ancient history. Educated at the École Normale Supérieure (1904–08) and at the universities of Leipzig and Berlin (1908–09), he continued his education while teaching. He served in the French infantry (1914–19) and, for his bravery, was admitted to the Legion of Honour and received the Croix de Guerre.

After the war Bloch earned his doctorate (1920) and taught at the University of Strasbourg (1919–36). His first major work, *Les Rois Thaumaturges: Étude sur le caractère surnaturel attribué à la puissance royale, particulièrement en France et en Angleterre* (1924; *The Royal Touch: Sacred Monarchy and Scrofula in England and France*), was an inquiry into the medieval belief in the ability of kings to heal disease. Bloch and his colleague Lucien Febvre founded (1929) and coedited (1929–38) *Annales d'histoire économique et sociale*, an influential journal of essays on modern historical studies. Bloch's second major work, *Les Caractères originaux de l'histoire rurale française* (1931; *French Rural History: An Essay on Its Basic Characteristics*), is a social history of rural France that investigates such matters as cropping systems and farming methods as well as the more traditional documents and sources of historical information. In 1936 he was appointed professor of economic history at the Sorbonne. *La Société féodale* (1939; *Feudal Society*), his third major study, led to a reexamination of assumptions about European feudalism. Bloch returned to military service in 1939, serving until France surrendered to Germany in 1940; he joined the French Resistance. He was captured and executed in 1944. Among his posthumously published books were *L'Étrange défaite: Témoignage écrit en 1940* (1946; *Strange Defeat: A Statement of Evidence Written in 1940*) and *Apologie pour le métier d'historien* (1949; *The Historian's Craft*).

Block, Herbert Lawrence: see Herblock.

block and tackle, combination of a flexible rope, or cable, and pulleys commonly used to augment pulling force; it can be used to lift heavy weights or to exert large forces in any direction. In the Figure there are four freely rotating pulleys, two on the upper block, which remains fixed, and two on the lower block, which moves up as the load *W* is lifted; one end of the rope is anchored to the upper block. If the load *W* is lifted one foot, each of the four rope links will shorten by one foot so that four feet of rope must be pulled off by the effort *F*; consequently the force magnification and the mechanical advantage, neglecting friction, is 4. Higher force ratios may be obtained by the use of more pulleys, but this advantage may be offset by increased friction. See also wheel and axle.

Block and tackle
From McGraw-Hill Encyclopedia of Science and Technology Copyright 1971 Used with permission of McGraw-Hill Book Company

block book, book printed from wooden blocks on which the text and illustration for each page had to be painstakingly cut by hand. Such books were distinct from printed books after the invention of movable type, in which words were made up of individual letters each of which could be reused as often as necessary and in which only illustrations and special devices, such as initial letters in paragraphs, had to be carved individually in wooden blocks set in forms with metal letters.

The art of block-book printing is almost certainly of Chinese origin, probably of the 6th century AD. The first examples were produced by hand-rubbing impressions from the block. The method had spread to Europe at least by

Block book, a page from the *Biblia Pauperum* illustrating the Resurrection and its Old Testament prototypes, c. 1470–80; in the British Library
Peter J. Davey

the 15th century, and early in the 15th century simple presses were probably sometimes being used to impress the "printing" from more elaborate text-illustration blocks. Block books were tedious to produce since each letter had to be carved each time it appeared on a page; the method was used most often for short, simple works—largely religious—in which the length of the text could be subordinated to illustration. Hardly any European block books are known to have been executed after the early 16th century.

Block Island, pear-shaped island coextensive with the town (township) of New Shoreham (inc. 1672), Washington county, southern Rhode Island, U.S., between Block Island Sound and the Atlantic Ocean. Lying about 9 miles (14 km) south of the mainland, it is about 6 miles (10 km) long and 3.5 miles (5.5 km) wide and has a land area of 10 square miles (25 square km). The island was sighted by the Italian navigator Giovanni da Verrazano in 1524 and later named for Dutch explorer Adriaen Block, who visited there in 1614. Settlers from Massachusetts arrived in 1661, and Block Island was admitted to the colony of Rhode Island three years later.

The economy is based mainly on resort activities, and a large area on the island has been set aside as a nature reserve. The Old Harbor (eastern side), the island's main settlement, was formed in 1873 with the construction of a breakwater; the New Harbor (western side) was formed (1896) by building a channel from the sound to Great Salt Pond. Ferries connect Old Harbor to the mainland. New Harbor is the centre of pleasure boating on the island. Block Island Race Week is an annual yachting event. Pop. (1999 est.) 987.

blockade, an act of war by which a belligerent prevents access to or departure from a defined part of the enemy's coasts.

Blockades are regulated by international customary law and by international treaty law. A blockade must be declared in advance by notification of all neutral powers, and it must be applied impartially against ships of all states. Mere declarations of a blockade or "paper blockades," common in the 18th and early 19th centuries, have no legal effect; the blockading state must make the blockade effective by maintaining naval or air forces in the area in sufficient strength to prevent ingress or egress from the enemy's ports. Once the blockade ceases to be effectively maintained, the legal state of blockade lapses and can only be reestablished by due notification and enforcement.

Penalties for breach of blockade are seizure of ship and cargo and their possible condemnation as lawful prize. Neutral ships may not be destroyed for blockade running.

The law of blockade, in common with other laws of war, has evolved historically to meet the needs of major powers. The development of submarines and aircraft, in particular, made it impossible to station blockading warships in constant positions off an enemy's coasts to maintain close blockades, and it has subsequently been accepted that long-range blockades (maintained by naval forces out of sight of the enemy's coast) are legal if they effectively prevent ingress and egress.

There is little legal authority, however, by which the meaning of "effective blockade" may be precisely defined under conditions of modern naval warfare. There is authority for the view that risk of seizure for ships running the blockade must be substantial, entailing the presence of patrolling ships.

Blocksberg (Germany): *see* Brocken.

Blockside, Charles William: *see* Baylebridge, William.

Bloemaert, Abraham (b. Dec. 25, 1564, Gorinchem [now in The Netherlands]—d. Jan. 27, 1651, Utrecht, Neth.), influential Dutch Mannerist painter and engraver.

Bloemaert studied at Utrecht under eminent painters, spent three years in Paris, and then returned to settle finally at Utrecht, where he became dean of the Guild of St. Luke. He painted and etched historical and allegorical pictures, landscapes, still lifes, animal pictures, and flower pieces. His four sons—Hendrick, Frederick, Cornelis, and Adriaen—all achieved considerable reputations themselves as painters and engravers. Bloemaert's work was influenced by Caravaggio, and he in his

turn was an influence on Jan Both, Aelbert Jacobszoon Cuyp, Gerrit van Honthorst, Hendrik Terbrugghen, and Jan Baptist Weenix.

Bloembergen, Nicolaas (b. March 11, 1920, Dordrecht, Neth.), Dutch-born American physicist, corecipient with Arthur Leonard Schawlow of the United States and Kai Manne Börje Siegbahn of Sweden (*qq.v.*) of the 1981 Nobel Prize for Physics for their revolutionary spectroscopic studies of the interaction of electromagnetic radiation with matter. Bloembergen made a pioneering use of lasers in these investigations.

Bloembergen received undergraduate (1941) and graduate (1943) degrees from the University of Utrecht. In 1946 he entered Harvard University, where with Edward Purcell and Robert Pound he did fundamental research on nuclear magnetic resonance. After receiving his Ph.D. from the University of Leiden in 1948, he returned to Harvard, where he became a professor of applied physics in 1951 and Gerhard Gade university professor in 1980. He became a U.S. citizen in 1958.

Bloembergen's early research on nuclear magnetic resonance led him to an interest in masers. He designed a three-stage crystal maser that was dramatically more powerful than earlier gaseous masers and that has become the most widely used microwave amplifier. Bloembergen then developed laser spectroscopy, which allows high-precision observations of atomic structure. His laser spectroscopic investigations led him in turn to formulate nonlinear optics, a new theoretical approach to the analysis of how electromagnetic radiation interacts with matter. Bloembergen's research in nonlinear optics helped procure him a share of the Nobel Prize.

Bloemfontein, city, capital of Free State province (formerly Orange Free State) and judicial capital of the Republic of South Africa.

Founded by Major H. Douglas Warden in 1846 as a fort and residency, it became the seat of the British-administered Orange River Sovereignty (1848–54) and of the Orange Free State (an independent Boer republic formed in 1854). The failure of the Bloemfontein Conference (May–June 1899) resulted in the outbreak of the South African War (1899–1902). In the 20th century the city became a geographic hub of South Africa's transportation (particularly, railroad) systems. The area's economic development was spurred after 1948 by exploitation of the Free State goldfields, lying 100 miles (160 km) northeast, and after 1962 by the Orange River multipurpose (irrigation and power) project.

The city lies on a high plateau at an elevation of 4,568 feet (1,392 m). Spacious and sprawl-

ing over hills and kopjes (hillocks), Bloemfontein ("Fountain of Flowers") is known for its many attractions, including King's Park and the Franklin Game Reserve on Naval Hill. The city contains the national Court of Appeal, the province's oldest Dutch Reformed

Bloemfontein, S.Af., from Naval Hill

J. Allan Cash

Church (Moeder Kerk), the Fourth Raadsaal (the current seat of the provincial council), and the Old Raadsaal (1849), a one-room house that is now a national monument. The city is the seat of the University of the Free State (founded 1904). Bloemfontein became part of the Mangaung Local Municipality in 2000. Pop. (2005 est.) city, 379,000.

Blois, feudal countship that rose to great importance in medieval France as its holders came to possess not only the city of Blois

The county of Blois, c. 1035

From W. Shepherd, *Historical Atlas*, Harper & Row, Publishers (Barnes & Noble Books), New York; revision Copyright © 1964 by Barnes & Noble, Inc.

itself and its immediate vicinity, the Blésois, but also other domains.

Under Robert the Strong (d. 866), duke of the entire region between the Seine and Loire rivers and ancestor of the French royal house of Capet, Blois was an appointive viscounty. About 940 the title of count was assumed by Thibaut I the Old, or the Cheat (d. c. 977), who founded the hereditary house of Blois. He enlarged his domain until it extended from the Indre River to the Eure.

From 987, when the accession of the Capetians to the French throne was firmly established, the counts of Blois were the king's immediate vassals; but they were also his most dangerous rivals. The immediate successors of Thibaut I continued to enlarge their domain, sometimes at the expense of the Capetians. When Eudes II (d. 1037) acquired Champagne (c. 1023), the Capetian

"The Preaching of St. John the Baptist," painting on canvas by Abraham Bloemaert; in the Rijksmuseum, Amsterdam

By courtesy of the Rijksmuseum, Amsterdam

domain was threatened both west and east by Blois-Champagne power. After the death of Eudes, however, his territories were gradually divided among his descendants, until Thibaut IV the Great (died 1152) reunited Champagne (as Thibaut II) with Blois in 1125.

Thibaut (whose brothers Henry and Stephen became, respectively, the bishop of Winchester and the king of England) was considered the second most powerful person in France; he was alternately the ally and the enemy of Louis VI and Louis VII. The countship was then at the zenith of its power. When Blois and Champagne were finally divided between Thibaut's sons in 1152, the countship began to decline. In 1230 it passed to the House of Châtillon and was further divided.

In the late 14th century Blois was sold to Louis de France, duc d'Orléans. In 1498 his grandson became king of France as Louis XII, and Blois passed to the crown. Gaston de France, duc d'Orléans, held Blois as an appanage from 1626 to 1660. Subsequently, Louis XIV gave it to his brother Philippe I, duc d'Orléans, with whose descendants it remained until the French Revolution.

tioned in the 6th century by Gregory of Tours, it was by the early Middle Ages seat of the powerful counts of Blois, from whom descended the Capetian kings of France. At the end of the 14th century, Blois was acquired by Louis de France, duc d'Orléans. Joan of Arc set out from Blois in 1429 to raise the siege of Orléans. In 1498 the son of Duke Charles and grandson of Duke Louis succeeded to the French throne as Louis XII. He had been born in the château, and from his coronation until the end of the 16th century, Blois was almost a second capital of France. Under Henry III, the States-General twice met there. At the second of the two meetings most of the deputies supported the Catholic League and its leader, Henri de Guise, who had been plotting with Spain to take the throne. Henry III, fearing deposition, had Guise murdered on the second floor of the château, Dec. 23, 1588. The queen mother, Catherine de Médicis, died a few days later in a room just below. Marie de Médicis was imprisoned there by her son, Louis XIII, but escaped after two years of luxurious confinement. In 1626 the same Louis sent his brother, Gaston de France, duc

d'Orléans, to Blois, inviting him to redesign the château. The classical wing designed by François Mansart was the result.

The château, begun as a feudal castle, displays splendid work of all the architectural periods from the 13th to the 17th century. The main hall, where the States-General met, is 13th century; the Charles d'Orléans Gallery is mid-15th, while the Chapelle Saint-Calais and the Louis XII Wing (1498-1503) mark the transition between Gothic and Renaissance. The Francis I facade (1515-24) is pure Renaissance, and its extraordinary staircase spirals five stories upward in a sculptured octagonal case.

Many of the ancient buildings between the château and the river were destroyed in World War II; some have since been rebuilt. The town has some picturesque streets and many Gothic and Renaissance buildings. It is a major tourist centre of the Loire Valley and an important market for the corn (maize), asparagus, and wine produced in the surrounding countryside. Chocolate and footwear are also made. The policy of decentralizing industry in the Paris region has promoted recent growth in Blois and other cities of the Loire Valley. Pop. (1982) 46,925.

Blois, François-Louis de: see Blossius, Franciscus Ludovicus.

Blok, Aleksandr Aleksandrovich (b. Nov. 28 [Nov. 16, old style], 1880, St. Petersburg, Russia—d. Aug. 7, 1921, Petrograd), poet and dramatist, the principal representative of Russian Symbolism, a modernist literary movement that was influenced by its European counterpart but was strongly imbued with indigenous Eastern Orthodox religious and mystical elements.

Born into a sheltered, intellectual environment, Blok was reared from the age of three in an atmosphere of artistic refinement at the manor of his aristocratic maternal grandparents, since his father, a law professor, and his mother, the cultured daughter of the rector of St. Petersburg University, had separated. In 1903 Blok married Liubov Mendeleyeva, daughter of the famous chemist D.I. Mendeleyev. To Blok, who began to write at the age of five, poetic expression came naturally, and his early verse communicates the exaltation and spiritual fulfillment his marriage brought.

Imbued with the early 19th-century Romantic poetry of Aleksandr Pushkin and the apocalyptic philosophy of the poet and mystic Vladimir Solovyov (1853-1900), Blok developed their concepts into an original poetic expression by a creative use of rhythmic innovations. For Blok, sound was paramount, and musicality is the primary characteristic of his verse.

His first collection of poems, the cycle *Stikhi o prekrasnoy dame* (1904; "Verses About the Lady Beautiful"), portrays his initial phase of Platonic idealism, personifying divine wisdom (Greek *sophia*) as the feminine world soul (eternal womanhood). But by 1904 Blok's romantic expectation of otherworldly fulfillment had been transformed into a concern for the human suffering surrounding him, and he began to dissipate himself in a frantic search for truth through sensual experience.

Thus, to the consternation of his earlier admirers, in his next collections of poems, *Gorod* (1904-08; "The City") and *Snezhnaya Maska* (1907; "Mask of Snow"), he sublimated his religious themes to images of sordid urban culture and transfigured his mystical woman into the "unknown courtesan." Blok exhibited the final phase of his tragic dilemma by rejecting what he termed the sterile intellectualism of the bourgeois Symbolists and embracing the

Blok
Novosti Press Agency

Bolshevik movement as the change essential for the redemption of the Russian people. He felt doubly betrayed, however, first by the desertion of his literary colleagues and then by the Bolsheviks, who scorned his work and aesthetic aspirations. The consequent alienation plunged him into a melancholy withdrawal that contributed to his premature death.

His late poems are testaments of his alternate moods of hope and despair. The unfinished narrative poem *Vozmezdnye* (1910-21; "Retribution") reveals his disillusionment with the new regime, while *Rodina* (1907-16; "Homeland") and *Skify* (1918; "Scythians") exalts Russia's messianic role in the new world order. A rhetorical ode, "Scythians" is the prime example of Blok's dramatic verse, rooted in gypsy folk ballad, with its lilting rhythms, uneven beat, and abrupt alternations of passion and melancholy. Exhorting and threatening in turn, it expresses Blok's Slavophilic love-hate relationship to the West, warning Europe that, should it interfere with Russia, the wave of the future, it would be scourged by a Russian-Asiatic horde.

Blok's preeminent work of impressionistic verse was his final composition, done amidst the chaos of the Revolution, the enigmatic ballad *Dvenadtsat* (1918; *The Twelve*, 1920). The poem is notable for its mood-creating sounds, polyphonic rhythms, and harsh, slangy language. It is a description of the march of a disreputable band of 12 Red Army men, looting and killing, through a fierce blizzard during the 1917-18 St. Petersburg uprising, with a Christ figure at their head. Though critics thought *The Twelve* obscure, it and others of Blok's works have endured. He is believed to have initiated the post-Revolutionary era of Russian literature.

Blom, Frans Ferdinand (b. Aug. 9, 1893, Copenhagen—d. June 23, 1963, San Cristóbal, Mex.) Danish archaeologist who was an authority on Mayan culture. He spent much of his life in the jungles of Chiapas state (adjoining Guatemala), where his explorations led to the discovery of several long-lost cities attributed to the "classical period" (AD 300-900) in the history of the central Maya lowlands.

After graduating from the University of Copenhagen, Blom immigrated to the United States in 1919 and received his M.A. from Harvard University in 1925. As a Mexican government archaeologist (1922-23) and subsequently as a member of American and joint Danish-American expeditions, he uncovered priceless examples of Mayan art and architecture at Palenque, Uaxactún (Guatemala), and Veracruz.

While exploring the Lacandon jungle in 1948 he discovered the last remnants of the Lacandon people, descendants of the original Mayans. From 1925 to 1941 Blom was director of the Middle American Research Institute of Tulane University, New Orleans. After settling in Mexico in 1950, he and his wife, Gertrude, established in San Cristóbal de Las Casas a research centre, museum, and library devoted to Mayan culture, about which

he wrote several books, including *Tribes and Temples* (1926–27; with Olivier La Farge) and *Conquest of Yucatán* (1936).

Blomberg, Werner (Eduard Fritz) von (b. Sept. 2, 1878, Stargard, Ger.—d. March 22, 1946, Nürnberg), German general and minister of war (1933–38) in the National Socialist government of Adolf Hitler. He was one of Hitler's most willing collaborators among the old-line officer corps.

A general staff officer during World War I, Blomberg was named chief of staff of the Stuttgart army area (1921), head of the department of military training (1925), and military commander in chief in East Prussia (1929). In January 1933 he was appointed German minister of defense in the new Hitler government and retained office until early 1938—as minister of war after 1935 and, concurrently, commander in chief of the *Wehrmacht* (German armed forces). An unquestioning follower of Hitler, so compliant as to be given the nickname “Rubber Lion,” he played a consenting role in the purge of the SA (storm troopers) of 1934, and in August 1934 imposed on the army an oath of personal allegiance to Hitler. In 1936 he was created field marshal. A personal domestic scandal was the immediate cause of his resignation as war minister in January 1938.

blonde lace, originally, bobbin lace made in France in the 18th century from unbleached pale beige Chinese silk. Subsequently, the term blonde was extended to cover lace made of bleached silk (white blonde) and black-dyed silk (black blonde). Blonde lace was made in France at Bayeux, Caen, and Chantilly in the mid-18th century and also in England (Dor-

his poetry. He was probably from Nesle, in Picardy; but the name Blondel may be a nickname, and it is uncertain how many of the 25 songs attributed to him are actually his. His poetry is conventional in its complaints to an unknown lady but contains no references to Blondel's relationship to her or to events of the time. Blondel's popularity is apparent in the widespread use by contemporaries of his melodies, which are extant in various manuscripts, and in the dubious but widespread legend, first narrated in the 13th century romance *Récits d'un ménestrel de Reims* (“Narrative of a Minstrel of Reims”), that he played a part in the discovery and release of King Richard I of England from his imprisonment (1192–94) by the Holy Roman emperor Henry VI.

Blondel, André-Eugène (b. Aug. 28, 1863, Chaumont, Fr.—d. Nov. 15, 1938, Paris), French physicist known for the invention of the oscillograph and for developments in photometry.

Blondel became a professor of electrotechnology at the École des Ponts et Chaussées and the École des Mines in Paris. In 1893 he invented the electromagnetic oscillograph, a device that allowed electrical researchers to observe the intensity of alternating currents. In 1894 he proposed new measurement units for use in photometry, based on the metre and the Violle candle; his system was endorsed in 1896 by the International Electrical Congress and remained in use for many years.

Blondel also contributed to developments in wireless telegraphy, acoustics, and mechanics and proposed theories for induction motors and for the coupling of alternating-current generators.

Blondel, Georges (b. March 8, 1856, Dijon, Fr.—d. July 31, 1948, Paris), historian and juridical scholar, the leading French authority on Germany and Austria before 1914.

After receiving his doctorate in 1881 and the rank of agrégé (highest teaching degree) in 1883, he was appointed to a chair of law at Lyon in 1884 and 10 years later was named professor of letters at Lille. He later taught at the École des Hautes Études Commerciales and the Collège de France in Paris.

A specialist in German and Austrian questions of pedagogy and labour organizations, Blondel participated in many academic societies, contributed to scholarly journals, and conducted lecture tours around Europe. Among his works are *L'Ouvrier allemand* (1899; “The German Worker”); *L'Essor industriel et commercial du peuple allemand* (1898; “The Industrial and Commercial Ascent of the German People”); *L'Éducation économique du peuple allemand* (1908; “The Economic Education of the German People”); and *Le Triomphe du germanisme* (1934; “The Triumph of Pan-Germanism”).

Blondel, Jacques-François (b. Jan. 17, 1705, Rouen, Fr.—d. Jan. 9, 1774, Paris), architect best known for his teaching and writing, which contributed greatly to architectural theory and the taste of his time. His art school

in Paris was the first such institution to teach architecture.

Of a famous architectural family, Blondel was reared by an uncle. Though the nephew early went along with the Rococo ornamentation of the preceding age, he eventually turned against it. In 1737 he executed some plates for Pierre-Jean Mariette's edition of Augustin Daviler's 17th-century treatise on architecture, taking the opportunity to refine some designs of the Rococo woodcarver Nicolas Pineau, who had earlier collaborated with his uncle. In the same year Blondel's *De la distribution des maisons de plaisance et de la décoration des édifices en général* (2 vol., 1737–38; “On the Designing of Country Seats and on the Decoration of Buildings in General”), began to appear. The work, while not original, expressed an ideal of the taste that continued through the Enlightenment. Blondel's own buildings of the 1730s included an orangery near Florence, the terraces of a château near Brittany, and his town house, Petit dâ Mari- vat, at Besançon.

As a teacher, first in his own school (1743–54) and later at the Académie Royale d'Architecture, Blondel influenced such students as the Scottish architect William (later Sir William) Chambers, best known for his Somerset House for the Royal Academy of Arts in London (1776; later replaced); the French architect Richard Mique, who did much work for Marie-Antoinette at Versailles; the Dutch architect Pieter de Swart, who designed the only remaining Rotterdam gate, the Gate of Delft; and the German architect Christian Weinlig, a member of the Dresden Neoclassical school. In this period Blondel designed a comprehensive plan for the decoration of the centre of Metz (1764), including the Hôtel de Ville (1765).

Blondel, Maurice (Édouard) (b. Nov. 2, 1861, Dijon, Fr.—d. June 4, 1949, Aix-en-Provence), French dialectical philosopher who formulated a “philosophy of action” that integrated classical Neoplatonic thought with modern Pragmatism in the context of a Christian philosophy of religion.

He studied at the École Normale Supérieure under Léon Ollé-Laprune and first formulated his philosophy in *L'action* (1893). Blondel was influenced by the theory that belief is a matter of will as well as logical demonstration. For him, the term action was comprehensive and meant the dynamism of life in all its manifestations; it includes all the conditions that contribute to the gestation, birth, and expansion of the free act. He argued that proving that God exists is not the question; it is determining what attitude a man should take regarding the possibility of his receiving eternal life with God.

Among Blondel's principal writings are *La Pensée*, 2 vol. (1934; “Thought”), and *Existences philosophiques du Christianisme* (1950; “Philosophical Demands of Christianity”).

Blondin, pseudonym of JEAN-FRANÇOIS GRAVELET (b. Feb. 28, 1824, Saint-Omer, Fr.—d. Feb. 19, 1897, London), tightrope walker and acrobat who owed his celebrity and fortune to his feat of crossing Niagara Falls on a tightrope 1,100 feet (335 metres) long, 160 feet above the water.

When he was five years old he was sent to the École de Gymnase at Lyon, and after six months' training as an acrobat he made his first public appearance as “the Little Wonder.” He crossed Niagara Falls a number of times, first in 1859, always with different theatrical variations: blindfolded, in a sack, trundling a wheelbarrow, on stilts, carrying a man on his back, and sitting down midway to make and eat an omelette. In 1861 he appeared in London at the Crystal Palace, turning somersaults

Blonde lace from Caen, Fr., mid-19th century; in the Victoria and Albert Museum, London

By courtesy of the Victoria and Albert Museum, London

set) c. 1754–80. Just before the Revolution of 1789, blonde lace was light and decorated with flowers. This style later gave way to a heavier “Spanish” style. A revival of blonde, including earlier styles, took place in France in the 19th century. Much blonde lace was imported by Spain for mantillas; for, although the Spanish made their own blonde from silk spun near Barcelona, it was inferior to the French.

Blondel DE NESLE (fl. late 12th century), early lyric poet-musician, or trouvère, of northern France.

Nothing is known about Blondel outside of

Hôtel de Ville, Metz, Fr., by Jacques-François Blondel

Giraudon—Art Resource/EB Inc

on stilts on a rope stretched across the central transept, 170 feet (52 m) from the ground. His final performance was given at Belfast in 1896.

Blondus, Flavius: see Biondo, Flavio.

blood, fluid in multicellular animals that transports oxygen and nutrients to the cells and carries away waste products. In many species it also conveys hormones and disease-fighting substances.

A brief treatment of blood follows. For full treatment, see *MACROPAEDIA: Blood*.

Technically, blood is a transport liquid pumped by the heart (or an equivalent structure) to all parts of the body, after which it is returned to the heart to repeat the process. Blood is both a tissue and a fluid. It is a tissue because it is a collection of similar cells that serve a particular function. These cells are suspended in a liquid matrix—called plasma—which makes the blood a fluid.

In single-celled animals and the smallest multicellular invertebrates there is no blood system. Because of their small size, these animals can absorb oxygen and nutrients and can discharge wastes directly into their surrounding medium. Sponges and coelenterates (*e.g.*, jellyfish and hydras) also lack a blood system; the means to transport foodstuffs and oxygen to all the cells of these larger multicellular animals is provided by water, sea or fresh, pumped through spaces inside the organisms.

In animals of increasing size and complexity, contact with the surrounding medium is no longer sufficient to supply the metabolic needs of internal body cells. Such animals possess a true blood system in which a specialized fluid—*i.e.*, blood—is pumped around the body. In most such animals the blood passes through a respiratory exchange membrane, which lies in the gills, lungs, or even the skin. There the blood picks up oxygen, which is necessary for cellular metabolism, and disposes of carbon dioxide, which is a waste product of metabolism. The blood also absorbs nutrients from the gastrointestinal tract or from various storage tissues and carries them to cells throughout the body. Another function of blood is the transport of water-soluble toxic wastes to excretory organs for elimination from the body.

Blood evolved from seawater, which in primitive organisms was the source of elements essential for growth. Thus, the basic chemical composition of plasma resembles that of seawater, consisting of water and dissolved salts. However, plasma also contains dissolved nutrients, wastes, and—in many species—hormones.

The cellular composition of blood varies from group to group in the animal kingdom. Most invertebrates have various large blood cells capable of amoeboid movement. Some of these aid in transporting substances; others are capable of surrounding and digesting foreign particles or debris (phagocytosis). Compared with vertebrate blood, however, that of the invertebrates has relatively few cells. Among the vertebrates, there are several classes of amoeboid cells (white cells, or leukocytes), special oxygen-carrying cells (red cells, or erythrocytes), and cells that help stop bleeding (thrombocytes, or platelets).

Oxygen requirements have played a major role in determining both the composition of the blood and the architecture of the blood circulatory system. In some of the smallest invertebrates, including certain worms and mollusks, transported oxygen is merely dissolved in the plasma. Larger and more complex animals, which have greater oxygen needs, have evolved respiratory pigments. These specialized compounds are able to carry larger amounts of oxygen because of the ability of

metal atoms in the pigments to react with and transport several atoms of oxygen. The red pigment hemoglobin, containing iron, is found in all vertebrates and some invertebrates. The blue pigment hemocyanin, containing copper, is found in some crustaceans, such as crabs and in some mollusks. Some annelids have the iron-containing green pigment chlorocruorin, others the iron-containing red pigment hemerythrin.

In many invertebrates the respiratory pigments are carried in solution in the plasma, but in higher animals, including all vertebrates, the pigments are enclosed in cells; if the pigments were freely in solution the pigment concentrations required would cause the blood to be so viscous as to impede circulation.

There are two basic types of blood circulatory systems—open and closed. In an open system, the blood flows out of vessels and directly bathes the internal body tissues. In a closed system, the blood never leaves its network of vessels; exchange of materials between the blood and tissues occurs across the walls of the capillaries, the tiniest blood vessels. Arthropods (insects, spiders, and crustaceans) have an open system, as do most mollusks. The cephalopod mollusks (squids and octopuses), however, have a closed system, as do the annelid worms and all vertebrates.

An open system is less efficient in delivering oxygen rapidly. It suffices for less active mollusks such as clams and snails, but the active cephalopods need the greater efficiency of a closed system. The fact that insects, most of which are highly active, have an open system might seem unusual; however, insects do not rely on the blood for delivery of oxygen. An elaborate network of air tubules (tracheae) performs this function in insects.

Among the vertebrates, the fishes have a circulation in which blood is pumped out of the heart, through the gills (where oxygen is loaded and carbon dioxide is unloaded), and then on to the body as a whole, without first returning to the heart. All other vertebrates—*i.e.*, amphibians, reptiles, birds, and mammals—have a double circulation in which, after traveling through the lungs and becoming oxygenated, the blood returns to the heart to be pumped out again through the body. For maximum efficiency, this double circulation requires the separation of the heart into two discrete pumps, so that oxygenated and deoxygenated blood do not become mixed in its chambers. This separation of the heart is achieved only partially in amphibians and reptiles, but it is complete in birds and mammals.

Content of mammalian blood. Mammalian blood consists of plasma, as well as the red and white cells and platelets (thrombocytes). In man, plasma is a straw-coloured liquid the chief components of which are water (90 to 92 percent) and proteins (6 to 8 percent). Plasma also contains various dissolved substances, including salts, nutrients (glucose, fats, and amino acids), carbon dioxide, nitrogen wastes, and hormones. Plasma has several functions, including: (1) serving as transport system and medium for nutrients, waste products, and blood cells, (2) helping to maintain blood pressure, (3) distributing heat equally throughout the body, and (4) keeping a steady acid-base balance in the bloodstream and body.

One of the main functions of the plasma proteins is to prevent excess fluid loss from the capillaries. The water and most of the dissolved substances of the plasma can freely pass through the capillary walls, but the plasma proteins cannot. The proteins, therefore, provide osmotic pressure that prevents the leakage of fluids. Albumin, which makes up more than half of all the proteins in the plasma of mammals, is the chief mediator of osmotic pressure.

Fibrinogen, another abundant mammalian blood protein, plays a vital role in the process

by which bleeding is halted by the formation of a clot. A complex series of chemical reactions, involving a number of clotting factors, takes place when a blood vessel is torn. As a result of these reactions, fibrinogen is converted into a sticky, threadlike compound called fibrin. Fibrin threads form a mesh that is the basic structure of a clot. Plasma from which the fibrinogen has been removed is called serum; it cannot clot.

A third major class of plasma proteins are the globulins. The gamma globulins are antibodies, substances that protect the body against microorganisms and toxins. Alpha and beta globulins are molecules that specialize in transport of lipids (*e.g.*, cholesterol), steroids, sugars, iron, copper, and other minerals, and free hemoglobin. Certain blood-clotting factors are also found among the alpha and beta globulins.

The red cells of mammals, like those of all vertebrates, contain hemoglobin; they are the oxygen carriers of the blood. Unlike those of other vertebrates, however, mammalian red cells lack nuclei, an adaptation that makes them even more efficient in oxygen transport. The red cells vary in size from species to species, with no apparent connection between the size of the cell and the size of the mammal. Red cells are formed in the bone marrow.

The mammal's white cells function primarily in body defense and repair. There are three main classes of white cells: granulocytes, which engulf and digest microorganisms; monocytes, which also digest microorganisms as well as cellular debris; and lymphocytes, which provide immunity to diseases by the production of antibodies and sensitized cells. Granulocytes and monocytes are produced in the bone marrow. Lymphocytes are formed in the marrow and in the lymph tissues, such as the spleen, lymph nodes, and thymus.

Platelets are cell fragments derived from megakaryocytes, large cells formed in the bone marrow. Platelets are vital in coagulation. Upon contact with a torn vessel wall, platelets stick to the wound and thus form a plug in the opening. For a small opening, this plug may stop the bleeding by itself. Larger breaks must be sealed by a clot; the platelets release chemicals that initiate clot formation, and the platelets themselves become an important part of the clot meshwork.

Human blood groups. The red blood cells of all normal human beings have an identical appearance. Protruding from their surface, however, are molecules, called antigens, that vary in type in different individuals and to some extent in different races. The red-cell antigens are probably of carbohydrate structure. When introduced by transfusion, red cells with antigens different from those of the recipient may be attacked by antibodies. The antibodies cause the donor red cells to clump together (agglutinate) like bunches of grapes. Like a lock and its specific key, each antigen on a red cell can be acted upon only by a specific antibody.

In 1900 and later, Karl Landsteiner found by studying these reactions that human beings could be divided into four large classes according to the type of antigen found on their red cells; those with antigen A (type A), those with antigen B (type B), those with both A and B (type AB), and those with neither A nor B (type O). In addition, it was found that the plasma of each person invariably had preformed antibodies against the antigens (A, B, or both) not found on his own red cells.

Following the discovery of the ABO blood-group system, several other systems were found, chief among them being the MN and Rh groups. Unlike the ABO system, these groups do not involve preformed antibodies in the plasma; antibodies form only after exposure to the foreign red cells.

Blood diseases and disorders. The disorders of the human blood are pathological

conditions that involve the cellular elements of the blood and the tissues in which they are formed.

The quantity of red blood cells in normal human beings varies with age and sex as well as with external conditions, but there can be pathological increases in the number of red cells, called polycythemia, or pathological decreases, called anemia (*q.v.*). In essence, anemia is not a disease but a symptom of disease. There are many different types of anemia, each of which is treated according to its cause.

Variations in the number of white cells occur normally from hour to hour, the highest counts being recorded in the afternoon and the lowest in the early morning. Temporary increases also normally occur during muscular exercise, menstruation, pregnancy, and childbirth, as well as in various emotional states. Abnormal changes in the count, appearance, or proportion of the various white cells are indicative of pathological conditions in the body. The condition in which white cells are present in greater numbers than normal is termed leukocytosis. It is usually due to an increase in the number of granulocytic leukocytes, most often as the result of the presence of an infection. An increase in the number of lymphocytes—many of which are abnormal—characterizes infectious mononucleosis, a viral disease seen frequently in young persons. It is accompanied by fever, sore throat, enlargement of the spleen, grippe-like symptoms, and enlargement of the lymph glands.

Leukemia (*q.v.*) is a very serious disorder of the blood-forming tissues that is characterized by unrestrained, morbid new (neoplastic) growth of white blood cells and ultimately by changes in various tissues, such as in the spleen and lymph glands, as well as by the development of anemia and a reduction in the number of blood platelets. The course of leukemia varies greatly, ranging from the acute type, which may cause the untreated patient to die in a few weeks or months, to the chronic type, which may produce little or no ill-health for 10 or more years. Disorders related to leukemia, *i.e.*, associated with neoplastic growth of cells formed in the blood-forming organs, lymph glands, and elsewhere, are reticulum-cell sarcoma, lymphosarcoma, and Hodgkin's disease.

Several different agents keep blood from flowing out of the blood vessels and into the tissues: the lining of the blood vessels, the blood platelets (thrombocytes), and the clotting factors in the plasma. A pathological disruption of any of these processes can cause various bleeding disorders. In cases of vitamin C deficiency (*see* scurvy), capillary integrity is lost and blood oozes into the tissues. With widespread capillary injury, the normal number of platelets (which tend to plug small breaks in blood vessels) is not sufficient to prevent bleeding. Absolute reduction in the number of platelets is termed thrombocytopenia; it is characterized by bleeding into the skin and from the mucous membranes that line the digestive and genitourinary tracts. Thrombocytopenia may result from a variety of causes.

Deficiencies in any of the clotting factors result in hemorrhages following minor injuries. In some of these disorders a specific deficiency is due to a hereditary defect (*e.g.*, classic hemophilia and Christmas disease, which are transmitted by females but are manifested only in males; and von Willebrand's disease, which affects both sexes). In other cases the deficiencies are acquired, often as a result of a shortage of vitamin K, which is necessary for the synthesis of many of the clotting factors.

Blood, Council of: *see* Troubles, Council of.

blood analysis, laboratory examination of a sample of blood to obtain information on its physical and chemical properties and on its components. Hundreds of hematological tests and procedures have been developed, and

many can be carried out simultaneously on one sample of blood with such instruments as autoanalyzers. Blood analysis includes the following areas of study: (1) determination of the number of red and white blood cells in the blood, together with the volume, sedimentation rate, and hemoglobin concentration of the red blood cells (*see* blood count); (2) classification of the blood according to specific red-blood-cell antigens, or blood groups (*see* blood typing); (3) elucidation of the shape and structural details of blood cells; (4) study of the structure of hemoglobin and other blood proteins; (5) determination of the activity of various enzymes, or protein catalysts, that are either associated with the blood cells or are found free in the blood plasma; (6) study of blood chemistry.

Other properties of blood that may be included in an analysis are total volume, circulation time, viscosity, clotting time and clotting abnormalities, acidity (pH), and clearance rate of various substances (*see* kidney function test). Blood analysis is commonly carried out on a sample of blood drawn from the vein of the arm, the finger, or the earlobe; in some cases, the blood cells of the bone marrow may also be examined (*see* bone marrow aspiration). In addition to the wide variety of procedures devised for the study of normal blood constituents, there are also special tests based on the presence in the blood of substances characteristic of specific infections, such as the Wassermann reaction in the case of syphilis (*see* syphilis test). *See also* serological test.

blood bank, organization that collects, stores, processes, and transfuses blood. The fact that stored blood could safely be used was demonstrated in World War I. Before the first blood banks came into operation, the physician determined the blood types of the patient's relatives and friends until the proper type was found, performed the crossmatch, bled the donor, and gave the transfusion to the patient.

The discovery of many new blood types important in transfusions, and of several new crossmatching techniques, led in the 1940s to the rapid development of blood banking as a specialized field and to a gradual shift of responsibility for the technical aspects of transfusion from practicing physicians to technicians and clinical pathologists.

The practicality of storing fresh blood and blood components for future needs made possible such innovations as artificial kidneys, heart-lung pumps for open-heart surgery, and exchange transfusions for infants suffering from erythroblastosis fetalis.

Whole blood can be stored only for a limited time, but various components (*e.g.*, red blood cells and plasma) can be frozen and stored for a year or longer. Therefore, most blood donations are separated and stored as components by the blood bank. These components include platelets to control bleeding; concentrated red blood cells to correct anemia; and plasma fractions, such as fibrinogen to aid clotting, gamma globulin to prevent or modify a number of infectious diseases, and albumin to augment the blood volume in cases of shock. Thus it is possible to serve the varying needs of five or more patients with a single blood donation.

In some areas blood replacement programs have been established whereby persons can donate a unit (450 ml) of blood (or an equivalent monetary payment) and become enrolled in a blood bank cooperative from which they can draw unlimited blood benefits over a specified period of time, in case of future need.

Despite such replacement programs, many blood banks face continual problems in obtaining sufficient donations. The chronic shortage of donors has been alleviated somewhat by the development of hemapheresis, a technique by which only a desired blood component is taken from the donor's blood, with the

remaining fluid and blood cells immediately transfused back into the donor. This technique allows the collection of large amounts of a particular component, such as platelets, from a single donor. *See also* blood transfusion.

blood brotherhood, special alliance or tie that binds persons together in a fashion analogous to, but distinct from, kinship ties. The relationship derives its name from the ritual commingling of the blood of the participants. The nature of the alliance thus formed typically enjoins the members to mutual support, loyalty, or affection. When practiced between groups, blood brotherhood most frequently serves to bind together potentially hostile groups, to form an alliance in war, or to conclude a peace. References to blood brotherhood occur in the works of many classical writers, beginning with Herodotus (5th century BC). Other accounts of blood brotherhood occur in myths and sagas from central Europe, Scandinavia, and Asia. In recent times, the custom has appeared and been described most frequently in Africa and, rarely, among North American Indians.

blood cell formation, also called HEMATOPOIESIS, or HEMOPOIESIS, continuous process by which the cellular constituents of blood are replenished as needed. Blood cells are divided into three groups: the red blood cells (erythrocytes), the white blood cells (leukocytes), and the blood platelets (thrombocytes). The white blood cells are subdivided into three broad groups: granulocytes, lymphocytes, and monocytes.

Blood cells do not originate in the bloodstream itself but in specific blood-forming organs, notably the marrow of certain bones. In the human adult, the bone marrow produces all of the red blood cells, 60–70 percent of the white cells (*i.e.*, the granulocytes), and all of the platelets. The lymphatic tissues, particularly the thymus, the spleen, and the lymph nodes, produce the lymphocytes (comprising 20–30 percent of the white cells). The reticuloendothelial tissues of the spleen, liver, lymph nodes, and other organs produce the monocytes (4–8 percent of the white cells). The platelets, which are small cellular fragments rather than complete cells, are formed from bits of the cytoplasm of the giant cells (megakaryocytes) of the bone marrow.

In the human embryo, the first site of blood formation is the yolk sac. Later in embryonic life, the liver becomes the most important red blood cell-forming organ, but it is soon succeeded by the bone marrow, which in adult life is the only source of both red blood cells and the granulocytes. Both the red and white blood cells arise through a series of complex, gradual, and successive transformations from primitive stem cells, which have the ability to form any of the precursors of a blood cell. Precursor cells are stem cells that have developed to the stage where they are committed to forming a particular kind of new blood cell.

In a normal adult the red cells of about half a litre (almost one pint) of blood are produced by the bone marrow every week. Almost 1 percent of the body's red cells are generated each day, and the balance between red cell production and the removal of aging red cells from the circulation is precisely maintained. The rate of blood cell formation varies depending on the individual, but a typical production might average 200,000,000,000 red cells per day, 10,000,000,000 white cells per day, and 400,000,000,000 platelets per day.

blood count, determination of the number of red blood cells (RBC's, or erythrocytes) and white blood cells (WBC's, or leukocytes) in a given volume of blood. The readings vary with sex, age, physiological state, and general

health, but a cubic millimetre of blood of a normal individual contains approximately 5,000,000 red cells and 7,000 white cells. A differential blood count is the enumeration of the number, or percent, of each type of white blood cell per 100 white cells counted; normally the white cells are about 55 percent neutrophils, 30 percent lymphocytes, and small percentages of eosinophils, basophils, and monocytes. A decrease in the number of red blood cells is usually associated with anemia, and an increase in the number of white blood cells with most infections or with leukemia. A blood count may also include a determination of the number of platelets, the volume by percent of red blood cells in whole blood (known as a hematocrit reading), the sedimentation rate of the red blood cells, and the hemoglobin concentration of the red cells.

blood feud: *see* feud.

blood fluke, any of certain parasitic flatworms that live in the veins of the host organism. *See* fluke.

blood money, compensation paid by an offender (usually a murderer) or his kin group to the kin group of the victim. In many societies blood money functions to prevent the continuation of hostilities in the form of a feud (*q.v.*). Some customs allow the injured party the choice of punishing the murderer by blood vengeance or by blood money.

Among the Anglo-Saxon tribes, members of the killer's kin group contributed to pay *wergild*, or blood money, to the kin of the victim. Kinsmen contributed according to the distance of the relationship to the murderer; the sum was divided among the victim's kin on the same basis. Among many Indians of the northern Pacific coast of North America, blood payment was mandatory after killings in order to make peace possible, even when actual blood vengeance was also required. In most places there was no fixed standard, each group demanding as large an amount as possible. If agreement was not reached, feud might result.

Blood of Isis (Egyptian religion): *see* girldie tie.

blood pressure, force originating in the pumping action of the heart, exerted by the blood against the walls of the blood vessels; the stretching of the vessels in response to this force and their subsequent contraction are important in maintaining blood flow through the vascular system. In man, blood pressure is usually measured indirectly over the brachial or femoral artery: the highest (systolic) pressure, normally about 120 (100 to 140) millimetres of mercury, occurs during contraction of the ventricles; the lowest (diastolic) pressure, normally about 80 (60 to 100) millimetres, occurs during ventricular relaxation. Blood pressure in the capillaries is usually about 20 to 30 millimetres, while the pressure in the large veins may become negative (lower than atmospheric pressure).

Arterial blood pressure varies among individuals and in the same individual from time to time. It is lower in children than in adults and increases gradually with age. It tends to be higher in those who are overweight. During sleep it decreases slightly, and during exercise and emotional excitement it increases. *See also* hypertension; hypotension.

Blood River, Battle of (Dec. 16, 1838), South African battle between the Zulu and the Voortrekkers (the Boers who made the Great Trek from Cape Colony to Transvaal). It was fought on the banks of a tributary of the Buffalo River, which became known as Blood River after its water reddened with the slaughter of about 3,000 Zulu. Four Boers

were wounded. This battle turned Voortrekker fortunes in Natal, at a low ebb as a result of successive earlier defeats at the hands of the Zulu. The power of the Zulu king, Dingane (Dingaan), was effectively undermined, and the Voortrekkers established themselves in Natal until its annexation by the British in 1843. Their victory is annually celebrated by white South Africans as the Day of the Covenant, or Dingaan's Day.

blood serum, the part of blood plasma remaining after coagulation, during which process the plasma protein fibrinogen is converted to fibrin and remains behind in the clot. Immune serum or antitoxin, serum prepared from the blood of animals or humans that have been exposed to a disease and have developed specific antibodies, is used to protect persons against diseases to which they have been exposed.

blood transfusion, therapeutic measure used to restore blood volume after extensive hemorrhage, burns, or trauma; to improve the oxygen-carrying capacity of the blood when hemoglobin levels are low in anemia; and to combat shock. Transfusion, now a frequent and lifesaving procedure, could not become useful or safe until the blood-group antigens and antibodies were discovered (the first system to be identified was ABO in 1900); thereafter, routine blood typing of donors and recipients permitted successful transfusion.

Attempts at transfusion were made in Europe from at least 1628 by the Italian physician Giovanni Colle, but so many patients died from incompatibility reactions that the process was banned in France, England, and Italy after the late 17th century. The Incas apparently practiced blood transfusion successfully much earlier—nearly all South American Indians are of blood type O-Rh-positive, and incompatibility reactions must have been few.

Blood can be kept in a state satisfactory for use in transfusion by the addition of special preservatives and refrigeration for up to 35 days, and methods of fractionating the blood have allowed its use in specialized form. Transfusions of whole blood or of blood fractions are used to treat at least 10 different conditions: (1) whole blood for acute blood loss; (2) packed red cells for chronic anemia; (3) washed red cells for allergies induced in frequently transfused patients by other elements in the blood; (4) platelets for bleeding caused by platelet deficiency; (5) white cells for low white-cell count in patients with infections; (6) plasma for shock without blood loss; (7) fresh-frozen plasma, freshly drawn plasma, or concentrates of the antihemophilic factor of plasma for bleeding in hemophilia; (8) albumin, concentrated from the plasma, for shock or for chronic low-albumin disorders and malnutrition; (9) gamma globulin, the antibody component of the plasma, concentrated for prevention of viral hepatitis and protection against or modification of measles after exposure; (10) fibrinogen, an important clotting factor in the blood, easily concentrated for bleeding conditions brought about by deficiency or absence of fibrinogen.

Exchange transfusion, in which all or most of the patient's blood is removed while new blood is simultaneously transfused, is of use in combatting erythroblastosis fetalis, removing certain poisons, and producing transient improvement in leukemias.

Undesirable reactions to transfusion are not uncommon and may occur for many reasons, such as allergy, sensitivity to donor leukocytes, or undetected red-cell incompatibility. Unexplained reactions are also fairly common. Rare causes of transfusion reaction include contaminated blood, air bubbles in the blood, overloading of the circulatory system through administration of excess blood, or sensitivity to donor plasma or platelets.

blood typing, classification of an individual's blood in terms of specific, distinctive antigenic characteristics that are inherited and are associated with the red blood cells. The ABO and the Rh blood groups (*qq.v.*) are among those most commonly considered. Identification of these determinants has become indispensable in connection with blood transfusion, because recipient and donor must have the same, or compatible, blood groups. Otherwise, hemolysis or clotting results from interaction of an antigen in the red blood cells of one with an antibody in the serum of the other. In addition, blood typing serves to identify promptly the cause of such disorders as erythroblastosis fetalis (hemolytic disease of the newborn), which results from blood-group incompatibility between mother and fetus. Since blood-group determinants are inherited according to generally known mechanisms of heredity, blood typing sometimes provides a method for resolving cases of disputed fatherhood. It has also been postulated that certain blood-group combinations may have a greater survival value than others; such conditions as repeated infertility, premature births, and stillbirths might be partly the result of some yet-undefined forms of blood-group incompatibility between the mating individuals.

blood vessel, a vessel in the human or animal body in which blood circulates. The vessels that carry blood away from the heart are called arteries, and their very small branches are arterioles. Very small branches that collect the blood from the various organs and parts are called venules, and they unite to form veins, which return the blood to the heart. Capillaries are minute, thin-walled vessels that connect the arterioles and venules; it is through the capillaries that nutrients and wastes are exchanged between the blood and body tissues. *See* artery; capillary; vein.

bloodfin, freshwater fish, a species of characin (*q.v.*).

bloodhound, breed of dog unsurpassed by any other in scenting ability and from which most of the scent-hunting hounds have been derived. It was known, although not in its

Bloodhound
Sally Anne Thompson—EB Inc.

present form, in the Mediterranean area in pre-Christian times. Typically calm and affectionate, it has been used in tracking animals and in trailing persons. A large, strong dog, it stands 23 to 27 inches (58 to 69 centimetres) and weighs 80 to 110 pounds (36 to 50 kilograms). It has short hair and long ears; its loose skin falls into folds and wrinkles about the head and neck. The coat is black-and-tan, red-brown and tan, or tawny.

Bloodless Revolution (England): *see* 1688, Revolution of.

bloodlily: *see* Cape tulip.

bloodroot, also called RED PUCKOON (*Sanguinaria canadensis*), plant of the poppy family (Papaveraceae), native throughout eastern and

midwestern North America. It grows mainly in deciduous woodlands, where it blooms in early spring. Bloodroot has a shining white, eight-petalled, cup-shaped flower with bright yellow stamens (male reproductive structures) in the centre. The 4- to 6-centimetre (2-inch)

Bloodroot (*Sanguinaria canadensis*)

Walter Chandoha

flower is borne on a 20-cm reddish stalk. Large, veiny, half-opened leaves on red stalks enfold the flower stem; after the flower has bloomed, these open into much-lobed, blue-green, round leaves. The orange-red sap, formerly used by the Indians for dye, is found in the horizontal rootstocks (rhizomes), which also contain the medical alkaloid sanguinarine.

The species and a variety *S. canadensis* "Multiplex," which has showy double flowers, can be planted in the wild garden.

bloodstone, also called HELIOTROPE, dark-green variety of the silica mineral chalcedony that has nodules of bright-red jasper distributed throughout its mass. Polished sections therefore show red spots on a dark-green background, and from the resemblance of these to drops of blood it derives its name. Bloodstone was greatly prized in the Middle Ages and was used in sculptures representing flagellation and martyrdom; it later became of small importance. Notable occurrences include the Kāthiāwār Peninsula, India. Its physical properties are those of quartz (see silica mineral [table]).

bloodworm, any of certain bright red, segmented, aquatic worms of the phylum Annelida. Included are worms of the genus *Tubifex*, also known as sludge worms (class Oligochaeta, family Tubificidae), which are used as a tropical-fish food. The proboscis

Proboscis worm (*Glycera dibranchiata*)

Runk/Schoenberger/Grant Heilman

worm *Glycera* (class Polychaeta, family Glyceridae) is sometimes called bloodworm. *G. dibranchiata* is found along the eastern coast of North America. It grows to 37 centimetres (about 15 inches) in length.

The blooded aquatic larvae of some species of the midge *Chironomus* of the insect family Chironomidae are also called bloodworms.

Bloody Assizes (1685), in English history, the trials conducted in the west of England by the chief justice, George Jeffreys, 1st Baron Jeffreys of Wem, and four other judges after the abortive rebellion (June 1685) of the Duke of Monmouth, illegitimate son of King Charles II, against his Roman Catholic uncle King James II. About 320 persons were hanged and more than 800 transported to Barbados; hundreds more were fined, flogged, or imprisoned. Although modern research has acquitted Jeffreys, in certain cases, of any technical irregularity, the trials were conducted with a ferocity that has made his name notorious.

Bloody Mary: see Mary I under Mary (England and Great Britain).

bloody shirt, in U.S. history, the post-Civil War political strategy of appealing to voters by recalling the passions and hardships of the war. This technique of "waving the bloody shirt" was most often used by Radical Republicans to focus public attention on Reconstruction issues still facing the country. The strategy was particularly effective in the North in attracting veterans' votes.

Bloody Sunday (Jan. 30, 1972), demonstration in Londonderry (Derry), N.Ire., by Roman Catholic civil rights supporters that turned violent when British paratroopers opened fire, killing 13 and injuring 14 others (one of the injured later died). Bloody Sunday precipitated an upsurge in support for the nationalist Irish Republican Army (*q.v.*), which advocated violence against the United Kingdom to force it to withdraw from Northern Ireland.

Bloody Sunday began as a peaceful—but illegal—demonstration by some 10,000 people organized in opposition to the British government's policy of internment of nationalists without trial. The demonstrators marched toward Guildhall Square in the city centre, but the British army had cordoned off much of the area, prompting most of the marchers to alter their course and head toward Free Derry Corner. However, some of the demonstrators confronted the soldiers, pelting them with stones and other projectiles. British troops responded by firing rubber bullets and a water cannon. Ordered to arrest as many demonstrators as possible, the army proceeded to confront the marchers, and violence erupted. Who fired the first shot remains a point of contention—the army maintained that it fired only after being fired upon, while the Roman Catholic community contended that military snipers opened fire on unarmed protesters—but the result was clear: after less than 30 minutes of shooting, 13 marchers lay dead.

British Prime Minister Edward Heath immediately ordered an inquiry, which concluded that the demonstrators fired the first shot but that none of those dead appeared to have carried weapons. The Londonderry coroner, however, was unequivocal, calling the deaths "unadulterated murder," and nationalists campaigned for more than two decades for the government to establish a new inquiry. Finally, in 1998 Prime Minister Tony Blair ordered a new investigation. Among other findings, the commission confirmed in 2004 that none of those killed in the shootings were armed.

Bloody Sunday, Russian KROVAVOYE VOSKRESENYE (Jan. 22 [Jan. 9, Old Style], 1905), massacre in St. Petersburg, Russia, of peaceful demonstrators marking the beginning of the violent phase of the Russian Revolution

of 1905. At the end of the 19th century, industrial workers in Russia had begun to organize; police agents, anxious to prevent the Labour Movement from being dominated by revolutionary influences, formed legal labour unions and encouraged the workers to concentrate their energies on making economic gains and to disregard broader social and political problems.

In January 1905 a wave of strikes, partly planned by one of the legal organizations of workers—the Assembly of Russian Workingmen—broke out in St. Petersburg. The leader of the assembly, the priest Georgy Gapon, hoping to present the workers' request for reforms directly to Emperor Nicholas II, arranged a mass demonstration. Having told the authorities of his plan, he led the workers—who were peacefully carrying religious icons, pictures of Nicholas, and petitions citing their grievances and desired reforms—toward the square before the Winter Palace.

The chief of the security police—Nicholas' uncle, Grand Duke Vladimir—tried to stop the march, then ordered his police to fire upon the demonstrators. More than 100 marchers were killed and several hundred more were wounded. Ensuing strikes, peasant uprisings, and mutinies seriously threatened the tsarist regime and became known as the Revolution of 1905.

Consult the INDEX first

Bloom, Claire, original name CLAIRE BLUME (b. Feb. 15, 1931, London), English dramatic actress noted for her moving portrayals of Shakespearean heroines; she played on the stage, on television, and in motion pictures.

She studied at the Guildhall School of Music and Drama in London. At the age of 14 she tried out for the part of Juliet with the company of the Shakespeare Memorial Theatre (later the Royal Shakespeare Theatre) in Stratford-upon-Avon; in 1948 at Stratford she was cast as Ophelia in *Hamlet*, Blanche in *King John*, and Perdita in *A Winter's Tale*. She won praise for her early motion-picture role as a ballet dancer, playing opposite Charles Chaplin in the film *Limelight* (1952). She performed with the Old Vic company (1952–53) and subsequently successfully combined a stage career with films. Some of her more notable movies include *Richard III* (1955), *The Spy Who Came In From the Cold* (1965), *Charly* (1968), and *Crimes and Misdemeanors* (1989). She continued to star in films and on television into the 21st century.

bl bloomers, lower part of a "rational dress" for women advocated by Amelia Jenks Bloomer in 1850. The entire costume consisted of a short jacket, a skirt extending below the knee, and the bloomers, or loose "Turkish" trousers, gathered at the ankles.

The innovation failed and was much mocked. The name survived, however, to be used for divided skirts, for the knickerbockers that women wore while riding bicycles in the craze for cycling of the 1890s, and for women's loose, baggy underwear.

Bloomfield, town (township), Hartford county, northwestern Connecticut, U.S., just northwest of Hartford. The site, drained by Wash Brook and the Farmington River, was settled about 1660, and the Parish of Wintonbury was organized in 1736 from parts of Windsor, Farmington, and Simsbury. In 1835 Wintonbury was renamed Bloomfield, possibly for a Hartford family, and was incorporated as a town. Until industries developed in the late 1940s the town was essentially a residential and farming community. Manufactures now include tools, screw machine

products, aircraft parts, and helicopters. The headquarters building of the Connecticut General Life Insurance Company, a fine exam-

Monoliths by Isamu Noguchi, with the Connecticut General Life Insurance Building in the background, Bloomfield, Conn.

Mark Sexton

ple of contemporary office architecture, is in Bloomfield. Pop. (1992 est.) 19,445.

Bloomfield, town, Essex county, northern New Jersey, U.S. It is a northwestern suburb of Newark. Settled in 1660 by Puritans, it was known as Wardsesson (a ward of Newark) until 1796, when it was renamed for the American Revolutionary general Joseph Bloomfield. During the Revolutionary War it served as a supply point for both sides. Large quantities of cloth for Union uniforms were produced there during the American Civil War.

The town's diversified modern industries include automobile assembly and the manufacture of textiles, drugs, chemicals, aluminum, and electrical products. Bloomfield College (Presbyterian) was founded in 1868. Inc. 1812. Pop. (1992 est.) 45,403.

Bloomfield, Leonard (b. April 1, 1887, Chicago, Ill., U.S.—d. April 18, 1949, New Haven, Conn.), American linguist whose book *Language* (1933) was one of the most important general treatments of linguistic science in the first half of the 20th century and almost alone determined the subsequent course of linguistics in the United States.

Bloomfield was educated at Harvard University and the universities of Wisconsin and Chicago. He taught from 1909 to 1927 at several universities before becoming professor of Germanic philology at the University of Chicago (1927–40) and professor of linguistics at Yale University (1940–49).

Concerned at first with the details of Indo-European—particularly Germanic—speech sounds and word formation, Bloomfield turned to larger, more general, and wider ranging considerations of language science in *An Introduction to the Study of Language* (1914). He then began (1917) pioneer studies of the Malayo-Polynesian (Austronesian) languages, especially Tagalog. In the early 1920s he began his classic work on North American Indian languages, contributing the first of many descriptive and comparative studies of the Algonquian family.

In the writing of *Language*, Bloomfield claimed that linguistic phenomena could properly and successfully be studied when isolated from their nonlinguistic environment. Adhering to behaviourist principles, he avoided all but empirical description.

A Leonard Bloomfield Anthology (1970) was edited by Charles F. Hockett.

Bloomfield, Robert (b. Dec. 3, 1766, Honington, Suffolk, Eng.—d. Aug. 9, 1823, Shefford, Bedfordshire), shoemaker-poet who

Robert Bloomfield, miniature by Henry Bone; in the National Portrait Gallery, London

By courtesy of the National Portrait Gallery, London

achieved brief fame with poems describing the English countryside.

His first poem, *The Farmer's Boy* (1800), written after he had left the land to become a London shoemaker, owed its popularity to its blend of late 18th-century pastoralism with an early Romantic feeling for nature. The works that followed, from *Rural Tales, Ballads, and Songs* (1802) to *The Banks of Wye* (1811), were almost equally successful.

Bloomfield Hills, city, Oakland county, southeastern Michigan, U.S. It lies just southeast of Pontiac and northwest of Detroit. The site was settled in 1819 by Amasa Bagley and was known as Bagley's Corners and Bloomfield Center until the present name was adopted in the 1890s. A farming community until Detroit residents began buying estates, it then became a restricted residential community. The Cranbrook Foundation, established in 1927 by Ellen Scripps Booth and George C. Booth (president of the *Detroit News*) on their 300-acre (121-hectare) estate, includes the Cranbrook Academy of Art and Museum, the Cranbrook Institute of Science, Cranbrook Gardens, the Tudor-style Cranbrook House, and the Gothic-style Christ Church (Episcopal); four of the buildings were designed by the architect Eliel Saarinen. The Stake Center (1959) of the Church of Jesus Christ of Latter-day Saints (Mormon) is located in the city. Oakland Community College was opened in 1964. Inc. village, 1927; city, 1932. Pop. (1990) 4,288.

Bloomgarden, Kermit (b. Dec. 15, 1904, Brooklyn, N.Y., U.S.—d. Sept. 20, 1976, New York City), American producer of dramatic and musical plays that were commercially and critically successful.

Bloomgarden graduated in 1926 from New York University and practiced as a certified public accountant for several years before assuming a managerial position with the theatrical producer Arthur Beckhardt. His first independent production was *Deep Are the Roots* (by Arnaud d'Usseau and James Gow), which opened in 1945 and ran for 477 performances. There followed Lillian Hellman's *Another Part of the Forest* (1946), *Command Decision* (1947), by William Wister Haines, and *Death of a Salesman* (1949) by Arthur Miller, which ran for 742 performances.

Bloomgarden's other award-winning productions included *The Crucible* (1953), by Arthur Miller; *The Diary of Anne Frank* (1955), by Frances Goodrich and Albert Hackett; *The Most Happy Fella* (1956), a musical by Frank Loesser; *Look Homeward, Angel* (1957), by Ketti Frings; *The Music Man* (1957), a musical by Meredith Willson; Lillian Hellman's *Toys in the Attic* (1960); *The Hot L Baltimore* (1973) by Lanford Wilson; and *Equus* (1975) by Peter Shaffer.

Bloomington, city, seat of McLean county, central Illinois, U.S., adjacent (south) to Nor-

mal (q.v.). The site was settled in 1822 and was known as Keg Grove and later as Blooming Grove. In 1831, when the town was laid out, it was renamed Bloomington. In 1856 at Old Majors Hall in Bloomington, Abraham Lincoln delivered his famous "lost speech" on slavery at a convention to organize the Republican Party in Illinois. The city lies in a rich agricultural region, and its economy is based mainly on farming (chiefly corn [maize]), livestock raising, and the manufacture and development of agricultural equipment and farm-related products, including farm seeds. The manufacture of electrical equipment and vacuum cleaners is also significant.

Illinois Wesleyan University (1850) is in Bloomington, and Illinois State University (1857) is in Normal. An annual spring event is the production of the American Passion Play. Adlai E. Stevenson, vice president (1893–97) of the United States, is buried in Evergreen City Cemetery, as is his grandson, Adlai E. Stevenson II, statesman and Illinois governor. Inc. city, 1850. Pop. (1990) city, 51,972; Bloomington-Normal MSA, 129,180.

Bloomington, city, seat (1818) of Monroe county, southern Indiana, U.S. It lies 51 miles (82 km) south-southwest of Indianapolis. Laid out in 1818, it is in the centre of the Indiana limestone belt, and extensive stone quarries and mills are nearby. Indiana University (1820) was a major element in the city's devel-

Lilly Library, Indiana University, Bloomington

Brian D. Palomoro

opment. The economy is based on diversified industry, especially production of refrigerators, electronic equipment, and television sets. The Monroe Reservoir recreation area is 4 miles (6 km) southeast. Inc. 1877. Pop. (1992 est.) city, 61,921; Bloomington MSA, 111,293.

Bloomington, city, Hennepin county, southeastern Minnesota, U.S., near the Minnesota River. A suburb of Minneapolis, it was settled in 1843, became a township in 1858, and was named for the Illinois city. A population increase after World War II was accompanied by an expansion of diversified industry. Bloomington is adjoined by the Minneapolis-St. Paul International Airport. The Mall of America in Bloomington is one of the largest indoor shopping malls in the United States. Normandale Community College (1965) is also in Bloomington. Inc. village, 1953; city, 1960. Pop. (1992 est.) 88,405.

Bloomsburg, town, seat (1846) of Columbia county, east-central Pennsylvania, U.S., on the Susquehanna River and Fishing Creek, 40 mi (64 km) southwest of Wilkes-Barre. Laid out in 1802 by Ludwig Eyer and originally known as Eysersburg and Eyertown, it was renamed in 1870 for its location in Bloom Township. It gained the distinction of being the only incorporated town (1870) in the state (all other incorporated communities are boroughs or cities). During the Civil War, Union troops vainly sought an alleged confederacy in the town of draft evaders who had reputedly built a fort in Fishing Creek Valley. In the 1870s Bloomsburg was the scene of one of the murder trials that ended a siege of violence in Pennsylvania coalfields carried

out by the Molly Maguires, an Irish miners' society seeking improved working conditions. The town's industries consist of textiles, architectural aluminum, processed foods, and electronic products. The Bloomsburg State College was founded in 1839. The Carroll Park and Western Railroad and the Magee Transportation Museum are nearby. Pop. (1990) 12,439.

Bloomsbury, residential and academic area, inner borough of Camden, London, north of the Thames. It is the site of the main buildings of the University of London, the British Museum, and the British Medical Association. The district has a reputation, enhanced by the Bloomsbury group, which gathered there, as an artistic and intellectual centre, and includes several squares and gardens bordered by elegant Georgian town houses, notably Bedford Square.

Bloomsbury group, name given to a number of English writers, philosophers, and artists who frequently met between about 1907 and 1930 at the houses of Clive and Vanessa Bell and of Vanessa's brother and sister Adrian and Virginia Stephen (later Virginia Woolf) in the Bloomsbury district of London, the area around the British Museum. They discussed aesthetic and philosophical questions in a spirit of agnosticism and were strongly influenced by G.E. Moore's *Principia Ethica* (1903) and by A.N. Whitehead's and Bertrand Russell's *Principia Mathematica* (1910–13), in the light of which they searched for definitions of the good, the true, and the beautiful and questioned accepted ideas with a "comprehensive irreverence" for all kinds of sham.

Nearly all the "Bloomsberries," as they were nicknamed, had been at Trinity or King's College, Cambridge, with Leslie Stephen's son Thoby, who had introduced them to his sisters Vanessa and Virginia. Most of them had been "Apostles"; i.e., members of the "society," a select, semisecret university club for the discussion of serious questions, founded at Cambridge in the late 1820s by J.F.D. Maurice and John Sterling. Tennyson, Arthur Hallam, Edward Fitzgerald, and Leslie Stephen had all been Apostles. In the early 1900s, when those who later formed the core of the Bloomsbury group were elected to the society, the literary critic Lowes Dickinson, the philosophers Henry Sidgwick, J.M.E. McTaggart, A.N. Whitehead, G.E. Moore, and the art critic Roger Fry, who became one of the Bloomsbury group himself, were members.

The Bloomsbury group included the novelist E.M. Forster, the biographer Lytton Strachey, the art critic Clive Bell, the painters Vanessa Bell and Duncan Grant, the economist John Maynard Keynes, the Fabian writer Leonard Woolf, and the novelist and critic Virginia Woolf. Other members were Desmond MacCarthy, Arthur Waley, Saxon Sidney-Turner, Robert Trevelyan, Francis Birrell, J.T. Sheppard (later provost of King's College), and the critic Raymond Mortimer and the sculptor Stephen Tomlin, both Oxford men. Bertrand Russell, Aldous Huxley, and T.S. Eliot were sometimes associated with the group, as was the economist Gerald Shove. The group survived World War I but by the early 1930s had ceased to exist in its original form, having by that time merged with the general intellectual life of London, Oxford, and Cambridge. Although its members shared certain ideas and values, the Bloomsbury group did not constitute a school. Its significance lies in the extraordinary number of talented persons associated with it.

Blosius, Franciscus Ludovicus (Latin), French FRANÇOIS-LOUIS DE BLOIS (b. 1506, Don-Étienne, Neth.—d. 1566, Liessies, Fr.), Benedictine monastic reformer and mystical writer.

Of noble birth, he was a page at the court of the future emperor Charles V and received his

early education from the future pope Adrian VI. In 1520 he entered the Benedictine Order at Liessies, becoming abbot in 1530. During the invasion of King Francis I of France, Blosius, accompanied by three monks, retired (c. 1537) to Ath. He returned to Liessies (1545), remaining there rather than accepting the archbishopric of Cambrai offered by Charles V in 1556.

His concern for the renewal of the monastic spirit inspired his writings, which for a time rivalled in popularity the *Imitation of Christ*, a Christian devotional work of uncertain authorship written between 1390 and 1440. Doctrinally, Blosius was a successor to the earlier Lowlands mystics, but without their speculative interests, and a forerunner of St. Francis of Sales, patron of all writers. Blosius' more important treatises are translated in the series *Spiritual Works* by B. Wilberforce and D.R. Huddleston.

blot drawing, technique in the visual arts of using accidental blots or other aleatory stains on paper as the basis for a drawing. Leonardo da Vinci was one of the first to expound the value of such accidental marks (in his case he referred specifically to marks on walls) as a means of stimulating the artist's imagination and providing him with the foundation of a composition.

"Imaginary Landscape of Tree with Distant Mountains," ink and brush blot drawing by Alexander Cozens, from his sketchbook of instruction for his son, 1785–86; in the British Museum

By courtesy of the trustees of the British Museum, photograph, J.R. Freeman & Co. Ltd

In 1786 the English drawing master Alexander Cozens published an instructional manual, *A New Method for Assisting the Invention in Drawing Original Compositions of Landscape*, entirely based on the development of blot drawing. In more recent times, the technique has been exploited by the Surrealists, as in the Automatic drawings of Max Ernst.

blotch (plant disease): see sooty mold.

Blount, Charles: see Mountjoy, Charles Blount, 8th Lord.

Blount, Edward, Blount also spelled BLUNT (b. c. 1565—d. after 1632), publisher and translator who, with Isaac and William Jagard, printed the First Folio of Shakespeare's plays (1623).

After serving as an apprentice to London publisher William Ponsonby, Blount in 1588 became a freeman of the Stationers' Company and opened a bookshop in London. His early publications include Giovanni Florio's Italian-English dictionary (1595) and Florio's translation of Montaigne's essays (1603), and Marlowe's *Hero and Leander* (1598), containing a dedication by Blount in which he speaks of his close friendship with the late poet. In 1612 he published Thomas Shelton's translation of *Don Quixote*, the first English version. The First Folio of Shakespeare's plays, entitled *Mr. William Shakespeares Comedies, Histories and Tragedies. Published According to the True Originall Copies*, appeared in 1623. It had been produced by Shakespeare's col-

leagues at the Globe theatre, Henry Condell and John Heming, but Blount presumably also acted as editor.

Blount, William (b. March 26, 1749, Bertie County, N.C.—d. March 21, 1800, Knoxville, Tenn., U.S.), first territorial governor of (1790–96) and later one of the first two U.S. senators from Tennessee (1796–97).

Blount served in the North Carolina militia during the Revolutionary War. During the 1780s he was elected to six terms in the North Carolina legislature, represented his state in Congress under the Articles of Confederation, and was a delegate to the 1787 Constitutional Convention in Philadelphia. Later he was a member of the North Carolina convention that ratified the Constitution. Disappointed in his defeat for election to the U.S. Senate in 1789, Blount secured appointment as territorial governor of the lands west of the Alleghenies ceded to the U.S. in 1789 by North Carolina. When this territory became the state of Tennessee, Blount was elected one of its first two senators.

Shortly thereafter, in financial difficulties arising from his speculations in Western lands, Blount became involved in a plan whose apparent aim was to organize an armed force of frontiersmen and Indians, and, with the help of the British fleet, to expel the Spanish from Florida and Louisiana and transfer control to Great Britain. When the plot came to the attention of Pres. John Adams, Blount was expelled from the Senate, and impeachment proceedings were begun, although they were dropped the following year. Blount returned to Tennessee, where his popularity was undiminished, and was elected in 1798 to the Tennessee senate, serving as speaker until his death.

Blountian orogeny, a mid-Ordovician episode of mountain building about 460 million years ago in the central Appalachians; evidence of this event consists of a clastic wedge of sediments of mid-Ordovician age in eastern Tennessee. The Blountian probably is an event marking an early phase of the Taconic orogeny.

Blow, John (baptized Feb. 23, 1649, Newark-on-Trent, Nottinghamshire, Eng.—d. Oct. 1, 1708, Westminster, London), organist and composer, remembered for his church music and for *Venus and Adonis*, which is regarded as the first true English opera.

He was probably educated at the Magnus Song School in Nottinghamshire and in 1660 became a chorister at the Chapel Royal. He was appointed organist of Westminster Abbey (1668), and in 1669 he became one of the king's musicians for virginals. In March 1674

Blow, engraving by R. White, 1700

By courtesy of the trustees of the British Museum, photograph, J.R. Freeman & Co. Ltd

he was sworn in as a gentleman of the Chapel Royal and became master of the children, a position he held until his death. He had great influence on the choristers under him and also on his student, Henry Purcell. In 1676 or 1677 he became one of the Chapel Royal organists, and in 1677 the dean and chapter of Canterbury conferred on him a doctorate of music—the first instance of what became known as a Lambeth Degree in music.

In 1679 Blow was succeeded as organist at Westminster Abbey by Purcell; he was reappointed after Purcell's death in 1695. The years 1680–1700 were the most productive and prosperous of his life. In 1687 he became master of the children of St. Paul's, a position he held for 16 years; and in 1699 he received his last appointment, as first composer to the Chapel Royal.

Blow's official positions entailed the writing of much religious and secular ceremonial music. Fourteen services and more than 100 anthems are extant, and many remain in regular use. He was at his best in the writing of full anthems in a simple chordal or contrapuntal style with melodies of great strength and sweetness developed over a ground bass. He excelled also in the writing of services; outstanding is his *Service in G Major*. His *Venus and Adonis*, written between 1680 and 1685 for performance at court and called by him *A Masque for the Entertainment of the King*, was important in the development of English opera. It is the first dramatic work in which the whole text is set to music without either dialogue or extraneous musical entertainment. His songs for one, two, three, and four voices, which appear in many contemporary collections and in his own *Amphion Anglicus* (1700), are notable for their charm of melody.

Blow, Susan Elizabeth (b. June 7, 1843, St. Louis, Mo., U.S.—d. March 26, 1916, New York City), ardent advocate of German educational ideas who launched the first public kindergarten in the United States.

Raised in a deeply religious home, Blow took easily to the mystical philosophy of the German Idealists, particularly the educational precepts of Friedrich Froebel. She spent some time in Germany and returned to the United States with the idea of opening a kindergarten in St. Louis.

In 1872 Blow went to New York City to study with Maria Kraus-Boelte, a Froebel disciple. She returned to St. Louis in 1873 and set up her kindergarten. In a short time, St. Louis became the focal point of the U.S. kindergarten movement, and in 1874 Blow established a training school for kindergarten teachers. In addition, she translated Froebel's *Mutter- und Kose-lieder* (1844) as *Mother Play*, which contained songs and games for weekly use in the kindergarten.

In 1884 Blow retired temporarily because of ill health. During the following decade she found herself in opposition to liberals in the kindergarten movement who advocated revisions of Froebel's concepts.

In 1895, having moved from St. Louis to the eastern United States, Blow began lecturing on the Bible and classical literature. During the final phase of her career she was associated with the New York Kindergarten Association and the International Kindergarten Union, and she spent a good deal of her time writing. Among her works were: *A Study of Dante* (1877), *Symbolic Education* (1894), *Poems and Pictures* (1895), *Letters to a Mother on the Philosophy of Froebel* (1899), *Kindergarten Education* (1900), and *Educational Issues in the Kindergarten* (1908). In addition, she published translations of the works of Froebel: *The Mottoes and Commentaries of Friedrich Froebel's Mother Play* (1895) and

The Songs and Music of Friedrich Froebel's Mother Play (1895).

blow fly, any member of the insect family Calliphoridae (order Diptera), metallic blue, green, or bronze in colour, and noisy in flight. They resemble the housefly in size and habits. Among the important members of this group are the screwworm, bluebottle fly, greenbottle fly, and cluster fly. Larvae (maggots) usually feed on decaying meat and sometimes infest open wounds (e.g., *Calliphora*, *Cochliomyia*). Although they may assist in preventing infection by cleaning away dead flesh, they may also destroy healthy tissue. During World War I, sterile blow fly larvae were put in open wounds to remove decaying tissue and to prevent bacterial growth. They were also used in the past to treat human osteomyelitis, a bone disease, and gangrene.

The screwworm (the name for the larvae of several North and South American blow

Screwworm (*Callitroga*)
William E. Ferguson

fly species, so called because of the screw-like appearance of the body, which is ringed with small spines) attacks livestock and other animals including man. The true screwworm (*Cochliomyia hominivorax*; formerly, *Callitroga americana*) and the secondary screwworm (*Callitroga macellaria*) develop in decaying flesh of surface wounds of domestic animals and occasionally of humans; larvae may attack living tissue as well. Each female deposits about 200 to 400 eggs near an open wound. The larvae burrow into the tissue, drop to the ground when mature, and pupate before emerging as adults. Severe infestations (myiasis) may lead to the death of the animal affected. Sterilization of male flies has been used in attempts to control screwworms. Greenbottles (*Lucilia*) commonly infest sheep; several species of bluebottles (*Calliphora*) are serious pests in Australia and frequently kill sheep. *Chrysomya megacephala*, which breeds in excrement and decaying material in Pacific and Oriental regions, is an important carrier not only of dysentery but also possibly of

Bluebottle fly (*Calliphora*)
E. S. Ross

jaundice and anthrax. *Protocalliphora* sucks blood from nestling birds.

Larvae of the cluster fly (*Pollenia rudis*) of Europe and North America, the adults of which are large, sluggish, and dark brown, are parasites of earthworms. The cluster fly usually breeds on animal carcasses or carrion and

Cluster fly (*Pollenia rudis*)
Ingmar Holmasen

is a carrier of anthrax, a disease of mammals including man. Infestation of living tissues produces severe irritation. In autumn huge buzzing clusters of the flies gather in sheltered places (e.g., attics) to hibernate.

blow molding, in glass production, method of forming an article of glass by blowing molten glass into a mold. This operation is performed with the aid of a hollow metal tube that has a mouthpiece at one end. A gob of molten glass gathered onto the opposite end of the tube is enlarged by a bubble of air blown into it through the tube. This preliminary shape is then lowered into a mold and inflated by blowing until it has assumed the desired shape and pattern. The mold may be constructed of one piece, in which case it is sheared off the glass article, or it may be an open-and-shut device comprised of two parts, which allows the mold to be removed and reused.

Syrian glassworkers appear to have developed blow molding in the 1st century BC. The first known mold-blown glass vessels bear the signature of Syrian masters, who used a ductile variety of soda glass that was particularly suitable for this method of shaping glassware. Roman glassmakers adopted the procedure between the 1st and 3rd centuries AD, using it to manufacture both luxury and domestic glass vessels. This technique of shaping glass made possible the low-cost production of fine decorative glassware, often with slogans molded in. Today much blow-molded glass is produced by machines that use compressed air for blowing the glass into molds. *See also* glassblowing.

blowfish: *see* puffer.

blowgun, tubular weapon from which projectiles are forcefully propelled by human breath. Primarily for hunting, it is rarely used in warfare. Employed by Malaysians and other Southeast Asian aboriginals, in southern India and Sri Lanka, in Madagascar (Malagasy Republic), in northwestern South America, in Central America north to central Mexico, among southeastern American Indians, and in Melanesia (rarely), it also may have been used prehistorically in the Antilles. Apparently invented by Malaysians, blowguns were Pre-Columbian in both hemispheres; whether their occurrence in the New World represents reinvention or introduction remains uncertain.

Blowguns vary in length from 18 inches to more than 23 feet (45 centimetres to 7 metres). The simplest of the four basic types is a single tube, usually a section of cane or bamboo. If the bamboo internodes are short, the septa may be burned or punched out and the interior polished. Single-tube bamboo blowguns occur widely, often in peripheral regions of use or where the weapon serves as a toy. Another variety has an inner and an outer tube. In the Old World (notably Malaya) these are usually bamboo, the inner tube commonly being made of two sections fitted into a short

length of bamboo; the outer tube also may be composite. In northernmost South America, a palm stem (pith removed) is the usual outer tube; occasionally another serves as the inner tube. A third major variety is made by splitting a length of wood, carving half the bore on each face, and binding the halves together. This split type is found in scattered locations including Malaya, Borneo, the Philippines, Japan, south India, and South America on the Pacific Coast and between the Negro and the Madeira rivers and has also been reported from Louisiana. Apparently unknown to New World artisans, the most difficult type of blowgun to construct is made from a single block of wood about 2.5 m (8 feet) long. After the bore is carefully drilled with a chisel on the end of a long rod, the block is trimmed to a cylinder. This type is most common in Borneo, with a spear usually attached. Single-piece wooden guns are known from Bali and the Celebes; in Madagascar the bore is burned out with a heated iron rod.

Darts are the most common blowgun missiles. They are usually made from palm-leaf midribs or from wood or bamboo splinters, and they may vary from 4 to 100 cm (1.5 to 40 inches) in length. A conelike bit of pith or a twist of fibre at the base of the dart makes it fit the tube snugly, ensuring that it will fly out of the tube from a puff of human breath. Clay pellets or bits of bone are also used as darts by some peoples. A hunter usually carries his darts in a quiver made of bamboo, basketry, wood, or leaves.

To be effective against quarry larger than small birds, blowgun darts require poison. The darts often are notched so that the poisoned tip will break off in the victim. The most common Old World poison is made from the sap of the upas tree (*Antiaris toxicaria*) and kills by cardiac effects; also used are the lianas *Strychnos strychnos* and *Strophanthus*. In South America, curare, whose action is paralytic, is widely used, though obtained from relatively few tribes, who prepare it largely from the *Strychnos toxifera* vine. Other poisons are made from snake venom, insect poisons, and decaying flesh. Dart poisons are not recorded for North American peoples.

blowpipe, a small tubular instrument for directing a jet of air or other gas into a flame in order to concentrate and increase the flame's heat. A blowpipe is usually operated directly by mouth, but a small bellows may also be used.

In mineralogy, the blowpipe technique for analyzing ores was developed by the Swedish mineralogist Baron Axel Fredrik Cronstedt. Its application in qualitative analysis was due to the work of the Swedish chemist Jöns Jacob Berzelius and the German mineralogist Johann Hausmann. By placing a substance in the flame of a blowpipe, information may be obtained as to its general nature by the changes it undergoes during heating and by the residue that remains. By treating the residue with certain reagents and again heating, specific information as to certain elements may be obtained.

Bloy, Léon (b. July 11, 1846, Périgueux, France—d. Nov. 2, 1917, Bourg-la-Reine), French novelist, critic, polemicist, a fervent Roman Catholic convert who preached spiritual revival through suffering and poverty.

As spiritual mentor to a group of friends that included the writer Joris-Karl Huysmans, philosopher Jacques Maritain, and painter Georges Rouault, Bloy influenced their reconciliation with the Roman Catholic church. Bloy's works are extremely varied in form (novels, pamphlets, a *Journal*, exegesis), but they reveal a powerful unity of thought: through pain and destitution man is redeemed by the Holy Spirit and is awakened to the hidden language of the universe. His autobiographical novels, *Le Désespéré* (1886; "De-

spairing") and *La Femme pauvre* (1897; *The Woman Who Was Poor*), express his mystical conception of woman as the Holy Spirit and of love as a devouring fire. The eight volumes of his *Journal* (written 1892–1917; complete edition published 1939) reveal him as a crusader of the absolute, launching onslaughts against lukewarm Christians. Several volumes of his letters—to his wife and daughters, to Pierre Termier, and to Jacques Maritain, among others—have been published.

Blücher, Gebhard Leberecht von, PRINCE (Fürst) VON WAHLSTATT, byname **MARSCHALL VORWÄRTS** ("Marshal Forward") (b. Dec. 16, 1742, Rostock, Mecklenburg [Germany]—d. Sept. 12, 1819, Krieblowitz, near Kanth, Silesia, Prussia [now Katy Wrocławskie, Pol.]), Prussian field marshal, a commander during the Napoleonic Wars, who was important in the victory of Waterloo.

Blücher entered the Swedish cavalry in 1756 and then joined the Prussian army in 1760. He distinguished himself against the French in 1793–94 and commanded the Prussian rear guard at the Battle of Jena (1806). Around this time he met Gerhard Johann David von Scharnhorst, who served as one of his principal staff officers until Scharnhorst's death in June 1813. After the Peace of Tilsit (1807) Blücher was employed for a time in the War Department and then went into retirement.

Blücher, detail from an oil painting by Friedrich Carl Gröger, 1817

Archiv für Kunst und Geschichte Berlin

In 1813, when war between France and Prussia broke out again, Blücher, then 71 years old, returned to active service. He took part in the battles of Lützen and Bautzen in May 1813, and three months later at Wahlstatt (Legnickie Pole), on the Katzbach (Kaczawa) River, he decisively defeated the French under Marshal Jacques-Alexandre Macdonald, capturing 18,000 prisoners and more than 100 guns. For his part in the Battle of Leipzig (October 1813) he was made a field marshal. After hard fighting he entered Paris with other victorious Allied commanders in May 1814. He then received his title of Prince of Wahlstatt and retired to his estates.

After Napoleon's return in 1815, Blücher again assumed command of the Prussian troops in Belgium, with August von Gneisenau as his invaluable chief of staff. Blücher immediately set about coordinating his force with that of the British and Allied forces under the Duke of Wellington. At Ligny (June 16, 1815) he was defeated by Napoleon; but, in order to ensure cooperation with Wellington later, he withdrew his army toward Wavre, although by so doing he endangered his own communications. His troops took no part in the early stages of the Battle of Waterloo (June 18, 1815); but, urged on by Gneisenau, they made an exhausting counterattack and appeared on the French right flank at a critical

stage of the battle. This action, together with a general advance by the British, completed Napoleon's defeat. Blücher's cavalry continued the pursuit of the French toward Paris throughout the night.

Blücher was described by a contemporary as a rough, ill-educated man, but he was endowed with common sense and fiery energy. He knew little of the higher art and science of war, and he required a good chief of staff to guide him. On the battlefield, however, his determination and personal courage and example proved invaluable.

Bludenz, town, Vorarlberg *Bundesland* (federal state), western Austria. It lies along the Ill River about 60 miles (100 km) east-southeast of Zürich. First mentioned in 830, it was fortified in the 13th century and had received town rights by 1296. It passed to the Habsburgs in 1394. Notable landmarks include the St. Laurentius parish church (1514); the 15th-century Spitalskirche, with a fine Baroque altar; and the Gayenhofen Castle (1228–45; converted 1746). An international summer resort and Alpine winter-sports centre, Bludenz produces textiles, watches, chocolate, building materials, and chemicals. Pop. (1991) 13,579.

blue-and-white ware, white porcelain decorated with blue painted under the glaze. At least as early as the 9th century, underglaze blue had been used in the Middle East, whence it was introduced to China in the Yüan dynasty (1279–1368). Particularly notable are the blue-and-white wares produced in China during the Ming (1368–1644) and Ch'ing (1644–1911) dynasties. From China, underglaze blue was introduced to Europe.

blue baby syndrome: see Fallot, tetralogy of.

Blue Book, The, annually revised publication listing notable persons in the United Kingdom, Ireland, Australia, New Zealand, Canada, and the United States; those listed are considered leaders of the English-speaking world in the arts and sciences, business, government, and the professions. It is published in London. Listings emphasize the individuals' current status, both personal and professional. Each entry also contains honours and awards, academic degrees (doctorate), nationality, age, names of immediate family members, immediate past career, extraprofessional activities, and cultural and civic appointments. Current personal and/or professional addresses are included, with the entrant's permission. For artists, musicians, authors, etc., an entry indicates designs, compositions, and collections in which their works appear. Also included are the orders of chivalry and a list of obituaries of entrants who were in the previous edition.

blue butterfly, any member of the insect subfamily Plebeiniinae of the widely distributed

Eastern tailed blue butterfly (*Everes comyntas*)

Robert P. Carr—Bruce Coleman Inc.

Lycaenidae family of common butterflies (order Lepidoptera). Adult lycaenids, sometimes known as gossamer-winged butterflies, are small and delicate, with a wingspan of 18 to 38 mm (0.75 inch to 1.5 inches). They are rapid fliers and are usually distinguished by iridescent wings. The male's forelegs are reduced, but the female's forelegs are fully developed.

Lycaenid larvae are short, broad, and slug-like. Some species secrete honeydew, a sweet by-product of digestion that attracts ants. The ants stroke, or "milk," the larva with their legs to stimulate honeydew secretion. The fragile adults of most blue species have brilliant blue wing surfaces, generally much darker in the females than in the males; a few species have white or brown coloration. The pigmy blue (species *Brephidium exilis*), the smallest blue, has a wingspan of less than 12 mm; the tailed blues (*Everes*) have a tail-like extension on the hindwings. The European blue (*Maculinea arion*) spends its larval and pupal stages in an ant nest, emerging in the spring as an adult.

blue cheese, any of several cheeses marbled with bluish or greenish veins of mold; important trademarked varieties include English Stilton, French Roquefort, and Italian Gorgonzola. Most blue cheeses are made from cow's milk, but Roquefort is made from the milk of the ewe. Spores of species *Penicillium roquefortii* are mixed with either the milk or the curd. The mold, during the three to six months of ripening, grows both in small, irregular, natural openings in the cheese and in machine-made perforations. Roquefort and some Gorgonzolas are ripened in caves, the stable, moist atmosphere of which imparts a distinctive character to the cheeses.

Blue cheeses may be soft and creamy or crumbly in texture, with a characteristically sharp, piquant flavour; they are often quite salty but should not be overly so, nor bitter. Well-known blue cheeses in addition to those mentioned above include Bleu de Bresse and Bleu d'Auvergne (France), Danablu (Denmark), Blue Cheshire (England), and several produced in the United States.

Blue Coat school: see charity school.

blue crab (genus *Callinectes*), any of a genus of crustaceans of the order Decapoda, particularly *Callinectes sapidus* and *C. hastatus*, common edible crabs of the western Atlantic coast that are prized as delicacies. Their usual habitat is muddy shores, bays, and estuaries.

The shell, greenish on top and dingy white below, is about 7.5 cm (3 inches) long and 15 to 18 cm wide; the legs are bluish. A distinctive, large, sharp spine projects from each side. Eight short spines occur on each side be-

Blue crab (*Callinectes sapidus*)

John H. Gerard from the National Audubon Society Collection/Photo Researchers—EB Inc

tween the large spine and the eyes. The chelae, or pincers, are large and somewhat unequal in size. The fifth pair of legs is flattened for swimming. The crabs are scavengers, feeding on the bodies of dead animals. At spawning time the female's abdomen swells with eggs. Larvae hatch two weeks after fertilization and remain attached to the female for a short time.

blue-eyed grass, any of the more than 75 species of *Sisyrinchium*, native to the Americas and the Caribbean. These grasslike members of the iris family (Iridaceae) bear starry, yellow, white, or blue to violet flowers with six petal-like segments and wiry, fibrous root-stalks.

Two species, *S. bermudiana*, from the West Indies, and *S. angustifolium*, from North America, have been naturalized in parts of Europe. The West Indian species has tall (50-centimetre [20-inch]) flower stems that bear 2-centimetre yellow-eyed blooms; *S. angustifolium* has smaller flowers. A Chilean plant, *S. striatum*, bears a spike up to 90 cm tall with clusters of creamy white blooms.

blue-green algae, also called CYANOBACTERIA, any of a large, heterogeneous group of prokaryotic, principally photosynthetic organisms. Cyanobacteria resemble the eukaryotic algae in many ways, including morphological characteristics and ecological niches, and were at one time treated as algae, hence the common name of blue-green algae. Algae have since been reclassified as protists, and the prokaryotic nature of the blue-green algae has caused them to be classified with bacteria in the prokaryotic kingdom Monera.

Like all other prokaryotes, cyanobacteria lack a membrane-bound nucleus, mitochondria, Golgi apparatus, chloroplasts, and endoplasmic reticulum. All of the functions carried out in eukaryotes by these membrane-bound organelles are carried out in prokaryotes by various parts of the cell, such as the cell membrane. Some cyanobacteria, especially planktonic forms, have gas vesicles that contribute to their buoyancy. Chemical, genetic, and physiological characteristics are used to further classify the group within the kingdom. Cyanobacteria may be unicellular or filamentous. Many have sheaths to bind other cells or filaments into colonies.

Cyanobacteria contain only one form of chlorophyll, chlorophyll *a*, a green pigment. In addition, they contain various yellowish carotenoids, the blue pigment phycobilin, and, in some species, the red pigment phycoerythrin. The combination of phycobilin and chlorophyll produces the characteristic blue-green colour from which these organisms derive their popular name. Because of the other pigments, however, many species are actually green, brown, yellow, black, or red.

Most cyanobacteria do not grow in the absence of light (*i.e.*, they are obligate phototrophs); however, some can grow in the dark if there is a sufficient supply of glucose to act as a carbon and energy source.

In addition to being photosynthetic, many species of cyanobacteria can also "fix" atmospheric nitrogen—that is, they can transform the gaseous nitrogen of the air into compounds that can be used by living cells. Particularly efficient nitrogen fixers are found among the filamentous species that have specialized cells called heterocysts. The heterocysts are thick-walled cell inclusions that are impermeable to oxygen; they provide the anaerobic (oxygen-free) environment necessary for the operation of the nitrogen-fixing enzymes. In Southeast Asia, nitrogen-fixing cyanobacteria often are grown in rice paddies, thereby eliminating the need to apply nitrogen fertilizers.

Cyanobacteria range in size from 0.5 to 60 micrometres, which represents the largest prokaryotic organism. They are widely distributed and are extremely common in fresh water, where they occur as members of both

the plankton and the benthos. They are also abundantly represented in such habitats as tide pools, coral reefs, and tidal spray zones; a few species also occur in the ocean plankton. On land, cyanobacteria are common in soil down to a depth of 1 m (39 inches) or more; they also grow on moist surfaces of rocks and trees, where they appear in the form of cushions or layers.

Cyanobacteria flourish in some of the most inhospitable environments known. They can be found in hot springs, in cold lakes underneath 5 m of ice pack, and on the lower surfaces of many rocks in deserts. Cyanobacteria are frequently among the first colonizers of bare rock and soil. Various types of associations take place between cyanobacteria and other organisms. Certain species, for example, grow in a mutualistic relationship with fungi, forming composite organisms known as lichens.

Cyanobacteria reproduce asexually, either by means of binary or multiple fission in unicellular and colonial forms or by fragmentation and spore formation in filamentous species. Under favourable conditions, cyanobacteria can reproduce at explosive rates, forming dense concentrations called blooms. Cyanobacteria blooms can colour a body of water. For example, many ponds take on an opaque shade of green as a result of overgrowths of cyanobacteria, and blooms of phycoerythrin-rich species cause the occasional red colour of the Red Sea. Cyanobacteria blooms are especially common in waters that have been polluted by nitrogen wastes; in such cases, the overgrowths of cyanobacteria can consume so much of the water's dissolved oxygen that fish and other aquatic organisms perish.

blue ground: see kimberlite.

blue jay, North American species of jay (*q.v.*).

blue jeans (apparel): see jeans.

Blue Lake (China): see Koko Nor.

blue law, in U.S. history, a law forbidding certain secular activities on Sunday. The name may derive from Samuel A. Peters' *General History of Connecticut* (1781), which purported to list the stiff Sabbath regulations at New Haven, Conn.; the work was printed on blue paper. A more probable derivation is based on an 18th-century usage of the word blue meaning "rigidly moral" in a disparaging sense. Strictest in Puritan, Bible-oriented communities, blue laws usually forbade regular work on Sunday, plus any buying, selling, traveling, public entertainment, or sports. Peters' account of the New Haven Puritan government's codes has been proved unreliable. Among the 45 blue laws he listed in his *History* (1781) that were wholly or substantially true, however, are the following: "The judges shall determine controversies without a jury"; "married persons must live together or be imprisoned"; "a wife shall be good evidence against her husband"; and "the selectmen, on finding children ignorant, may take them away from their parents and put them into better hands, at the expense of their parents." To some degree, similar laws existed in all the American colonies. In general, they lapsed after the U.S. War of Independence. As late as the 1990s, however, blue laws remained on the statutes in some states, and their influence has persisted wherever public activity on Sunday is regulated.

Blue Mountains, section of the Great Dividing Range, New South Wales, Australia. The range comprises a well-dissected sandstone plateau that rises from an eastern escarpment (1,200–1,800 feet [370–550 m]) to 3,871 feet (1,180 m) in a western scarp at Bird Rock. Its slopes are generally precipitous. The first Europeans to cross the range were the explorers Gregory Blaxland, William C. Wentworth, and William Lawson in 1813. The range was

used as a retreat for wealthy Sydney residents: it is now accessible by good roads and forms a popular tourist area with many scenic attractions, including Jenolan Caves and the Zig Zag (an abandoned railway providing a route over the mountains). Blue Mountains National Park, a 768-sq-mi (1,989-sq-km) nature reserve centred on the Grose River Valley, lies within the region. The mountains are named for their bluish colour, which apparently is caused by light rays diffusing through droplets of oil dispersed into the air by the many types of indigenous eucalyptus trees.

The City of Blue Mountains is a confederation of more than 20 townships, formed in 1947. The principal centres are Katoomba, Leura, Mount Victoria, Blackheath, Springwood, Wentworth Falls, and Hazelbrook, all of which lie on both the rail line and Great Western Highway between Sydney (40 mi [60 km] east) and Lithgow on the western slopes of the mountains. Urban growth has been rapid, as the area is a popular vacation centre. Pop. (1996) 72,506.

Blue Mountains, range in eastern Jamaica, that extends for about 30 mi (50 km) from Stony Hill, 8 mi north of Kingston, eastward to the Caribbean Sea. The highest point in the range is Blue Mountain Peak (7,402 ft [2,256 m]). The Blue Mountains are thickly covered with tree ferns. The slopes facing the trade winds receive an average of 200 in. (5,000 mm) of rain annually, resulting in much topsoil erosion and a network of streams. Winter temperatures may fall to 45° F (7° C), while frost and even sleet have been experienced on Blue Mountain Peak. Coffee, formerly grown on large plantations, is cultivated in the valleys by peasants.

Blue Mountains, range curving northeastward for 190 mi (310 km) from central Oregon to southeastern Washington, U.S. The range reaches a width of 68 mi and an average elevation of about 6,500 ft (2,000 m); it comprises an uplifted, warped, and dissected lava plateau, above which rise several higher mountain ridges, including Aldrich, Strawberry, and Elkhorn. The highest peak is Rock Creek Butte (9,105 ft), on the Elkhorn Ridge. The mountains are drained by tributaries of the Columbia River. At lower elevations, the basins or flats are cultivated, some with irrigation. The slopes are heavily forested with pine and Douglas fir. Stock grazing and outdoor recreation are the main activities in the region since the decline of mining. The mountains are within parts of the Umatilla, Whitman, and Malheur national forests and probably received their name from the dark-blue appearance of the pine trees.

Blue Nile River, Arabic AL-BAHR AL-AZRAQ, Amharic ABĀY, headstream of the Nile River

The Sannār Dam on the Blue Nile River in the Sudan

Tor Eigeland—Black Star

(*q.v.*) and source of almost 70 percent of its floodwater at Khartoum. It reputedly rises as the Abāy from a spring 6,000 ft (1,800 m) above sea level, near Lake Tana in northwestern Ethiopia. The river flows into and out of the lake, runs through a series of rapids, and then drops into a gorge. It flows through a deep canyon southeast and west around the Choke Mountains and then turns northwest through The Sudan to join the White Nile at Khartoum. Its length is about 907 mi (1,460 km). By far the greater part of the Blue Nile's waters come from such tributaries as the Dinder and the Rahad rivers, which rise in the Ethiopian highlands. Dams at er Roseires (ar-Ruṣayrīs) and Sannār, in The Sudan, irrigate 1,000,000 ac (400,000 ha) in the plain of al-Jazirah (Gezira) between the Blue and White Nile rivers; the Sannār Dam also produces hydroelectric power.

Blue Peter (foaled 1936), English racehorse (Thoroughbred), unbeaten during the 1939 racing season when he won two of the events comprising the British Triple Crown: the Two Thousand Guineas at Newmarket and the Derby at Epsom Downs. The beginning of World War II deprived him of the chance to race in the Saint Leger, the last of the Triple Crown events, at Doncaster. Foaled by Fancy Free and sired by Fairway, Blue Peter was bred and owned by Lord Rosebery and trained by Jack Jarvis. He raced only twice in 1938, but in 1939 he was unbeaten in four races. Blue Peter sired Occan Swell, the 1944 Derby winner.

blue-ribbon jury, also called SPECIAL JURY, or STRUCK JURY, a group, chosen from the citizenry of a district, that has special quali-

Blue Ridge Mountains from Stony Man Overlook, Virginia

Enc Carle—Shostal/EB Inc

fications to try a complex or important case. The blue-ribbon jury is intended to overcome the problems of ordinary juries in interpreting complex technical or commercial questions. If an antitrust suit involved merger, acquisition, holding companies, and restraint of trade, for example, a group of qualified economic experts might be summoned. In the United States blue-ribbon juries are provided for by statutes, the terms varying by jurisdiction. Under some statutes, the blue-ribbon jury is available only in civil cases; under others, in criminal cases, too. In either situation, this jury is ordered by the court on the motion of one of the litigants. Under some statutes the blue-ribbon jury is an absolute right.

The selection is similar to that for an ordinary trial jury, but the lists of potential jurors contain only specially qualified persons. Although the origin of the blue-ribbon jury is uncertain, it was clearly in use under William III of England (reigned 1689–1702). Complexity was not the only reason for the blue-ribbon jury. When the sheriff (who impanelled juries)

was suspected of bias, this special jury was invoked as a safeguard. By placing important persons on the jury, the court prevented intimidation.

At present the blue-ribbon jury is seldom used. One problem in this form of trial is that the jurors' expertise may colour their perceptions. Medical experts trying a case involving a doctor, for example, may be biased, consciously or unconsciously, in his favour. The more common solutions to the increasing complexity of litigation have been greater use of expert witnesses and assignment of cases to quasi-judicial administrative agencies.

Blue Rider, The (group of artists): *see* Blaue Reiter, Der.

Blue Ridge, also called BLUE RIDGE MOUNTAINS, segment of the Appalachian Mountains in the United States, extending southwestward for 615 mi (990 km) from Carlisle, Pa., through parts of Maryland, Virginia, North Carolina, and South Carolina, to Mt. Oglethorpe, Georgia. The range, a relatively narrow ridge, is 5 to 65 mi wide, with average heights of 2,000 to 4,000 ft (600 to 1,200 m). Included in the Blue Ridge system are the Black Mountains, with Mt. Mitchell (6,684 ft), in North Carolina, the highest peak east of the Mississippi River; and the Great Smoky and the Unaka mountains. Notable Blue Ridge peaks are Mt. Rogers (5,729 ft; highest point in Virginia); Sassafras Mountain (3,560 ft; highest point in South Carolina); Brasstown Bald (4,784 ft; highest point in Georgia); Stony Man (4,010 ft) and Hawksbill (4,049 ft) in Virginia; and

Grandfather Mountain (5,964 ft) in North Carolina.

The whole region has been intricately dissected by many small streams, and three major rivers have cut gaps through the ridge—the Roanoke, James, and Potomac, all in Virginia. Beginning south of Front Royal, Va., the Skyline Drive runs through the Shenandoah National Park and connects at Rockfish Gap, Va., with Blue Ridge Parkway, a scenic motor route that runs south to the Great Smoky Mountains National Park.

The mountains lie within Chattahoochee, Cherokee, Nantahala, Pisgah, Jefferson, and George Washington national forests, and more than 700 varieties of trees and plants have been catalogued. The region, although known for its isolation, contains numerous small farms with picturesque log cabins. Intensive truck farming, tobacco production, and cattle raising are important activities. The hardwood forests of the Blue Ridge are a source of timber, and some minerals are worked.

Blue Ridge Parkway, noncommercial motor route established in 1936 and administered by the U.S. National Park Service, extending for 469 mi (755 km) through the Appalachian Mountains in Virginia and North Carolina. Following along mountain crests (elevations varying from 600 to 6,000 ft [180–1,800 m]), it links the Shenandoah National Park (north) with the Great Smoky Mountains National Park (south) and probes the George Washington, Jefferson, and Pisgah national forests. It traverses colourful mountain scenery with facilities for outdoor recreation (camping, hiking, picnicking) along its route.

blue shark, also called **GREAT BLUE SHARK** (*Prionace glauca*), abundant shark of the family Carcharhinidae found in all oceans, from warm temperate to tropical waters. Also

Blue shark (*Prionace glauca*)
Painting by Richard Ellis

known as the blue whaler, the blue shark is noted for its attractive, deep-blue colouring contrasting with a pure-white belly. It is a slim shark, with a pointed snout, saw-edged teeth, and long, slim pectoral fins. Maximum length is about 4 metres (12 feet).

Fish form the main part of its diet, but the blue shark is also a scavenger and sometimes follows ships for extended periods. It is noted for the speed with which it appears near slaughtered whales and its avidity in feeding on the carcasses. It is generally considered potentially dangerous to man.

Blue Shirt, Spanish CAMISA AZUL, member of a 20th-century Irish fascist movement founded by the former Irish president William Cosgrave. Gen. Eoin O'Duffy, former commissioner of the Irish National guards, took the movement's group of 600 men to Spain in 1936. There the Blue Shirts trained at Cáceres and fought with the Nationalist forces during the Spanish Civil War.

blue vitriol, hydrated cupric sulfate, a compound of copper occurring as large, blue-bright crystals (see copper).

blue whale (*Balaenoptera musculus*), the heaviest animal ever to have lived, a species of baleen whale that weighs approximately 150 tons and may attain a length of more than 30 m (98 feet). Females are generally larger than males, and the largest accurately measured blue whale was a 29.5-m female that weighed 180 metric tons (nearly 200 short [U.S.] tons). There are reports of 33-m catches that may have reached 200 metric tons. The heart of one blue whale was recorded at nearly 700 kg (about 1,500 pounds).

Blue whale (*Balaenoptera musculus*)
Painting by Richard Ellis

This cetacean is blue-gray in colour with lighter gray mottling in the form of large spots, the lower surfaces of the flippers are lighter gray or white in some instances. The blue

whale has also been called the "sulfur-bottom" because of the yellowish algae living on the underside of some individuals. Found alone or in small groups in all oceans, it spends the summer in polar waters, feeding on shrimplike crustaceans called krill (*q.v.*). In winter the whales move toward the Equator to breed; calves are about 8 m (26 feet) at birth.

Whaling greatly reduced the number of blue whales during the first half of the 20th century, and populations have remained small (several thousand). The blue whale is classified scientifically as a rorqual (family Balaenopteridae), and is considered an endangered species.

blueback, common name for a number of blue-coloured fishes, particularly the lake herring, or cisco, a whitefish (*q.v.*); the summer, or glut, herring (see herring); and the sockeye salmon (*q.v.*).

Bluebeard, murderous husband in a story, "La Barbe bleue," in Charles Perrault's collection of fairy tales, *Contes de ma mère l'oye* (1697; *Tales of Mother Goose*). Similar stories exist in European, African, and Eastern folklore; the essentials are the locked and forbidden room, the wife's curiosity, and her 11th-hour rescue. Perrault's version probably derived from Brittany and may have been based on the career of the 15th-century marshal of France Gilles de Rais and that of Comorre the Cursed, a 6th-century Breton chief, each of whom committed crimes similar to those in the Bluebeard stories.

In an Estonian version, the wife is rescued by a gooseherd (or a page), a childhood friend who slays her husband and marries her. In the

Bluebeard, illustration by Gustave Doré

story "Feather-bird" in *Grimms' Fairy Tales* (1812–15), three sisters are the intended victims.

The identification in some stories of Bluebeard with the devil and of the locked door as the gate of hell are probably later additions. Andrew Lang's translation (1888) of Perrault's *Conte* includes a close comparison with other folktales and details of the careers of Gilles de Rais and Comorre.

bluebell, any plant of the genus *Endymion* of the family Liliaceae, native to Eurasia. The bell-shaped blue flower clusters of bluebell, or wild hyacinth (*E. nonscriptus*), and Spanish bluebell (*E. hispanicus*) are borne on plants about 30 centimetres (1 foot) tall. Both species are cultivated as garden ornamentals. Some authorities consider them as belonging to the related genus *Scilla* of the same family.

Many other plants are commonly known as bluebells, including species of the genera *Cam-*

Wild hyacinth (*Endymion nonscriptus*)

M.T. Tanton—The National Audubon Society Collection/Photo Researchers

panula, *Eustoma*, *Polemonium*, and *Clematis*. In the United States the name bluebell is usually reserved for *Mertensia virginica*.

blueberry, North American shrub of the species *Vaccinium australe* (family Ericaceae), prized for its sweet edible fruits, which provide a source of vitamin C and iron. Blueberries are eaten fresh, often with cream, as a dessert fruit, or baked in a variety of pastries.

Blueberry

Grant Heilman—EB Inc.

Blueberries grow only in highly acidic and well-drained but moist soils. About 36,000 acres (14,500 hectares) of the high-bush blueberry are cultivated, primarily in Maine, New Jersey, southwestern Michigan, and eastern North Carolina. See also bilberry.

bluebill (duck): see scaup.

bluebird, any of the three species of the North American genus *Sialia* of the chat-thrush

Western bluebird (*Sialia mexicana*)

Herbert Clerke

group (family Turdidae, order Passeriformes). The eastern bluebird (*S. sialis*), 14 cm (5½ inches) long, and the western bluebird (*S. mexicana*) are red-breasted forms found east and west of the Rockies, respectively; the mountain bluebird (*S. curruoides*), also of the west, is all blue. Bluebirds arrive from the south in earliest spring, uttering soft, blurry notes. They live in open country and woodland glades; they nest in holes in trees or in fenceposts—and in bird boxes, if they are not driven away by starlings or house sparrows.

bluebonnet, any of several flowering plants, including the Texas bluebonnet (*Lupinus sub-carnosus*), a North American annual plant of the pea family (Fabaceae), native to the plains of Texas. It grows about 0.3 m (1 foot) tall, has silky-haired leaves composed of five leaflets, and bears clusters of purplish-blue flowers that are marked in the centre with white or yellow. In the spring the plants cover immense areas in southern and western Texas like a blue carpet. The bluebonnet is one of the most popular wildflowers of Texas.

In Scotland the name bluebonnet is given to the bluebottle (*Centaurea cyanus*) and also to the blue scabious, or devil's bit (*Succisa pratensis*).

bluebuck: see nilgai.

bluecap, species of fairy wren (*q.v.*).

Bluefield, city, Mercer county, extreme southern tip of West Virginia, U.S., lying in the Blue Ridge Mountains. It is adjacent to the town of Bluefield in Tazewell county, Virginia. Situated at the foot of East River Mountain (3,480 feet [1,061 m]), it is one of the highest cities (elevation 2,612 feet [796 m]) in the United States east of the Rocky Mountains. First settled in 1777, Bluefield took its name from the bluish chicory plants and bluegrass of the region. The nearby Pocahontas Coal Field brought an influx of miners to the area, and in 1889 the Norfolk and Western Railway established yards, shops, and a division point in the town. The railroad and coal are still the economic mainstays. Other assets include iron, limestone, silica, and lumber. Bluefield State College was founded in 1895, and Bluefield College (1922) is in Bluefield, Va. Inc. city, 1889. Pop. (1990) 12,756.

Bluefields, city, eastern Nicaragua, just south of the mouth of the Escondido River and inland from its outer port of El Bluff. Named after the Dutch pirate Blewfeldt, who used it as a base in the 17th century, it was the capital of the British Mosquito Coast protectorate until returned to Nicaragua in 1850. U.S. Marines were stationed there (1912–25; 1927–32) at the request of the Nicaraguan president to quell revolutionary activity. The town's populace, long-accustomed to limited local autonomy, rioted against Sandinista military control in the early 1980s.

Bluefields is the nation's most important Caribbean port, handling mainly cabinet woods, frozen fish, shrimp, lobsters, and bananas. The city is also a commercial centre and has some light manufacturing. The Escondido is navigable for 60 miles (100 km) inland; from the river port of Rama a road leads westward over the central highlands to Managua, the national capital. Bluefields is also served by a domestic airline. Pop. (1985 est.) 17,721.

bluefish, also called TAILORS, or SNAPPER (*Pomatomus saltatrix*), swift-moving marine food and game fish, the only member of the family Pomatomidae (order Perciformes). The bluefish ranges through warm and tropical regions of the Atlantic and Indian oceans, living in schools and preying with voracity on other, smaller animals, especially fishes. Elongated in form, it has two dorsal fins, a forked tail, and a large mouth with strong, pointed teeth. It is blue or greenish and grows to a length of

Bluefish (*Pomatomus saltatrix*)

Painting by Richard Ellis

about 1.2 m (4 feet) and weight of 11.5 kg (25 pounds).

bluegill (*Lepomis macrochirus*), popular game fish in the sunfish family, Centrarchidae (order Perciformes). It is one of the best-known sunfishes throughout its original range in the freshwater habitats of the central and southern United States. Bluegills have been introduced into numerous freshwater habitats throughout the western United States as well as in other parts of the world. Bluegills are also regionally known as blue sunfish, bluegill sunfish, copperheads, copperbellies, and bluegill bream.

Bluegills are one of the smallest popular food and game fishes, normally reaching lengths of only 15–23 cm (6–9 inches) and usually weighing less than 0.25 kg (0.5 pound). A dark spot at the rear of the dorsal fin and a dark flap at the rear of the gill cover are characteristic. The body colour of bluegills is variable but is basically bluish or greenish. Despite their small size, bluegills are highly spirited fighters when on the end of a fishing line and are among the most popular hook-and-line-caught fishes in North America. They are frequently stocked in small farm ponds.

bluegrass, in botany, any of many lawn, pasture, and forage grasses of the genus *Poa* (family Poaceae). About 250 species are found in temperate and cool climates. They are slender annuals and perennials, usually with small spikelets lacking bristles and arranged in open clusters. The narrow leaf blades have boat-shaped tips.

Of the more than 50 species found in the United States, Kentucky bluegrass (*P. pratensis*) is the best-known. It was introduced from Eurasia and is a popular lawn and pasture grass in the northern states and is common in open areas and along roadsides. It is 30 to 100 cm (12 to 40 inches) tall, with soft, blue-green leaves; its creeping rootstalks form a good sod. Canada bluegrass (*P. compressa*), native to Europe and now common in North America, is a wiry plant with flat stems, sim-

Kentucky bluegrass (*Poa pratensis*)

J.W. Wilburn

ilar to Kentucky bluegrass in appearance and use. Texas bluegrass (*P. arachnifera*), mutton grass (*P. fendleriana*), and plains bluegrass (*P. arida*) are important western forage grasses. Annual bluegrass (*P. annua*), a small, light-green species, is a European introduction that has spread throughout North America; it is considered a pest in lawns.

bluegrass, in music, country and western style that emerged in the United States after World War II, a direct descendant of the old-time string-band music that had been widely played and recorded by such groups as the Carter Family from the late 1920s. Bluegrass is distinguished from the older string-band music by its more syncopated (off-beat) rhythm, its relatively high-pitched tenor (lead) vocals, tight harmonies, and a strong influence of jazz and blues. It differs from other varieties of country and western music in its driving rhythms and its repertory, as well as in the very prominent place given to the banjo, always played in the three-finger Scruggs style, which is unique to bluegrass. Mandolin and fiddle are generally featured considerably more in bluegrass than in other country and western music, and traditional square-dance tunes, traditional religious songs, and ballads furnish a much larger part of the repertory.

The bluegrass style was originated by Bill Monroe, who by the mid-1940s had experimented considerably with new methods of presenting string-band music. He began to evolve a highly distinctive mandolin style while playing with his brothers Birch and Charlie; and after their group broke up, he formed his own group, the Blue Grass Boys. The band already showed many of the distinctive features of modern bluegrass when in 1945 Earl Scruggs, originator of the revolutionary aforementioned banjo technique, joined it. The bluegrass style emerged fully in the years 1945–48, and by the late 1940s a number of bands were playing the music; the most successful were usually led by musicians who had at one time or another played with the Blue Grass Boys and learned the style directly from Monroe.

Bluegrass moved from performances on the radio in small Southern communities in the 1940s to television and "hillbilly" bars in the 1950s, to college concerts, coffeehouses, and folk festivals in the 1960s; and in the 1970s the influx of younger musicians interested in bluegrass brought some influence from rock music.

blueprint, a type of print used for copying engineering drawings and similar material. The name is popularly applied to two separate methods, more exactly designated as the blueprint and the whiteprint, or diazotype. In blueprinting, the older method, the drawing to be copied, made on translucent tracing cloth or paper, is placed in contact with paper sensitized with a mixture of ferric ammonium citrate and potassium ferricyanide, which is then exposed to light. In the areas of the sensitized paper not obscured by the lines of the drawing, the light reduces the ferric salt to the ferrous state, in which it reacts with the potassium ferricyanide to form insoluble prussian blue. The exposed paper is then washed in water, producing a negative in which the lines of the drawing appear in white against a dark blue background.

In the whiteprinting method, the paper is sensitized with a mixture of a diazonium salt, a coupler that reacts with the diazonium salt to form an azo dye, and an acid that prevents coupling. Exposure to light destroys the diazonium salt. Final treatment with an alkaline agent, such as ammonia gas, neutralizes the acid, thereby bringing about the coupling reaction. Because it produces dark lines on

a "white" or light background, whiteprinting has become the favoured method.

blues, secular folk music of African American origin. From its obscure beginning among Southern blacks in the early 20th century, the blues' simple but expressive forms had become by the 1960s one of the most important influences on the development of popular music in the United States.

As a musical style the blues are characterized by expressive pitch inflections (blue notes), a three-line textual stanza of the form AAB, and a 12-measure form. Typically the first two and a half measures of each line are devoted to singing, the last measure and a half consisting of an instrumental "break" that repeats, answers, or complements the vocal line.

African influences are apparent in the blues tonality; the call and response pattern of the repeated refrain structure of the blues stanza; the falsetto break in the vocal style; and the imitation of vocal idioms by instruments, especially the guitar and harmonica.

Although instrumental accompaniment is almost universal in the blues, the blues are essentially vocal. Blues songs are lyrical rather than narrative; the singer expresses his feelings rather than tells a story. The emotion expressed is generally one of sadness or melancholy, often due to problems in love. To express this musically, blues performers use vocal techniques such as melisma and syncopation and instrumental techniques such as "choking" or bending guitar strings on the neck or applying a metal slide or bottleneck to the guitar strings to create a whining, voice-like sound.

The origins of the blues are poorly documented. Blues developed in the southern United States after the American Civil War. It was influenced by work songs and field hollers, minstrel-show music, ragtime, church music, and the folk and popular music of whites. Blues derived from and was largely played by southern black men, most of whom came from the milieu of agricultural workers. The earliest references to blues date back to the 1890s and early 1900s. In 1912 black bandleader W.C. Handy's composition "Memphis Blues" was published. It became very popular, and thereafter many other Tin Pan Alley songs entitled blues began to appear.

The rural blues developed in three principal regions, Georgia and the Carolinas, Texas, and Mississippi. The blues of Georgia and the Carolinas are noted for their clarity of enunciation and regularity of rhythm. Influenced by ragtime and white folk music, they are more melodic than the Texas and Mississippi styles. Blind Willie McTell and Blind Boy Fuller were representative of this style. The Texas blues are characterized by high, clear singing accompanied by supple guitar lines that consist typically of single-string picked arpeggios rather than strummed chords. Blind Lemon Jefferson (*q.v.*) was by far the most influential Texas bluesman. Mississippi Delta blues are the most intense of the three styles and have been the most influential. Vocally they are the most speech-like, and the guitar accompaniment is rhythmic and percussive; a slide or bottleneck is often used. The Mississippi style is represented by Charley Patton, Willie Brown, Eddie "Son" House, Robert Johnson (*q.v.*), and Johnny Shines.

The first blues recordings were made in the 1920s by black women such as Mamie Smith, Ma Rainey (*q.v.*), Ida Cox, and Bessie Smith (*q.v.*). These performers were primarily stage singers backed by jazz bands; their style is known as classic blues.

The Great Depression and the world wars caused the geographic dispersal of the blues as millions of blacks left the South for the cities

of the North. The blues became adapted to the more sophisticated urban environment. Lyrics took up urban themes, and the blues ensemble developed as the solo bluesman was joined by a pianist or harmonica player and then by a rhythm section consisting of bass and drums. The electric guitar and the amplified harmonica created a driving sound of great rhythmic and emotional intensity.

Among the cities in which the blues initially took root were Atlanta, Memphis, and St. Louis. John Lee Hooker settled in Detroit, and on the West Coast Aaron "T-Bone" Walker developed a style later adopted by Riley "B.B." King. It was Chicago, however, that played the greatest role in the development of urban blues. In the 1920s and 1930s Memphis Minnie, Tampa Red, Big Bill Broonzy, and John Lee "Sonny Boy" Williamson were popular Chicago performers. After World War II they were supplanted by a new generation of bluesmen that included Muddy Waters (*q.v.*), Chester Arthur Burnett (Howlin' Wolf), Elmore James, Little Walter Jacobs, and Otis Spann.

The blues have influenced many other musical styles. Blues and jazz are closely related; such seminal jazzmen as Jelly Roll Morton and Louis Armstrong employed blues elements in their music. Soul music and rhythm and blues also show obvious blues tonalities and forms. The blues have had their greatest influence on rock music. Early rock singers such as Elvis Presley often used blues material. British rock musicians in the 1960s, especially the Rolling Stones, Eric Clapton, and John Mayall, were strongly influenced by the blues, as were such American rock musicians as Mike Bloomfield, Paul Butterfield, and the Allman Brothers Band.

BIBLIOGRAPHY. Works of history and criticism include Samuel B. Charters, *The Country Blues* (1959, reprinted 1975); Paul Oliver, *Screening the Blues* (also published as *Aspects of the Blues Tradition*, 1968, reprinted 1989), and *The Story of the Blues* (1969, reissued 1998); Giles Oakley, *The Devil's Music*, rev. ed. (1983); and Lawrence Cohn et al., *Nothing but the Blues: The Music and the Musicians* (1993, reissued 1999). Paul Oliver, *Blues Fell This Morning: Meaning in the Blues*, 2nd ed. (1990), studies the historical context of blues lyrics.

bluestem, also called BEARD GRASS, any of the approximately 200 species of perennial, sometimes tufted grasses in the genus *Andro-*

Big bluestem (*Andropogon gerardii*)

Louise K. Broman from Root Resources—EB Inc.

pogon (family Poaceae), distributed throughout the temperate and tropical zones. The

coarse plants have flat or folded leaf blades, solid or pithy stems, and flower spikelets clustered at the stem tips or in the leaf axils. The stems are often hairy, sometimes reddish or greenish in appearance. Several species have underground stems.

Big bluestem (*A. gerardii*), often more than 2 metres (6½ feet) tall, is the characteristic plant species of the North American tall-grass prairie. Little bluestem (*A. scoparius*), 0.5 to 1.5 m tall, is found in drier prairie areas. Both species are good hay and pasture plants. Sand bluestem (*A. hallii*), with yellowish spikelets, grows on sand hills in the central and western United States. Broom sedge (*A. virginicus*) and bushy beard grass (*A. glomeratus*) are coarse grasses, unsuitable for forage, that grow in poor soils in eastern and southern North America. Silver beard grass (*A. saccharoides*), 0.6 to 1.3 m tall, has silvery white flower clusters 7 to 15 centimetres long; it is a forage grass in the southwestern United States.

Bluestocking, any of a group of women who in mid-18th-century England held "conversations" to which they invited men of letters and members of the aristocracy with literary interests. The word has come to be applied derisively to a woman who affects literary or learned interests. The Bluestockings attempted to replace social evenings spent playing cards with something more intellectual. The term probably originated when one of the ladies, Mrs. Vesey, invited the learned Benjamin Stillingfleet to one of her parties; he declined because he lacked appropriate dress, whereupon she told him to come "in his blue stockings"—the ordinary worsted stockings he was wearing at the time. He did so, and Bluestocking (or Bas Bleu) society became a nickname for the group. This anecdote was later recounted by Madame d'Arblay (the diarist and novelist better known as Fanny Burney), one of the most famous of the Bluestockings.

The group was never a society in any formal sense. Mrs. Vesey seems to have given the first party, in Bath. After she moved to London, a rivalry developed with Mrs. Elizabeth Montagu, who became the leader of the literary ladies. Others included Mrs. Hester Chapone, Mrs. Elizabeth Carter, Miss Mary Monckton, and Miss Hannah More, whose poem "The Bas Bleu, or Conversation," supplies valuable inside information about them. Guests included Dr. Johnson, David Garrick, the earl of Bath, Lord Lytton, and Horace Walpole (who called them "peticoteries"). For additional information, W.S. Scott's *The Bluestocking Ladies* (1947) is of interest.

bluethroat (*Erithacus svecicus* or *Luscinia svecica*), Eurasian chat-thrush of the thrush

Bluethroat (*Erithacus svecicus*)

family, Turdidae (order Passeriformes). The bluethroat is about 14 centimetres (5½ inches) long and has a bright blue throat, incorporating a crescentic spot of red or white, depending on the subspecies. Found from western Europe eastward to western Alaska, the bluethroat is essentially a bird of damp thickets in mountains, but in western Europe it occurs in lowlands also. It has a rich, varied, warbling song.

Bluford, Guion S(tewart), Jr. (b. Nov. 22, 1942, Philadelphia, Pa., U.S.), astronaut who was the first African American launched into space.

Bluford received an undergraduate degree in aerospace engineering from Pennsylvania State University in 1964 and was commissioned as an officer in the U.S. Air Force, where he trained as a fighter pilot. He flew 144 combat missions during the Vietnam War. In 1978 he earned a doctorate in aerospace engineering from the Air Force Institute of Technology.

Bluford was one of 35 individuals selected in 1978 from 10,000 applicants in NASA's first competition to become space shuttle astronauts. On Aug. 30, 1983, he rode into Earth orbit on the shuttle orbiter *Challenger*; he subsequently flew on three additional shuttle missions between 1985 and 1992. Bluford served as a mission specialist on all four flights, with responsibility for a variety of in-orbit tasks, including the deployment of an Indian communications satellite as well as the operation and deployment of scientific and classified military experiments and payloads.

In 1987 Bluford received a graduate degree in business administration from the University of Houston, Clear Lake. He left NASA in 1993 for a private-sector career in the information technology and engineering services field.

Blum, Léon (b. April 9, 1872, Paris—d. March 30, 1950, Jouy-en-Josas, France), the first Socialist (and the first Jewish) premier of France, presiding over the Popular Front coalition government in 1936–37.

Blum was born in an Alsatian Jewish family. Educated at the École Normale Supérieure, he proceeded to study law at the Sorbonne, graduating in 1894 with the highest honours,

Blum

By courtesy of the Bibliothèque Nationale, Paris

and thereafter he made his name as a brilliant literary and dramatic critic. The Dreyfus affair brought him into active politics on the side of the republican Dreyfusards, and his close association with Jean Jaurès, whom he greatly admired, eventually led to his joining Jaurès's French Socialist Party in 1904.

Blum was first elected to the Chamber of Deputies in 1919. His first task was to reconstruct the Socialist Party after the split of December 1920, when the Communist section of it won a majority at the party's Congress of Tours and so inherited the party machinery, funds, and press. Blum ranks in history as the maker of the modern French Socialist Party and of its chief journal, *Le Populaire*. He led the opposition to the governments of Alexan-

dre Millerand and Raymond Poincaré and in 1924 supported Edouard Herriot's Cartel des Gauches (Radical coalition), though refusing to participate in the ministries of Herriot and Aristide Briand. In the elections of 1928 the Socialist Party won 104 seats in the Chamber of Deputies, but Blum himself was defeated. A year later he was returned for Narbonne, which also returned him in 1932 and again in 1936.

After the right-wing demonstrations in Paris of February 1934, Blum worked for solidarity between Socialists, Radicals, and all other opponents of Fascism. In 1932 he had developed a Socialist program of pacifism, nationalization of French industry, and measures against unemployment. These efforts contributed to the formation of the electoral alliance of the left known as the Popular Front which, in the elections of April and May 1936, won a large majority in the Chamber. Blum, its chief architect, became premier as leader of the Popular Front government of June 1936. He was the first Socialist and the first Jew to become premier of France. His government introduced, against considerable opposition, the 40-hour workweek and secured paid vacations and collective bargaining for many workers; it nationalized the chief war industries and the Bank of France, and carried other social reforms. Its most intractable problem was national defense against the growing power of the Rome-Berlin axis, and its policy of "nonintervention" in the Spanish Civil War was denounced as appeasement. Blum's plans to establish effective state controls over private industry and finance aroused bitter hostility among French business leaders, who refused to cooperate with his government, and it was at this time that sections of the right wing adopted the ominous slogan, "Better Hitler than Blum."

In June 1937 Blum resigned after the conservative majority in the Senate refused to grant him emergency decree powers to tackle the country's financial difficulties. Modified Popular Front governments were formed by Camille Chautemps, in which Blum served as vice-premier, and by Blum again in March 1938. He refused office under his successor, Edouard Daladier. In October 1940, after the French collapse in World War II, Blum was indicted by the Vichy government on charges of war guilt, and in February 1942 was brought to trial at the court of Riom. The powerful defense put up by Blum and his co-defendants so greatly discomfited the Vichy authorities and so irritated the Germans that in April the hearings were suspended indefinitely, and Blum was returned to prison. He was freed by U.S. forces from a German concentration camp in May 1945.

After the liberation of France, Blum emerged as one of France's leading veteran statesmen, and in the spring of 1946 he negotiated a U.S. loan to France of \$1,370,000,000 for postwar reconstruction. In December 1946 he formed a month-long "caretaker government," the first all-Socialist French ministry, pending the election of the first president of the new Fourth Republic. Blum retired from public life in January 1947, but served as vice-premier in André Marie's ministry of August 1948. He lived in retirement thereafter at his estate at Jouy-en-Josas.

Blumberg, Baruch S(amuël) (b. July 28, 1925, New York City), American research physician whose discovery of an antigen that provokes antibody response against hepatitis B led to the development by other researchers of a successful vaccine against the disease. He shared the Nobel Prize in Physiology or Medicine in 1976 with D. Carleton Gajdusek for their work on the origins and spread of infectious viral diseases.

Blumberg received his M.D. degree from Columbia University's College of Physicians and

Surgeons and his Ph.D. degree in biochemistry from Oxford University in 1957. In 1960 he became chief of the Geographic Medicine and Genetics Section of the U.S. National Institutes for Health, in Maryland. In 1964 he was appointed associate director for clinical research at the Institute for Cancer Research, Philadelphia, and he served as professor of medicine, human genetics, and anthropology at the University of Pennsylvania during the 1960s and '70s.

In the early 1960s Blumberg was examining blood samples from widely diverse populations in an attempt to determine why the members of different ethnic and national groups vary widely in their responses and susceptibility to disease. In 1963 he discovered in the blood serum of an Australian aborigine an antigen that he later (1967) determined to be part of a virus that causes hepatitis B, the most severe form of hepatitis. The discovery of this so-called Australian antigen, which causes the body to produce antibody responses to the virus, made it possible to screen blood donors for possible hepatitis B transmission. Further research indicated that the body's development of antibody against the Australian antigen was protective against further infection with the virus itself. In 1982 a safe and effective vaccine utilizing Australian antigen was made commercially available in the U.S.

Blumenau, city, eastern Santa Catarina state, southern Brazil, on the Rio Itajaí, at 46 ft (14 m) above sea level. It was founded in 1852 by

Blumenau on the Rio Itajaí, Brazil

Ernst Jahn

German colonists. The city's economy is based on the manufacture of textiles (especially towels) from cotton grown in the hinterland. The Universidade Regional de Blumenau (1968) is located in the city. Roads and air service link Blumenau with Florianópolis, the state capital. It can also be reached by riverboat, train, or automobile from Itajaí, a port at the mouth of the Rio Itajaí. Pop. (2005 est.) 270,800.

Blumenbach, Johann Friedrich (b. May 11, 1752, Gotha, Ger.—d. Jan. 22, 1840, Göttingen), German physiologist and comparative anatomist, frequently called the father

Blumenbach, detail of a lithograph, 1892

Bavana-Verlag

of physical anthropology, who proposed one of the earliest classifications of the races of mankind.

He joined the faculty of the University of Göttingen in 1776, publishing *Institutiones Physiologicae* (1787; *Institutes of Physiology*) and a handbook of comparative anatomy and physiology (1824). Blumenbach was the first to show the value of comparative anatomy in the study of man's history. His research in the measurement of craniums led him to divide mankind into five great families—Caucasian, Mongolian, Malayan, Ethiopian, and American. His most important anthropological work was a collection of 60 human craniums described in his *Collectionis suae Craniorum Diversarum Gentium Illustratae Decades* (1790–1828; "Illustrated Parts of His Collection of Craniums of Various Races").

Articles are alphabetized word by word,

Blumenthal, Leonhard, Graf von (count of) (b. July 30, 1810, Schwedt an der Oder, Brandenburg—d. Dec. 22, 1900, Quellendorf, Anhalt, Ger.), Prussian field marshal active in the wars that founded the German Empire.

He entered the guards as second lieutenant in 1827 and took part in 1848 in the suppression of the Berlin riots. In 1849 he served on the staff of General von Bonin in the Schleswig-Holstein campaign and so distinguished himself, particularly at Fredericia, that he was appointed chief of staff of the Schleswig-Holstein army. In 1858 he was appointed personal adjutant to Prince Frederick Charles. He was chief of staff of the 3rd army corps in 1864 when, on the outbreak of the Danish War of 1864, he was made chief of the general staff of the army against Denmark and distinguished himself at Düppel and the passage to Alsen Island.

In the Seven Weeks' War with Austria in 1866 Blumenthal was chief of the general staff to the crown prince of Prussia, commanding the 2nd army. From 1866 to 1870 he commanded the 14th division at Düsseldorf. In the Franco-German War of 1870–71 he was chief of staff of the 3rd army under Crown Prince Frederick William, whose victories owed much to Blumenthal's bold decisions. In 1873 he became a general of infantry, and 10 years later he was made a count. In 1888 he was made a general field marshal.

blunderbuss, short, muzzle-loading shoulder weapon, usually a flintlock, with a wide smooth bore flared at the muzzle to a maxi-

Flintlock blunderbuss
Brown Brothers

mum width of about 4 inches (10 centimetres). The flaring was intended to scatter the shot at very close range, an effect that later scientific experiments showed did not occur. The blunderbuss, forerunner of the shotgun, was common in the 18th century, though in use somewhat earlier and later.

Blundeville, Ranulf de, Ranulf also spelled RANDULF, or RALPH: see Chester, Ranulf de Blundeville, 6th earl of.

Blunt, Anthony (Frederick), also called (1956–79) SIR ANTHONY BLUNT (b. Sept. 26, 1907, Bournemouth, Hampshire, Eng.—d.

March 26, 1983, London), British art historian who late in his life was revealed to have been a Soviet spy.

While a fellow of Trinity College, Cambridge, in the 1930s Blunt became a member of a circle of disaffected young men led by Guy Burgess (*q.v.*), under whose influence he was soon involved in espionage on behalf of the Soviet Union. His public career was brilliant. From 1937 he published scores of scholarly papers and books by which he largely established art history in Great Britain. He was an authority on 17th-century painting, particularly that of Nicolas Poussin. During World War II he served in MI-5, a military intelligence organization, and was able to supply secret information to the Soviets and, more importantly, to give warning to fellow agents of counterintelligence operations that might endanger them.

In 1945 Blunt was appointed surveyor of the king's (later the queen's) pictures, and in 1947 he became director of the Courtauld Institute, one of the world's leading centres of training and research in art history. His major publications in subsequent years included *Art and Architecture in France 1500–1700* (1953) and *Nicolas Poussin* (1966–67). Although his active intelligence work had apparently ceased in 1945, he maintained contacts with Soviet agents and in 1951 was able to arrange for the escape of Burgess and Donald Maclean from Britain. In 1964, after the defection of Kim Philby (*q.v.*), he was confronted by British authorities and secretly confessed his Soviet connections. Not until 1979, seven years after he retired from his posts, was his past made public. In the outcry that surrounded his being revealed as the long-sought "fourth man" in the spy ring he was stripped of the knighthood that had been awarded him in 1956.

Blunt, Edward: see Blount, Edward.

Blunt, Wilfrid Scawen (b. Aug. 17, 1840, Petworth House, Sussex, Eng.—d. Sept. 12, 1922, Newbuildings, Sussex), English poet best known for his expression of anti-imperialism based on sympathy for small or oppressed nations.

He entered the diplomatic service in 1858 but retired on his marriage with Lady Anne Noel in 1869. Later he established a famous stud for the breeding of Arabian horses and with his wife travelled frequently in North Africa, Asia Minor, and Arabia, seeking horses.

Blunt became known as an ardent sympathizer with Muslim aspirations, and in *The Future of Islam* (1882) he directed attention to the forces that produced the movements of Pan-Islamism and Mahdism. He was a violent opponent of British policy in the Sudan and supported the national party in Egypt.

Ideas About India (1885) was the result of two visits to that country, which confirmed his distrust of colonialism as exploitation. His best-known volume of verse, *Love Sonnets of Proteus* (1880), reveals his real merits as an emotional poet. Blunt published a complete edition of his poetical works in 1914 and two volumes of *My Diaries* (1919 and 1920).

Bluntschli, Johann Kaspar (b. March 7, 1808, Zürich—d. Oct. 21, 1881, Karlsruhe, Ger.), writer on international law, whose book *Das moderne Kriegsrecht* (1866; "The Modern Law of War") was the basis of the codification of the laws of war that were enacted at the

Hague conferences of 1899 and 1907. Bluntschli studied law at Zürich, Berlin, and Bonn and taught at Zürich, Munich (from

Bluntschli, engraving by C.H. Merz after a drawing by Wilhelm von Kaulbach

By courtesy of the Bibliotheque Nationale Suisse, Bern

1848), and Heidelberg (from 1861). In 1873 he helped to found the Institute of International Law.

Das moderne Kriegsrecht was largely taken from the code prepared by Francis Lieber (1863) for the Federal Army in the U.S. Civil War. Bluntschli's next major work, *Das moderne Völkerrecht* (1868; "Modern International Law"), presented an apparently comprehensive code that was translated into several languages and became a widely used reference book for diplomats. *Lehre vom modernen Staat*, 3 vol. (1875–76; "Lessons of the Modern State"), which was translated into English and French, is considered by some to be his finest work.

Bly, Nellie, pseudonym of ELIZABETH COCHRANE (b. May 5, 1867, Cochran's Mills, Pa., U.S.—d. Jan. 27, 1922, New York City), U.S. newspaper writer whose around-the-world race against a theoretical record made the name celebrated and a synonym for the feminine star reporter.

She obtained a job at 18 as feature writer on *The Pittsburgh Dispatch*, whose managing editor suggested her pen name from a song by Stephen Foster. There she did a series of articles on such subjects as divorce, slum life, and conditions in Mexico. She was employed by the *New York World* in 1887. Feigning insanity to get into the asylum on Blackwell's Island, she wrote an exposé that brought about needed reforms. Later she exposed tenement conditions, the techniques of "mashers," the Albany lobby, and the like.

On Nov. 14, 1889, she sailed from New York to beat the record of Phileas Fogg, hero of Jules Verne's romance *Around the World in Eighty Days*. The *World* built up the story by daily articles and a guessing contest in which whoever came nearest to naming Nellie's time in circling the globe would get a trip to Europe. There were nearly 1,000,000 entries in the contest. Nellie rode on ships and trains, in jinrikishas and sampans, on horses and burros. On the final lap of her journey the *World*

Nellie Bly, 1890

By courtesy of the New-York Historical Society

brought her from San Francisco to New York by special train; she was greeted everywhere by brass bands, fireworks, and like panoply. Her time was 72 days, 6 hours, 11 minutes, and 14 seconds.

She married the millionaire Robert Seaman in 1895; but after his death she suffered financial reverses and returned to newspaper work on *The New York Journal* in 1920.

Blyth Valley, district (borough), county of Northumberland, England, on the North Sea coast northeast of Newcastle upon Tyne. The district has an area of 27 square miles (70 square km).

The town of Blyth was an early centre of the salt industry, is now an exporting port for the declining Northumberland coalfield, and has shipbuilding and ship repairing.

Seaton Delaval, the regional administrative centre, had strong links with the landowning Delaval family, for whom the classical-style Seaton Delaval Hall was built (1720–29). Pop. (1988 est.) 78,500.

Blytheville, city, northern seat of Mississippi county (the southern seat is Osceola), northeast Arkansas, U.S., in the Mississippi Valley. Laid out in 1880 by Henry T. Blythe, a Methodist minister, it had a lumber-oriented economy until the local alluvial soil, devoid of timber, was drained for crops. Blytheville annexed Chickasawba (1907) and developed as the service centre for a productive cotton area that also supports soybeans and wheat. Light industrialization followed. The population increased after 1962, when Blytheville Air Force Base (Strategic Air Command) was included within the city limits. The Mississippi County Community College (1974) is in Blytheville. Big Lake National Wildlife Refuge is 12 miles (19 km) west. Inc. town, 1891; city, 1915. Pop. (1990) 22,906.

Blytt-Sernander system, chronology of bog peat deposits in Scandinavia worked out by the 19th-century Swedish geologist Axel Blytt and later modified by the 20th-century Swedish botanist Johan Rutger Sernander; the Blytt-Sernander system divides the Holocene Epoch, roughly the last 10,000 years of Earth history, into smaller units. These units are based upon the sequence of plant fossils, such as remains of twigs and leaves, found preserved in bogs. The fossil sequence represents the climatic changes that have occurred since the prominent continental glaciers retreated about 10,000 years ago. Later studies have modified the Blytt-Sernander system and incorporated the results of studies on fossil pollen. To a large extent, the Blytt-Sernander system has been confirmed by these later studies as valid. Although first worked out for northern Europe, the Blytt-Sernander system has been applied to sequences throughout the world with modifications.

BMR: see basal metabolic rate.

BMW: see Bayerische Motoren Werke AG.

B'nai B'rith (Hebrew: "Sons of the Covenant"), oldest and largest Jewish service organization in the world, with men's lodges, women's chapters, and youth chapters in countries all over the world.

B'nai B'rith, founded in New York City in 1843, defends human rights, promotes intercultural relations, provides for the religious and cultural needs of Jewish college students (especially through the Hillel Foundation), sponsors Jewish education among adults and youth groups, supports hospitals and philanthropic institutions, provides vocational guidance, sponsors Jewish education among adults and youth groups, supports hospitals and philanthropic institutions, provides vocational guidance, sponsors welfare projects in Israel, assists victims of natural disasters, and carries on a broad program of community service and welfare. It confers with government leaders on such issues as civil rights, immigration, abuses of freedom by totalitarian states, the position of Israel, and problems affecting Jews

throughout the world. In 1913 it established the Anti-Defamation League. B'nai B'rith is represented at the United Nations through its membership in the Coordinating Board of Jewish Organizations.

The order is headed by a president elected at triennial meetings of the supreme lodge (made up of representatives of district grand lodges), a board of governors, and an administrative committee.

In 1990 B'nai B'rith International voted to admit women as full members; a self-governing, affiliated organization—B'nai B'rith Women—desiring to remain concerned with women's issues continued its independent status.

BND, abbreviation of **BUNDESNACHRICHTEN-DIENST** (German: "Federal Intelligence Service"), foreign intelligence agency of the West German government. Created in April 1956, it absorbed the "Gehlen Organization," a covert intelligence force which was created by Major General Reinhard Gehlen after World War II and which cooperated with U.S. intelligence agencies. Gehlen had headed the Foreign Armies East section of the *Abwehr*, the intelligence service of the German general staff. He directed the BND until 1968, when he was succeeded by General Gerhard Wessel, a noted specialist on Soviet affairs and organizations. The BND reported to the West German chancellor. Its divisions were concerned with subversion, counterintelligence, and foreign intelligence, and it was headquartered at Munich, W.Ger. In addition to foreign intelligence the BND engaged in communications intelligence and exchanged information with the intelligence services of NATO and other friendly countries.

Bo, town, south-central Sierra Leone, western Africa. Located near the intersection of roads from Freetown and Makeni, it became the largest town (and for a time capital, 1930–61) of the Sierra Leone Protectorate. The commercial hub of the interior, it trades in palm oil and kernels, ginger, coffee, cocoa, and rice, which are transported mainly by road to Freetown (108 miles [174 km] west-northwest). Bo has been the educational centre of the interior since the opening in 1906 of a secondary school for the sons of Mende and other chiefdoms; it now has government, Christian, and Muslim schools, a main library, and teacher-training colleges. Several periodicals are published locally. Bo also has the largest government hospital outside Freetown. Pop. (1985 prelim.) 56,797.

Bo Hai (China): see Po Hai.

Bo Juyi (Chinese poet): see Po Chū-i.

Bo tree, also called **BODHI TREE**, according to Buddhist tradition, the pipal (species *Ficus religiosa*) under which the Buddha sat when he attained enlightenment (bodhi) at Bodh Gayā (near Gayā, west-central Bihār state, India). In early Buddhist art the Bo tree was often used as an aniconic symbol of the Buddha.

Bo tree shrine worship, stone relief from Bhārhut, c. 2nd century BC; in the Indian Museum, Calcutta
Pramod Chandra

A living pipal at Anuradhapura, Ceylon (now Sri Lanka), is said to have grown from a cutting from the Bo tree sent to that city by King Aśoka in the 3rd century BC. See also *Ficus*.

boa, any of about 60 species in more than a dozen genera of snakes comprising the subfamily Boinae of the family Boidae. Boas occur in both the Old and New World, chiefly in warm regions. They vary in length from about 20 cm (8 inches) to perhaps more than 7.6 m (25 feet) and have stout bodies and rather short tails. Most are terrestrial or semi-

Emerald tree boa (*Corallus caninus*)

Tierbilder Okapia Frankfurt am Main

aquatic; some are arboreal. Most have disruptive patterns—blotches and diamonds—on their brown, green, or yellowish bodies. The young are born alive in the majority of the species, not in eggs. Boas bite their prey, then kill by constricting; a number have heat-sensitive lip pits for detecting warm-blooded prey. Folklore to the contrary, boas are not dangerous to humans.

The boa constrictor (species *Boa constrictor*) occupies a variety of habitats from coastal northern Mexico and the Lesser Antilles to Argentina. (In popular usage any large snake of this kind is likely to be called a boa constrictor.) It is seldom more than 3.3 m (11 feet) long; the record is 5.55 m (18.2 feet).

Several boas are arboreal and long-toothed for catching birds. An example is the 1.8-metre (6-foot) emerald tree boa (*Corallus caninus*) of tropical South America; the adult is green above, with white dorsal stripe and crossbars, and yellow below. The rainbow boa (*Epicrates cenchria*) of Costa Rica to Argentina is not strongly patterned but is markedly iridescent. The brown, 45-centimetre (18-inch) rubber boa (*Charina bottae*) of western North America is the most northerly boa and is a burrowing species that looks and feels rubbery. The 90-centimetre (35-inch) rosy boa (*Lichanura trivirgata*), ranging from southern California and Arizona into Mexico, usually is brown or pink-striped.

The 10 species of sand boas (*Eryx*) of northern Africa to India and central Asia are burrowers in drylands. Often called wood snakes and separated as the subfamily Tropidophinae are the two species of *Trachyboa* of South America and more than 10 species of *Tropidophis*, chiefly of the West Indies. See also anaconda.

Boa Vista, city, capital of Roraima estado ("state"), northwestern Brazil, situated on the west bank of the Branco River, a tributary of the Negro River. Boa Vista was given city status in 1926 and was made the capital in 1943, when the territory (from 1990, state) was created. The city and its municipality are potentially rich, but they are isolated. Diamonds, gold, bauxite, and cassiterite are mined in the area; income is also derived from forest and animal products. Manufactures include petroleum and alcohol fuels made from sug-

arcane and cassava, metallurgical products, and construction materials. A thermal-electric plant serves the city, and an antenna was installed in 1975 for satellite telephone connections. Boa Vista is accessible by shallow-draft river vessels or by air; it is linked by road with the Caracará and Manaus river ports. Paved roads link Boa Vista, an important frontier military outpost, to the northeastern part of Roraima state. The town has air service to Guyana. Pop. (1985 est.) 66,357.

Boa Vista Island, Portuguese ILHA DA BOA VISTA, easternmost island of Cape Verde, in the Atlantic Ocean, 300 miles (500 km) off the western African coast. It has an area of 239 square miles (620 square km) and rises to an elevation of 1,269 feet (387 m). The chief town is Sal Rei, on the northwest coast. Salt and archil (a plant yielding a violet dye) are produced. Pop. (1990 prelim.) 3,457.

Boabdil (sultan of Granada): see Muḥammad XI under Muḥammad (Granada).

Boaco, town, central Nicaragua, situated on the western flanks of the central highlands. Boaco is a commercial and manufacturing centre for the agricultural and pastoral hinterland. Dairying and the processing of livestock products are the town's most important activities. Soap, bricks, mineral water, and Panama hats are manufactured, and there is some sawmilling.

The region surrounding Boaco is important agriculturally, producing cattle, swine, hides and skins, dairy products, rice, corn (maize), and beans. The rural population is concentrated in highland valleys around Boaco. There are no railroads, but Boaco is connected to the Pan-American Highway and to Managua, the national capital. Pop. (1985 est.) 15,645.

Boadicea (ancient British queen): see Boudicca.

boar, also called WILD BOAR, or WILD PIG, any of the wild members of the pig species *Sus scrofa*, family Suidae. The term boar is also used to designate the male of the domestic pig, guinea pig, and various other mammals. The term wild boar, or wild pig, is sometimes used to refer to any wild member of the *Sus* genus.

The wild boar—which is sometimes called the European wild boar—is the largest of the wild pigs and is native to forests ranging from western and northern Europe and North Africa to India, the Andaman Islands, and China. It has been introduced to New Zealand and to the United States (where it

mixed with native feral species). It is bristly haired, grizzled, blackish or brown in colour, and stands up to 90 cm (35 inches) tall at the shoulder. Except for old males, which are solitary, wild boars live in groups. The animals are swift, nocturnal, and omnivorous and are good swimmers. They possess sharp tusks, and, although they are normally unaggressive, they can be dangerous.

From earliest times, because of its great strength, speed, and ferocity, the wild boar has been one of the favourite beasts of the chase. In some parts of Europe and India it is still hunted with dogs, but the spear has mostly been replaced with the gun.

In Europe the boar is one of the four heraldic beasts of the chase and was the distinguishing mark of Richard III, king of England. As an article of food, the boar's head was long considered a special delicacy.

Board of Trade: see Trade, Board of.

boarfish (family Caproidae), any of six species of fishes (order Zeiformes) characterized by red coloration and a laterally compressed body that is as high as it is long. All six species live in deep marine waters, occurring in the Atlantic, Pacific, and Indian oceans. The two genera, *Antigonia* and *Capros*, are placed in different subfamilies. A typical species, *A. capros*, reaches a length of about 18 cm (7 inches).

Boarfishes typically have three anal spines that are completely separated from the soft rays of the anal fin. When viewed from the side, boarfishes appear almost rhomboid, or diamond-shaped, owing to the angular profiles of their backs.

Boas, Franz (b. July 9, 1858, Minden, Westphalia, Prussia [Germany]—d. Dec. 22, 1942, New York, N.Y., U.S.), German-born American anthropologist of the early 20th century, the founder of the relativistic, culture-centred school of anthropology that became

Boas, 1941
AP/Wide World Photos

dominant in the 20th century. During his tenure at Columbia University in New York City (1899–1942), he developed one of the foremost departments of anthropology in the United States. Boas was a specialist in North American Indian cultures and languages, but he was, in addition, the organizer of a profession and the great teacher of a number of scientists who developed anthropology in the United States, including Ruth Benedict, Margaret Mead, Melville Herskovits, and Edward Sapir.

Boas was the son of a merchant. He was of delicate health as a child and spent much of his time with books. His parents were free-thinking liberals who held to the ideals of the Revolutions of 1848. Although Jewish, he grew up feeling completely German. From the age of five he took an interest in the natural sciences—botany, geography, zoology, geology, and astronomy. While studying at the Gymnasium in Minden, he became deeply interested in the history of culture. He followed his various intellectual bents in his course of studies at the universities of Heidelberg, Bonn,

and Kiel, taking his Ph.D. in physics and geography at Kiel in 1881.

After a year's military service Boas continued his studies in Berlin, then undertook a year-long scientific expedition to Baffin Island in 1883–84. Firmly interested now in human cultures, he took posts in an ethnological museum in Berlin and on the faculty of geography at the University of Berlin.

In 1886, on his way back from a visit to the Kwakiutl and other tribes of British Columbia (which became a lifelong study), he stopped in New York City and decided to stay. He found a position as an editor of the magazine *Science*.

Boas' first teaching position was at the newly founded Clark University (Worcester, Mass.) in 1889. Next, he spent a period in Chicago, where he assisted in the preparation of the anthropological exhibitions at the 1893 Columbian Exposition and held a post at the Field Museum of Natural History. In 1896 he became lecturer in physical anthropology and in 1899 professor of anthropology at Columbia University. From 1896 to 1905 he was also curator of anthropology at the American Museum of Natural History in New York; in that capacity he directed and edited the reports submitted by the Jesup North Pacific Expedition, an investigation of the relationships between the aboriginal peoples of Siberia and of North America.

From his earliest years in America, Boas was an innovative and prodigiously productive scholar, contributing equally to statistical physical anthropology, descriptive and theoretical linguistics, and American Indian ethnology, including important studies of folklore and art. His personal research contributions alone would have given him an important place in the history of anthropology, but he also exerted enormous influence as a teacher. By the turn of the century, national leadership in anthropology was firmly in Boas' hands. In 1906, at the age of 48, he was presented with the festschrift (volume of tributes), usually awarded by his colleagues to a scholar nearing retirement. The 36 years that followed were no less productive, influential, or honoured. Boas established the *International Journal of American Linguistics*, was one of the founders of the American Anthropological Association, and served as president (1931) of the American Association for the Advancement of Science.

In 1911 Boas published *The Mind of Primitive Man*, a series of lectures on culture and race. It was often referred to in the 1920s by those who were opposed to new U.S. immigration restrictions based on presumed racial differences. In the 1930s the Nazis in Germany burned the book and rescinded his Ph.D. degree, which Kiel University had in 1931 ceremonially reconferred. Boas updated and enlarged the book in 1937. Other books by Boas include *Primitive Art* (1927) and *Race, Language and Culture* (1940).

The revolutionary significance of Boas' work can only be understood in terms of the differing beliefs of anthropologists about man. Almost all anthropologists have almost always believed that the human species is one; but not as many of them believed in Boas' day that the races of mankind show equally the human capacity to develop cultural forms. It is partly because of Boas' influence that the proposition is now almost universally accepted that every surviving population large enough to have a distribution of individual differences shows equally the human capacity to develop cultural forms, and that differences in outcome are attributed by anthropologists to historic "cultural" rather than genetic factors.

Within this common framework there have sometimes been differences in view as to the actual attainments of particular peoples. Some anthropologists, often calling themselves "ev-

Wild boar (*Sus scrofa*)

By courtesy of the New York Zoological Society

olutionary," argue that some peoples have achieved "higher" states of culture, leaving behind—at least temporarily—other peoples. They believe that the differences between "civilized" and "primitive" peoples are the result of environmental, cultural, and historical circumstances. Other anthropologists, frequently called cultural relativists, argue that the evolutionary view is ethnocentric, deriving from a human disposition to characterize groups other than one's own as inferior, and that all surviving human groups have evolved equally but in different ways.

Franz Boas was of the second persuasion. Since British and U.S. anthropologists in the last third of the 19th century were not particularly disposed to this view, Boas' success in making it overwhelmingly dominant was all the more remarkable. While he had originally assumed as a natural scientist that universal laws must exist that would explain how different peoples have wound up with their characteristic ways of life, he concluded that the problem was too complex for any general solution. Laws of cultural causation, he argued, had to be discovered rather than assumed.

Boas' view requires the anthropologist to be capable of understanding all factors that might influence the histories of peoples. Thus, to assert that cultural differences are not the result of biological differences, one must know something of biology; and to see the interrelations of man and his environment, the anthropologist must understand such things as migration, nutrition, child-raising customs, and disease, as well as the movements and interrelations of peoples and their cultures. Anthropology then becomes holistic and eclectic, involved in any field of science or scholarship that appears relevant to a particular problem.

(So.T.)

Bobadilla, Francisco de (d. June 1502, at sea near Hispaniola), Spanish soldier who arrested Christopher Columbus on Santo Domingo (the island of Hispaniola) after dissensions had arisen between Columbus and several of the Spanish adventurers who served under him.

Bobadilla was a noble who served the Spanish crown in the wars of reconquest against the Moors. He was thought to have been the knight commander of the Calatrava, a Spanish religious-military order of crusaders. In 1500 he was sent to Santo Domingo by Ferdinand and Isabella with the full powers of a royal commissioner and chief justice.

When Bobadilla landed and discovered that Columbus had hanged five Spaniards, he became so furious that he immediately ordered the arrest of Columbus' brother, Diego (in charge of the Spanish settlement in Columbus' absence), impounded Columbus' papers, and took possession of the town of Santo Domingo. Shortly thereafter, Columbus voluntarily gave himself up and was immediately placed in irons and sent back to Spain by Bobadilla.

Failing to restore order in Santo Domingo, Bobadilla was ordered back to Spain by the monarchs, while Columbus was given back all the honours and titles taken from him after his arrest. On the return voyage to Spain, a hurricane destroyed Bobadilla's fleet off the coast of Hispaniola, and all were lost.

bobbin furniture, also called **SPOOL FURNITURE**, heavy furniture made in the 17th cen-

tury, whose legs and other parts were lathe-turned to ornamental shapes; also lighter, less boldly turned pieces made in 19th-century cottage style (see cottage furniture). Bobbin turning was a type of ornament consisting of a series of small knobs resembling spools, or bobbins, used on the legs and stretchers of chairs and tables, on the finials of the stiles (vertical posts) of chairbacks, and occasionally on the finials of the front arm supports.

bobbin lace, also called **PILLOW LACE**, or **BONE LACE**, with needle lace, one of two main kinds of lace. Bobbin lace is made with a number of threads, each fastened to an elongated spool (bobbin). A pattern is drawn on parchment or paper, and holes are pricked to indicate where pins will be placed to keep

Bobbin lace from Flanders, first quarter of the 17th century; in the Museum Boymans-van Beuningen, Rotterdam

By courtesy of the Museum Boymans van Beuningen, Rotterdam

the threads in position while the lace is being made. The parchment is placed on a pillow or cushion, and the threads, with the bobbins hanging on them, are attached. The lace is worked with each hand holding a pair of bobbins, which are moved from side to side to form a twist, a braid, or a clothlike fabric called toile. The technique arose later than that of needle lace and derived from the practice of knotting fringes of material. The first bobbin lace probably originated in the early 16th century. The question of its place of origin—Italy or Flanders—has not been resolved, but most agree that it was probably developed in Flanders. The first weights were of lead, followed by other materials such as wood and bone (hence "bone lace"). Early bobbin lace consisted of rows of deep acute-angled points worked from a narrow band, and the patterns usually were similar to those of the needle

laces. It was much used for ruffs and collars in the 16th and 17th centuries.

Bobbio, town, Piacenza province, Emilia-Romagna region, northern Italy, in the valley of the Trebbia River, southwest of Piacenza. The ancient Bobium, it became famous when the Irish missionary monk St. Columban (Colombano) founded a monastery there c. 612, after fleeing from what is now Switzerland. He died three years later, but the monastery flourished and became a centre of medieval culture and learning, especially renowned for its great library. The monastery declined in the 15th century, and the library, with its approximately 700 manuscripts from the 10th century, was subsequently dispersed, most of it going to the Vatican, Milan, and Turin. The monastery was suppressed in 1803 by the French, but its 15th- to 17th-century buildings survive, including the tomb of the saint, whose relics are preserved in the museum. During the medieval period the town was ruled by the Lombard kings and Frankish emperors. The bishopric was created in 1014. In 1176 the town fought against Emperor Frederick I Barbarossa at the Battle of Legnano, which ended his attempted invasion of northern Italy. In 1748 Bobbio became part of Savoy. Besides the abbey of S. Colombano, notable landmarks include the Romanesque and Baroque cathedral, the medieval Ponte Vecchio (Old Bridge) over the Trebbia, the 15th-century Casa di Teodolinda, the 14th-century Palazzo Malaspina, and the 17th-century church of Sta. Maria dell'Aiuto.

Bobbio is a commercial and tourist centre on a busy road between the Emilia plain and Genoa. Pop. (2002 est.) 3,787.

bobcat, also called **BAY LYNX**, or **WILDCAT** (*Lynx rufus*), bobtailed North American cat, family Felidae, found from southern Canada to southern Mexico. The bobcat is a close relative of the lynx and caracal, the former also being classified in the genus *Lynx*.

A long-legged cat with large paws, a rather short body, and tufted ears, the bobcat is 60–100 centimetres (24–40 inches) long, excluding the 10–20-cm tail; stands 50–60 cm at the shoulder; and weighs 7–15 kilograms (15–33 pounds). Its fur, stiffer and less valuable than that of the lynx, is pale brown to reddish with black spots. The underparts are white; the tail tip is black above, white below.

Sometimes found in suburban areas, the bobcat is a nocturnal, generally solitary cat equally at home in forests and deserts; it is less inclined than the lynx to climb trees or swim. It feeds on rodents, rabbits, hares, and some birds. Breeding takes place in spring (sometimes a second time later in the year); a litter of one to six kittens is born after a gestation period of about 50 days. Economically, the bobcat is of some value as a fur bearer and is important in keeping the numbers of rodents and rabbits under control.

Bobo, people of Burkina Faso (formerly Upper Volta), who speak a language of the Gur branch of the Niger-Congo family.

The Bobo are a sedentary agricultural people growing such staples as millet and sorghum and a wide variety of other crops. Crop rotation and some irrigation are utilized, and small numbers of cattle and other animals are tended. Hunting, fishing, and the gathering of wild plants provide additional food.

The typical household contains an extended family that dwells in a rectangular house with mud walls, a beaten-earth roof, and, frequently, a defensive outer wall. Local lineages constitute clans that dominate a particular locality. There is a high incidence of polygyny, and the levirate (compulsory marriage of a widow to her dead husband's brother) and the sororate (compulsory marriage of a woman to her dead or barren sister's husband) are practiced. Social structure is otherwise relatively egalitarian, although slavery was once present and despised castes of smiths and leatherworkers persist. The Bobo follow traditional religious practice, although Islām and Christianity have claimed some converts.

Bobo Dioulasso, city, southwestern Burkina Faso (formerly Upper Volta). Dating (according to tradition) from the 15th century, the city was engaged in continual conflict with Kong to the south, and in the 18th century it was occupied by the Kong prince Famara Wattara, who made it the capital of the surrounding region, Gwiriko. In the 19th century the Kong empire disbanded, Gwiriko was rent by revolts, and Bobo Dioulasso fell to French troops in 1897.

The country's second largest city and its chief trade and industrial centre, Bobo Dioulasso has light manufacturing and processing plants for agricultural products. The sale of ivory, bronze, and iron handicrafts as well as traditionally crafted jewelry is significant. Major roads radiate from the city, and it is a stop on the rail line between Abidjan (capital of the Côte d'Ivoire) and Ouagadougou, Burkina Faso's capital. Borgo International Airport is just to the west. Bobo Dioulasso is an Islāmic centre with a large clay mosque dramatically studded with wooden pikes. It has a college, the West African Centre for Economic and Social Studies, and it is the seat of government research institutes for geology and mines and for cotton and textiles. Pop. (1993 est.) 300,000.

Boboli Gardens, Italian GIARDINO DI BOBOLI, approximately 111 acres (45 hectares) of lavishly landscaped gardens behind the Pitti Palace, extending to modern Fort Belvedere, in Florence. Designed in a carefully structured and geometric Italian Renaissance style, the gardens were begun in 1550 by Niccolò di Raffaello de' Pericoli detto Tribolo, who had been commissioned by Eleanor de Toledo, wife of Cosimo I, to create a setting that would be appropriate for vast pageants and Medici court entertainments.

Lacking a natural water supply, the gardens relied on an elaborate system of water distribution, a special conduit being built to tap the river; this was further enlarged by Ferdinando I, Cosimo's son, and the garden waters are known as the Acqua Ferdinanda. The Boboli, preserved by the Italian monarchy and today a public park, displays statuary from various historical periods and includes works by important Mannerist and Baroque sculptors. Among well-known features are the Artichoke Fountain, the Museum of Porcelain, a Rococo Kaffeehaus, and a horseshoe-shaped amphitheatre with an Egyptian obelisk.

bobolink (*Dolichonyx oryzivorus*), American bird of the family Icteridae (order Passeri-

formes) that breeds in northern North America and winters chiefly in central South America. Migrating flocks may raid rice fields, and at one time the fat "ricebirds" were shot as a table delicacy. In the breeding season the 18-centimetre (7-inch) male bobolink—named for his bubbling song—has a black underside, yellow hindneck, white back and rump, and

Bobolink (*Dolichonyx oryzivorus*)

Painting by Richard Keane

white patches on the wings; in winter he resembles the brown female.

Bobone, Giacinto, also called GIACINTO BOBO-ORSINI; see Celestine III.

Bobriki (Russia); see Novomoskovsk.

Bobrikov, Nikolay (Ivanovich) (b. Jan. 27 [Feb. 8, New Style], 1839, Strelna, near St. Petersburg, Russia—d. June 4 [June 17], 1904, Helsinki), ruthless ultranationalist Russian governor-general of Finland from 1898 until his assassination.

After a career in the Russian army, which he left with the rank of general, Bobrikov was named governor-general of the grand duchy of Finland in 1898. Under his regime Finland experienced its first intense wave of Russification, including the forced introduction of Russian practices into many different areas of Finnish life, the abrogation of Finnish constitutional rights, and the abolition of the Finnish army. Supported by Tsar Nicholas II, who granted him dictatorial powers in 1903, Bobrikov met the large-scale Finnish passive resistance campaign with arrests, banishments, press censorship, dismissal of officeholders, and personal close control of the Finnish government. He was assassinated by the son of a Finnish senator who also killed himself.

Bobruysk, also spelled BOBRUJSK, city, Mogilyov oblast (administrative region), east-central Belarus, on the right bank of the Berezina River. Founded in the 16th century, it was held in turn by Lithuania, Poland, and Russia and was the scene of a major battle in World War II. The fortress of 1769 survives. Industries include engineering, machine building, chemicals, woodworking, and the manufacture of tires, clothing, and footwear. Pop. (1998 est.) 227,000.

Bobrzyński, Michał (b. Sept. 30, 1849, Kraków, Pol., Austrian Empire—d. July 3, 1935, Poznań, Pol.), Polish historian and Conservative politician who maintained that the weakening of the central government had been the main cause of the 18th-century partitions of Poland and, on that basis, inaugurated a reappraisal of Poland's history.

Professor of legal history at the University of Kraków (1877), Bobrzyński studied (1873–85) the social history of medieval Poland, published his politically influential *Dzieje Polski* ("History of Poland") in 1879, and became the chief exponent of the "pessimistic" (or Kraków) school of Polish historiography,

Bobrzyński, c. 1920

By courtesy of the Państwowe Wydawnictwo Naukowe, Warsaw

which sharply criticized Poland's former political and social institutions.

Entering politics in 1885, he served in the Galician Diet and in the Vienna Reichsrat (legislature). He was Galician viceroy (1908–13) and minister in Vienna (1917). He retired after 1918 but continued serving as a government adviser.

bobsledding, also called BOBSLEIGHING, the sport of sliding down an ice-covered natural or artificial incline on a four-runner sled, called a bobsled, bobsleigh, or bob, that carries either two or four persons.

Bobsledding developed in the 1880s both in the lumbering towns of upstate New York and at the ski resorts of the Swiss Alps. The first organized competition was held in 1898 on the Cresta Run at Sankt Moritz, Switz. The sport earned its name after competitors adopted the technique of bobbing back and forth to increase the speed of the sled. In 1923 bobsledding became an internationally recognized sport with the organization of the Fédération Internationale de Bobsleigh et de Tobogganing

Jill Bakken (front) and Vonetta Flowers of the U.S. race down the ice during the bobsleigh competition at the 2002 Olympics

© Reuters New Media—Corbis

and with its inclusion in the first Olympic Winter Games at Chamonix, France, the following year. Since 1931 both two-person and four-person world-championship competitions have been held yearly, except during World War II. Though women have participated in bobsledding since the sport's creation, international competition for women did not begin until the 1990s. The women's two-person bobsled event made its Olympic debut in 2002. The gold medal for the inaugural women's event went to Jill Bakken and Vonetta Flowers of the United States. Flowers was the first black athlete to win an Olympic gold medal at the Winter Games.

The bob run used in international competition is between 1,200 and 1,600 m (1,312 and 1,750 yards) long, with an average slope of between 8 and 15 percent. There are generally from 15 to 20 turns per course, ranging in size up to huge hairpins of more than 180°. Most bob runs have permanent foundations of concrete or stone, which are covered with several inches of ice. The straightaways have sidewalls of reinforced ice about 46 cm (18 inches) high. The large turns are banked very steeply, built up as high as 6 m (20 feet), and may have an overhanging lip of ice to prevent the fast-traveling bobsleds from flying out of the turn.

Early bobsleds were built mostly of wood. Steel runners were adopted within a few years and, by the mid-20th century, steel and aluminum were used throughout. The four runners are generally mounted in pairs on two axles. Steering is accomplished by turning the front axle either with ropes or by a wheel linked to the axle by cables. The brake is a toothed bar that is pressed against the ice between the rear runners.

Racing bobsleds have a streamlined cowling in front of the driver to reduce wind resistance. Three types are used: two-person bobsleds, as they often are called in Europe, and four-person bobsleighs. Rules limit combined team and sled weights to 390 kg (860 pounds) and 630 kg (1,389 pounds), respectively. The maximum team-and-sled weight for the two-women competition is 350 kg (770 pounds).

The start of the race is crucial to a team's success. Riders, wearing cleated shoes, run alongside the sled, pushing it to achieve maximum velocity. As it builds speed, the riders jump in, the driver in front and the brakeman, pushing the back of the sled, entering last. The heavier four-person sleds attain speeds approaching 160 km (100 miles) per hour; the smaller, lighter two-person sleds are only slightly slower. A race consists of four descents by each team, the total time for the four heats determining the winner. Electric timing equipment measures elapsed time to 0.01 second.

Due in large part to their innovative sled design and construction, bobsleds from the United States were both successful and influential during the first half of the 20th century. Since then German and Swiss teams have dominated international competition.

For Olympic champions, see Olympic Games.

bobwhite, North American quail species. See quail.

Boca Raton, city, Palm Beach county, southeastern Florida, U.S. It is located about 15 miles (25 km) north of Fort Lauderdale on the Atlantic Ocean. Although the Spanish occasionally used Boca Raton's harbour, the first settlers arrived in the area about 1895, around the same time as the Florida East Coast Railway. The city's name comes from *boca de ratones*, a Spanish term meaning "rat's mouth" that appeared on early maps and referred to hidden sharp-pointed rocks that gnawed at ships' cables. The settlers grew vegetables and pineapples, and in the early 1900s Japanese farmers started the Yamato Colony in the area. The town of Boca Raton was incorporated in 1925, and the architect Addison Mizner began designing a luxury resort city centring on the Cloister Inn, a Spanish architectural extravaganza that the financier Clarence H. Geist turned into an exclusive club in 1930. Arthur Vining Davis, an aluminum magnate, purchased the property in 1956. As the Boca Raton Hotel and Club, it prospered with the convention trade, and a resort-retirement community of expensive homes entwined with waterways developed around it. Boca Raton became a city in 1957.

Boca Raton is a major retirement centre. Tourism, manufacturing (including electronics and pharmaceuticals), and high-technology industries contribute to the economy. Florida

Atlantic University (1961) occupies a former air base; the city is also home to Lynn University (1962). The International Museum of Cartoon Art contains exhibits on cartoons and animation. Loxahatchee National Wildlife Refuge, in the northern Everglades, is west of the city. Pop. (2000) city, 74,764; West Palm Beach-Boca Raton MSA, 1,131,184.

bocage, in western France (e.g., Bocage Normand, Bocage Vendéen), a well-timbered district in distinction to the *campagne*, which denotes a hedgeless tract of farmland characteristic of old-established areas of open-field agriculture. The fields of bocage country are small, irregular, and enclosed by hedges and groves of trees. Failed attempts to cut down the hedges and trees to promote agriculture served only to confirm the traditional richness of the bocage in the raising of cattle.

Bocage, Manuel Maria Barbosa du (b. Sept. 15, 1765, Setúbal, Port.—d. Dec. 21, 1805, Lisbon), Neoclassical Portuguese lyric poet who aspired to be a second Camões but who dissipated his energies in a stormy life.

Bocage left school at the age of 14 to join the army, then transferred to the navy at 16. At the Royal Navy Academy in Lisbon, he devoted his time to love affairs, poetry, and bohemianism. In 1786 he was sent, like his hero Camões, to India and also like him was disillusioned by the Orient. He deserted to Macau, returning to Lisbon in 1790. He then joined the New Arcadia, a literary society with vaguely egalitarian and libertarian sympathies, but his satires on his fellow members resulted in his expulsion, and a long verse war ensued, engaging most of the poets of Lisbon.

In 1797 he was accused of propagating republicanism and atheism and was imprisoned. During his imprisonment he undertook translations of Virgil and Ovid. Translations provided him with a livelihood during the few years that he lived after his release. He also translated Torquato Tasso, Jean-Jacques Rousseau, Jean Racine, and Voltaire.

Bocage employed various verse forms, but he is at his best in the sonnet. Despite the Neoclassical framework of his poetry, his intensely personal voice, frequent violence of expression, and self-dramatizing obsession with fate and death anticipate Romanticism. His collected poems were published as *Rimas*, 3 vol. (1791, 1799, 1804).

Bocas del Dragón (Caribbean Sea): see Dragon's Mouths.

Boccaccio, Giovanni (b. 1313, Paris, France—d. Dec. 21, 1375, Certaldo, Tuscany [Italy]), Italian poet and scholar, best remembered as the author of the earthy tales in the *Decameron*. With Petrarch he laid the foundations for the humanism of the Renaissance and raised vernacular literature to the level and status of the classics of antiquity.

Youth. Boccaccio was the son of a Tuscan merchant, Boccaccio di Chellino (called Boccaccio), and a mother who was probably French. He passed his early childhood rather unhappily in Florence. His father had no sympathy for Boccaccio's literary inclinations and sent him, not later than 1328, to Naples to learn business, probably in an office of the Bardi, who dominated the court of Naples by means of their loans. In this milieu Boccaccio experienced the aristocracy of the commercial world as well as all that survived of the splendours of courtly chivalry and feudalism. He also studied canon law and mixed with the learned men of the court and the friends and admirers of Petrarch, through whom he came to know the work of Petrarch himself.

These years in Naples, moreover, were the years of Boccaccio's love for Fiammetta, whose person dominates all his literary activity up to the *Decameron*, in which there also appears a Fiammetta whose character somewhat resembles that of the Fiammetta of his earlier works.

Attempts to use passages from Boccaccio's writings to identify Fiammetta with a supposedly historical Maria, natural daughter of King Robert and wife of a count of Aquino, are untrustworthy—the more so since there is no documentary proof that this Maria ever existed.

Early works. It was probably in 1340 that Boccaccio was recalled to Florence by his father, involved in the bankruptcy of the Bardi. The sheltered period of his life thus came to an end, and thenceforward there were to be only difficulties and occasional periods of poverty. From Naples, however, the young Boccaccio brought with him a store of literary work already completed. *La caccia di Diana* ("Diana's Hunt"), his earliest work, is a short poem, in terza rima (an iambic verse consisting of stanzas of three lines), of no great merit. Much more important are two works with themes derived from medieval romances: *Il filocolo* (c. 1336; "The Love Afflicted"), a prose work in five books on the loves and adventures of Florio and Biancofiore (Floire and Blanchefleur); and *Il filostrato* (c. 1338; "The Love Struck"), a short poem in ottava rima (a stanza form composed of eight 11-syllable lines) telling the story of Troilus and the faithless Criseida. The *Teseida* (probably begun in Naples and finished in Florence, 1340–41) is an ambitious epic of 12 cantos in ottava rima in which the wars of Theseus serve as a background for the love of two friends, Arcita and Palemone, for the same woman, Emilia; Arcita finally wins her in a tournament but dies immediately.

While the themes of chivalry and love in these works had long been familiar in courtly circles, Boccaccio enriched them with the fruits of his own acute observation of real life and sought to present them nobly and illustriously by a display of learning and rhetorical ornament, so as to make his Italian worthy of comparison with the monuments of Latin literature. It was Boccaccio, too, who raised to literary dignity ottava rima, the verse metre of the popular minstrels, which was eventually to become the characteristic vehicle for Italian verse. Boccaccio's early works had an immediate effect outside Italy: Geoffrey Chaucer

Boccaccio, detail of a fresco by Andrea del Castagno; in the Cenacolo di Sant' Apollonia, Florence

drew inspiration from *Il filostrato* for his own *Troilus and Criseyde* (as William Shakespeare was later to do for *Troilus and Cressida*) and from Boccaccio's *Teseida* for his "Knight's Tale" in *The Canterbury Tales*.

The 10 or 12 years following Boccaccio's return to Florence are the period of his full maturity, culminating in the *Decameron*. From 1341 to 1345 he worked on *Il ninfale d'Ameto* ("Ameto's Story of the Nymphs"), in prose and terza rima; *L'amorosa visione* ("The Amorous Vision"; 1342-43), a mediocre allegorical poem of 50 short cantos in terza rima; the prose *Elegia di Madonna Fiammetta* (1343-44); and the poem *Il ninfale fiiesolano* (perhaps 1344-45), in ottava rima, on the love of the shepherd Africo for the nymph Mensola.

Boccaccio, meanwhile, was trying continually to put his financial affairs in order, though he never succeeded in doing so. Little is known, however, of the detail of his life in the period following his return to Florence. He was at Ravenna between 1345 and 1346, at Forlì in 1347, in Florence during the ravages of the Black Death in 1348, and in Florence again in 1349.

The Decameron. It was probably in the years 1348-53 that Boccaccio composed the *Decameron* in the form in which it is read today. In the broad sweep of its range and its alternately tragic and comic views of life, it is rightly regarded as his masterpiece. Stylistically, it is the most perfect example of Italian classical prose, and its influence on Renaissance literature throughout Europe was enormous.

The *Decameron* begins with the flight of 10 young people (7 women and 3 men) from plague-stricken Florence in 1348. They retire to a rich, well-watered countryside, where, in the course of a fortnight, each member of the party has a turn as king or queen over the others, deciding in detail how their day shall be spent and directing their leisurely walks, their outdoor conversations, their dances and songs, and, above all, their alternate storytelling. This storytelling occupies 10 days of the fortnight (the rest being set aside for personal adornment or for religious devotions); hence the title of the book itself, *Decameron*, or "Ten Days' Work." The stories thus amount to 100 in all. Each of the days, moreover, ends with a canzone (song) for dancing sung by one of the storytellers, and these canzoni include some of Boccaccio's finest lyric poetry. In addition to the 100 stories, Boccaccio has a master theme, namely, the way of life of the refined bourgeois, who combined respect for conventions with an open-minded attitude to personal behaviour.

The sombre tones of the opening passages of the book, in which the plague and the moral and social chaos that accompanies it are described in the grand manner, are in sharp contrast to the scintillating liveliness of Day I, which is spent almost entirely in witty disputation, and to the playful atmosphere of intrigue that characterizes the tales of adventure or deception related on Days II and III. With Day IV and its stories of unhappy love, the gloomy note returns; but Day V brings some relief, though it does not entirely dissipate the echo of solemnity, by giving happy endings to stories of love that does not at first run smoothly. Day VI reintroduces the gaiety of Day I and constitutes the overture to the great comic score, Days VII, VIII, and IX, which are given over to laughter, trickery, and license. Finally, in Day X, all the themes of the preceding days are brought to a high pitch, the impure made pure and the common made heroic.

The prefaces to the days and to the individual stories and certain passages of especial

magnificence based on classical models, with their select vocabulary and elaborate periods, have long held the attention of critics. But there is also another Boccaccio: the master of the spoken word and of the swift, vivid, tense narrative free from the proliferation of ornament. These two aspects of the *Decameron* made it the fountainhead of Italian literary prose for the following centuries.

The influential 19th-century critic Francesco De Sanctis regarded the *Decameron* as a "Human Comedy" in succession to Dante's *Divine Comedy* and Boccaccio as the pioneer of a new moral order superseding that of the European Middle Ages. This view is no longer tenable, however, since the Middle Ages can no longer be presented as having been wholly ascetic or wholly concerned with God and heavenly salvation in contrast with a Renaissance concerned only with the human.

Also, in particular, the whole corpus of Boccaccio's work is basically medieval in subject matter, form, and taste, at least in its point of departure. It is the spirit in which Boccaccio treats his subjects and his forms that is new. For the first time in the Middle Ages, Boccaccio in the *Decameron* deliberately shows man striving with fortune and learning to overcome it. To be truly noble, according to the *Decameron*, man must accept life as it is, without bitterness, must accept, above all, the consequences of his own action, however contrary to his expectation or even tragic they may be. To realize his own earthly happiness, he must confine his desire to what is humanly possible and renounce the absolute without regret. Thus Boccaccio insists both on man's powers and on their inescapable limitations, without reference to the possible intervention of divine grace. A sense of spiritual realities and an affirmation of moral values underlying the frivolity even in the most licentious passages of the *Decameron* are features of Boccaccio's work that modern criticism has brought to light and that make it no longer possible to regard him only as an obscene mocker or sensual cynic.

During the years in which Boccaccio is believed to have written the *Decameron*, the Florentines appointed him ambassador to the lords of Romagna in 1350; municipal councillor and also ambassador to Louis, duke of Bavaria, in the Tirol in 1351; and ambassador to Pope Innocent VI in 1354.

Petrarch and Boccaccio's mature years. Of far more lasting importance than official honours was Boccaccio's first meeting with Petrarch, in Florence in 1350, which helped to bring about a decisive change in Boccaccio's literary activity. Boccaccio revered the older man as his master, and Petrarch proved himself a serene and ready counselor and a reliable helper. Together, through the exchange of books, news, and ideas, the two men laid the foundations for the humanist reconquest of classical antiquity.

After the *Decameron*, of which Petrarch remained in ignorance until the very last years of his life, Boccaccio wrote nothing in Italian except *Il Corbaccio* (1354-55; a satire on a widow who had jilted him), his late writings on Dante, and perhaps an occasional lyric. Turning instead to Latin, he devoted himself to humanist scholarship rather than to imaginative or poetic creation. His encyclopaedic *De genealogia deorum gentilium* ("On the Genealogy of the Gods of the Gentiles"), medieval in structure but humanist in spirit, was probably begun in the very year of his meeting with Petrarch but was continuously corrected and revised until his death. His *Bucolicum carmen* (1351-66), a series of allegorical eclogues (short pastoral poems) on contemporary events, follows classical models on lines already indicated by Dante and Petrarch. His other Latin works include *De claris mulieribus* (1360-74), a collection of biographies of famous women; and *De casibus*

virorum illustrium (1355-74; "On the Fates of Famous Men"), on the inevitable catastrophe awaiting all who are too fortunate.

The meeting with Petrarch, however, was not the only cause of the change in Boccaccio's writing. A premature weakening of his physical powers and disappointments in love may also have contributed to it. Some such occurrence would explain how Boccaccio, having previously written always in praise of women and love, came suddenly to write the bitterly misogynistic *Corbaccio* and then turn his genius elsewhere. Furthermore, there are signs that he may have begun to feel religious scruples. Petrarch describes how the Carthusian monk Pietro Petrone, on his deathbed in 1362, sent another Carthusian, Gioacchino Ciani, to exhort Boccaccio to renounce his worldly studies; and it was Petrarch who then dissuaded Boccaccio from burning his own works and selling his library. As early as 1360, moreover, Boccaccio's way of life was regarded as austere enough to justify his being entrusted with a pastoral cure of souls in a cathedral. He had taken minor orders many years earlier, perhaps at first only in the hope of being given benefices.

Boccaccio's circle in Florence was of vital importance as a nucleus of early humanism. Leonzio Pilato, whom Boccaccio housed from 1360 to 1362 and whose nomination as reader in Greek at the Studio (the old University of Florence) he procured, made the rough Latin translation through which Petrarch and Boccaccio became acquainted with Homer's poems—the starting point of Greek studies by the humanists. The recovery of Latin classical texts—Varro, Martial, Apuleius, Seneca, Ovid, and, above all, Tacitus—likewise occupied Boccaccio's admiring attention. Even so, he did not neglect Italian poetry, his enthusiasm for his immediate predecessors, especially Dante, being one of the characteristics that distinguish him from Petrarch. His *Vita di Dante Alighieri*, or *Trattatello in laude di Dante* ("Little Tractate in Praise of Dante"), and the two abridged editions of it that he made show his devotion to Dante's memory.

Last years. All these studies were pursued in poverty, sometimes almost in destitution, and Boccaccio had to earn most of his income by transcribing his own works or those of others. In 1363 poverty compelled him to retire to the village of Certaldo. In October 1373, however, he began public readings of Dante's *Divina commedia* in the Church of San Stefano di Badia in Florence. A revised text of the commentary that he gave with these readings is still extant but breaks off at the point that he had reached when, early in 1374, ill health made him lose heart. Petrarch's death in July 1374 was another grief to him, and he retired again to Certaldo. There Boccaccio died the following year and was buried in the Church of SS. Michele e Jacopo.

Boccaccio and the Renaissance. Boccaccio was a man of the Renaissance in almost every sense. His humanism comprised not only classical studies and the attempt to rediscover and reinterpret ancient texts but also the attempt to raise literature in the modern languages to the level of the classical by setting standards for it and then conforming to those standards. Boccaccio advanced further than Petrarch in this direction not only because he sought to dignify prose as well as poetry but also because, in his *Ninfale fiiesolano*, in his *Elegia di Madonna Fiammetta*, and in the *Decameron*, he ennobled everyday experience, tragic and comic alike. Although his *Teseida* and *Ninfale d'Ameto* invite comparison with classical genres, his *Filocolo* and *Filostrato* raised to the level of learned art the literature of chivalry and love that had fallen to the level of the populace. The same attention to popular and medieval themes characterized Italian culture in the second half of the 15th century; without Boccaccio, the literary culmination of the

Italian Renaissance would be historically incomprehensible. (U.Bo./Ed.)

BIBLIOGRAPHY. Edward Hutton, *G. Boccaccio: A Biographical Study* (1910), is still recommended. Other studies of Boccaccio and his works include Francis MacManus, *Boccaccio* (1947); Vittore Branca, *Boccaccio* (1976); and Thomas G. Bergin, *Boccaccio* (1981), which includes a detailed summary of each work as well as discussion of style, themes, and structure. On Boccaccio's language and style, Gordon Rutledge Silber, *The Influence of Dante and Peirarch on Certain of Boccaccio's Lyrics* (1940), is useful. Giuseppe Mazzotta, *The World at Play in Boccaccio's Decameron* (1986), examines the most famous of Boccaccio's works.

Boccalini, Traiano (b. 1556, Loreto, Papal States [Italy]—d. Nov. 29, 1613, Venice), prose satirist and anti-Spanish political writer, influential in the Europe of his time for a widely circulated satire, *Ragguagli di Parnaso* ("Reports from Parnassus").

The son of an architect, Boccalini was educated for the law and spent many years in Rome in the papal service (1584–1612), becoming acquainted with many eminent men of his day. After 1612 he lived in Venice, where, in contact with the papal nuncio, he was probably occupied with diplomatic activities.

Boccalini's political experience is mirrored particularly in *Ragguagli di Parnaso*, a light and fantastic satire on the actions and writings of his contemporaries, written in the form of 201 ironical newsletters in which the wise men of all centuries, presided over by Apollo, discuss art, literature, and politics. Another series appeared in *Pietra del paragone politico* (posthumously published, 1614; "Political Touchstones"), a vigorous denunciation of the Spanish domination of Europe. They were widely translated, the first English version being by Henry Carey, 2nd Earl of Monmouth, and called *Advertisements from Parnassus in Two Centuries with the Politicke Touchstone* (1656). This and other European translations influenced Miguel de Cervantes, Joseph Addison, and Jonathan Swift.

A weightier work was *Commentarii sopra Cornelio Tacito* ("Comments upon Cornelius Tacitus"), a discussion of politics and government, offering Machiavellian advice to princes. *Religione e ragione di stato* (first published 1933; "Religion and State Law") is a dialogue concerned with the attitude of the Holy Roman emperor Charles V toward the German Protestants.

Boccanegra FAMILY, wealthy Genoese family that played an important role in two great "popular" (democratic) revolutions, one in 1257 and the other in 1339, and furnished several admirals to the Genoese republic and to Spain.

Guglielmo Boccanegra (d. 1274) became virtual dictator of Genoa in 1257, when an insurrection against the government of the old aristocracy made him captain of the people. The major accomplishment of his administration was the conclusion with the Byzantine emperor Michael VIII Palaeologus of the Treaty of Nymphaeum in 1261, an offensive-defensive alliance that opened up the Black Sea and the Byzantine Empire to Genoese commerce. Later the same year Guglielmo's brother Marino, commanding a Genoese fleet, helped the Byzantines to recover Constantinople from Venice. In 1262 Genoese nobles overthrew Guglielmo; his brother Lanfranco was killed in the insurrection, and Guglielmo was condemned to perpetual exile. The command of the fleet was taken from Marino and divided among the noble families. The lack

of unified command caused disaffection with Constantinople, which retaliated by nullifying many of the advantages won by the Treaty of Nymphaeum.

In 1339 another popular revolution resulted in the election of Simone Boccanegra (1301–63), descendant of Guglielmo's brother Lanfranco, as the first Genoese doge. Deposed in 1344, Simone fled with his family to Pisa, returning to office in 1356 with the aid of the Visconti, the rulers of Milan. According to tradition, he was poisoned at a banquet in 1363. An opera by Giuseppe Verdi, *Simon Boccanegra*, is based on his story.

Simone's brother Egidio (d. 1367), grand admiral in the service of Alfonso XI of Castile, inflicted a memorable defeat on a Moroccan fleet off Algeciras in 1344. He was succeeded by his son Ambrogio, who in 1371 won two naval victories, one against the Portuguese at the mouth of the Tagus River and the other against an English fleet three times more numerous at the Battle of La Rochelle, in which the English admiral, the Earl of Pembroke, was taken prisoner.

Boccherini, Luigi, in full LUIGI RODOLFO BOCCHERINI (b. Feb. 19, 1743, Lucca [Italy]—d. May 28, 1805, Madrid, Spain), Italian composer and cellist who influenced the development of the string quartet as a musical form and who composed the first music for a quintet for strings, as well as a quintet with strings and piano. His approximately 500 works also include sacred music, symphonies, and concerti.

Boccherini, 1790

By courtesy of the Istituto Musicale Boccherini, Lucca

Early life. Luigi Rodolfo was the third child of a double-bass player, Leopoldo Boccherini, and Maria Santa Proserpi. At an early age he was put under the care of the musical director of the local cathedral. When he reached the age of 13, he was sent to Rome to study with the renowned cellist Giovanni Battista Costanzi, musical director at St. Peter's Basilica. In Rome Boccherini was influenced by the polyphonic tradition (*i.e.*, music with two or more interweaving melodic parts) stemming from the works of Giovanni da Palestrina and from the instrumental music of Arcangelo Corelli.

In 1757 Boccherini and his father were invited to play in the Imperial Theatre orchestra in Vienna. On his second journey to Vienna (1760), Boccherini, at 17, made his debut as a composer with his *Six Trios for Two Violins and Cello*, G 77–82. During his third stay in that city (1764), a public concert by Boccherini was enthusiastically received.

In spite of his success, Boccherini grew homesick for Lucca, to which he returned (August 1764), having obtained a permanent position with the local church and theatre orches-

tras there. He was in Lombardy in 1765, in the orchestra of Giovanni Battista Sammartini. Through his association with this Milanese composer, the 22-year-old Boccherini strengthened the new "conversational" style of the quartet: the cello's line was now as important as the counterpoint (*i.e.*, the intertwining of independent melodic lines) of the violin and viola. Boccherini had a chance to put into practice this conquest with an extraordinary string quartet made up of outstanding Tuscan virtuosos.

After his father's death (1766), he decided to leave Lucca for good. His destination was Paris—a happy choice since France welcomed Italian musicians. In Paris the French publishers Grange, Venier, and Chevardiére published Boccherini's compositions of the previous years (*Six String Quartets*, G 159–164, and *Six Duets for Two Violins*, G 56–61, of 1761) as well as the new ones (*Six Trios for Two Violins and Cello*, G 83–88, and *Symphony in D Major*, G 500, of 1766 and *c.* 1766?). Musical Paris competed for the young man from Lucca. From Boccherini's contact with Madame Brillon de Jouy, the harpsichord player, were born the wonderful *Six Sonatas for Harpsichord and Violin*, G 25–30. Boccherini's style spread throughout Europe, and his *Cello Concerto No. 6 in D Major*, G 479 (*c.* 1768?), became the model for W.A. Mozart's *Violin Concerto in D Major*, K 218 (1775).

Later life. Such vital contact and enthusiasm were interrupted when the Spanish ambassador to Paris persuaded Boccherini to move to Madrid. Attracted by this flattering offer, he began his long sojourn at the intrigue-ridden court of Charles III. The king's brother, the infante Don Luis, conferred on him a yearly endowment of 30,000 reals as a cellist and composer. During this period Boccherini wrote his well-known *Six String Quartets*, G 177–182 (1772).

Madrid became Boccherini's second home. There he married Clementina Pelicho, with whom he had five children. At the infante's death (1785), the king granted him a pension of 12,000 reals. He received another pension from Frederick William II of Prussia, who was an amateur cellist. Lastly, the Duchess of Osuna appointed him conductor of her private orchestra at the Puerta de la Vega Palace in Madrid. To his prodigious instrumental production, Boccherini added vocal compositions: the *Stabat Mater*, G 532 (1781), the zarzuela *La Clementina*, G 540 (1786), with libretto by Ramon de la Cruz, and the Christmas *Villancicos*, G 539 (1783).

Having lost his first wife, Boccherini married Joaquina Porreti (1787). From 1787 to 1797 he was probably in Berlin, at a post provided by Frederick William II. In 1798 the new king of Prussia withdrew Boccherini's pension, the Duchess of Osuna moved to Paris, and Boccherini's financial distress was aggravated by poor health. His life was further saddened by the death of his second wife and two daughters during an epidemic. Thereafter he subsisted for the most part in poverty, which by 1804 had compelled him to live in one room with his three surviving children. His last complete work, the *String Quartet No. 90 in F Major*, G 248, was composed that year. Shortly thereafter he died.

Assessment. In 1969 the French scholar Yves Gérard published his *Thematic, Bibliographical, and Critical Catalogue of the Works of Luigi Boccherini*. Numbers preceded by "G" are the numbers assigned by Gérard according to type of composition, not chronological order.

Boccherini was primarily a composer of chamber music. He produced more than 100 quintets and quartets each, more than 50

trios, and more than 50 chamber works in other forms. The *Cello Concerto in B-flat*, Boccherini's best-known complete work, was actually arranged from two Boccherini concertos by the 19th-century composer and cellist Friedrich Grützmacher. Boccherini's well-known minuet is from his *String Quintet in E Major*, G 275.

As a composer Boccherini has often been compared to Joseph Haydn, usually to his disadvantage. A contemporary, Giovanni Puppo, characterized him as no more than an emasculated Haydn. But their qualities are of different kinds. It is true that his music often lacks Haydn's characteristic forward drive and virility, qualities which derive from a keen sense of form and symphonic development. Thus whereas Haydn's first movements usually centre upon the closely reasoned argument of their development sections, Boccherini's depend on their thematic material and the way in which it is presented and re-presented, and his development sections often lack a firm sense of direction and purpose. Concertante writing was of fundamental importance to Boccherini's music, and he obtained a wide variety of tone colours by writing high viola or cello parts (he was clearly influenced here by his own instrumental facility). His varied treatment of instrumental texture was one of the most characteristic features of his music. Whereas Haydn, with his emphasis on the dramatic nature of sonata form, was in the mainstream of musical development, Boccherini can be said to have represented a backwater. His concern was the production of smooth, elegant music: his favourite expression marks were *soave* (soft), *con grazia* (with grace), and *dolcissimo* (very sweetly). It is in his gentle warmth and superlative elegance—often with a hint of melancholy just below the surface—that Boccherini's most characteristic contribution is found.

BIBLIOGRAPHY. Germaine de Rothschild, *Luigi Boccherini: His Life and Work* (1965), a biography, incorporates much new information. A companion work, Yves Gérard (comp.), *Thematic, Bibliographical, and Critical Catalogue of the Works of Luigi Boccherini* (1969), includes 580 compositions.

Bocchus I (fl. late 2nd and early 1st centuries BC), king of Mauretania from about 118 to 91 BC and father-in-law of Jugurtha, king of Numidia, directly to the east of Mauretania.

At the beginning of the war between Jugurtha and the Romans (111–105), Bocchus attempted unsuccessfully to make a treaty with Rome. In 106 the Mauretanian king entered the conflict to provide half-hearted assistance to Jugurtha. But, after suffering heavy losses, Bocchus was persuaded by the Roman officer Lucius Cornelius Sulla to betray his ally. He helped the Romans to capture Jugurtha and was rewarded for his treachery with some Numidian territory. Thereafter Bocchus remained a loyal dependent of Rome and a supporter of Sulla (dictator of Rome in 82–81), furnishing Sulla with gifts and money.

Bocchus II (d. c. 33 BC), king of the eastern half of Mauretania in North Africa from 49 to about 38 BC, when he became ruler of all Mauretania. He was probably a son of Bocchus I.

At the time that Bocchus II succeeded to power, he ruled that part of Mauretania east of the Mulucha River (Moulouya River in northeastern Morocco), while his brother, Bogud, controlled western Mauretania. Both kings backed the Roman general Julius Caesar in his struggle against the supporters of Pompey the Great in Africa (49–45), and, on Caesar's victory over Pompey at Thapsus (on the coast of modern Tunisia) in 46, Bocchus was given control of much of Numidia. Af-

ter Caesar had been assassinated in 44, the two Mauretanian rulers took opposite sides in the split that developed in the Caesarian forces. Bogud supported Mark Antony, while Bocchus stood by Octavian (later the emperor Augustus). About 38, Bocchus seized Bogud's territory while Bogud was campaigning in Spain and forced him to flee to Antony in the East. Bocchus then became sole ruler of Mauretania and was so confirmed by Octavian. After Bocchus died, the kingdom became a Roman province.

boccie, also spelled **BOCCI**, or **BOCCE**, Italian bowling game that is especially popular in Piedmont and Liguria and is also played in Italian communities in the United States, Australia, and South America. The governing organization is the *Unione Federazione Italiane Bocce*. The first world championships were held at Genoa, Italy, in 1951.

The boccie court, or *campo*, is about 75 feet long by 8 feet wide (23 by 2.4 m), with a level surface of sand or clay, enclosed with boarded ends and sides about 18 inches (45 cm) and 12 inches (30 cm) high, respectively. Each player or team in turn rolls or tosses four wooden, metal, or composition balls, called *boce*, each 4–5 inches (10–13 cm) in diameter, toward a smaller ball, called the *boccino*, or *pallino*. The object, as in the game of lawn bowls, is to bring the ball to rest nearer the *pallino* than an opponent's ball, to protect a well-placed ball, or to knock aside an opponent's ball. Rebounds from the side walls are permitted. At the end of a round, a side receives a point for every ball nearer the *pallino* than the nearest opposing ball. The game usually proceeds until one side has 12 points.

Boccioni, Umberto (b. Oct. 19, 1882, Reggio di Calabria, Italy—d. Aug. 16, 1916, Verona), Italian painter, sculptor, and theorist of the Futurist movement in art.

Boccioni was trained from 1898 to 1902 in the studio of the painter Giacomo Balla, where he learned to paint in the manner of the Pointillists. In 1907 he settled in Milan and gradually came under the influence of the poet Filippo Marinetti, who launched the literary movement Futurism, which glorified the dynamism of modern technology. Boccioni adapted Marinetti's ideas to the visual arts and became the leading theoretician of Futurist art. In 1910 he and other painters drew up and published the "Technical Manifesto of the Futurist Painters," promoting the representation of the symbols of modern technology—violence, power, and speed.

Boccioni's first major Futurist painting, "Riot in the Gallery" (1909), remained close to Pointillism and showed an affiliation with Futurism mainly in its violent subject matter and dynamic composition. "The City Rises"

(1910–11), however, is an exemplary Futurist painting in its representation of dynamism, motion, and speed. The swirling human figures in these crowd scenes are repetitively fragmented according to the Futurist style, but the rhythmic, muscular energy they generate is unrelated to the Futurist cult of the machine.

Boccioni was probably influenced by Cubism in 1911–12, and about this time he also became interested in sculpture. In 1912 he published the "Manifesto of Futurist Sculpture," several of whose suggestions anticipated developments in modern sculpture. Boccioni advocated the use in sculpture of non-traditional materials such as glass, wood, cement, cloth, and electric lights, and he called for the combination of a variety of materials in one piece of sculpture. He also envisioned a new type of sculpture that would mold and enclose the space within itself. In practice, however, Boccioni's sculpture was much more traditional than his theories. Only "Development of a Bottle in Space" (1912) successfully creates a sculptural environment. His most famous work, "Unique Forms of Continuity in Space" (1913), is one of the masterpieces of early modern sculpture.

Boccioni enlisted in the army during World War I and was killed by a fall from a horse in 1916. He was the most talented of the Futurist artists, and his untimely death marked the virtual end of the movement.

Bochart de Saron, Jean-Baptiste-Gaspard (b. Jan. 16, 1730, Paris, France—d. April 20, 1794, Paris), French lawyer and natural scientist who became especially known for his advances in astronomy.

After having studied at the college of Louis-le-Grand, Bochart became legal counselor to the Parlement of Paris in 1748, master of requests in 1750, advocate general in 1753, a judicial president in 1755, and president of the Parlement of Paris in 1789 a few months prior to the outbreak of the French Revolution.

Well-to-do, he became a patron of the sciences, financing the publication of the marquis de Laplace's *Theory of the Movement and Elliptic Figure of the Planets* (1784) and developing one of Europe's largest and finest collections of reflecting telescopes and other astronomical instruments for his own use and the use of his scientific friends. Bochart's own studies included calculation of the orbits of comets, using data contributed by his long-time collaborator Charles Messier. In 1779 Bochart was received into the Academy of Sciences as an honorary member.

Bochart protested the dissolution of the Parlement and was guillotined during the Reign of Terror.

"Development of a Bottle in Space," bronze sculpture by Umberto Boccioni, 1912; in the Mattioli Collection, Milan, Italy

Giraudon/Art Resource, New York City

Bocher, Joan, Bocher also spelled BOUCHER, or BUTCHER, byname JOAN OF KENT, or JOAN KNEL (d. May 2, 1550, Smithfield, London, Eng.), English Anabaptist burned at the stake for heresy during the reign of the Protestant Edward VI.

Bocher first came to notice about 1540, during the reign of Henry VIII, when she began distributing among ladies of the court William Tyndale's forbidden translation of the New Testament. Subsequently, for beliefs that contradicted both Roman Catholic and Protestant orthodoxy, she was charged with heresy in 1543, but the charges were dropped after the intercession of higher authority, perhaps Henry VIII himself. In 1548, under the new monarchy, a group of divines headed by Archbishop of Canterbury Thomas Cranmer examined her, passed a sentence of excommunication, and handed her over to civil authority for punishment. More than a year later, after Cranmer and others unsuccessfully attempted to persuade her to recant, the lord chancellor condemned her to death, and she was burned at Smithfield.

Bôcher, Maxime (b. Aug. 28, 1867, Boston, Mass., U.S.—d. Sept. 12, 1918, Cambridge, Mass.), American mathematician and educator whose teachings and writings influenced many mathematical researchers.

Bôcher graduated from Harvard University in 1888 and received his doctorate from the University of Göttingen in 1891. Within months of acquiring his Ph.D., Bôcher was asked to join the faculty at Harvard as an instructor in mathematics; this association lasted until his death. He became an assistant professor in 1894 and, 10 years later, professor.

By combining teaching with his research in differential equations, series, and higher algebra, Bocher developed a considerable reputation. He published nearly a hundred papers and reviews, of which his work on algebra, published in 1907, provided new insights. His Harvard seminars were fully attended and served as a seminal training ground for many who went on to become mathematical leaders in teaching and research.

Bochner, Salomon (b. Aug. 20, 1899, Kraków, Austria-Hungary [now in Poland]—d. May 2, 1982, Houston, Texas, U.S.), Galician-born American mathematician and educator responsible for the development of the Bochner theorem of positive-definite functions and the Bochner integral.

Bochner graduated from the University of Berlin, receiving his Ph.D. there in 1921. After lecturing for several years at the University of Munich, where he wrote his first book on Fourier integrals, Bochner received an invitation in 1933 to join the faculty at Princeton University as an assistant professor. He immediately applied for U.S. citizenship, which was granted him in 1938. In 1946 he became a full professor and taught at Princeton until 1968, when he left to become professor of mathematics at Rice University.

Bochner was the author of *Several Complex Variables* (1948); *Fourier Transforms* (1949); *Harmonic Analysis and the Theory of Probability* (1956); *Fourier Integrals* (1959), which contains the theorem of positive-definite functions; and *The Role of Mathematics in the Rise of Science* (1966).

Bocholt, city, North Rhine-Westphalia Land (state), northwestern Germany, on the Aa, a stream near the Dutch border, just north of Wesel. Chartered in 1222 by the bishop of Münster, Bocholt derives its name from Buchenholz, the "beech wood" of its surroundings. Historic buildings include the Gothic Church of St. George (1415–86), the Dutch Renaissance town hall (1618–21, restored 1928–34), and the nearby castles of Anholt and Gemen. A centre of the textile industry, it also has iron foundries and machine works.

Annexations during the 1970s enlarged the city by more than a third. Pop. (1989 est.) 67,565.

Bochum, city, North Rhine-Westphalia Land (state), northwestern Germany, in the heart of the industrial Ruhr district. Chartered in 1298 and 1321, it passed to the duchy of Cleves (Kleve) in 1461 and to Brandenburg in 1609. A small agricultural town until the development of its iron, coal, and steel industries in the mid-19th century, it is now a commercial and cultural centre for the Ruhr. Its Diocese Church, or Propsteikirche (1599), is the only historic building intact after the destruction of the city centre in World War II. In the suburbs, however, the 13th-century Blankenstein Castle and an 11th-century church at Bochum-Stiepel still stand.

Bochum is the seat of Ruhr University (1965) and has an institute for satellite and space research, a planetarium (1964), and a college of administration, industry, and foreign trade. The city presents a modern appearance with new schools, housing estates, sports facilities, and a theatre (1953); it supports a municipal orchestra and a zoo. In 1975 Wattenscheid, a neighbouring city, was united with Bochum and serves, to some extent, as a dormitory suburb for the surrounding industrial complexes of Gelsenkirchen and Essen.

Until the late 1950s, mining was the city's economic mainstay; its importance is shown by the mining college, geologic and mining museums, the mining research institute, and the headquarters building of the miners' trade union, insurance, and cooperative organizations. The closure of the last mine in 1973 marked a new pattern in Bochum's economy. New industries have grown, particularly car factories. Metallurgy and allied industries are important; chemicals, textiles, beer, tobacco products, and electrical items are also manufactured. Pop. (1989 est.) 389,087.

Bock, Fedor von (b. Dec. 3, 1880, Küstrin, near Berlin, Ger.—d. May 1945, Lensahn, Holstein), German army officer and field marshal (from 1940), who participated in the German occupation of Austria and the invasions of Poland, France, and Russia during World War II.

Educated at the Potsdam military school, Bock was assigned to an infantry guards regiment in 1897 and advanced to a captaincy by 1914. Emerging from World War I as a major, he became commander of the 3rd Army group in 1920 and remained in that post until 1938, when Adolf Hitler made him commander of the 1st Army group. During the invasion of Belgium and France in May and June 1940, he commanded the lower Somme army group. He was one of the 12 German generals whom Hitler created field marshals of the Reich on July 19, 1940.

In 1941 Bock took command of the central German armies in the Russian campaign. He dealt the Russians some of their severest defeats in the early part of the campaign, notably at Bialystok and Minsk and also, later, at Smolensk and Vyazma. He unleashed six separate major offensives against Moscow in the fall of 1941 but failed to take the city. Then Bock began his series of "orderly retreats" and "defensive actions." He was later shifted to the southern front and led the columns that bludgeoned their way to Stalingrad in the big German summer offensive of 1942. He was relieved of his command when he complained of the strategic impracticality of operating massive German offensives simultaneously against Stalingrad and in the Caucasus. Bock was killed along with his wife and daughter in an air raid.

Bock, Hieronymus (Tragus) (b. 1498, Heidersbach, Ger.—d. Feb. 21, 1554, Hornbach), German priest, physician, and botanist who helped lead the transition from the philog-

ical scholasticism of medieval botany to the modern science based on observation and description from nature.

Little is known of Bock's life and career. He worked from 1523 to 1533 in Zweibrücken and then accepted a canonry in Hornbach. He became a follower of Martin Luther and was forced to leave Hornbach in 1550. He

Cherry tree (*Prunus avium*), woodcut by David Kandel from *De stirpium historia* (1552), Latin translation of *New Kreuterbuch* by Hieronymus Bock. By courtesy of the Lindley Library of the Royal Horticultural Society, London, photograph: The Cooper-Bridgeman Library, London

then served briefly as personal physician to the duke of Nassau, returning to Hornbach in 1551.

Bock's major work, the *New Kreuterbuch* (1539), broke from the past by providing detailed descriptions and (in the 1546 edition) careful illustrations of approximately 700 plants, which he classified on the basis of structural similarity.

Böcklin, Arnold (b. Oct. 16, 1827, Basel, Switz.—d. Jan. 16, 1901, Fiesole, Italy), painter whose moody landscapes and sinister allegories greatly influenced late 19th-century German artists and presaged the symbolism of the 20th-century Metaphysical and Surrealist artists.

Although he studied and worked throughout much of northern Europe—Düsseldorf, Antwerp, Brussels, and Paris—Böcklin found his real inspiration in the landscape of Italy, where he returned from time to time and where the last years of his life were spent.

Böcklin first won a reputation with the large mural "Pan in the Bulrushes" (c. 1857), which brought him the patronage of the king of Bavaria. From 1858 to 1861, he taught at the Weimar Art School, but his nostalgia for the Italian landscape pursued him. After an interval during which he completed his mythological frescoes for the decoration of the Public Art Collection (Öffentliche Kunstsammlung), Basel, he settled in Italy and only occasionally returned to Germany, and then to experiment with flying machines. During his last two decades, Böcklin's work became increasingly subjective, often showing fabulous creatures or being based on dark allegorical themes, as in "Island of the Dead" (1880), which provided the inspiration for the symphonic poem

The Isle of the Dead by the Russian composer Sergey Rachmaninoff. Such spectral scenes as his "Odysseus and Calypso" (1883) and "The

"Self-Portrait with Death as a Fiddler," oil on canvas by Arnold Böcklin, 1872, in the Nationalgalerie, Berlin

Pest" (1898) reveal the morbid symbolism that anticipated the so-called Freudian imagery of much 20th-century art.

Bocskay, István, German STEPHAN BOCSKAY (b. 1557, Kolozsvár, Transylvania [now Cluj-Napoca, Rom.]—d. Dec. 29, 1606, Kassa [now Košice], Slovakia), prince of Transylvania, who defended Hungarian interests when Hungary was divided into Ottoman and Habsburg spheres of influence.

Bocskay, engraving
Interfoto MTT, Hungary

Brought up at the court of the Báthorys, Bocskay won the confidence of Sigismund Báthory, prince of Transylvania, whom he advised to form an alliance with the Holy Roman emperor (who was also the Habsburg king of Hungary) instead of with the Ottoman sultan. When in 1599 Báthory's successors deprived Bocskay of his estates, he fled to Vienna to seek protection and redress. He was alienated, however, by the emperor Rudolf II's attempts to deprive royal Hungary of its constitution and the Hungarian Protestants of their religious liberties. Bocskay, a devout Protestant, therefore sought Turkish aid and helped the Turkish armies in driving the Habsburg forces out of Transylvania. As a reward the Hungarian Diet elected him prince of Transylvania in 1605, and he was recognized as such by the sultan Ahmed I, who sent him a magnificent jeweled crown made in Persia.

Although Bocskay refused to assume the title of king, he made skillful use of the Turkish alliance. Rudolf, faced with the possible loss of

Hungary and strongly urged by his brother the archduke Matthias, entered into negotiations with Bocskay and ultimately made peace with him by the Peace of Vienna (June 23, 1606). This treaty restored and guaranteed all constitutional and religious rights and privileges of the Hungarians in Transylvania and in royal (*i.e.*, Habsburg) Hungary. Bocskay was recognized as the prince of Transylvania, and the right of the Transylvanians to elect their own princes was affirmed. Soon afterward he concluded with the Turks the Treaty of Zsitvatorok, which confirmed the provisions of the Peace of Vienna. Bocskay's sudden death in 1606 was attributed to poison given him by his chancellor, Mihály Kátay, who was killed in the marketplace of Kassa (Košice in Slovakia) by the enraged followers of Bocskay.

Bocuse, Paul (b. Feb. 11, 1926, Collonges-au-Mont-d'Or, Fr.), French chef and restaurateur known for introducing and championing a lighter style of cooking.

Scion of a long line of restaurateurs, Bocuse apprenticed under several prominent chefs before taking over the family's failing hotel-restaurant in Collonges, near Lyon, in 1959. Before long he had attracted much attention with his innovative *nouvelle cuisine*, a style of cooking that emphasized lightly cooked vegetables, sparing use of dressings and sauces made from materials low in fats, and artfully simple presentation. Bocuse's abandonment of many conventions of traditional *grande cuisine* won many followers among younger chefs, and *nouvelle cuisine* soon appeared in many variants, especially in France and the United States. Bocuse's own restaurant was rated three stars by the influential *Guide Michelin*.

Among his books were *La Cuisine du marché* (1976; "The Cuisine of the Market"; Eng. trans. *Paul Bocuse's French Cooking*) and *La Journée du cuisinier* (1980; "The Day of a Chef").

BOD: see biochemical oxygen demand.

Bodawpaya (b. 1740/41—d. 1819, Amara-pura, Myanmar [Burma]), king of Myanmar, sixth monarch of the Alaungpaya, or Konbaung, dynasty, in whose reign (1782–1819) the long conflict began with the British.

A son of Alaungpaya (reigned 1752–60), the founder of the dynasty, Bodawpaya came to power after deposing and executing his grandnephew Maung Maung. In 1784 Bodawpaya invaded Arakan, the maritime kingdom on the eastern coast of the Bay of Bengal, captured its king, Thamada, and deported more than 20,000 people into Myanmar as slaves. When Arakan was made a Myanmar province in 1785, the borders of Myanmar and British India were contiguous for the first time. The king's success in Arakan led him to invade Siam (Thailand) in 1785, but his army was defeated.

Bodawpaya's rule in Arakan was so oppressive that the people revolted in 1794. When the king sent an army to crush the revolt, thousands of refugees fled to British territory, with Myanmar troops crossing the border in pursuit of the rebel leaders. Conditions on the border became so unsettled that in 1795 the British sent a representative to Amara-pura, the Myanmar capital, to negotiate with Bodawpaya. The disturbances continued, however, and Bodawpaya's campaigns in Assam added to the tension. Open conflict was narrowly avoided.

Bodawpaya was a fervent Buddhist who proclaimed himself *Arimittya* (*i.e.*, noble *maitreya*), the messianic Buddha destined to conquer the world. He persecuted heterodox sects; made drinking, smoking opium, and killing animals punishable by death; and built many pagodas. His most ambitious project was the Mingun pagoda, which, if completed, would have been 500 feet (150 m) high. Dur-

ing his reign, he made a major economic survey of the entire kingdom (1784).

Bode, Wilhelm von (b. Dec. 10, 1845, Calvörde, Prussian Saxony [Germany]—d. March 1, 1929, Berlin, Ger.), art critic and museum director who helped bring Berlin's museums to a position of worldwide eminence.

Having studied art, Bode became an assistant at the Berlin Museum in 1872. In 1906 he was named general director of all the royal Prussian museums, a post he held until his retirement in 1920. He wrote books and essays on the decorative arts as well as on his particular specialties—Rembrandt, 17th-century Dutch and Flemish painting, and Italian Renaissance sculpture. He greatly influenced the American collectors J.P. Morgan, Henry Clay Frick, and Peter A.B. Widener.

Bodel, Jehan, Jehan also spelled JEAN (b. c. 1167, Arras, Artois [France]—d. 1210, Arras), jongleur, epic poet, author of fabliaux, and dramatist, whose *Jeu de Saint Nicolas* ("Play of St. Nicholas") is the first miracle play in French.

Bodel probably held public office in Arras and certainly belonged to one of its *puys*, or literary confraternities. He planned to go on the Fourth Crusade but, stricken with leprosy, was admitted to a lazaret house, where he died. He wrote five *pastourelles* (four in 1190–94; one in 1199), nine fabliaux (1190–97), *La Chanson des Saisnes* (before 1200; "Song of the Saxons"), the *Jeu de Saint Nicolas* (performed 1200), and *Les Congés* (1202; "Leave-Takings"), his poignant farewell to his friends, a lyrical poem of 42 stanzas.

The *Jeu de Saint Nicolas* treats a theme presented in Latin, notably by Hilarius (flourished 1125), giving it new form and dimensions by relating it to the Crusades. In Bodel's play the saint's image, to which the sole survivor of a Christian army is found praying, becomes the agent of a miracle. The image is found by the victorious Saracens, but when placed upon the Saracen king's treasure it does not prevent the treasure's removal by thieves, who interrupt their dicing, drinking, and brawling (in tavern scenes given local colour by their portrayal of the people and manners of Arras) to carry it away. The saint himself appears, however, and compels the rogues to return the treasure, and as a result the Saracen king and his people are converted to Christianity.

In its crusading fervour, piety, and satirical wit, Bodel's *Jeu* is outstanding. It is also of importance because of the introduction of comic scenes based on contemporary life and for being possibly the first of the Latin college plays to be translated into vernacular verse. *La Chanson des Saisnes*, a successful late epic, adds *roman d'aventure* episodes to a historical narrative of Charlemagne's Saxon Wars.

Bodenheim, Maxwell, original name MAXWELL BODENHEIMER (b. May 26, 1893, Hermanville, Miss., U.S.—d. Feb. 6, 1954, New York, N.Y.), poet who contributed to the development of the Modernist movement in American poetry but is best remembered for his long career as a personality in literary bohemia.

Largely self-educated, Bodenheim appeared in Chicago around 1913, during the period of the Chicago Renaissance. He wrote plays with Ben Hecht and helped him edit the short-lived *Chicago Literary Times* (1923–24). Later they fell out, conducting a much-publicized feud and featuring each other as characters in their novels: Bodenheim appears as a character in Hecht's *Count Bruga* (1926), and Hecht appears in Bodenheim's *Ninth Avenue* (1926).

Bodenheim's poems were first published in *Poetry* magazine in 1914, and his first collection was *Minna and Myself* (1918). Several other volumes of poetry followed, his *Selected Poems, 1914–44* appearing in 1946. He em-

ployed many of the striking visual techniques of the Imagists.

Bodenheim settled in New York's Greenwich Village in the latter part of the 1920s. Novels as well as poems appeared regularly during that decade and the next, but increasing dissipation curtailed his output after World War II. He had been reduced to peddling his poems in bars when he and his third wife were found murdered by a former mental patient in their sleazy lodgings. Ben Hecht helped with the funeral expenses and portrayed Bodenheim with affection in his play *Winkelberg* (1958). Bodenheim's unfinished autobiography, *My Life and Loves in Greenwich Village*, appeared in 1954, shortly after his death. Among the better of his largely forgotten novels are *Blackguard* (1923), *Crazy Man* (1924), *Georgie May* (1927), *Sixty Seconds* (1929), and *Naked on Roller Skates* (1930).

Bodensee (Europe): see Constance, Lake.

Bodenstedt, Friedrich Martin von (b. April 22, 1819, Peine, Hanover [Germany]—d. April 18, 1892, Wiesbaden, Ger.), German writer, translator, and critic whose poetry had great popularity during his lifetime.

As a young man Bodenstedt obtained an appointment as head of a school in Tiflis (now Tbilisi, Georgia), where he made a study of Persian literature. His *Lieder des Mirza Schaffy* (1851; *The Songs of Mirza Schaffy*), a collection of poems written in an Oriental style, was instantly successful. In 1854 he became professor of Slavic languages at the University of Munich. During this period he made numerous translations from Russian authors, notably Aleksandr Pushkin, Ivan Turgenev, and Mikhail Lermontov. He relinquished his post (1858) to take up a professorship in early English literature and from that time devoted his attention primarily to William Shakespeare. He collaborated with others in a translation of Shakespeare's works (1866–72), and he himself translated the sonnets. In 1866 he was made director of the court theatre at Meiningen. Among his other

Bodenstedt, engraving, 1876, after a portrait by C. Kolb

Archiv für Kunst und Geschichte, Berlin

works are *Tausend und ein Tag im Orient* (1850; "One Thousand and One Days in the Orient"), *Shakespeares Zeitgenossen und ihre Werke* (1858–60; "Shakespeare's Contemporaries and Their Work").

Bodenstein von Karlstadt, Andreas Rudolf: see Karlstadt, Andreas Rudolf Bodenstein von.

Bode's law, also called TITIVS-BODE LAW, empirical rule giving the approximate distances of planets from the Sun. It was first announced in 1766 by the German astronomer Johann Daniel Titius and only popularized, from 1772, by his fellow countryman Johann Elert Bode. The rule may be given as follows: Write down the sequence 0, 3, 6, 12, 24, etc. To each number add 4. Divide each result by 10. Of the first seven answers (0.4, 0.7, 1.0,

1.6, 2.8, 5.2, 10.0), six closely approximate the distances from the Sun, in astronomical units (a.u.; the distance between the Earth and the Sun), of the six planets known when Titius devised the rule: Mercury, Venus, Earth, Mars, Jupiter, and Saturn. At about 2.8 a.u. from the Sun, between Mars and Jupiter, the asteroids (sometimes called minor planets) were later discovered. The rule also holds for the seventh planet, Uranus, which lies at about 19 a.u. Bode's law fails for the eighth planet, Neptune. However, Pluto, the ninth planet from the Sun, is at a distance (39 a.u.) roughly equal to that given by the rule for the eighth planet.

Bodh Gayā, also spelled BUDDH GAYĀ, village in central Biḥār state, northeastern India. It is situated west of the Phalgu River, a tributary of the Ganges. One of the holiest

The Mahābodhi temple at Bodh Gayā, Biḥār state, India

Art Resource

of Buddhist sites, it was there, under the sacred pipal, or bodhi (Bo) tree, that Gautama Buddha (Prince Siddhārtha) attained enlightenment and became the Buddha. A simple shrine was built by the emperor Aśoka (3rd century BC) to mark the spot, and this was later enclosed by a stone railing (1st century BC), part of which still remains. The uprights have representations of the Vedic gods Indra and Sūrya, and the railing medallions are carved with imaginary beasts. This shrine was replaced in the Kushān period (2nd century AD) by the present Mahābodhi temple, which was itself refurbished in the Pāla-Sena period (750–1200), heavily restored by Sir Alexander Cunningham in the second half of the 19th century, and finally restored by Myanmar (Burmese) Buddhists in 1882. The temple's central tower stands 180 feet (54 m) above the ground. A museum contains various Buddhist relics. Bodh Gayā is the site of Magadh University (1962). Pop. (1991 prelim.) 21,686.

bodhi (Sanskrit and Pāli: "awakening," "enlightenment"), in Buddhism, the final Enlightenment, which puts an end to the cycle of transmigration and leads to Nirvāṇa, or spiritual release; the experience is comparable to the Satori of Zen Buddhism in Japan. The accomplishment of this "awakening" transformed Siddhārtha Gautama into a Buddha (an Awakened One).

The final Enlightenment remains the ultimate ideal of all Buddhists, to be attained by ridding oneself of false beliefs and the hindrance of passions. This is achieved by following the course of spiritual discipline known as the Eightfold Path. Mahāyāna Buddhism, while embracing this ideal, places a high valuation on the compassion of the bodhisattva (one whose essence is *bodhi*), who postpones his own entrance into Nirvāṇa in order to work for the salvation of all sentient beings. See also Eightfold Path.

bodhi tree (Buddhism): see Bo tree.

Bodhidharma, Chinese (Wade-Giles romanization) TA-MO, Japanese DARUMA (fl. 6th century AD), Indian monk who is credited with the establishment of the Ch'an (Japanese: Zen) sect of Buddhism.

A native of Conjeeveram, near Madras, Bodhidharma in 520 traveled to Kuang (modern Canton), China. He was granted an interview with the Liang emperor Wu-ti, noted for his good works. To the emperor's dismay, he stated that merit applying to salvation could not be accumulated through good deeds. Soon afterward he went to a monastery in Loyang, China, where he is said to have spent nine years looking at a cave wall, a legend that some scholars believe refers simply to a lengthy period of deep meditation.

Considered the 28th Indian patriarch in a direct line from Gautama Buddha, Bodhidharma is regarded by the Ch'an as their first patriarch. Because he taught meditation as a return to the Buddha's spiritual precepts, his school was known as the Dhyana (meditation) sect. The word was converted in the Chinese to Ch'an and in the Japanese to Zen.

The accounts of his life are largely legendary. According to one such story, he cut off his eyelids in a fit of anger after falling asleep in meditation. On falling to the ground his eyelids grew up as the first tea plant. The legend serves as a traditional basis for the drinking of tea by Zen monks in order to keep awake during meditation.

bodhisattva (Sanskrit), Pāli BODHISATTA ("one whose essence is *bodhi* [enlightenment]"), in Buddhism, the historical Buddha, Gautama, prior to his Enlightenment; also, other individuals who are destined to become buddhas in this or in another life.

In Mahāyāna Buddhism the decision of the *bodhisattva* to postpone his own final entrance into Nirvāṇa in order to alleviate the suffering of others is given special valuation. The ideal of the *bodhisattva* supplants the earlier, Theravāda goal of the arhat, or disciple, who perfects himself by following the Buddha's teachings, and of the pratyeka buddha, or self-enlightened Buddha, both of whom are criticized by Mahāyāna as concerned solely with their own personal salvation. The *bodhisattva* concept elevates the virtue of compassion (*karuna*) to equality with wisdom (*prajna*). The *bodhisattva* exercises his compassion by transferring his own merit to his devotees.

Once the *bodhisattva* declares his intention, he enters the first of 10 spiritual stages (*bhūmi*) and henceforward is reborn only in the world of men or of gods. The aspirant *bodhisattva* must be a male but (according to Japanese schools) may live the life of a householder and need not be a monk.

Just as the number of buddhas in the world is theoretically limitless, so also the number of possible *bodhisattvas* is infinite. The title has been frequently applied to great scholars and teachers and, in Southeast Asia, was a conventional title honouring Buddhist kings.

The celestial *bodhisattvas*, who are considered to be manifestations of the eternal Buddhas, are, however, the great saviour figures who—particularly in East Asia—often eclipse the historical Buddha in the personal devotion they inspire. Foremost among the celestial *bodhisattvas* is the compassionate and merciful Avalokiteśvara, who is associated with the eternal buddha, Amitābha. In China the most widely worshiped *bodhisattvas* are Mañjuśrī (representing wisdom), Kṣitigarbha (the saviour of the dead), Samantabhadra (representing happiness), and Avalokiteśvara (known in China as Kuan-yin). In Tibet, Avalokiteśvara, Mañjuśrī, and Vajrapāṇi (who holds the thunderbolt) form a popular trinity.

Maitreya, represented both as a future Buddha and as a *bodhisattva*, is the only *bodhisattva* honoured by Theravādins (followers of the Way of the Elders and continuers of the early Hīnayāna teaching) as well as by Mahāyānists.

Bodin, Jean (b. 1530, Angers, France—d. June 1596, Laon), French political philosopher whose exposition of the principles of stable government was widely influential in Europe at a time when medieval systems were giving way to centralized states.

Bodin, engraving, 16th century
By courtesy of the Bibliothèque Nationale, Paris

In 1551 Bodin went to the University of Toulouse to study civil law and remained there, as student or teacher, until 1561. That year he abandoned the teaching of law for its practice and returned to Paris as *avocat du roi*, just as the civil wars between Roman Catholics and Huguenots were starting. In 1571 he entered the household of the king's brother, François, Duke d'Alençon, as master of requests and councillor. He himself appeared only once on the public scene, and that was as deputy of the third estate for Vermandois at the Estates-General of Blois in 1576. His disinterested conduct on that occasion lost him royal favour. He opposed the projected resumption of war on the Huguenots in favour of negotiation with them, and he also opposed Henry III's suggested alienation, or sale, of royal domains as damaging to the monarchy. When the Duke d'Alençon died in 1583, Bodin retired to Laon as *procurateur* to the presiding court. He remained there until his death 13 years later, from the plague.

Bodin's principal writing, *Six Livres de la République* (1576; *The Six Bookes of a Commonwealth*, 1606), won him immediate fame and was influential in western Europe into the 17th century. The bitter experience of civil war and its attendant anarchy in France had turned Bodin's attention to the problem of how to secure order and authority in a state. Bodin thought that the secret lay in recognition of the sovereignty of the state. According to him, supreme power is the distinctive mark of the state. This power is unique, absolute in that no limits of time or competence can be placed upon it, and self-subsisting in that it does not depend for its validity on the consent of the subject. Bodin assumed that governments command by divine right because government is instituted by providence for the well-being of humanity. Government consists essentially of the power to command, as expressed in the making of laws. In a well-ordered state, this power is exercised subject to the principles of divine and natural law; in other words, the Ten Commandments are enforced, and certain fundamental rights, chiefly liberty and property, are extended to those governed. But should these conditions be violated, the sovereign still commands and may not be resisted by his subjects, whose whole duty is obedience to their ruler. Bodin distinguished only three types of political systems—monarchy, aristocracy, and democracy—according to whether sovereign power rests in

one person, in a minority, or in a majority. Bodin himself preferred a monarchy that was kept informed of the peoples' needs by a parliament or estates-general.

Bodleian Library, library of the University of Oxford and one of the oldest and most important nonlending reference libraries in Great Britain. A legal deposit library entitled to free copies of all books printed in Great Britain, the Bodleian is particularly rich in Oriental manuscripts and collections of English literature, local history, and early printing.

A library was established at the University of Oxford by Thomas de Cobham (d. 1327), but it was not completely secured by the university until 1410. Then, Humphrey, Duke of Gloucester, endowed the institution with books and money for a room between 1411 and 1447. Completed in 1450, the room is still in existence.

With the impoverishment of the university, the development of printing, and the growth of college libraries, the university library declined in importance; and in 1550, Edward VI's commissioners withdrew what books were left. Soon after, the shelves were also dismantled. About 50 years later the library was restored by Sir Thomas Bodley (a collector of medieval manuscripts) and reopened in 1602. Bodley added new buildings, surrounding university buildings were taken over, and additions were made at various times up to the 19th century. A new building, connected with the old buildings by an underground way and designed by Sir Giles Gilbert Scott, was opened in 1946.

By agreement with the Stationers' Company in 1610 and later by the Press Licencing Act of 1662, the Bodleian was entitled to receive a free copy of all books printed in England.

The Radcliffe Camera of the Bodleian Library, University of Oxford, built by James Gibbs, 1737–49, to house the science library of John Radcliffe
Thomas Photos Oxford

The library built up a collection of more than 4,200,000 printed volumes and 50,000 manuscripts. The Bodleian Library includes the Old Library, the Radcliffe Camera, the New Library, and four dependent libraries.

Bodmer, Johann Georg (b. Dec. 6, 1786, Zürich, Switz.—d. May 30, 1864, Zürich), Swiss mechanic and prolific inventor of machine tools and textile-making machinery.

Information on Bodmer's life is scanty, but it is known that he lived in Switzerland, England, France, and Austria. Because many of his ideas were in advance of their time, his manufacturing ventures were not always successful. In 1803, at St. Blaise in the Black

Forest, he established a small firearms factory, employing a special series of machines to make interchangeable parts.

Bodmer later made three visits to England, the first in 1816, when he visited ironworks, engineering shops, and textile mills. In 1824 he established a small factory at Bolton, Lancashire, to manufacture machinery that made the process from carding to spinning wool continuous. Though this machinery was widely adopted in England and later in the United States and is said to have revolutionized the industry, its inventor does not appear to have profited, for that venture also failed, and he returned for a time to the European continent.

In 1833 he set up a machine shop in Manchester, equipped with machine tools he had designed and constructed for himself. Between 1839 and 1841 he patented more than 40 specialized machine tools that he then set up in an ingenious factory-type arrangement to produce parts from iron and steel. One of the most important was a machine to make gears; it could cut teeth of predetermined pitch, form, and depth in a metal blank. Bodmer also patented various steam-engine devices and is credited with inventing the cylinder with opposed pistons.

Bodmer, Johann Jakob (b. July 19, 1698, Greifensee, Switz.—d. Jan. 2, 1783, near Zürich), Swiss historian, professor, and critical writer who contributed to the development of an original German literature in Switzerland.

Bodmer, engraving by H. Pfenninger after a portrait by F. Tischbein
Archiv für Kunst und Geschichte, Berlin

Bodmer was professor of Helvetic history at the University of Zürich from 1725 until 1775 and from 1737 was a member of the Grosser Rat (cantonal legislature). In conjunction with others, he published (1721–23) *Die Diskurse der Mahlern*, a weekly journal after the model of *The Spectator*. His most important writings are the treatises *Von dem Einfluss und Gebrauche der Bildungskraft* (1727), *Von dem Wunderbaren in der Poesie* (1740), and *Kritische Betrachtungen über die poetischen Gemälde der Dichter* (1741), in which he pleaded for freeing the literary imagination from the restrictions imposed upon it by French Neoclassicism. Bodmer also engaged in studies of William Shakespeare, Torquato Tasso, Dante, and Miguel de Cervantes; translated Homer (in hexameters); rediscovered the importance of medieval German poetry (*Minnesang*, *Nibelungenlied*, *Parzival*); espoused the causes of Montesquieu and Jean-Jacques Rousseau; and thus played a part in European literature as a precursor of Johann Gottfried von Herder. In his own country he was an influential national educator. As a poet he was unsuccessful.

Bodmin, town ("parish"), North Cornwall district, county of Cornwall, England. The town lies on the edge of Bodmin Moor, a barren heathland covering an area of 80 square miles (207 square km). Bodmin grew around the main road to Land's End. The Cornish trade in tin, which was mined locally from Roman

times, led to Bodmin's medieval development as a "coinage," with the privilege of taxing tin bars. Most of the town is built of local stone. The Perpendicular-style church is named after St. Petroc, a Celtic missionary of the 6th century. Pop. (1991) 12,553.

Bodo, group of peoples speaking Tibeto-Burman languages in the northeastern Indian states of Assam and Meghalaya and in Bangladesh. The Bodo are the largest minority group in Assam and are concentrated in the northern areas of the Brahmaputra River valley. Most of them are settled farmers, though they formerly practiced shifting cultivation. The Bodo consist of a large number of tribes. Their western tribes include the Cütiya, Plains Kachāri, Rābhā, Gāro, Mech, Koch, Dhimāl, and Jaijong; the eastern tribes include the Dimasa (or Hill Kachāri), Galong (or Gallong), Hojai, Lalung, Tippera, and Moran. The Bodo were formerly dominant in Assam until about 1825. The total number of speakers of Bodo languages in India was estimated at about 2.2 million in the late 20th century.

The Bodo tribes are not culturally uniform. The social system of some, such as the Gāro, is matrilineal (descent traced through the maternal line), while other tribes are patrilineal. Several of the Bodo tribes were so influenced by Hindu social and religious concepts that in modern times they have regarded themselves as Hindu castes. Thus the Koch (*q.v.*) lay claim to the high Hindu status of Kshatriya; their claim is not generally admitted, however, and many of the subdivisions of the Koch rank very low in the caste hierarchy.

The Kachāri tribe is divided into clans named after aspects of nature (*e.g.*, heaven, earth, rivers, animals, and plants). Descent and succession to property are in the male line. They have a tribal religion, with an extensive pantheon of village and household gods. Marriage is usually arranged by the parents and involves the payment of a bride-price. Such institutions as the community house for bachelors and many features of their religion link them with the Nāga and other hill tribes of Assam, but the growing influence of Hindu ideas and customs works toward assimilation into the caste society of the Assam plains.

Bodø, town, port, and seat of Nordland fylke (county), north-central Norway. It is located at the end of a peninsula projecting into the Norwegian Sea, at the northern entrance to Salt Fjord. Bodø was founded by Trondheim merchants and chartered in 1816. A commercial-fishing centre specializing in cod drying, it also has ship repair yards and a brewery. In World War II much of the town was destroyed by German air and ground action, but it has been completely rebuilt and enlarged. Reconstruction included a large airport and the extension of the North Norway Railway to Bodø from Lønsdal to the south. Places of interest include the 13th-century Bodin Church and the Bodø Cathedral (Lutheran), a modern edifice (consecrated 1956). Bodø's far northern site enables the midnight sun to be seen for about a month (early June-early July). Pop. (1998 est.) mun., 40,388.

Bodoni, Giambattista (b. Feb. 16, 1740, Saluzzo, Piedmont [Italy]—d. Nov. 29, 1813, Parma, French Empire [now in Italy]), Italian printer who designed several modern typefaces, one of which bears his name and is in common use today.

The son of a printer, Bodoni left home as a boy to go to Rome, where he served an apprenticeship at the press of the Congregation for the Propagation of the Faith, the missionary arm of the Roman Catholic church. In 1768 he was asked to assume management of the Royal Press (Stamperia Reale), the press of the Duke of Parma. There he produced Italian, Greek, and Latin books and printed materials for court use.

Bodoni at first employed old-style typefaces with much decorative detail. He was gradually won over to the typographical theories of a French printer, Pierre Didot, however, and by 1787 was printing pages almost devoid of decoration and containing modern typefaces of his own design. The typeface that retained the Bodoni name appeared in 1790. Of the many books that he produced during this period, the best known is his *Manuale tipografico* (1788; "Inventory of Types"), a folio collection of 291 roman and italic typefaces, along with samples of Russian, Greek, and other types. A second edition of his book was published by his widow in 1818.

Bodoni, engraving
see Hulton Picture Library

By 1790 Bodoni had become widely known; important travelers visited his press, and collectors sought his books. The Duke of Parma gave him a larger press and more independence; he no longer had to confine himself to the duke's projects. Although his books were better known for their beauty and typographical excellence than for textual accuracy, he printed many important works, the most famous of which were his fine editions of the writings of Horace and Virgil in 1791 and 1793, respectively, and Homer's *Iliad* in 1808. The last years of his life brought Bodoni international fame. He received compliments from the pope and was honoured with a pension by Napoleon Bonaparte.

Bodrum, town, southwestern Turkey. It lies at the northern end of the Gulf of Kerme (ancient Ceramic Gulf) on the Aegean Sea, opposite the Greek island of Cos. It was built on the ruins of ancient Halicarnassus (*q.v.*) by the Hospitalers, a crusading order who occupied the site in 1402. Their spectacular castle, the Petronium, or Castle of St. Peter, remained a Christian stronghold until the Turkish sultan Süleyman I the Magnificent captured it in 1522. The castle continues to be the town's major landmark. The town was briefly occupied by Italy between 1919 and 1921. Bodrum is picturesquely situated before a backdrop of green hills and is now a growing tourist resort. Pop. (1990 prelim.) 21,273.

body, human: see human body.

body armour, also spelled BODY ARMOR: see armour.

body building, also spelled BODYBUILDING, a regimen of exercises designed to enhance the human body's muscular development. As a competitive activity, body building aims at displaying pronounced muscle tone and exaggerated muscle mass and definition for overall aesthetic effect. Barbells and dumbbells and other devices are used in the exercises. For the use of similar exercises for sports training and conditioning, general conditioning, and rehabilitation therapy, see weight training.

Body building was practiced from the time of the ancient Babylonians, but the modern competitive form grew largely out of European strong-man theatrical and circus acts of the 19th century. The first American physique contest, staged by physical culturist Bernarr Macfadden (1868-1955), took place in 1903

in New York City, with the winner named "the most perfectly developed man in America." Thereafter many promoters staged body-building competitions, the most important annual events becoming the International Federation of Body Builders' Mr. Universe contest (founded in 1947) and its later and more prestigious Mr. Olympia contest. From the 1920s through the '60s, Charles Atlas, the 1922 Macfadden title winner, vigorously promoted the activity through a program of mail-order lessons advertised around the world.

The premier figure in the history of the sport, or art, was the Austrian-born American body builder Arnold Schwarzenegger, who won the Mr. Olympia title seven times (1970-75, 1980). Competition for women began in the 1970s.

body heat, thermal energy that is a by-product of metabolism in higher animals, especially noticeable in birds and mammals, which exhibit a close control of their body temperature in the face of environmental fluctuation. Birds and mammals can conserve body heat by fluffing up feathers or erecting their hairs and by reducing blood flow to the exterior surface and extremities. They can increase body heat by shivering and exercise. Excessive body heat is dispelled chiefly by increasing blood flow to the surface and extremities, by sweating or panting, and by maximizing exposure of the body surface to the surroundings.

In humans, body heat is regulated to provide a normal temperature of 37° C (98.6° F). The brain stem, specifically the thermostatic region of the hypothalamus, is the centre of temperature regulation. When it becomes deranged, as during infections, heat is conserved unnecessarily and the temperature can exceed the normal range (see fever).

body modifications and mutilations, intentional permanent or semipermanent modifications of the living human body for religious, aesthetic, or social reasons. The methods of modification and mutilation used are incision, perforation, complete or partial removal, cautery, abrasion, adhesion, insertion of foreign bodies or materials, compression, distention, diversion, enlargement, and staining.

Body modifications are frequently performed for magical and medical purposes, but cosmetic (aesthetic) motives are perhaps equally common. The variability of the results in different cultures is an excellent indication of the relativity of ideals of beauty. Ritualistic motives for modification are concerned with religion (sacrifice, ascetic mortification), magical protection, mourning, the indication of status or rank or group membership, bravado, and punishment. The practice of ritual mutilation is generally used to modify the social position of an individual in a manner visible to and recognized by other members of the society. Mutilation may be performed as a part of initiation, marriage, or mourning rites, or it may be inflicted as a means of punishment, either for serious crimes or for social transgressions.

The head. Mutilation and modification of the head includes alterations of the skull, lips, teeth, tongue, nose, eyes, or ears. Cephalic deformation is the best-documented form, largely because archaeological skeletal remains clearly show its presence. Tabular deformations are produced by constant pressure of small boards or other flattened surfaces against the infant's head (see head flattening). Annular deformations are produced by a constricting band; each kind is subdivided according to the resulting head shape, which is often strikingly different from the normal. Cranial deformation is known from all continents except Australia and from Oceania. It is rather rare in Africa south of the Sahara and apparently absent from south India.

Perforation of the lower lip (or less often the upper) for insertion of a decorative plug or other ornament is widespread in Africa and among lowland South American Indians and was formerly common among Indians of the northwest North American coast and the Eskimo. The most striking instance is that of the women of the Sara tribe of central Africa (commonly known as Ubangi after the name erroneously applied in P.T. Barnum's publicity), whose lips are slit and then stretched by saucer-shaped plugs.

Dental mutilations take the form of removal, usually of one or more incisors (ancient Peru, most Australian Aborigines, some groups in Africa, Melanesia, and elsewhere); pointing in various patterns by chipping (Africa) or filing (ancient Mexico and Central America); filing of the surface, sometimes into relief designs (Indonesia); incrustation with precious stones or metal (Southeast Asia, India, ancient Mexico, and Ecuador); insertion of a peg between the teeth (India); and blackening (south India, hill peoples in Myanmar [Burma], some Malaysian groups.)

Ancient Aztec and Maya Indians drew a cord of thorns through the tongue as a form of sacrifice; some Australian tribes draw blood from gashes under the tongue at initiation rites.

For the insertion of decorative objects through the nose, perforation of the septum, or one or each of the wings, or alae (or both procedures combined), is widespread among South American Indians, Melanesians, and inhabitants of India and Africa; it is sporadic elsewhere (e.g., Polynesians, North American Indians).

The ancient Maya Indians considered crosseyes beautiful and induced the condition by hanging an object between a baby's eyes.

Perforation of the earlobe for insertion of an ornament is widespread. Sometimes the hole is gradually stretched to carry a larger ornament or to yield a greater distended pendant margin. More rarely, ornaments are inserted in holes along the auricular margin (eastern North American Indians and some African and tropical South American groups).

The genitalia. The best-known and most widespread genital modification is circumcision (*q.v.*). Subincision (opening the urethra along the inferior surface of the penis for a varying distance between the urinary meatus and the scrotum) is a common practice at puberty initiations among Australian Aborigines and is recorded as a therapeutic measure among Fijians, Tongans, and Amazonian Indians. Customary unilateral castration (monorchy) is known in central Algeria, among the Beja (Egypt), Sidamo (Ethiopia), San and Khoikhoi (southern Africa), and some Australian Aborigines, and on Ponape Island (Micronesia). Bilateral castration was common to produce eunuchs for Muslim harem attendants and for several centuries (until prohibited by Pope Leo XIII in the late 19th century) to produce male sopranos or contraltos called castrati (*see* castrato) for ecclesiastical chants in the Roman Catholic church. Bilateral castration is a mutilation mentioned as punishment for adultery among the Azande (central Africa), Babylonians, ancient Egyptians, ancient Chinese, and elsewhere.

Among the Toradja and Sadang (Celebes) and some Dayak groups (Borneo), many adult men wore a penis pin, knobbed on each end and averaging about 1.5 inches (4 cm) long, in a permanent perforation through the glans, to increase pleasure in their sexual partners. The Alfur (Celebes) inserted pebbles under the skin of the glans for the same purpose.

Female modifications include excision (of part or all of the clitoris—clitoridectomy, female circumcision—and sometimes also of the labia, mons, or both), in much of Africa,

ancient Egypt, India, Malaysia, and Australia, and among the Skoptsy (a Russian Christian sect); incision (of the external genitalia, without removal of any part) among the Totonac (Mexico) and tropical South American Indians; infibulation (induced adhesion of the labia minora, leaving only a small orifice, to prevent sexual intercourse until the orifice is reopened by incision) in the Horn of Africa and among some Arabs; dilatation (of the vaginal orifice, often with incision) among some Australian Aborigines; elongation of the labia (*tablier*), recorded for southern Africa and the Caroline Islands; and artificial defloration (among Australian Aborigines and elsewhere).

The limbs. Constriction of the arms or legs by tight bands may cause permanent enlargement of the unstricted area. The custom occurs among several East African and tropical South American peoples and also sporadically in Nigeria, Southeast Asia, and Melanesia.

From the T'ang dynasty (AD 618–907) until the 20th century, many Chinese women had their feet tightly bound in early childhood; forming the famous "golden lily" feet, much reduced in size and deformed to match the aesthetic ideal.

Amputation of a phalanx or whole finger, usually as a form of sacrifice or in demonstration of mourning, was common among North American Indians, Australian Aborigines, San and Khoikhoi, Nicobarese, Tongans, Fijians, and some groups in New Guinea, South America, and elsewhere. Amputation of the toes is less common but occurred in Fijian mourning.

The skin. Mutilation and modification of the skin are accomplished primarily by tattooing and cicatrization, or scarification (*see* tattoo). In the former, colour is introduced under the skin; in the latter, raised scars (keloids) are produced by incision or burning, usually in decorative patterns. Scarification occurs primarily among darker-skinned peoples in much of Africa, among Australian and Tasmanian aborigines, and in many Melanesian and New Guinean groups; it is practiced both for aesthetic effect and to indicate status or lineage. Another form of skin modification is the introduction of objects under the skin: e.g., magical protective amulets inserted under the skin by some Myanmar (Burmese).

The torso. Mutilation and modification of the torso focus on the neck, trunk, and breasts. The Padaung women of Myanmar are famous for necks stretched by a coiled brass neck ring to a length of about 15 inches (38 cm), with about four thoracic vertebrae pulled up into the neck.

The shape of the breasts has sometimes been customarily altered for aesthetic reasons by compression (e.g., in the Caucasus, in 16th–17th century Spain) or distention (e.g., among the Payaguá of Paraguay). Silicone gel implants to enlarge the breasts came into use in the United States and other modern societies in the second half of the 20th century. Mutilations are also known: removal of the right breast by the Amazons of classical legend; removal of both nipples of both breasts for religious reasons by the Skoptsy; amputation of the breasts as punishment under Hammurabi's Code.

Among several African peoples (Efik, Ganda, Nyoro, and others), girls were secluded at puberty for several months and fattened with special diets. Women in Middle Eastern harems were also artificially fattened for aesthetic reasons. The reverse effect was achieved in Europe by means of tight-fitting corsets that caused permanent and often deleterious deformations of the rib cage and internal organs.

Boë, Franz de le: *see* Sylvius, Franciscus.

Boë, Jacques: *see* Jasmin, Jacques.

Boece, Hector, Latin BOETHIUS (b. c. 1465, Dundee, Angus, Scot.—d. c. 1536), historian

and humanist, author of an important Latin history of Scotland.

Boece was educated at Dundee and the University of Paris, where he was appointed regent (professor) of philosophy and became a friend of Desiderius Erasmus. He was chief adviser to William Elphinstone, bishop of Aberdeen, in the foundation of the University of Aberdeen and was that institution's first principal and, as such, lectured on divinity. He received a small pension from the Scottish court (1527–34) and was a canon of Aberdeen, vicar of Tullynessle, and then rector of Tyrie.

Boece's fame rests on his history of Scotland, *Scotorum historiae a prima gentis origine* (1526; *The History and Chronicles of Scotland*). Boece's history is a glorification of the Scottish nation, based on legendary sources, and is more interesting as romance than as history. It had wide currency abroad in a French translation, and the plot of William Shakespeare's *Macbeth* is ultimately traceable to it.

Boegoebergdam, concrete irrigation dam, on the middle Orange River, Northern Cape province, South Africa. The Orange River flows through a hard quartzite outcrop at the dam site. Built in 1931, the Boegoebergdam irrigates about 42,000 acres (17,000 hectares) for about 150 miles (240 km) on both sides of the river, an area where about one-half of South Africa's cotton crop is grown.

Boehm, Theobald, Boehm also spelled BÖHM (b. April 9, 1794, Munich, Bavaria [Germany]—d. Nov. 25, 1881, Munich, Ger.), German flutist, composer for the flute, and flute maker whose key mechanism and fingering system were widely adopted by later makers.

The son of a goldsmith, Boehm studied flute and became a Munich court musician in 1818. In 1828 he opened a factory in which in 1832 he developed the first so-called Boehm flute, characterized by a system of levers (keys) and rings for controlling the opening and closing of the tone holes. The ring keys allow a finger to close a hole and at the same time, by means of a rod or axle attached to the ring, to activate another key distant from the finger. By using keys it is possible to place the holes where they are acoustically needed and to make them as large as necessary for proper intonation, without regard to the size of the hand.

Boehm's original system was improved by many flute makers, notably the Frenchman Auguste Buffet, through whose skill the Boehm system became widely used in the late 1830s. The flute system was accepted readily in France and England but more slowly in Germany. In 1847 Boehm designed and applied his keywork system to the cylindrical flute body and parabolic head joint; the new design was widely accepted and is essentially the modern orchestral flute. A Boehm-system clarinet was exhibited as early as 1839, and Boehm-system oboes are also found.

Boehm invented an iron-smelting process that bears his name, as well as an improved piano-stringing design, and he conducted extensive research in acoustics. The degree to which his flute improvements were completely innovative or represent refinements of contemporary developments is a matter of controversy.

boehmite, white and relatively soft basic aluminum oxide [AlO(OH)] that is a common mineral in bauxite, in which it forms disseminated grains or pealike masses. It is especially abundant in European bauxites, sometimes as the main constituent; bauxites from the Western Hemisphere commonly contain only a few percent boehmite. Deposits exist at Gánt and Barátka, Hung.; Stangenrode, Ger.; Ayr, Scot.; and Recoux, Pécille, and Cadarcet, France. Boehmite is dimorphous (identical in

composition but differing in crystal structure) with diaspore; its crystals have orthorhombic symmetry. For detailed physical properties, see oxide mineral (table).

Boeing Company, American aerospace company—the world's largest—that is the foremost maker of commercial jet transports. It is also a leading producer of military aircraft, helicopters, spacecraft and launch vehicles, and missiles, a standing significantly enhanced with its acquisition of the aerospace and defense units of Rockwell International (*q.v.*) in 1996, its merger with McDonnell Douglas (*q.v.*) in 1997, and its acquisition of the satellite business of Hughes Electronics in 2000. Headquarters were in Seattle, Wash., until 2001, when Boeing announced its decision to move them to Chicago within the year.

Boeing's origin dates to 1916 when William E. Boeing founded Aero Products Company. Renamed Boeing Airplane Company in 1917, the enterprise built flying boats for the U.S. Navy during World War I, and in the 1920s and '30s it developed a variety of aircraft for the U.S. military. In the late 1920s it expanded into airmail services, and in 1928 William Boeing formed Boeing Airplane & Transport Corporation to encompass both manufacturing and airline operations. Subsequently the company was renamed United Aircraft and Transport Corporation and acquired several aircraft makers and airlines. In 1934, under new federal antitrust guidelines, aircraft manufacture was divorced from air transport, and a newly incorporated Boeing Airplane Company (along with United Airlines and United Aircraft) emerged from the breakup of United Aircraft and Transport.

Prior to and during World War II, Boeing built several notable commercial aircraft, and its legendary piston-engine bombers, the B-17 Flying Fortress and the B-29 Superfortress, played key roles in the Allied war effort. After the war it developed the B-52 jet bomber, a mainstay of U.S. strategic forces until the 1990s. It also introduced the first American jetliner, the Boeing 707 (entered service 1958). The company went on to create a highly successful series of jetliners, which by the start of the 21st century formed seven families—the narrow-body 737 and 757; the wide-body 747, 767, and 777; the 717 (formerly the McDonnell Douglas MD-95); and the MD-11. Beginning in the 1980s Boeing entered into partnerships to build a number of military aircraft, including the B-2 stealth bomber (with Northrop Grumman), the V-22 Osprey tiltrotor aircraft (with Bell Helicopter Textron), and the F-22 stealth fighter (with Lockheed Martin).

In 1960 Boeing purchased Vertol Aircraft, then the world's largest independent manufacturer of helicopters. As Boeing Helicopters, the unit developed the CH-47 Chinook and CH-46 Sea Knight military transport helicopters. Boeing's work on missiles, which began in 1945, resulted in such weapons as the silo-launched Minuteman intercontinental ballistic missile and the Air-Launched Cruise Missile. In 1961 the company removed "Airplane" from its name to reflect its growing involvement in other businesses.

In the space sector during the 1960s, Boeing built the Lunar Orbiters, Lunar Roving Vehicles, and the first stage of the Saturn V rockets for the U.S. Apollo program. Later it developed the Inertial Upper Stage, a two-stage payload delivery vehicle that could be taken into space by a space shuttle or an expendable launch vehicle. Beginning in 1993, Boeing served as the U.S. National Aeronautics and Space Administration's prime contractor for the International Space Station.

Boémia, Martinho de: see Behaim, Martin.

Boémond (name of princes of Antioch and counts of Tripoli): see under Bohemond.

Boeotia, Modern Greek Βοιωτία, district of ancient Greece with a distinctive military, artistic, and political history. It corresponds somewhat to the modern *nomós* (department) of Boeotia, the administrative centre of which is Levádhia. The *nomós* extends farther to the northwest, however, to include part of ancient Phocis (Fokís). It is bounded by Attica (Atikí; southeast), the Gulf of Corinth (south), Phocis (west), the Gulf of Euboea (east), and the *nomós* of Fthiótis (north).

Boeotia has two extensive fertile plains separated by a low ridge, an outlier of Mount Helicon (5,735 feet [1,748 m]) on which Thebes (Thívai) stands. The northern plain is a drained basin that formerly contained Lake Kopaís, once the largest lake in Greece, and now a fertile plain growing cereals and cotton and supporting pedigreed cattle. The southern plain is watered by the Asopós River.

In classical times the much-reorganized Boeotian defensive league figured prominently in the rivalry between Athens and Sparta. The league led an uprising against Sparta during the Corinthian War (395–387 BC) and in the Battle of Chaeronea (338) was thoroughly decimated in the struggle to preserve Greek independence from Macedonia. When Boeotia rose again (335) against Alexander III the Great, it was destroyed and thereafter was of little consequence.

In spite of a harsh climate (the hills effectively block sea breezes), modern Boeotia's fertile plains produce wheat, corn (maize), tobacco, olives, and grapes. Bauxite is mined and converted to alumina and aluminum at a large plant at Áspra Spítia, on the Gulf of Corinth. A highway and rail line enters Boeotia's northwest-southeast-trending valley east of Delphi, running southeast past Thebes; the highway then swings northward to Chalcis (Khalkís), while the rail line passes around the hills to Attica, paralleled by the new superhighway from Athens. Area (*nomós*) 1,240 square miles (3,211 square km). Pop. (1991) 134,108.

Boeotian League, league that first developed as an alliance of sovereign states in Boeotia, a district in east-central Greece, about 550 BC, under the leadership of Thebes. After the defeat of the Greeks at Thermopylae, Thebes and most of Boeotia sided with the Persians during the Persian invasions of 480 and 479. Subsequently, the victorious Greeks dissolved the Boeotian League as punishment. The Boeotians remained weak until 446, when they revolted against Athenian domination and reconstituted the league in alliance with Sparta. The league later opposed Sparta in the Corinthian War (395–387) and was defeated and again dissolved.

Before the Corinthian War the league had become a close-knit confederacy, organized in 11 districts by 431. Each district, comprising one or more cities, sent a general (boeotarch), several judges, and 60 counselors to a federal government; the federal council of 660 was probably divided into four panels, each in turn convening for one year. The vote was given only to the propertied classes. Thebes, where the council met, dominated the league since it controlled four districts and supplied the best contingent to the federal army.

In 379 Thebes joined Athens in a successful effort to overturn Spartan supremacy in Greece. The league was then reconstituted on an initially successful democratic basis: all Boeotians, whatever their property, were members of an assembly convened at Thebes; their vote decided all matters of policy. The seven-man executive (one from each of the then seven districts, of which Thebes controlled three) was directly responsible to the Assembly. Other districts under federal systems joined Boeotia: Euboea, Acarnania, Phocis, Thessaly, Arcadia, and Achaea. But this great block of military power was soon split by imperialist ambitions, and the Boeotian

League itself destroyed Orchomenus (364) and intervened in the Achaean League (366) and Arcadian League (362).

Decline set in rapidly when Phocis hired mercenaries and ravaged Boeotia in the Sacred War (355–346), which Philip II of Macedon ended as an ally of Thebes. Thebes suffered defeat, however, along with Athens, when Philip quelled their efforts to maintain Greek independence in 338 at the Battle of Chaeronea. The Boeotian League was again dissolved, and after an abortive revolt (335) against Alexander the Great of Macedon, Thebes and the rest of Boeotia fell permanently under external domination.

Boer (Dutch: "husbandman," or "farmer"), a South African of Dutch or Huguenot descent, especially one of the early settlers of the Transvaal and the Orange Free State. Today, descendants of the Boers are commonly referred to as Afrikaners.

In 1707 the white population of Cape Colony stood at 1,779, largely of Dutch and German stock, with some French Huguenot lines. For the most part, the modern Afrikaner people have descended from those enumerated in 1707. Afrikaners in the late 20th century made up roughly 60 percent of the white population, approximately 2,600,000 people.

In 1652 the Dutch East India Company sent out a party of soldiers and officials under Jan van Riebeeck to establish a shipping station on the Cape of Good Hope. In the early years the company encouraged immigration, but after the first decade of the 18th century Cape Colony grew largely by natural increase. Though the colony prospered, over half the white population eventually turned to the life of the *trekboeren* (wandering farmers). With the Cape Town market for agricultural produce glutted and slaves doing the work of the colony, there was nothing to keep the increase of the white population in the southwestern Cape and much to encourage them to disperse and to become self-sufficient pastoral farmers. The Boers were hostile both toward Africans, with whom they fought frequent range wars, and toward the government of the Cape, which was attempting to restrain their movements and their commerce.

The Boers developed their own subculture, based on self-sufficient patriarchal communities. They were wandering pastoralists with little interest in sedentary agriculture. The Boers compared their way of life to that of the Hebrew patriarchs of the Old Testament. Staunch Calvinists, the Boers saw themselves as the children of God in the wilderness, a Christian elect divinely ordained to rule the land and the backward natives therein. Further, by the end of the 18th century, they, like the rest of the Cape Colony whites, spoke Afrikaans, a language deviating from Dutch.

As a result of the Napoleonic Wars, the Cape Colony became a British possession in 1806. Though at first they accepted British administration, the Boers soon grew disgruntled with the liberal policies of the British, especially in regard to the frontier and the freeing of the slaves. Between 1835 and 1843 about 12,000 Boers left the colony in the Great Trek, heading for the relatively empty spaces of the high veld and southern Natal. In 1852 the British government agreed to recognize the independence of the settlers in the Transvaal (later the South African Republic) and in 1854 of those in the Vaal-Orange rivers area (later the Orange Free State). Both countries committed themselves to apartheid, a policy of strict inequality in church and state between the black and white populations.

The discovery of diamonds and gold between 1867 and the end of the century set the stage for the South African War (1899–

1902), which had its origins in British claims of suzerainty over the wealthy South African Republic and British concern over the Boer refusal to grant civic rights to the Uitlanders (immigrants, largely British, to the Transvaal gold fields and diamond fields).

Supported by the Orange Free State and some of the Cape Dutch, the South African Republic waged battle against the British Empire for more than two years. Though brilliant practitioners of guerrilla warfare, the Boers eventually surrendered to British forces in 1902, thus ending the independent existence of the Boer republics. The Afrikaners, however, retained their language and culture and eventually attained politically the power they had failed to establish militarily.

Boer War: see South African War.

Boerhaave, Hermann (b. Dec. 31, 1668, Voorhout, Neth.—d. Sept. 23, 1738, Leiden), Dutch physician and professor of medicine who was the first great clinical, or “bedside,” teacher.

Boerhaave graduated in philosophy from the University of Leiden in 1684 and in medicine from the academy at Harderwijk in 1693. He spent the whole of his professional life at the University of Leiden, serving as professor of

Boerhaave, detail of a portrait by Cornelis Troost; in the Rijksmuseum, Amsterdam

botany and of medicine, rector of the university, professor of practical medicine, and professor of chemistry. By his brilliant teaching he restored the prestige of the Faculty of Medicine at the University of Leiden, and students came from all parts of Europe to hear his lectures. Through his pupils Boerhaave exerted an influence on later medical teaching at Edinburgh, at Vienna, and in Germany, and he is often credited with founding the modern system of teaching medical students at the patient's bedside.

Boerhaave's principal works are textbooks that were widely used during and after his lifetime: *Institutiones Medicae* (1708; “Medical Principles”), *Aphorismi de Cognoscendis et Curandis Morbis* (1709; “Aphorisms on the Recognition and Treatment of Diseases”), and *Elementa Chymiae* (1724; “Elements of Chemistry”). Boerhaave's reputation as one of the greatest physicians of the 18th century lay partly in his attempts to collect, arrange, and systematize the mass of medical information that had accumulated up to that time.

Boerhaave Museum, byname of ROYAL MUSEUM OF THE HISTORY OF NATURAL AND EXACT SCIENCES, DUTCH RIJKSMUSEUM VOOR DE GESCHIEDENIS VAN DER NATUURWETENSCHAPPEN EN VAN DE GENEESKUNDE, in Leiden, Neth., museum of the history of natural sciences and one of the foremost European museums of its type. It has a fine collection of old scientific instruments. There is a collection of microscopes belonging formerly to Antonie van Leeuwenhoek (1632–1723) and

thermometers from the collection of D.G. Fahrenheit (1686–1736).

Consult the INDEX first

Boesak, Allan (Aubrey) (b. Feb. 23, 1946, Kakamas, S.Af.), South African clergyman who was one of South Africa's leading spokesmen against the country's policy of racial separation, or apartheid.

Boesak was born to Christian parents who were classified as Coloured (of mixed European and African ancestry) by the South African government. From an early age he had been interested in preaching, and at age 17 he entered the University of the Western Cape to begin his theological studies. Frustrated by the attitudes of his white teachers at the all-Coloured university, Boesak was eventually persuaded to remain in the Dutch Reformed Mission Church (Nederduitse Gereformeerde Sendkerk, the Coloured branch of the Dutch Reformed Church) by Beyers Naudé, a white minister who had been cast out for his anti-apartheid position. Boesak was ordained in the Dutch Reformed Church in 1968. From 1970 to 1976 he studied in The Netherlands and in the United States. After he returned to South Africa, he became politically active, teaching and preaching while organizing opposition to South African government policies. In 1982 he persuaded members of the World Alliance of Reformed Churches to declare apartheid a heresy and to suspend membership of the white South African churches; he was also elected president of the alliance. In 1983 he helped organize the United Democratic Front (UDF), a multiracial association of all manner of groups opposed to apartheid, and in 1984 he and others organized a massive boycott of the national elections. He was arrested a number of times for his participation in demonstrations, and his movements and speech were restricted.

Boesak's doctoral dissertation, *Farewell to Innocence: A Socio-Ethical Study on Black Theology and Black Power*, was published in 1977. His other books included *The Finger of God: Sermons on Faith and Socio-Political Responsibility* (1982) and *Black and Reformed: Apartheid, Liberation, and the Calvinist Tradition* (1984).

Boesmanland, also called BUSHMANLAND, historic region in northeastern Namibia traditionally inhabited by the San (Bushmen). A part of the northwestern Kalahari (desert), Boesmanland is a semiarid region having deep, permeable sand beds with a vegetational cover consisting of perennial grasses, low-lying shrubs, and thorny woodlands. The San of Boesmanland (and of the Kalahari in general) were increasingly forced to congregate around boreholes and water storage basins at isolated settlements (such as Tsumkwe) as the water table of the Kalahari was lowered by the introduction of grazing cattle. The government has encouraged their instruction in rudimentary agricultural techniques and animal husbandry. By late 20th century, many San had become labourers and trackers in settled areas.

Boethius, Anicius Manlius Severinus (b. AD 470–475?, Rome? [Italy]—d. 524, Pavia?), Roman scholar, Christian philosopher, and statesman, author of the celebrated *De consolatioe philosophiae* (*Consolation of Philosophy*), a largely Neoplatonic work in which the pursuit of wisdom and the love of God are described as the true sources of human happiness.

The most succinct biography of Boethius, and the oldest, was written by Cassiodorus, his senatorial colleague, who cited him as an accomplished orator who delivered a fine eulogy of Theodoric, king of the Ostrogoths who made himself king of Italy. Cassiodorus also mentioned that Boethius wrote on theology,

composed a pastoral poem, and was most famous as a translator of works of Greek logic and mathematics.

Other ancient sources, including Boethius' own *De consolatioe philosophiae*, give more details. He belonged to the ancient Roman family of the Anicii, which had been Christian for about a century and of which Emperor Olybrius had been a member. Boethius' father had been consul in 487 but died soon afterward, and Boethius was raised by Quintus Aurelius Memmius Symmachus, whose daughter Rusticiana he married. He became consul in 510 under the Ostrogothic king Theodoric. Although little of Boethius' education is known, he was evidently well trained in Greek. His early works on arithmetic and music are extant, both based on Greek handbooks by Nicomachus of Gerasa, a 1st-century-AD Palestinian mathematician. There is little that survives of Boethius' geometry, and there is nothing of his astronomy.

It was Boethius' scholarly aim to translate into Latin the complete works of Aristotle with commentary and all the works of Plato “perhaps with commentary,” to be followed by a “restoration of their ideas into a single harmony.” Boethius' dedicated Hellenism, modeled on Cicero's, supported his long labour of translating Aristotle's *Organon* (six treatises on logic) and the Greek glosses on the work.

Boethius had begun before 510 to translate Porphyry's *Eisagogē*, a 3rd-century Greek introduction to Aristotle's logic, and elaborated it in a double commentary. He then translated the *Kategoriāi*, wrote a commentary in 511 in the year of his consulship, and also translated and wrote two commentaries on the second of Aristotle's six treatises, the *Peri hermeneias* (“On Interpretation”). A brief ancient commentary on Aristotle's *Analytika Protera* (“Prior Analytics”) may be his too; he also wrote two short works on the syllogism.

About 520 Boethius put his close study of Aristotle to use in four short treatises in letter form on the ecclesiastical doctrines of the Trinity and the nature of Christ; these are basically an attempt to solve disputes that had resulted from the Arian heresy, which denied the divinity of Christ. Using the terminology of the Aristotelian categories, Boethius described the unity of God in terms of substance and the three divine persons in terms of relation. He also tried to solve dilemmas arising from the traditional description of Christ as

Boethius, detail of a miniature from a Boethius manuscript, 12th century; in the Cambridge University Library, England (MS li.3.12[D])

By courtesy of Cambridge University Library, England

both human and divine, by deploying precise definitions of “substance,” “nature,” and “person.” Notwithstanding these works, doubt has at times been cast on Boethius’ theological writings because in his logical works and in the later *Consolation*, the Christian idiom is nowhere apparent. The 19th-century discovery of the biography written by Cassiodorus, however, confirmed Boethius as a Christian writer, even if his philosophic sources were non-Christian.

In about 520 Boethius became *magister officiorum* (head of all the government and court services) under Theodoric. His two sons were consuls together in 522. Eventually Boethius fell out of favour with Theodoric. The *Consolation* contains the main extant evidence of his fall but does not clearly describe the actual accusation against him. After the healing of a schism between Rome and the church of Constantinople in 520, Boethius and other senators may have been suspected of communicating with the Byzantine emperor Justin I, who was orthodox in faith whereas Theodoric was Arian. Boethius openly defended the senator Albinus, who was accused of treason “for having written to the Emperor Justin against the rule of Theodoric.” The charge of treason brought against Boethius was aggravated by a further accusation of the practice of magic, or of sacrilege, which the accused was at great pains to reject. Sentence was passed and was ratified by the Senate, probably under duress. In prison, while he was awaiting execution, Boethius wrote his masterwork, *De consolatione philosophiae*.

The *Consolation* is the most personal of Boethius’ writings, the crown of his philosophic endeavours. Its style, a welcome change from the Aristotelian idiom that provided the basis for the jargon of medieval Scholasticism, seemed to the 18th-century English historian Edward Gibbon “not unworthy of the leisure of Plato or Tully.” The argument of the *Consolation* is basically Platonic. Philosophy, personified as a woman, converts the prisoner Boethius to the Platonic notion of Good and so nurses him back to the recollection that, despite the apparent injustice of his enforced exile, there does exist a *summum bonum* (“highest good”), which “strongly and sweetly” controls and orders the universe. Fortune and misfortune must be subordinate to that central Providence, and the real existence of evil is excluded. Man has free will, but it is no obstacle to divine order and foreknowledge. Virtue, whatever the appearances, never goes unrewarded. The prisoner is finally consoled by the hope of reparation and reward beyond death. Through the five books of this argument, in which poetry alternates with prose, there is no specifically Christian tenet. It is the creed of a Platonist, though nowhere glaringly incongruous with Christian faith. The most widely read book in medieval times, after the Vulgate Bible, it transmitted the main doctrines of Platonism to the Middle Ages. The modern reader may not be so readily consoled by its ancient modes of argument, but he may be impressed by Boethius’ emphasis on the possibility of other grades of Being beyond the one humanly known and of other dimensions to the human experience of time.

After his detention, probably at Pavia, he was executed in 524. His remains were later placed in the church of San Pietro in Ciel d’Oro in Pavia, where, possibly through a confusion with his namesake, St. Severinus of Noricum, they received the veneration due to a martyr and a memorable salute from Dante.

When Cassiodorus founded a monastery at Vivarium, in Campania, he installed there his Roman library and included Boethius’ works on the liberal arts in the annotated reading list (*Institutiones*) that he composed for the education of his monks. Thus, some of the literary habits of the ancient aristocracy entered the monastic tradition. Boethian logic domi-

nated the training of the medieval clergy and the work of the cloister and court schools. His translations and commentaries, particularly those of the *Katēgoriai* and *Peri hermeneias*, became basic texts in medieval Scholasticism. The great controversy over Nominalism (denial of the existence of universals) and Realism (belief in the existence of universals) was incited by a passage in his commentary on Porphyry. Translations of the *Consolation* appeared early in the great vernacular literatures, with King Alfred (9th century) and Chaucer (14th century) in English, Jean de Meun (a 13th-century poet) in French, and Notker Labeo (a monk of around the turn of the 11th century) in German. There was a Byzantine version in the 13th century by Planudes and a 16th-century English one by Elizabeth I.

Thus the resolute intellectual activity of Boethius in an age of change and catastrophe affected later, very different ages; and the subtle and precise terminology of Greek antiquity survived in Latin when Greek itself was little known. (J.Shi.)

Boethius, Hector: see Boece, Hector.

Boethius, member of a Jewish sect that flourished for a century or so before the destruction of Jerusalem in AD 70. Their subsequent history is obscure, as is also the identity of Boethus, their founder. Because of evident similarities, some scholars tend to view the Boethusians as merely a branch of the Sadducees. Both parties, they point out, associated with the aristocracy and denied the immortality of the soul and the resurrection of the body, because neither of these doctrines was contained in the written Torah, or first five books of the Bible. The Boethusians testified to their disbelief in the “world to come” by living lives of luxury and by ridiculing the piety and asceticism of the Pharisees. The Talmud—the authoritative compendium of law, lore, and commentary—speaks of the Boethusians in derisive tones. Still other scholars have argued that the Boethusians should be identified with the Essenes and Dead Sea Sect and that the word *Boethusian* may not derive from the name Boethus but from *Beth Essaya*, or Essenes.

Boetoeng, also spelled BOETON (Indonesia): see Butung.

Boeuf River, also spelled BOEUFF, river rising in southeastern Arkansas, U.S., and flowing southwest between the Bartholomew and Mason bayous into Louisiana, entering the Ouachita River in Catahoula Parish. Part of the river’s 230-mile (370-kilometre) course is

navigable. The name Boeuf is derived from the French word for ox, or steer.

Boeyens, Adrian Florenz. (pope): see Adrian VI.

Boffa, town and fishing port, western Guinea, West Africa, on the Pongo Estuary formed by the Fatala River on the Atlantic coast. The surrounding region is drained by the Fatala River and is mainly inhabited by the Baga and Susu (Soussou) peoples. The town is the chief trading centre for fish, swamp rice, bananas, and palm oil and kernels. Once a collecting point for slaves, it became a French trading post in the 1860s and was an important exporter (1870–1914) of wild rubber. Its wharf, 10 miles (16 km) upstream, can accommodate vessels of 16-foot (5-metre) draft at high tide, but the development of Conakry’s port (50 miles [80 km] south-southeast) and shifting sandbars and mangrove swamps in the Pongo Estuary greatly reduced Boffa’s importance as a port. Boffa was the site of Guinea’s first Catholic (Holy Ghost Fathers) mission (1877) and its first French school (1878). Pop. (1983 prelim.) 28,885.

Boffrand, (Gabriel-)Germain (b. May 7, 1667, Nantes, Fr.—d. March 18, 1754, Paris), French architect noted for the great variety, quantity, and quality of his work.

Boffrand went to Paris in 1681, where, after studying sculpture for a time under François Girardon, he entered the workshop of the architect Jules Hardouin Mansart. As early as 1690, he received a commission to design buildings for the king, and in 1709 he was placed in charge of the decoration of the apartments of the Hôtel de Soubise (begun 1732). In 1710 the princesse de Condé commissioned his enlargement of the Palais Bourbon, a project noted for the large staircase added by Boffrand.

Boffrand, best known for his *Livre d’architecture* . . . (1745; “Book of Architecture”), was instrumental in spreading French taste across 18th-century Europe. He was responsible for a multitude of works, great and small, including plans for the new palace of Nantes and construction of the great altar for Nantes cathedral. He also built several private houses in Nantes and Paris. Between 1718 and 1728 Boffrand directed the work on the Arsenal in Paris and in 1722 was asked to restore the chamber of the Palais de Justice.

Boffrand also worked abroad: he built a fountain in the gardens of the favourite château of

Salon de la Princesse in the Hôtel de Soubise, Paris, by Germain Boffrand, begun 1732

J.E. Bulloz

Maximilian II Emanuel, the elector of Bavaria, and assisted Balthasar Neumann in 1724 in designing the episcopal Residency (1719–44) in Würzburg. Boffrand next restored the rose window of the transept of Notre-Dame de Paris (1725–27) and in 1727 constructed the Hospice des Enfants of the general hospital, for which he was appointed chief architect in 1728.

In 1732 he was appointed inspector general of roads and bridges of France. Boffrand's noted later achievements were his restoration (1746) of the Saint-Esprit chapel and the door he built (1748) for the cloister of Notre-Dame. In addition to his vast architectural accomplishments and the *Livre d'architecture*, Boffrand left *Description de ce qui a été pratiqué pour fonder en bronze d'un seul jet la figure équestre de Louis XIV*... (1743; "Description of What Was Done to Cast in a Single Jet the Equestrian Statue of Louis XIV").

bog, type of wetland ecosystem characterized by wet, spongy, poorly drained peaty soil. Bogs can be divided into three types: (1) typical bogs of cool regions, dominated by the growth of bog mosses, *Sphagnum*, and heaths, particularly *Chamaedaphne* (northern bogs with trees growing on them are often called muskegs); (2) fens, dominated by grasslike plants, grasses, sedges, and reeds; and (3) tropical tree bogs, in which the peat may be formed almost entirely from tree remains. Typical, or *Sphagnum*, bogs are highly acid with a pH (index of acidity-alkalinity) of less than five (seven being neutral) and are associated with waters containing no more minerals than are contained in rainwater, often the only source of water for a bog. Fens are watered with groundwater that has some dissolved minerals and that has a pH above five; that is, it is only moderately acid. Fens and bogs are often associated in one area that usually is called a bog. Tropical bogs occur only in areas where the water is very low in minerals. They are less common than swamps but still cover extensive areas in Malaya, Indonesia, tropical South America, and Africa.

Typical bogs have simple floras. Other than the *Sphagnum*s and heaths, there are a few sedges and grasses, such as cotton grass; insectivorous sundews; pitcher plants; and many orchids. Desmids, a group of unicellular green algae divided into symmetrical halves, are characteristic of bogs. Animals are not common on bogs.

*Sphagnum*s are large mosses with large empty cells with pores opening to the outside that lie between the chlorophyll-bearing cells of the leaves. These empty cells readily absorb and retain water, giving a spongelike quality to the moss. *Sphagnum* absorbs minerals (cations) from the water, replacing them with acid (hydrogen ions), and thus makes the water around itself more acid.

The saturation of the moss with water retards passage of air, so that parts of a mass of *Sphagnum* more than a few inches from the surface are usually anoxic. The combination of lack of oxygen, lack of minerals, and highly acid condition greatly retards the action of bacteria and fungi, the usual decay organisms. With the retardation of decomposition of the dead moss, a *Sphagnum* peat develops under the living plants. This is particularly the case in areas where there is a mean annual temperature of below 10° C (50° F), which also retards decay.

Bogs are most common in parts of the world glaciated during the Pleistocene Epoch (10,000 to 2,500,000 years ago). They cover vast areas in the tundra and boreal forest regions of Canada, northern Europe, and Russia. Areas of high rainfall farther to the south, such as the wetter parts of the British Isles, also con-

tain extensive bogs. Glacial ice created many local depressions by scouring underlying rocks and spreading an uneven deposit of till on the ground. With the melting of the ice, these depressions filled with water. If the mineral content of the water was low, the ponds so formed were colonized by *Sphagnum*, which converted them to bogs.

Once bogs are formed, they retard the development of efficient drainage by inhibiting water movement and slowing erosion of the soil or rocks on which they rest. Thus, bogs tend to be long-lived if temperatures remain low and sufficient excess of rainfall over evaporation exists to prevent their drying out. If they do dry out, upland plants will colonize the former bog.

Small lakes in glaciated regions have also often developed into bogs if they were not drained by headward erosion of stream beds or completely filled with terrestrial sediments. The lake begins to fill by the development of a floating mat of vegetation next to the shore. This may become a fen, with grasses and sedges principally involved, if the lake water has sufficient mineral content. A lake on resistant rocks, poor in minerals, will develop a floating bog mat with *Sphagnum* and *Chamaedaphne*. In larger lakes, wave action will not allow such floating mats to develop.

As the mat grows into the water, it floats at the surface supported by air in the plant tissues. Upward growth shades the lower parts and these die, forming an increasingly thick floating mat, the top of which remains only a few inches above the level of the lake surface. Slow decay and mechanical disturbances break off waterlogged bits from the bottom of the mat. These sink and collect on the lake bottom so that the lake is filled from both the bottom up and the top down. The material collecting on the lake bottom is very fine, only a little denser than the water. It does not compact into a firm layer but forms a false bottom layer through which heavy objects fall to the solid original lake bottom.

From the surface down, the layers are (1) floating bog, (2) clear water, (3) false bottom, and (4) true bottom. With the continued thickening of the mat there is less influence of the lake water on plant growth, and *Sphagnum* usually begins to invade the surface of the mat even if it was previously dominated by grasses. With the growth of the moss a true bog is formed and various heaths invade the mat, especially *Chamaedaphne*. With continued thickening, trees may begin to grow, the first usually being larch (*Larix*). Black spruce may invade in the last stages of bog development. From a distance it may be difficult to detect the original boundary between the upland and the now filled lake.

During much of this process the vegetation is floating. The bog is called a quaking bog to indicate the instability of the surface, which will sink slightly beneath a weight. It is even possible to break through the vegetation into the water beneath. Both people and animals have drowned this way. Nonfloating bogs may also quake if the peat is thick and spongy.

Ultimately, by upward and centripetal growth, the bog fills the lake completely. The original glacial basin will then contain a bottom layer of inorganic sediment combined with organic debris derived both from lake production and from terrestrial sources surrounding the lake. On top of that, a layer of false-bottom material, compacted by the weight of overlying peat, may be visible. Bog peat fills the remainder of the basin. Growth of the bog does not necessarily stop at this stage for, if rainfall is sufficient, the water-retaining properties of *Sphagnum* are sufficient to maintain a wet, stagnant environment above the original water table represented by the lake surface. Thus, continued upward growth of the bog plants creates a raised bog. The raised bog is similar to the ordinary bog except that

it does not lie in a depression but is raised above the surroundings. A moat containing some open water typically surrounds a raised bog where water drains from the raised bog and surrounding upland. Because the moat receives upland drainage it may be a fen. The raised bog itself receives only rainwater. Because rain is very low in mineral content, the raised bog is more completely dominated by the characteristics of *Sphagnum* than that of the floating bog. Heaths, larches, and black spruce, which grow fairly well on the floating bog, survive only as stunted specimens around the edges of the raised bog.

The peat underlying a *Sphagnum* bog is composed largely of partly decomposed moss. There may be some inclusion of windblown particles, pollen, and dust. The water content of peat may be as high as 90 percent. The ash content of dried peat varies from 2 to 20 percent, with lower values more usual because the higher ash amounts come from sand and clay blown into the peat when it was at the surface. Other chemical characteristics of peat underlying bogs are the absence of free oxygen; the presence of carbon dioxide at high pressure, though in small amounts; low electrolyte concentration; and high acidity.

In general, temperatures in lowland tropical areas are high enough for organic decay to be too fast for large quantities of peat to accumulate. But in areas with very high rainfall and with groundwater of very low mineral content, bogs may occur. As is the case in colder regions, the bogs may fill low basins, or they may develop into raised bogs. The plants of these bogs are mainly broad-leaved evergreen trees, which may be as tall as 100 feet (30 metres). Palms and screw-pines may also occur. The number of kinds of plants of these bogs is very limited in comparison with the surrounding forests, just as is the case in colder bogs. Toward the centre of the raised bogs, trees are shorter or absent. Grasses and sedges cover more of the ground and open pools of water may occur. *Sphagnum* does not grow in tropical bogs to any extent, and the peat is composed of the remains of seed plants. The limited number of species is caused entirely by the lack of any groundwater supply of minerals and the rapid removal, by heavy rainfall, of those that arrive in dust.

bog rosemary, also called MOORWORT (*Andromeda polifolia*), low evergreen shrub, of the heath family (Ericaceae), native to bogs in northeastern North America, northern and central Europe, and northern Asia. The plant

Bog rosemary (*Andromeda polifolia*)
G.E. Hyde from the Natural History Photographic Agency

grows 30 to 60 centimetres (1 to 2 feet) tall and has a creeping rootstock and green leaves about 3 cm long. The small white flowers grow in small terminal clusters.

Bogalusa, city, Washington parish, southeastern Louisiana, U.S., at the northern terminus of the Pearl River Navigation Canal, 60 mi (97 km) north of New Orleans, near the Mississippi border. Founded in 1906 by the Great Southern Lumber Company and named after a local creek (Bogue Lusa: Choctaw for "dark" or "smoky" waters), it has through reforestation programs remained a major logging centre producing yellow-pine lumber, paper, and tung oil (from Chinese tung trees, first planted in 1902). It is the site of Louisiana State University Forestry School and state and federal agricultural experiment stations. Its basic forest economy is supplemented by light manufacturing and agriculture. Inc. 1914. Pop. (1990) 14,280.

Bogan, Louise (b. Aug. 11, 1897, Livermore Falls, Maine, U.S.—d. Feb. 4, 1970, New York City), poet and literary critic who served as poetry critic for *The New Yorker* from 1931 until 1969. Described by poet Marianne Moore as "compactness compacted," Bogan's poetry resembles that of the English Metaphysical poets in its restrained, intellectual style and use of traditional techniques. Yet it is modern, both deeply personal and immediate.

Bogan's poems first appeared in the *New Republic*. *Body of This Death* was published in 1923. She later wrote verse and literary criticism for *The New Yorker*, *Poetry: A Magazine of Verse*, *Atlantic Monthly*, and *The Nation*. Among other honours, Bogan was awarded the John Reed Memorial Prize (in 1930) and two Guggenheim Fellowships, and her *Collected Poems 1923-1953* (1954) received the Bollingen Prize in Poetry. As a critic Bogan became known for fairness and generosity, because she focussed on the strengths of authors in such works as the survey *Achievement in American Poetry 1900-1950* (1955) and *Selected Criticism: Prose, Poetry* (1955). Other works include *The Sleeping Fury* (1937), *The Blue Estuaries: Poems 1923-1968* (1968), and *A Poet's Alphabet* (1970).

Boganda, Barthélemy (b. April 4, 1910, Bobangui, French Equatorial Africa—d. March 29, 1959, near Bangui), the major nationalist leader of the Central African Republic (formerly Oubangui-Chari) in the critical decolonization period of the 1950s. His strong popular support was unmatched by that of any other political figure in the four colonies of French Equatorial Africa. Stridently anti-colonial but pragmatic, he could (and did) make "deals" with the colonial administration and European businessmen to gain his ends.

Born of a peasant family, Boganda became the first African Roman Catholic priest in Oubangui-Chari and was sponsored by the Catholic missions as a candidate in the November 1946 elections to the French National Assembly. He won against an administration-backed candidate but soon denounced the missions as well as the colonial administration and left the French Catholic party, *Mouvement Républicain Populaire*, and the priesthood. In 1949 he founded his own party, *Mouvement pour l'Évolution Sociale de l'Afrique Noire*, which he dominated completely. In the 1951 campaign a French administrator briefly arrested him for "endangering the peace."

From then on Boganda's prestige was essentially unchallenged. Even the French realized it was useless to oppose him and in 1953 appointed a new governor to conciliate him. In 1956 he also came to an agreement with

French businessmen, who offered him financial support in return for European representation on municipal and territorial election lists.

Secure at home, Boganda, in 1957 and 1958, turned his attention to French Equatorial Africa as a whole (which also included Chad, Gabon, and the French Congo). He hoped for a federation of these states under African rather than French control, and for the eventual creation of a "United States of Latin Africa" that would also include Angola, the Belgian Congo, Ruanda-Urundi, and Cameroon. By late 1958 this dream was shattered, and he turned back to the future Central African Republic, where he was killed a few months later in an airplane crash.

Bogardus, James (b. March 14, 1800, Catskill, N.Y., U.S.—d. April 13, 1874, New York City), inventor and builder who popularized cast-iron construction, which was commonly used in American industrial and commercial building from 1850 to 1880. He did so by shipping prefabricated sections from his factory in New York City to construction sites, and he further popularized the new method of building by his authorship of *Cast Iron Buildings: Their Construction and Advantages* (1858). This method of supporting the weight of construction by columns, rather than the walls, was a significant step toward later development of skeleton framing and skyscrapers. Bogardus' first use of these methods (1848) was in his own five-story factory in New York City. His other inventions included a means of engraving postage stamps that was used by the British government, the ring flier used for many years in cotton spinning, and rubber cutting, glass pressing, and deep-sea sounding and drilling machines.

Bogart, Humphrey, original name HUMPHREY DFOREST BOGART (b. Dec. 25, 1899, New York City—d. Jan. 14, 1957, Hollywood), actor who became a preeminent motion picture "tough guy" and was a top box-

Humphrey Bogart in *Sahara*, 1943

office attraction during the 1940s and '50s. In his performances he created an image of a weather-beaten, individualistic adventurer with a touch of idealism hidden beneath a deadpan exterior. Offscreen he appeared to be a cynical loner, granting only minimal concessions to Hollywood conventions, and became a cult hero of the American cinema.

The son of a prominent surgeon and a famous illustrator, Bogart served in the United States Navy during World War I. A wood splinter accidentally penetrated his upper lip

and stiffened it, giving him a physical characteristic that was later one of his screen trademarks. He began a stage career playing juvenile roles in drawing-room comedies and made his screen debut in *Broadway's Like That* (1930). Achieving little success in films, he returned to New York. His portrayal of the murderer Duke Mantee in the Broadway production of *The Petrified Forest* (1935) and later in the film version (1936) was a turning point in his career. Throughout the late 1930s he was a popular gangster figure in crime pictures starring Edward G. Robinson, James Cagney, and others. In 1941 Bogart attained stardom for his portrayals of Mad Dog Roy Earle, the aging gangster in *High Sierra* (1941), and then as Sam Spade, the hard-boiled private detective in *The Maltese Falcon* (1941). Other famous characterizations followed, e.g., the expatriate cabaret proprietor Rick in *Casablanca* (1942); the greedy prospector Fred C. Dobbs in *The Treasure of the Sierra Madre* (1948); a gin-drinking boatman in *The African Queen* (1951), for which he won an Academy Award for best actor; the neurotic Captain Queeg in *The Caine Mutiny* (1954); a burnt-out journalist in *The Harder They Fall* (1956). Bogart formed a sensational screen partnership with Lauren Bacall, his fourth wife (whom he married in 1945), in a number of pictures: *To Have and Have Not* (1944), *The Big Sleep* (1946), *Dark Passage* (1947), and *Key Largo* (1948).

Boğaziçi (Turkey): see Bosphorus.

Boğazköy (Turkish: Gorge Village), modern BOĞAZKALE, also spelled BOĞHAZKEUI, village, north-central Turkey. Located 17 mi (27 km) northwest of Yozgat, it is the site of the archaeological remains of Hattusas (Hattusa, Hattusha, or Khattusas), the ancient capital of the Hittites, who established a powerful empire in Anatolia and northern Syria in the 2nd millennium bc.

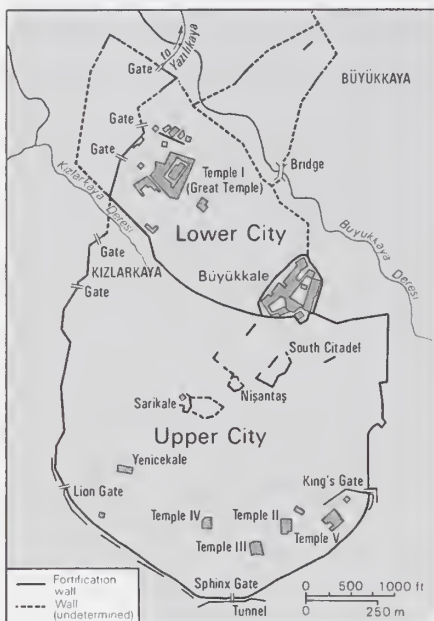

The ancient city. The ancient city occupies a section of a mountain slope at the southern end of a small fertile plain. It lies between two deeply cut streambeds, filling the angle between their converging courses. Their confluence at the level of the plain (elevation about 3,100 ft) marks the northernmost point of the city area, which rises toward the south by about 1,000 ft (300 m) on a length of 1/4 mi. The eastern valley narrows in some places to form a pronounced gorge.

The earliest settlement in the city area dates to the 3rd millennium bc, in the so-called Early Bronze Age. There are no written documents that would reveal the identity of the first settlers. Remains of this period were found on top and at the northwest foot of the high hill dominating the east side of the city, known as Büyükkale (Great Fortress), which later became the acropolis of the Hittite kings.

The earliest written sources found at Boğazköy are clay tablets inscribed in cuneiform writing in the Old Assyrian language. They attest the presence of Assyrian merchants on the site, which at that time was called Hattus. The largest Assyrian trade colony was at Kanesh (Kültepe, near Kayseri). Whereas the latter flourished from around 1950 to 1850 bc and, after a destruction, reemerged sometime around 1820 and lasted through another two generations, that of Boğazköy is contemporary with only this later period.

Hattus was the name of the city also in the language of the early inhabitants of the "Land of Hatti," a language still little understood and not belonging to any known family. Scholars call it Hattic to distinguish it from Hittite, the name of the Indo-European official language of the Hittite kingdom. Just as in other parts of the world, the Indo-European speakers must have been invaders who conquered

the older population, but the exact date and the details are unknown, except that individuals bearing Indo-European Hittite names are attested before 1850 in Kanesh in documents

Plan of Boğazköy

After Hattusha. *The Capital of the Hittites* by Kurt Bittel, copyright © 1970 by Oxford University Press, Inc., reprinted by permission

of the older Assyrian colony. In Hattus the population or its rulers may still have been "Hattians" even during the later colony period, but there is no proof of it. The houses of the merchants were in the lower city. The town extended up to Büyükkale, probably culminating in the palace of the local king. Both this town and the merchants' houses were destroyed, probably by King Anittas of Kussara (after 1800). A Hittite text ascribed to Anittas tells of his conquests in Anatolia and how he defeated King Piyusti of Hattus, destroyed the city, and put a curse on the site.

The Indo-European speakers added the vowel *a* to the city name and declined it according to their language; thus the nominative case became Hattusas. The first mention of the name in the form of Hattusas is on a tablet from Mari, on the middle Euphrates, datable to the time of Hammurabi (or Hammurapi; 1792–50); possibly this refers to the city before its destruction by Anittas.

About the middle of the 17th century BC, another king of Kussara, disregarding Anittas' curse, made Hattusas his capital; while his own name was Labarnas, he became known as Hattusilis I, "The One from Hattusas." He is the first ruler of whom there are authentic texts in the Hittite language and one of the founders of the Old Hittite kingdom. One of his successors, Hantilis, is said to have fortified the city. The line of the Old Hittite city wall can be followed today; it surrounds the northern terraces and follows the edge of the eastern valley up to Büyükkale, which must then have been the acropolis; in the west it descends along a side valley to the lower terrace.

Hattusas remained the capital throughout Hittite history with few interruptions. The sources tell of one destruction of the city by enemies around 1380 BC. Soon afterward, King Suppiluliumas I not only restored the city but, by his conquest of most of Anatolia and of Syria to the Lebanon, made it the capital of a real empire. Scholars have wondered how this empire could be ruled from such a remote place. Apart from tradition, it must have been the natural advantages of the site—plen-

tiful water and the protection provided by the terrain—that kept the dynasty at Hattusas. King Muwatallis (around 1300 BC) is said to have transferred the capital to the south "upon the command of the gods." The real reasons behind this move are not known, and his successor brought the government back to Hattusas where it remained to the end.

In the New Kingdom, or Empire, Period (c. 1400–c. 1190 BC) the city was extended toward the south: the wide arc of the city wall, running from Büyükkale up to the top and down along the western valley, dates from the New Kingdom. The inclusion of these southern hills strengthened the fortification system considerably, especially by the sophisticated construction of the highest section. Here a deep fosse, or moat, and a high earth rampart carrying the wall protected the city against the hills to the south, while a corbelled tunnel, called Yerkapu (Ground Gate), a paved glacis (or defensive slope), and flights of steps aided the defenders. The gates with sculptural decoration also belong to this period: the King's Gate in the southeast (whose relief of a warrior god has been removed to the Archaeological Museum in Ankara) and the Lion Gate in the southwest.

Although temples are mentioned in the Old Kingdom, the actual temple ruins all date from the New Kingdom. Four temples in the upper city belong to the extension just mentioned. Also the Great Temple in the lower city, in the shape revealed by excavation with its large complex of subsidiary buildings, is a work of the empire. The acropolis, Büyükkale, was completely rebuilt in a monumental manner during the same period.

A further extension of the city wall across the gorge so as to enclose the plateau of Büyükkaya (Great Rock), east of the valley, belongs to the 13th century, as do the reliefs and structures at the rock sanctuary, Yalılıkaya, about a mile from the city on the slope of the eastern mountains.

Residential quarters have been excavated only in small parts. Large sections of the city area are taken up by temples and other official buildings, while other parts are too precipitous for building. It is therefore not possible to estimate the population of the city.

With the downfall of the Hittite Empire (c. 1190 BC) the city was destroyed; traces of burning are found in all parts. The site, it seems, remained vacant for a long time. The next settlement, mainly on Büyükkale and in the lower city, was in size and layout much more modest than the Hittite capital. Through pottery and other finds, this settlement is linked to the Phrygians, to whose kingdom the region belonged in the 8th century BC. These post-Hittite settlements saw several rebuildings and lasted into the Hellenistic Age (3rd to 1st centuries BC), when a tribe of the Galatians, Celtic invaders from Europe, settled in the region. There are only scattered remains of Roman and early Christian times, after which the place was again uninhabited until the foundation of the village of Boğazköy in the 18th century AD.

Excavations. Boğazköy was discovered in 1834 by the French explorer Charles Texier, who saw Yalılıkaya and those remains of the ancient city that were above ground. After visits by British and German travellers, it was another Frenchman, Ernest Chantre, who in 1892–93 made the first soundings and found the first cuneiform tablets there. The language in which these texts were written was not known at the time, but its identity with that of the so-called Arzawa letters found in Tell el-Amarna in Egypt was soon recognized. This led the Berlin Assyriologist Hugo Winckler to undertake excavations in 1906 together with Theodore Makridi (Bey) of the Istanbul Museum. This first season yielded 2,500 fragments of tablets from the west side of Büyükkale, including some in Akkadian; these showed that

Boğazköy was the capital of the kings of Hatti. Winckler and Makridi returned in 1907, 1911, and 1912. In 1907 another German expedition under Otto Puchstein excavated and surveyed the fortifications and temples. After World War I new excavations were started by the German Archaeological Institute and the German Orient Society, with Kurt Bittel as field director. They continued from 1931 to 1939 and again after World War II. These excavations established the stratigraphy and, thereby, the history of the site, besides yielding many more tablets from several locations on Büyükkale and the area of the Great Temple. The excavators had to remove the post-Hittite structures in order to reach the Hittite levels, and they covered all levels earlier than the Hittite Empire with earth again in order to present and preserve as much as possible of the remains of the city of the 13th century BC. Pop. (latest est.) Boğazkale, 2,097. (H.G.G.)

BIBLIOGRAPHY. Kurt Bittel, *Hattusha: The Capital of the Hittites* (1970), is a comprehensive description of the city and its history and remains, with an extensive bibliography. See also E. Akurgal, *The Art of the Hittites* (Eng. trans. 1962).

Bogdan: see Moldavia.

Bogdanovich, Peter (b. July 30, 1939, Kingston, N.Y., U.S.), U.S. film director noted for his attempts to revitalize film genres of the 1930s and '40s.

Bogdanovich gained experience as a writer, actor, and director in small theatrical productions while turning his lifelong passion for the movies to good effect by contributing criticism and scholarly articles to various periodicals. His first film was a low-budget thriller titled *Targets* (1968), which he wrote, produced, directed, and starred in. His second, *The Last Picture Show* (1971), was a box-office hit that won critical acclaim for its portrayal of sexual mores and social change in a drab Texas town in the 1950s. Later films included *What's Up, Doc?* (1972), *Paper Moon* (1973), *Daisy Miller* (1974), *At Long Last Love* (1975), *They All Laughed* (1981), and *Mask* (1985).

Bognor Regis, parish, Arun district, administrative county of West Sussex, historic county of Sussex, England, on the English Channel south-southwest of London. The name Regis, meaning "King's," commemorates George V's convalescence there in 1929. The resort, which has sandy beaches, dates from the late 18th-century Regency period when Hotham House and Dome House (now a teacher-training college) were built, although a small fishing community had existed on the site since medieval times. Pop. (1991) 56,744.

Bogolyubsky, Andrey Yuryevich: see Andrew I under Andrew (Vladimir).

Bogomil, member of a dualist religious sect that flourished in the Balkans between the 10th and 15th centuries. It arose in Bulgaria toward the middle of the 10th century from a fusion of dualistic, neo-Manichaean doctrines imported especially from the Paulicians, a sect of Armenia and Asia Minor, and a local Slavonic movement aimed at reforming, in the name of an evangelical Christianity, the recently established Bulgarian Orthodox Church. The Bogomils were so called after their founder, the priest Bogomil.

The Bogomils' central teaching, based on a dualistic cosmology, was that the visible, material world was created by the devil. Thus, they denied the doctrine of the incarnation and rejected the Christian conception of matter as a vehicle of grace. They rejected Baptism, the Eucharist, and the whole organization of the Orthodox Church. The moral teaching of the Bogomils was as consistently dualistic. They

condemned those functions of man that bring him into close contact with matter, especially marriage, the eating of meat, and the drinking of wine. In fact, the moral austerity of the Bogomils invariably was acknowledged by their fiercest opponents.

During the 11th and 12th centuries Bogomilism spread over many European and Asian provinces of the Byzantine Empire. Its growth in Constantinople resulted, about 1100, in the trial and imprisonment of prominent Bogomils in the city and in the public burning of their leader, Basil. In the second half of the 12th century, it spread westward. The Serbian ruler Stefan Nemanja was obliged to summon a general assembly of his land to check it. Roman Catholic authorities were greatly disturbed by reports of heresy in Dalmatia and Bosnia (though modern scholarship casts doubt on the theory that the Bosnian church ever adopted the dualist theology of the Bogomils). By the early 13th century the dualistic communities of southern Europe—comprising the Paulicians and Bogomils in the east and the Cathari in the west—formed a network stretching from the Black Sea to the Atlantic.

In the 13th and 14th centuries, Rome dispatched several legations and Franciscan missionaries to convert or expel Bosnian heretics, among whom there may have been some Bogomils. In the country of its birth Bogomilism remained a powerful force until the late 14th century. The Bulgarian authorities convened several church councils to condemn its teachings. With the Ottoman conquest of southeastern Europe in the 15th century, obscurity descended upon the sect. Traces of a dualistic tradition in the folklore of the South Slavs are all that remain today of the most powerful sectarian movement in the history of the Balkans.

Bogong, Mount, highest peak (6,516 feet [1,986 m]) of Victoria, Australia. It is in the Australian Alps, 150 miles (240 km) northeast of Melbourne. Well known for winter sports, the peak derived its name from an Aboriginal word meaning "high plains." Bogong township was established there during the construction of the Kiewa Hydro-Electric Scheme (completed 1958), near Albury.

Bogor, formerly BUITENZORG, *kotamadya* (municipality), Jawa Barat *provinsi* (province), Java, Indonesia. It lies 870 feet (265 m) above sea level in the foothills of Mount Gede and Mount Salak. The city, established by the Dutch in 1745, is famous for its botanical gardens (1817), which cover 215 acres (87 hectares). The Bogor Agricultural University was founded in 1963. There are also research institutes for veterinary science,

Typical houses with rice paddies in Bogor district, Java, Indonesia

W.H. Hodge

animal sciences, and food crops. The former residence (1856) of the Dutch governor-general is now the occasional residence of the Indonesian president. Bogor (meaning "without care") is primarily a residential city, with a healthful climate. There is some manufacturing of tires, textiles, and machinery. The chief crops of the surrounding area are rice,

tea, cinchona, rubber, and coffee. Pop. (1995 est.) 285,114.

Bogoraz, Vladimir Germanovich, pseudonym N.A. TAN, or V.G. TAN (b. April 27 [April 15, Old Style], 1865, Ovruch, Russia—d. May 10, 1936, on the way to Rostov-na-Donu), Russian anthropologist whose study of the Chukchi people of northeastern Siberia ranks among the classic works of ethnography.

Arrested in 1886 for activities with the revolutionary Narodnaya Volya ("People's Will") political party, Bogoraz was exiled to the Yakutia region of northeastern Siberia, where he studied the ethnography and linguistics of the area with an exiled colleague, Vladimir Jochelson. He continued research in northeastern Siberia for the Russian Geographical Society (1895–97). For the Jessup North Pacific Expedition of the American Museum of Natural History, New York City (1900–01), Bogoraz took charge of the Anadyr region of extreme northeastern Siberia, gathering materials for his Chukchi ethnography. Fleeing Russia for political reasons, he settled in New York City (1901–04), became a curator of the American Museum, and produced his great works *The Chukchee* (1904–09) and *Chukchee Mythology* (1910).

Returning to Russia (1904), Bogoraz helped to organize the first peasant congress and the Labour Group in the Duma (parliament). He continued scientific work and writing until his appointment as professor at the university at Petrograd (St. Petersburg) and curator of the Anthropological and Ethnographical Museum (1918). During the 1920s and '30s he directed Asian research for the Institute of the Peoples of the North, Leningrad (St. Petersburg). He published grammars, a dictionary, textbooks for Chukchi children, folklore collections, ethnographic and historical studies, and a novel about the Chukchis.

Bogotá, official Spanish SANTA FÉ DE BOGOTÁ, D.C. ("Distrito Capital"), capital of Colombia. It lies in central Colombia in a fertile upland basin 8,660 feet (2,640 m) above sea level in the Cordillera Oriental of the Northern Andes Mountains.

Bogotá occupies a sloping plain at the base of two mountains, Guadalupe and Monserrate, upon whose crests stand two imposing churches. The city is laid out in a grid pattern and has a number of plazas, or squares, including the Plaza Bolívar, along which face the principal public buildings and churches. Modern apartment towers stand alongside buildings dating from the colonial period.

European settlement in Bogotá began in 1538, when Gonzalo Jiménez de Quesada conquered Bacatá, the main seat of the Chibcha Indians. The settlement was christened Santa Fé de Bacatá: "Santa Fé" after Quesada's birthplace in Spain, and "Bacatá" for the original Indian name, which was soon corrupted to Bogotá. Bogotá's fate was closely allied to that of the viceroyalty of New Granada, of which it was made the capital city, soon becoming a centre of Spanish colonial power in South America. Bogotá's citizens successfully revolted against Spanish rule in 1810–11 but had to contend with Spanish loyalists until 1819, when Simón Bolívar took the city after his victory at the Battle of Boyacá. With independence from Spain achieved, Bogotá in 1821 was made capital of Gran Colombia, a confederation that included the present republics of Venezuela, Ecuador, Panama, and Colombia. When the confederation was dissolved in 1830, it remained the capital of New Granada, which later became the Republic of Colombia.

Turbulent struggles for political power in the capital city, as well as its geographic isolation, stunted Bogotá's growth and prosperity in the 19th century. In April 1948 the city was severely damaged by riots, and a wave of

violence, known as the *bogotazo*, swept the region. Undercurrents of unrest continued in Bogotá until 1958, when the Liberal and Conservative parties reached a settlement.

Bogotá is the home of the nation's tire, chemical, and pharmaceutical industries, but its chief activities are commercial. A stock exchange (1928) and the main banks are located in the city. It is the hub of air travel in Colombia and the home of Avianca (Aerovías Nacionales de Colombia), the first commercial airline in South America. Railroads connect Bogotá with the Caribbean coast to the north and via Puerto Berrío with the Pacific coast to the west. Bogotá is on the Colombian section of the Pan-American and Simón Bolívar highways and has road connections with all major Colombian cities.

The Xavier Pontifical University (1622) and the University of Santo Tomás (1580) are among the several excellent universities in Bogotá. Other cultural institutions include the Botanical Institute, the National Conservatory of Music, the National Museum, the National Astronomical Observatory, the National Library, and the Columbus Theatre. There are also a planetarium, a museum of natural history, several modern art galleries, and the Gold Museum, which houses the world's largest collection of pre-Columbian gold objects.

Numerous parks adorn the city and its outskirts. Prime tourist attractions are the 515-foot (157-metre) Tequedama Falls, about 20 miles (32 km) south, and the tram and cable car that climb more than 1,800 feet (333 m) to the church and shrine atop Monserrate mountain. Pop. (1999 est.) 6,260,862.

Bogra, formerly BAGURA, city, northwestern Bangladesh. It lies on the west bank of the Karatoya River, which is a tributary of the Jamuna River. Easy accessibility by road and railway makes Bogra a commercial centre for the southern Barind tract between the Ganges and the Jamuna rivers. Incorporated as a municipality in 1876, it has a park, a theatre hall, and a nursery for sericultural development and is the seat of colleges affiliated with the National University (1992).

The site of Mahāsthān, identified by inscriptions as Puṇḍravardhana, capital of the Puṇḍra dynasty, lies just north of the town; it dates from Mauryan times (300 BC) and also flourished during subsequent (Gupta, Pāla) periods. Pop. (1991) 120,170.

Bogusławski, Wojciech (b. April 9, 1757, Poznań, Pol.—d. July 23, 1829, Warsaw), actor, director, and leading playwright of the Polish Enlightenment.

After studying singing and joining the court of the bishop of Kraków, Bogusławski became a soldier and in 1778 an actor. Between 1783 and 1814, he directed the Polish National Theatre in Warsaw; later he worked in Lwów and toured with his company, performing both Polish and foreign plays.

Bogusławski is considered by many to be the father of the Polish theatre. He wrote more than 80 plays, mostly comedies adapted from writers of western Europe, and greatly raised the status of the acting profession. His best-known and most popular original play is *Cud mniemany czyli Krakowiaci i górale* (1794; "The Pretended Miracle or Krakovians and Highlanders"), a patriotic comic opera based on national folklore.

Bohemia, Czech ČECHY, German BÖHMEN, historic country of central Europe that was a kingdom in the Holy Roman Empire and subsequently a province in the Habsburgs' Austrian Empire. Bohemia was bounded on the south by Austria, on the west by Bavaria, on the north by Saxony and Lusatia, on the northeast by Silesia, and on the east by Moravia. From 1918 to 1939 and from 1945 to 1992 it was part of Czechoslovakia, and since 1993 it has formed much of the Czech Republic (*q.v.*).

Bohemia's name comes from a Celtic people known as the Boii, though the Slavic Czechs were firmly established in the region by the 5th or 6th century AD. Bohemia was briefly subordinated to greater Moravia in the late 9th century. Saints Cyril and Methodius introduced Christianity into Bohemia from Moravia in the 9th century, and by the 10th century Bohemia had been Christianized and consolidated by the princes of the ruling Přemyslid dynasty. Although they gradually became dependent on the Holy Roman Empire, the Přemyslid rulers were able to attach Moravia to Bohemia and transform them into a viable kingdom. The Přemyslid prince Vratislav II (reigned 1061–92) was the first to obtain from the Holy Roman emperors the title of king of Bohemia as a personal (nonhereditary) privilege, and in 1198 the greatest of the Přemyslids, Otakar I, was named hereditary king of Bohemia, which became a kingdom within the Holy Roman Empire.

Bohemia reached a new peak of political power and economic prosperity under Otakar II, who consolidated control over parts of Austria and waged wars for territory with Hungary, extending Bohemia's domain to the Adriatic Sea. After 1278, however, when Otakar was killed in an invasion of Austria, Bohemia was soon once again reduced in size and influence, and the Přemyslid dynasty itself came to an end in 1306. In 1310 the Luxembourg dynasty began its rule of the kingdom of Bohemia, which by the end of the 14th century included Moravia, Silesia, and Upper and Lower Lusatia, as well as the province of Bohemia. In 1355 the Luxembourg king of Bohemia, Charles I, became Holy Roman emperor as Charles IV. He is remembered for founding the University of Prague (1348) and for greatly increasing the boundaries and importance of Prague, which he made the capital of the empire. From this time on Prague was a principal centre of intellectual and artistic activity in central Europe.

In the early 15th century, however, Bohemia fell victim to disputes between Roman Catholics and the followers of the Bohemian religious reformer Jan Hus, who was burned as a heretic in 1415. Wars between Bohemian Hussites and the Roman Catholics of Bo-

hemia and Germany engulfed the kingdom until compacts were negotiated in 1436 that granted the more moderate Hussites (known as Utraquists) some degree of religious freedom and reduced the power of the Roman Catholic church there.

The Luxembourg dynasty ended in 1437, and, in the disputes over succession that followed, the nobility gained power not only at the expense of the Bohemian monarchy but also over the townspeople and peasants. The latter were deprived of much of their freedom, some being reduced to the level of serfs. Bohemia was ruled rather ineffectively by the Jagiellon dynasty from 1471 to 1526, and in the latter year the Habsburg archduke Ferdinand I of Austria laid claim to the throne, thereby establishing Habsburg rule over Bohemia. A Roman Catholic himself, Ferdinand demonstrated moderation in religious affairs for a time, but eventually he was forced into a confrontation with Protestant forces—as were his immediate successors.

Conflicts between Protestants and Roman Catholics culminated in 1618 in a Protestant revolt against the Habsburgs. The Roman Catholic forces of the empire defeated the Bohemian Protestants at the Battle of the White Mountain (Nov. 8, 1620), and the emperor Ferdinand I was able to reassert Habsburg authority over Bohemia. The country lost its status as a kingdom and was henceforth subjected to the absolutist rule of the Habsburgs. Protestantism was suppressed, and most of the population gradually converted to Roman Catholicism. Bohemia was stripped of the two Lusatias in 1635 and of Silesia in the mid-18th century, by which time it had been thoroughly absorbed into the Austrian Empire—a state of affairs that would last until the early 20th century.

Under the Habsburgs Czech nationalism was suppressed and German was instituted as the language of instruction in grammar schools and the university. After the Czechs of Bohemia and Moravia unsuccessfully revolted against Habsburg rule in 1848, however, serfdom was abolished and economic power began to pass from the local aristocracy to the middle classes. The Czechs continued to agitate for autonomy within an Austro-Hungarian empire that would have a federal structure. The Slovaks, who were closely related to the Czechs, also expressed opposition to the Habsburgs, and at the end of World War I the two peoples joined together (1918) to form the Republic of Czechoslovakia, of which Bohemia became the westernmost province and the industrial heartland.

The presence in western Bohemia of many German-speaking citizens (the Sudeten Germans) furnished a pretext for Nazi Germany to occupy Czechoslovakia in the wake of the Munich Agreement (1938), and Bohemia (together with Moravia) became a German protectorate until the Czechoslovak state was restored by the victorious Allies in 1945, at the end of World War II. From 1945 to 1949 Bohemia was once more the westernmost province of Czechoslovakia, but in the latter year it and the other provinces (Moravia and Slovakia) were replaced by new, smaller districts. Bohemia's long administrative existence thus came to an end.

Czechoslovakia peacefully separated into the Czech Republic and Slovakia in 1993, with Bohemia comprising the central and western portions of the former.

Bohemian Confession, Latin CONFESSIO BOHEMICA, Protestant doctrinal statement formulated in Bohemia by the Czech Utraquists (moderate Hussites) in 1575 and subscribed to by the Unitas Fratrum, Lutherans, and Calvinists in the kingdom. The document was based on the Augsburg Confession, and it upheld the Lutheran position on justification and the Calvinist interpretation of the Eucharist.

Though Emperor Maximilian II withheld formal approval of the Confession, he orally guaranteed religious freedom to the Protestants of Bohemia. Eventually Emperor Rudolf II granted official recognition to Bohemia's Protestants with his Letter of Majesty (1609). Previously, the Unitas Confession (1535), introduced by Martin Luther and published by him at Wittenberg as a sign of agreement between Lutherans and Utraquists, had been presented to Emperor Ferdinand I for legal recognition, but without success.

Bohemian Forest, German BÖHMER WALD, or BÖHMERWALD, Czech ŠUMAVA, forested southwestern highlands of the Bohemian Massif largely on the German-Czech Republic frontier and extending from the upper valley of the Ohre River, in the northwest, to a section of the Danube River valley in Austria (between Melk and Krems), in the southeast. The nomenclature of the subranges that compose the highlands is intricate and confused. The main group, the Šumava in the Czech Republic and Hinterer Wald in Germany, averages 3,500 feet (1,100 m) and rises to the summits of Grosser Arber (Javor; 4,777 feet [1,456 m]) on the Bavarian (western) side and Plechý (Pločkenstein; 4,521 feet [1,378 m]) on the Czech (eastern) side. The Šumava is the source for the Vltava (German: Moldau) River, which cuts a broad trough through part of the region and is a source of hydroelectric power. Forests, both coniferous and deciduous, cover more than a third of the range, and the population is sparse. There are some mineral deposits and stone quarries. To the northwest, the much lower range of the Český les (Oberpfälzerwald Mountains) is separated from the main group (the Šumava and Hinterer Wald) by a depression that extends roughly between the towns of Cham, Furth im Wald, and Domažlice (German: Taus). The gradients there are gentler and the hills largely cleared for upland farming. The Regen and Ilz rivers also rise in the Bohemian Forest. The parallel and lower ranges of the Bavarian Forest (Bayerischer Wald) lie in German territory to the southwest. The Bohemian Forest is noted for its glass industry and its lumber-milling activities.

Bohemian garnet: see pyrope.

Bohemian glass, decorative glass made in Bohemia and Silesia from the 13th century. Especially notable is the cut and engraved glass in high Baroque style made from 1685 to 1750. Early in the 17th century, Caspar Lehmann, gem cutter to Emperor Rudolf II in Prague, adapted to glass the technique of gem

Bohemian glass goblet, relief cut and decorated with intaglio-engraved Baroque flowers, from the workshop of Friedrich Winter in Silesia, about 1710–20; in the Museum of Decorative Arts, Prague

Museum of Decorative Arts, Prague

engraving with copper and bronze wheels. Although intaglio (*Tiefschnitt*, "deep cut") and high relief (*Hochschnitt*, "high cut") engraving on glass were known to the ancients, Lehmann was the first modern glass engraver to perfect the technique and develop a personal style. He founded a school, but his most gifted pupils—such as Georg Schwanhardt, originator of the famous Nürnberg school of engravers—moved out of Bohemia; and glass engraving did not flourish there until about 1700, when a heavy, high-lustre, potash-lime glass (Bohemian crystal) was invented. Its original designs, profusion of motifs, and rich, ostentatious ornamentation made Bohemian glass the leading glass in the world. Silesia also became a major centre for the production of this type of glassware through the work of Friedrich Winter and other glass engravers. In the late 18th century English lead glass with cut decoration surpassed Bohemian glass in popularity after the introduction of the new Rococo style. Bohemian glass responded to competition with the invention of Hyalith glass, black with gold chinoiserie designs (Chinese-inspired designs), and Lithyalin glass, resembling semiprecious stones. An inexpensive ruby glass and an opaque white overlay glass, both carved and enameled, were also produced. Artistic quality declined in the late 19th century but was revived by Ludwig Lobmeyr, a Viennese industrialist who founded a glass-designing studio at Kamenický Šenov (Steinschönau).

Bohemian language: see Czech language.

Bohemian Massif, dissected quadrangular plateau, with an area of about 60,000 square miles (about 158,000 square km), occupying Bohemia, Czech Republic. Centring on Prague, it reaches a maximum elevation of 5,256 feet (1,602 m) and is bounded by four ranges: the Ore Mountains (Krušné hory, or Erzgebirge) in the northwest, the Giant Mountains (Krkonoše, or Riesengebirge) in the northeast, the Bohemian-Moravian Highlands (Českomoravská vysočina) in the southeast, and the Bohemian Forest (Šumava) in the southwest. The landscape is a rounded, forested, rather monotonous highland of crystalline rock.

Bohemian-Moravian Highlands, Czech ČESKOMORAVSKÁ VYSOČINA, or VRCHOVINA, plateau (125 miles [200 km] long and 35 to 50 miles wide) forming the southeastern boundary of the Bohemian Massif, which separates the former historic provinces of Bohemia and Moravia, now in the Czech Republic. The highlands are roughly defined by the Lužnice River (west), the Dyje River (south), the Morava River (east), and the tributaries of the Elbe (Labe) River (north). They form a rolling, densely forested, hilly country averaging from 2,000 to 2,500 feet (600 to 750 m) in height. There are two highland areas: the Jihlava Heights (Jihlavské vrchy) to the south rise to 2,746 feet (837 m) at Javořice, and the Žďár Heights (Žďárské vrchy) to the north rise to 2,743 feet (836 m) at Devět skal. On the Moravian side, the Dražanská vrchovina group of limestone hills contains the famous Moravian Karst (*q.v.*). The Bohemian-Moravian Highlands are part of a major watershed between the Elbe and the Danube river systems.

A bleak, inhospitable area unfavourable to agriculture, the highlands began to develop after the late 1930s, when new industries came to Žďár nad Sázavou and to Jihlava, the largest town. There are many historically interesting towns and castles in the highlands.

Bohemian school, school of the visual arts that flourished in and around Prague under the patronage of Charles IV, king of Bohemia from 1346 and Holy Roman emperor from 1355 to 1378. Prague, as Charles's principal residence, attracted many foreign artists and

"Resurrection," panel painting by the Master of Wittingau, c. 1380–90; in the Národní Galerie, Prague

Giraudon—Art Resource

local masters. Although it was heavily exposed to the artistic traditions of France and northern Italy (mainly through the importation of illuminated manuscripts), Prague nevertheless produced a vital Bohemian tradition in architecture and a distinctive, independent style in painting that had an important influence on 14th-century, late-Gothic art, especially that of Germany.

The major architectural monuments of the Bohemian school are Charles's palace (Karlštejn Castle) and the St. Vitus' Cathedral, both in Prague. The cathedral and parts of Karlštejn Castle were begun according to routine French design by the Flemish master mason Mathieu d'Arras; when Mathieu died in 1352 the work on both buildings was taken over by the influential German architect Petr Parléř, who, in his virtuoso experiments with decorative vault design in the cathedral, provided the starting point for late German Gothic architectural achievements in the 15th century.

The most significant achievements of the Bohemian school were in fresco and panel painting. Most of the painters of the school are anonymous, but a few distinct personalities can be discerned who seem to exemplify three fairly well-defined generations of artists. Before the emergence of the Bohemian school proper, impetus was given by the work of Tommaso da Modena, a northern Italian painter who created a number of panel paintings for Charles. His work was not directly influential on the first generation of Bohemian painters who, working in the 1350s and typified by the Master of the Hohenfurth Altarpiece (or Master of the Vyšší Brod Cycle), were strongly affected by the more elegant models of the Siennese school, though they already exhibited the dark intensity characteristic of Bohemian painting. Tommaso's style, however, was important in the formation of that of Theodoricus of Prague, a member of the second generation of Bohemian artists (working c. 1360–80) and perhaps the principal master of the Bohemian school. Commissioned by Charles to decorate the Chapel of Holy Cross at Karlštejn Castle (c. 1357–67), Theodoricus painted a crucifixion and a host of panel paintings of saints. Although these works show Siennese influence, they are also closely related to Tommaso da Modena's paintings in their naturalism, psychological penetration, and solid modeling. The emphasis on modeling manifests itself in Theodoricus' works in a solemn, massive

rendering of heavily rounded faces and thick, heavy drapery, a consolidation of the so-called soft style that was to dominate German painting well into the 15th century.

Other artists, working in the Emmaus Monastery at Prague in about 1360, produced frescoes of the life of Christ, with deep, crowded compositions, fluent lustrous draperies, substantial figures, and forceful characterization. The last major artist of the Bohemian school, who represented the third generation of artists (working between about 1380 and 1390), was the Master of Wittingau (or Master of the Třeboň Altarpiece). His major works are the Wittingau altar Passion scenes, originally painted in about 1380 for the town of Třeboň (German: Wittingau). His style is evolved from that of Theodoricus: in their mystical quality and almost abstract emphasis on simple solid forms with smooth surfaces, Theodoricus' paintings anticipate the expressive use of chiaroscuro (light and dark contrast) and the smoldering intensity of the Wittingau Passion. The Master of Wittingau, however, seems also to have been influenced much more strongly than his predecessors by contemporary French painting.

Charles's son Wenceslas, who succeeded his father as sole ruler of Germany and Bohemia in 1378, sponsored a flourishing school of manuscript illumination. Prague's role as a prominent artistic centre declined, however, in the early 15th century, largely as a result of severe political and religious conflicts within the empire.

Bohemond, also spelled BOHEMUND, French BOHÉMOND, or BOÉMOND, name of princes of Antioch and counts of Tripoli, grouped below chronologically and indicated by the symbol ●.

● **Bohemond I**, byname BOHEMUND OF OTRANTO, French BOHÉMOND DE TARENTE, original name MARC (b. 1050–58—d. March 7, 1111, Canossa, Apulia [now Canosa di Puglia, Italy]), prince of Otranto (1089–1111) and prince of Antioch (1098–1101, 1103–04), one of the leaders of the First Crusade, who conquered Antioch (June 3, 1098).

Son of Robert Guiscard (the Astute) and his first wife, Alberada, Bohemond was christened Marc but nicknamed after a legendary giant named Bohemond. The nickname proved well taken because physically Bohemond was the ideally tall and strong knight—in the words of a contemporary, "a wonderful spectacle." His boyhood home was in southern Italy, where his Norman father, Robert, had gone as a mercenary and had risen to the rank of duke of Apulia and Calabria. Here Bohemond became involved in his father's wars and learned his trade as a fighter and leader. This early training must be inferred, however, as Bohemond's childhood is poorly recorded, and even his date of birth is unknown. In 1079 he was in command of a unit of his father's army. Meanwhile, his stepmother, Sigelgaita, bore his father's heir-to-be, Roger Borsa; thus, Bohemond no doubt felt early in life that he would have no patrimony because of his half brother and so would have to seek lands and fortune in the weakened condition of the Byzantine Empire.

In 1081 Bohemond, in command of his father's army, captured Avlona, a town south of Durazzo; but in this same year Alexius I Comnenus became ruler of the Byzantine Empire and challenged the Normans. For more than three decades Alexius and Bohemond were rivals. In the opening struggle, 1081–85, Bohemond and his father came close to dismembering the Greek Empire in the West. The Norman army won a few brilliant victories, but Alexius drove Bohemond from Larissa in Thessaly in 1083, and the death of Robert in

1085 left Bohemond without a patrimony and with little hope of success against Byzantium. In the next four years Roger Borsa allowed Bohemond to gain a foothold in Bari, where he awaited another chance to move against Alexius.

The chance came when Pope Urban II launched the First Crusade in November 1095 by offering rewards in both this world and the next for those who wrested the Holy Sepulchre from the Saracens. When the word reached Bohemond, he set off for the East. He and his small band of Normans crossed the Greek lands in the winter of 1096–97 with few incidents; and on passing through Constantinople (Istanbul), he made friendly, though cautious, terms with the emperor Alexius. The latter managed to extract oaths from most of the leaders, including Bohemond, and helped them cross the Bosphorus, speeding them with promises of aid if they would return to the sovereignty of the emperor the Byzantine lands recaptured from the Muslims. In the ensuing campaigns against the Turks, Bohemond distinguished himself at Nicaea, Dorylaeum, and Antioch, which was besieged from October 1097 until June 3, 1098. The city of Antioch fell to the crusaders through his cunning and his negotiations with a traitor. After a brief, unsuccessful countersiege by the Turks, during which Bohemond more or less assumed command, the crusaders dawdled away the summer and fall.

When the crusading army marched southward to Jerusalem in January 1099, Bohemond was left the de facto possessor of Antioch, although his claim was not openly supported for fear of violating the oath of Alexius. The Norman leader did not participate in the capture of Jerusalem but did, for the sake of appearances, journey later to the Holy Sepulchre. With the departure of many crusaders for their homelands, Bohemond was left with his city. It might seem in 1100 that Bohemond was destined to found a great principality in Antioch; he had a fine territory, a good strategical position, and a strong army. But he had to face two great forces—the Byzantine Empire, which claimed the whole of its territories, and the strong Muslim principalities in the northeast of Syria. Between these two forces he failed. Following sorties against Aleppo, Bohemond made the mistake of moving against the emir of Sebastea (Sivas), north of Antioch. He fell into an ambush and was captured and held for months.

Released in 1103, he returned to Antioch and its problems. In 1105 Bohemond was in Bari to enlist reinforcements for his struggle with the Byzantines. In September 1105 he went to Rome to interview the pope and then journeyed, early in 1106, through France. There, babies were named for him, crowds heard him denounce the perfidious Alexius, and shrines received sacred relics from his hands. In the spring of 1106 Bohemond married Constance, the daughter of Philip I of France.

Bohemond, who 30 years before had been a landless young man, now stood at the pinnacle of his career. By September 1107 he was ready to launch his crusade against the Byzantines and within a month had landed a large army at Avlona. In the months that followed, Durazzo held firm against the Normans, and Bohemond met with misfortune in Albania. In this impasse Alexius, anxious to end the war, offered Bohemond Antioch and other Greek cities in return for vassalage. In accepting these terms, Bohemond suffered humiliation even though he retained control of Antioch. He had used the crusade against Alexius to further his ambition for an empire that stretched from Apulia to Antioch and had thereby cheapened the crusading idea.

The years following this peace of discord are

poorly recorded. Constance bore Bohemond two sons, one of whom later became prince of Antioch. Bohemond probably sought to raise another army, but these efforts were curtailed by his death in 1111. His combat with the Byzantines was ended, and his rival Alexius followed him in death in 1118. Nicknamed for a giant, Bohemond had fought against gigantic odds and at death bequeathed to his heirs one of the important crusader states, the principality of Antioch. History records him as a handsome man, a warrior of genius, and a gifted diplomat. (J.H.Hi./L.L.H.)

BIBLIOGRAPHY. Ralph Bailey Yewdale, *Bohemond I: Prince of Antioch* (1924, reprinted 1980), offers the best biography of Bohemond. Robert Lawrence Nicholson, *Tancred: A Study of His Career and Work in Their Relation to the First Crusade and the Establishment of the Latin States in Syria and Palestine* (1940), supplements the work of Yewdale. Kenneth M. Setton (ed.), *A History of the Crusades*, vol. 1 (1958), is the best general work on Bohemond.

• **Bohemond II** (b. 1107—d. February 1130), prince of Antioch from 1119 to 1130.

The son of Bohemond I and Constance of France, he went from Apulia to Antioch in 1126. Antioch had been under the regency of Baldwin II of Jerusalem since 1119, when the previous prince, Roger, had been killed. Soon after his arrival in Antioch, Bohemond married Alice, the younger daughter of Baldwin II. After joining with Baldwin in an attack on Damascus (1129), he was slain on the northern frontier by a Muslim army. The local emir had his severed head embalmed and sent as a gift to the caliph.

• **Bohemond III**, byname **BOHEMOND THE CHILD, OF THE STAMMERER**, French dialect **BOHÉMOND LE BAMBE, OF LE BAUBE** (b. 1145—d. 1201), prince of Antioch from 1163 to 1201.

The son of Constance (daughter of Bohemond II) by her first husband, Raymond of Poitiers, he succeeded to the principality upon attaining his majority and then exiled his mother. In the following year (1164) he suffered defeat and was captured by the Muslims, and thereafter the principality of Antioch was never again a power in the Levant. Until about 1180 it was a Byzantine protectorate, and it was the influence of the emperor Manuel I Comnenus that secured Bohemond's early release from captivity.

In 1180 he deserted his second wife, Irene, or Theodora Comnena, for a certain Sibyl, and he was in consequence excommunicated. By his first wife, the princess Orgueilleuse, he had had two sons, Raymond and Bohemond (the future Bohemond IV). Raymond died in 1197, leaving a son, Raymond Ruben; and the problem that occupied the last years of Bohemond III was to determine whether his grandson, Raymond Ruben, or his younger son, Bohemond, should succeed him in Antioch. Leo II (the Great) of Armenia championed his grandnephew, Raymond Ruben. Bohemond the younger, however, prosecuted his claim with vigour and even evicted his father from Antioch about 1199; but he was ousted through the efforts of Leo (then king of Armenia by the grace of the emperor Henry VI), and Bohemond III died in possession of his principality (1201).

• **Bohemond IV**, byname **BOHEMOND THE ONE-EYED**, French **BOHEMOND LE BORGNE** (b. c. 1175—d. 1233), count of Tripoli (1187–1233) and prince of Antioch (1201–16, 1220–33).

The younger son of Bohemond III and Orgueilleuse, he became count of Tripoli in 1187 and succeeded his father in the principality of Antioch to the exclusion of his nephew Raymond Ruben in 1201. In 1216 Raymond seized control while Bohemond was off in Tripoli, but he was deposed in 1221 and died the following year. Bohemond reigned in Antioch and Tripoli until his own death.

• **Bohemond V** (b. c. 1198—d. January 1252), prince of Antioch and count of Tripoli from 1233 to 1252.

The son of Bohemond IV by his wife Plaisance, he succeeded his father in 1233 and carried on the struggle with Armenia until 1251, when the marriage of the future Bohemond VI to the sister of the Armenian king finally brought peace. By his first marriage (1225) with Alice, the widow of Hugh I of Cyprus, Bohemond V connected the history of Antioch for a time with that of Cyprus. He had resided chiefly at Tripoli, and under him Antioch was left to be governed by its commune, or town council.

• **Bohemond VI** (b. 1237—d. 1275), prince of Antioch (1252–68) and count of Tripoli (1252–75).

The son of Bohemond V by Luciana, he succeeded his father in 1252. In 1250 his sister Plaisance had married Henry I of Cyprus, the son of Hugh I; and the Cypriot connection of Antioch was thus maintained. In 1252 Bohemond VI established himself in Antioch, leaving Tripoli to itself, and in February 1258 he procured the recognition of his nephew, Hugh II of Cyprus, as king of Jerusalem. In 1268 he lost Antioch to the Mamlūks. Thus fell the richest and oldest of the Frankish Middle Eastern principalities.

• **Bohemond VII** (d. Oct. 19, 1287), count of Tripoli from 1275 to 1287.

The son of Bohemond VI by Sibyl, sister of Leo III of Armenia, he succeeded to the county of Tripoli in 1275, with his mother as regent. He had trouble with the Templars, who were established in Tripoli; and in the very year of his death he lost Laodicea to the sultan of Egypt. He died without issue, and within two years Tripoli was captured by the Egyptians (1289).

Bohlen und Halbach, Gustav von: see Krupp von Bohlen und Halbach, Gustav.

Böhm, Georg (b. Sept. 2, 1661, Hohenkirchen, Thuringia [Germany]—d. May 18, 1733, Lüneburg, Hanover), German composer known primarily for his keyboard music.

The son of an organist-schoolmaster, Böhm went to study at the University of Jena in 1684 and left probably in 1690. In 1698 he became organist at the Church of St. Johannis in Lüneburg, where he remained for the rest of his life and where the young J.S. Bach doubtless heard him play. Although Böhm wrote numerous cantatas and sacred songs, he is chiefly remembered for his keyboard works, in which he deploys differing styles for harpsichord and organ. His harpsichord suites are in the manner of J.J. Froberger, but his organ works are more important. Some of his toccatas, preludes, fugues, and postludes for organ are brilliant, and his treatment of chorale melodies in organ partitas was truly original and exercised a strong influence on Bach.

Böhm, Karl (b. Aug. 28, 1894, Graz, Austria—d. Aug. 14, 1981, Salzburg), Austrian conductor who earned an international reputation for his concert performances and recordings of Richard Strauss, Richard Wagner, W.A. Mozart, and other composers.

Böhm studied law but also studied music in Vienna with Eusebius Mandyczewski and Guido Adler. His debut at the Graz Opera House in 1917 was followed three years later by his appointment there as its first conductor. In 1921 he joined the Munich Opera. Böhm became musical director at Darmstadt in 1927, at Hamburg in 1931, and at Dresden in 1934. He made his London debut at Covent Garden in 1936. Böhm came under public criticism for taking the Dresden position because he had replaced Fritz Busch,

Karl Böhm
© Lautenwasser

who had been forced to resign by the Nazis; Böhm replaced Bruno Walter at Salzburg in 1938 under similar circumstances.

After conducting at Dresden until 1943, Böhm directed the State Opera in Vienna from 1943 to 1945 and again from 1954 to 1956. In 1957 he conducted *Don Giovanni* in his debut at the Metropolitan Opera in New York City. From the early 1960s he was perhaps the best-known interpreter of Wagner through his work at the Bayreuth Festivals. He recorded the complete symphonies of Mozart. Böhm's recordings and performances elicited admirable qualities of warmth, subtlety, and lyricism.

Böhm, Theobald (German flute maker): see Boehm, Theobald.

Böhm-Bawerk, Eugen von, in full EUGEN, KNIGHT (Ritter) VON BÖHM VON BAWERK (b. Feb. 12, 1851, Brünn, Moravia, Austrian Empire [now Brno, Czech Republic]—d. Aug. 27, 1914, Kramsach, Tirol, Austria-Hungary [now in Austria]), Austrian economist and statesman.

After graduating from the University of Vienna, Böhm-Bawerk worked in the Austrian Ministry of Finance (1872-75). He was allowed by the ministry to study at several German universities. In 1880 he moved to Innsbruck, becoming a full professor at the university there in 1884. In 1890 he returned to the Ministry of Finance and took part in the currency reform of 1892 and the adoption of the gold standard. He later held cabinet office several times, resigning in 1904 and subsequently returning to the University of Vienna.

Böhm-Bawerk was, with Carl Menger and Friedrich von Wieser, one of the three pillars of the Austrian school of economists. Starting from Menger's work, Böhm-Bawerk developed a theory of the origin and determination of the rate of interest and the period of turnover of capital occurring with the attainment of the market clearing wage. This provided the capital theory of the Austrian school. Through its influence on later writers such as Knut WickSELL and Irving Fisher, it provided the basis for the modern treatment of interest, which is currently regarded as arising from the interaction of preference for present goods (which inhibits willingness to save and thus provide funds for investment) and the productivity of longer periods of turnover of capital (which causes investment funds to be demanded).

Böhme, Jakob (b. 1575, Altseidenberg, near Görlitz, Saxony [Germany]—d. Nov. 21, 1624, Görlitz), German philosophical mystic

who had a profound influence on such later intellectual movements as idealism and Romanticism. *Erklärung über das erste Buch Moses*, better known as *Mysterium Magnum* (1623; *The Great Mystery*), is his synthesis of Renaissance nature mysticism and biblical doctrine. His *Von der Gnadenwahl* (*On the Election of Grace*), written the same year, examines the problem of freedom, made acute at the time by the spread of Calvinism.

Early life. Böhme was born at the end of the Protestant Reformation period. After receiving a rudimentary education, he went, in 1594 or 1595, to nearby Görlitz, a town where controversies over Reformation issues seethed. Here crypto-Calvinists (Lutherans charged with maintaining Calvinist views), Anabaptists (radical Protestants), Schwenkfeldians (followers of the Reformer Schwenkfeld), Paracelsian physicians (followers of the occultic physician Paracelsus), and humanists vied with orthodox Lutherans. Martin Möller, the Lutheran pastor of Görlitz, was "awakening" many in the conventicles that he had established.

In 1600, newly married and just established with a shoemaker's bench of his own, Böhme, probably stimulated by Möller, had a religious experience within the period of a quarter hour wherein he gained an empirical and speculative insight that helped him to resolve the tensions of his age. The strain between medieval and Renaissance cosmologies (dealing with the order of the universe), the perennial problem of evil, the collapse of feudal hierarchies, and the political and religious bifurcation of the time found resolution in Böhme's rediscovery, as he said, of the dialectical principle that "in Yes and No all things consist." Basically Lutheran ("we shall fear and love God," as Luther's Small Catechism states), this principle became with Böhme a *Realdialektik* ("real dialectic"), a wide-ranging polarization of empirical or natural reality.

Böhme, woodcut by Hugo Bürkner
By courtesy of the Staatsbibliothek, Berlin

Writings. Germinating for several years, the insight led him to commit his thoughts to paper, at first for his own use. The manuscript was entitled *Aurora, oder Morgenröthe im Aufgang* (1612; *Aurora*) and was written in stages. Called by Böhme a "childlike beginning," it was a conglomeration of theology, philosophy, and what then passed for astrology, all bound together by a common devotional theme. Circulating among Böhme's friends, a copy of *Aurora* fell into the hands of Gregory Richter, successor to Martin Möller as pastor, who condemned the shoemaker's pretensions to theology. Richter brought the matter up with the Görlitz town council, which forbade further writing on Böhme's part.

A period of silence ensued during which Böhme's ideas matured and his outer affairs prospered. He read the "high masters" as well as other unnamed books that were lent to him by the circle of neighbours and friends who were awed by the book-writing intellectual cobbler. These friends—some physicians, and others of the nobility—introduced Böhme to speculative alchemy, especially to the writings of the Swiss physician Paracelsus which

were then quite popular. The alchemical and mystical views of Paracelsus further inspired Böhme's interest in nature mysticism and gave him the terminology that, in a partly integrated way, dominated his next period.

Although he never worked in a laboratory himself, Böhme did use its alchemical terms to describe both his nature mysticism and his subjective experiences, which he sought to integrate into a common framework. During this period Böhme wrote at least six tracts that were circulated guardedly among his friends, creating an influential and respected reputation for him. This second period of writing activity began in 1619, the year when the Thirty Years' War (1618-48) was beginning to gain momentum; in fact, Böhme himself was in Prague when the Winter King, Frederick V of the Rhine Palatinate, entered. The various strident controversies of the age forced Böhme into a period of religious apologetics wherein he had to protest his orthodoxy against accusations, more implied than actual, of Calvinism (Reformed views), chiliasm (belief in the 1,000-year reign of God's people at the end of history), and rabid sectarianism. Reconstructing his theological views, he wrote a series of devotional tracts dealing with penitence, resignation, regeneration—traditional themes of German mysticism. In 1622 his friends had several of these devotional tracts printed in Görlitz under the title *Der Weg zu Christo* (*The Way to Christ*), a small work joining nature mysticism with devotional fervour. Publication of this tract brought about the intense displeasure of Richter, who incited the populace against Böhme.

In 1623, the year of his maturity, he wrote two major works: *The Great Mystery* and *On the Election of Grace*. The former explained the creation of the universe as told in Genesis in terms of the Paracelsian three principles (including the mystical elements "salt," "sulfur," and "mercury"), thus joining Renaissance nature mysticism with biblical religion. The latter, more philosophical, gave exposition in terms of dialectical insight to the problem of freedom that Calvinist predestination (the view that man's destiny is foreknown by God) was then making acute. This theme later was taken up by the idealist philosopher Friedrich Schelling and by a German theologian, Franz von Baader, whose commentary for *On the Election of Grace* is still held in high regard by scholars.

Böhme continued his writing at hectic pace, perhaps freed from business obligations by financial help from his friends. Between 1619, when he defiantly renewed his writing, and 1624, when he died, he produced at least 30 works. His defiance of the town council of Görlitz brought him further difficulty, and he was banished, being cited to the elector's court in Dresden, where, to all appearances, he found vindication because he returned to his home. Although vindicated by the theologians who had examined his views, he was not free from the rancorous moods of his neighbours who were instigated in their attacks by Richter. Esteemed by his friends among the nobility, physicians, and intellectuals, he fled to one of the neighbouring castles where he clearly was the central figure in some kind of secretive group. There he fell sick, and, sensing that his end was near, he was taken back home to Görlitz where, attended by his wife and sons, he began to weaken. He was examined by ecclesiastical authorities and found orthodox enough to be given the sacrament, and in a mood of charismatic expectancy, he died. (J.J.S.)

BIBLIOGRAPHY. The 17th-century translation of Böhme into English by J. Elphinstone and J. Sparrow, *The Works of Jacob Behmen*, 4 vol., reprinted in the 20th century, is considered to have more grace

and elegance than modern translations of some tracts by J.R. Earle and J.J. Stoudt. The 1730 German edition of the collected works, edited by J.W. Ueberfeld and reprinted in facsimile during the 1950s by W.E. Peuckert, remains the best text, although in modernized German. The most serviceable English biography utilizing modern materials is J.J. Stoudt, *Jacob Boehme: His Life and Thought* (1968), based on the standard German biographical works by W.E. Peuckert, *Das Leben Jakob Böhmes* (1924); and R. Jecht, *Jakob Böhme, Gedenkgabe der Stadt Görlitz* (1924). The best modern interpretation is A. Koyre, *La Philosophie de Jacob Boehme* (1929).

Böhmer, Johann Friedrich (b. April 22, 1795, Frankfurt am Main [Germany]—d. Oct. 22, 1863, Frankfurt am Main), historian known for his *Regesta*, an annotated collection of charters and imperial documents of medieval Germany.

After studying at the universities of Göttingen and Heidelberg, Böhmer journeyed to Italy, where he became interested in art history. Upon his return to Frankfurt (1822), he became an assistant librarian at the art institute but subsequently devoted himself to general history. Named archivist (1825) and then head librarian (1830) of the city of Frankfurt, Böhmer began publishing the *Regesta*. The first volume, *Urkunden der römischen Könige und Kaiser von Konrad I bis Heinrich VII, 911–1313* (1831; "Documents of the Roman Kings and Emperors from Conrad I to Henry VII, 911–1313"), contained extracts of documents with Böhmer's comments and historical introductions; it was followed by a more extensive treatment for the period 1198–1313. Other *Regesta* were *Urkunden sämtlicher Karolinger* (1833; "Documents of the Carolingian Kings") and a series of German imperial registers for the periods 1314–47 (1839), 1246–1313 (1844), and 1198–1254 (1849), with introductions and explanatory passages by Böhmer. He also published *Fontes Rerum Germanicarum* (1843–68), a valuable collection of original authorities for German history during the 13th and 14th centuries, and he edited many other collections. On his death he left many manuscripts, some of which were subsequently published.

Böhmer Wald (central Europe): see Bohemian Forest.

Bohol, island, Visayan group, south-central Philippines. Roughly oval in shape, the island has an area of 1,492 square miles (3,864 square km) and lies between the Camotes Sea (north) and the Bohol Sea (south). Its volcanic core is mostly covered with coralline limestone. The rivers are short, and there are few good anchorages. Settlement is mainly coastal, except for a low central plateau that encircles

"Chocolate hills" of Bohol, Philippines
Ted Spiegel from Rapho/Photo Researchers—EB Inc

the town of Carmen. The spectacular "chocolate hills," or "haycock hills," in west-central Bohol are named for their brown appearance in the dry season and their symmetrical, conical shapes. They are limestone remnants of an earlier erosion cycle, a phenomenon known to be present in only two or three other places in the world. The area has been developed for tourists.

Bohol's character is essentially rural. Rice, corn (maize), and coconuts are the principal crops. A secondary livestock industry is centered at Ubay, on rougher terrain near the east coast. Extensive, low-grade deposits of manganese are mined in the southeast. Loon and Talibon are important towns. Pop. (1990 est.) 881,051.

Bohol Sea, also called MINDANAO SEA, section of the western North Pacific Ocean. Measuring about 170 miles (270 km) east–west, it is bounded by the islands of the Philippines—Mindanao (south and east), Leyte, Bohol, and Cebu (north), and Negros (west). It opens north to the Visayan Sea through Bohol and Tañon straits and the Canigao Channel, east to the Philippine Sea through the Surigao Strait, and west to the Sulu Sea. The sea has rich fishing grounds.

Bohomolec, Franciszek (b. Jan. 29, 1720, near Vitebsk, Pol.—d. April 24, 1784, Warsaw), Jesuit priest, editor, and linguist; a prominent dramatist of the Enlightenment in Poland.

After completing his studies in Rome for the Jesuit priesthood, Bohomolec taught in Warsaw and began to adapt comedies of Carlo Goldoni and Molière for performance by his pupils. His early works satirized the ignorance and folly of the Polish aristocracy. He wrote a number of other plays for a wider public, such as *Matżeństwo z kalendarza* (1766; "Marriage by the Calendar"), which ridicules ignorance and superstition and is usually considered his best work, and *Czary* (1774; "Sorcery"), also satirizing superstition. *Pan dobry* (1767; "The Good Lord") is a social commentary on the relationship between the peasants and gentry. For the last 20 years of his life Bohomolec edited the magazine *Monitor*, which greatly contributed to the Enlightenment in Poland. It was modeled on the famed *Tatler* and *Spectator* of England and was one of the first modern periodicals in Poland. His works in Latin include a study of the Polish colloquial tongue.

Bohr, Aage N(iels) (b. June 19, 1922, Copenhagen, Den.), Danish physicist who shared the 1975 Nobel Prize for Physics with Ben R. Mottelson and James Rainwater for their work in determining the asymmetrical shapes of certain atomic nuclei.

Bohr was educated at the University of Copenhagen, where he received his doctorate in 1954. During the 1940s he worked as assistant to his father, Niels Bohr (1922 Nobel physics laureate), on the development of the atomic bomb at Los Alamos, N.M. From 1946 he was associated with the Niels Bohr Institute of Theoretical Physics, founded in Copenhagen by his father, whom he succeeded as director from 1963 to 1970. From experiments inspired by the theories of James Rainwater and conducted in collaboration with Ben R. Mottelson (*q.v.*) in the early 1950s, Bohr discovered that the motion of subatomic particles can distort the shape of the nucleus, thus challenging the widely accepted theory that all nuclei are perfectly spherical. This discovery was important for the understanding and development of nuclear fusion. Bohr's writings include *Rotational States of Atomic Nuclei* (1954) and *Nuclear Structure*, 2 vol. (1969, 1975).

Bohr, Harald August (b. April 22, 1887, Copenhagen, Den.—d. Jan. 22, 1951, Copenhagen), Danish mathematician who devised a

theory that concerned generalizations of functions with periodic properties, the theory of almost periodic functions.

The brother of the noted physicist Niels Bohr, he became professor at the Polytechnic Institute in Copenhagen in 1915 and at the University of Copenhagen in 1930. His early mathematical research was mainly concerned with the Dirichlet series, a series introduced by Peter Dirichlet of Germany in the application of analysis to the theory of numbers. Later, in collaboration with Edmund Landau of Germany, Bohr concentrated his efforts on a study of the Riemann zeta function, a function of fundamental importance to the theory of prime numbers and also to the theory of analytic functions in general. In 1914 they formulated the theorem (now called the Bohr–Landau theorem), which concerns the conditions under which the zeta function is equal to zero (distribution of zeros).

Bohr, Niels (Henrik David) (b. Oct. 7, 1885, Copenhagen, Den.—d. Nov. 18, 1962, Copenhagen), Danish physicist and Nobel laureate, the major contributor to the development of quantum physics for almost 50 years. He is responsible for the Bohr theory of the atom and liquid-drop model of the atomic nucleus.

A brief treatment of Niels Bohr follows. For full treatment, see MACROPAEDIA: Bohr.

Bohr, son of Christian Bohr, a professor of physiology at the University of Copenhagen, showed an interest and talent in the physical sciences early in life. At the age of 22 he won a gold medal from the Danish Scientific Society for his determination of the surface tension of water. He received a doctorate in physics from the University of Copenhagen in 1911 for a thesis on the electron theory of metals. He then went to England and worked at the University of Cambridge under J.J. Thomson and subsequently at Victoria University of Manchester with E. Rutherford's group studying the structure of the atom. Bohr stayed on at Manchester, with some interruptions, until 1916 and served on the university faculty for two years. He returned to Copenhagen in 1916 as professor and in 1920 became director of the newly created Institute of Theoretical Physics, a position he held until his death. He was awarded the Nobel Prize for Physics in 1922.

When Denmark was occupied by the Germans in 1940, Bohr took an active part in the anti-Nazi resistance movement. In 1943, under threat of immediate arrest, he escaped to Sweden with his family by fishing boat. Although he participated in the atomic bomb project at Los Alamos, N.M., as early as 1944 his concern about such awesome weapons was clear. He was convinced that free exchange of people and ideas among countries was necessary to achieve control of nuclear weapons. Bohr received the first Atoms for Peace Award in 1957.

Bohr's works include *The Theory of Spectra and Atomic Constitution* (1922), *Atomic Theory and the Description of Nature* (1934), and *Atomic Physics and Human Knowledge* (1958). The last mentioned contains Bohr's account of his discussions with Albert Einstein on quantum theory over two decades.

Bohr atomic model, description of the structure of atoms, especially that of hydrogen, proposed (1913) by the Danish physicist Niels Bohr. The Bohr model of the atom, a radical departure from earlier, classical descriptions, was the first that incorporated quantum theory and was the predecessor of wholly quantum-mechanical models. The Bohr model and all of its successors describe the properties of atomic electrons in terms of a set of allowed (possible) values. Atoms absorb or emit radiation only when the electrons abruptly jump between allowed, or stationary, states. Direct experimental evidence for the existence of

such discrete states was obtained (1914) by the German-born physicists James Franck and Gustav Hertz.

Immediately before 1913, an atom was thought of as consisting of a tiny positively charged heavy core, called a nucleus, surrounded by light, planetary negative electrons revolving in circular orbits of arbitrary radii.

Bohr amended that view of the motion of the planetary electrons to bring the model in line with the regular patterns (spectral series) of light emitted by real hydrogen atoms. By limiting the orbiting electrons to a series of circular orbits having discrete radii, Bohr could account for the series of discrete wavelengths in the emission spectrum of hydrogen. Light, he proposed, radiated from hydrogen atoms only when an electron made a transition from an outer orbit to one closer to the nucleus. The energy lost by the electron in the abrupt transition is precisely the same as the energy of the quantum of emitted light.

Bohrā, also spelled BOHORĀ, in general, any Shī'ī Ismā'īlī Muslim of the Musta'li sect, living in western India. The name is a corruption of a Gujarati word, *vahaurau*, meaning "to trade." The Bohrās include, in addition to this Shī'ī majority, often of the merchant class, a Sunnī minority who are usually peasant farmers. The Musta'li sect (see Ismā'īliyah), which originated in Egypt and later moved its religious centre to Yemen, gained a foothold in India through missionaries of the 11th century. After 1539, by which time the Indian community had grown quite large, the seat of the sect was moved from Yemen to Sidhpur, India. A split resulted in 1588 in the Bohrā community between followers of Dā'ūd ibn Qutb Shāh and Sulaymān, who both claimed leadership of the community. The followers of Dā'ūd and Sulaymān have since remained the two major groups within the Bohrās, with no significant dogmatic differences, the *dā'ī*, or leader, of the Dā'ūdis residing in Bombay, the leader of the Sulaymāni in Yemen.

Böhlingk, Otto von (b. June 11 [May 30, old style], 1815, St. Petersburg, Russian Empire—d. April 1, 1904, Leipzig), language scholar and lexicographer whose writings and seven-volume Sanskrit-German dictionary formed a notable contribution to 19th-century linguistic study.

While completing his education at the University of Bonn (1839–42), Böhlingk published a two-volume edition (1839–40) of the earliest known grammar, that of Pāṇini, the 5th- or 6th-century-BC Indian Sanskrit grammarian. This edition served as a vehicle for criticizing the research methods of Franz Bopp, a major German Sanskritist of the time. Returning to St. Petersburg in 1842, he joined the Imperial Academy of Sciences and published a number of works on Sanskrit, including an edition and translation of the drama *Śakuntalā* by Kālidāsa (1842). He also explored one of the languages of Siberia in *Über die Sprache der Jakuten*, 3 vol. (1851; "Concerning the Language of the Yakuts"). His great work, the *Sanskrit-Wörterbuch* (1853–75; "Sanskrit Dictionary"), was prepared in collaboration with the Indic scholars Rudolf von Roth, Albrecht Weber, and others and appeared in a new edition in 1879–89. Late in his life, he published, in addition to other Sanskrit research, a new edition of the Pāṇini grammar along with a translation.

Bohuslän, landskap (province), southwestern Sweden, on the Norwegian border, with the *landskap* (provinces) of Dalsland and Västergötland to the east and the Kattegat to the west. Its land area of 1,717 sq mi (4,447 sq km) comprises most of the administrative *län* (county) of Göteborg och Bohus. A maritime province, it has a wild, steep coast fringed by rocky, bare islands and skerries.

Hällristningar, or rock carvings, especially

notable in the parish of Tanum, near Grebbestad, and ancient burial grounds attest to the existence of Stone, Bronze, and Iron Age settlements in Bohuslän, which is also reputedly the scene of the second part of the Old English epic *Beowulf*. Because of its strategic location, the province was the object of numerous wars between the Scandinavian countries until it was finally ceded to Sweden by the Peace of Roskilde (1658). There is some agriculture, with potatoes, oats, and rye being the chief crops. The leading industries are fishing (which accounts for 60–70 percent of Sweden's marine catch), stone quarrying (especially granite), and tourism. Shipbuilding is also important. Principal towns, most of which are seaside resorts, include Kungälv, with its 14th-century Bohus Castle, which has given its name to the area; Marstrand; Lysekil; Uddevalla, the biggest municipality in the region; and Strömstad. Pop. (1983 est.) 231,343.

Boian, Neolithic culture (c. 7000 BC) centred in what is now southern Romania; it was characterized by terrace settlements, consisting at first of mud huts and later of fortified promontory settlements. The Boian phase was marked by the introduction of copper axes, the extension of agriculture, and the breeding of domestic animals. The distinctive Boian pottery was decorated by rippling, painting, and excised or incised linear designs. By spreading northward into Transylvania and northeastward to Moldavia, the Boian culture gradually assimilated earlier cultures of those areas.

Boiardo, Matteo Maria, CONTE (count) DI SCANDIANO (b. May 1440/41, Scandiano, Papal States—d. Dec. 19, 1494, Reggio nell'Emilia), poet whose *Orlando innamorato*, the first poem to combine elements of both Arthurian and Carolingian traditions of romance, gave new life to the chivalrous epic, which was declining in popularity. Boiardo spent much of his childhood at Ferrara, and served the dukes of Este. He was captain of the ducal forces at Modena from 1480 to 1482 and at Reggio from 1487 until his death.

His chief pleasures were in study and poetry, and he wrote numerous works, both in Latin and Italian. Of the Italian works, the *Amorum libri tres* (1499; "Three Books on Love") tells of his love for Antonia Caprara and is among the most personal and spontaneous collections of 15th-century lyrics, written at a time when most love poetry was a conventional exercise. *Orlando innamorato*, begun about 1476, was intended to consist of three parts, but only the first two (published 1483) and part of the third were completed at the poet's death. *Orlando innamorato* (to which Ariosto's *Orlando furioso* was conceived as a sequel) glorifies military honour, patriotism, and religion. The poem did not achieve popularity, partly because of its dialectical and erudite language, partly because of the careless construction of the episodes and characters, but chiefly because of its delineation of strong and primitive passions, which was not in tone with the tendencies of his time. Boiardo, however, breathed an intimate, personal strain into the stereotype of the epic that future generations emulated and expanded.

An English translation by Robert Tofte appeared in 1598 and one in prose by W.S. Rose in 1823.

boïd, any member of the snake family Boidae, which includes boas and pythons. The more than 80 species occur chiefly in the tropics, worldwide. Almost all have two lungs, a pelvic girdle, and vestigial hindlimbs, which show as small spurs opposite the vent. Some have heat-sensitive lip pits. Boïds tend to be iridescent, especially after shedding the skin.

Nonvenomous, they kill by biting and constricting. The family includes the world's largest snakes (reticulated python and anaconda) as well as small burrowing forms.

Boie, Heinrich Christian (b. July 19, 1744, Meldorf, Holstein—d. March 3, 1806, Meldorf), German poet and editor, chiefly noted as a founder of literary periodicals.

After studying theology and law at the University of Jena, with Christian W. von Dohm, Boie founded the literary journal *Deutsche Museum* (1776; in 1789 renamed *Neue Deutsche Museum*). In 1776 he began a career in government that was concurrent with his literary activities. He served in various local posts, finally as provincial governor of the rural district of Süderdithmarschen.

Boieldieu, François-Adrien (b. Dec. 16, 1775, Rouen, Fr.—d. Oct. 8, 1834, Jarcy), composer who developed the farcical French opéra comique into a more serious form of early romantic opera.

In Rouen he studied under the organist Charles Broche and composed two operas and numerous piano sonatas, remarkable for their form, which constitute the first important body of piano works by a French composer. In 1796 he settled in Paris, where he met Étienne Méhul and Luigi Cherubini. The following year he produced three comic operas. He became professor of piano at the conservatory in 1798 and composed his successful operas *Le Calife de Bagdad* (1800) and *Ma Tante Aurore* (1803). From 1804 to 1810 he directed the opera at St. Petersburg, Russia. In 1816

Boieldieu, detail of an oil painting by Louis-Léopold Boilly; in a private collection

The Andre Meyer Collection—J.P. Ziolo

he became director of music to Louis XVIII, in 1817 a member of the French Institute, and in 1820 professor of composition at the conservatory. His main operas of this period were *Jean de Paris* (1812), *Le Petit Chaperon rouge* (1818; "Little Red Riding Hood"), and his masterpiece, *La Dame blanche* (1825; "The White Lady"). Composed on a libretto by Eugène Scribe, derived from Sir Walter Scott's *The Lady of the Lake*, *Monastery*, and *Guy Mannering*, it had received 1,700 performances by 1914. Boieldieu's work illustrates the evolution of French operatic music in the generation following the French Revolution. In its lighter aspects, his style was compared to Rossini's. His scenes of mystery and romance, particularly in *La Dame blanche*, are akin to those of Carl Maria von Weber. He also composed numerous romances for voice and harp or piano and a harp concerto.

Boii, a Celtic tribe, one section of which settled in Cisalpine Gaul around Bononia (Bologna, Italy) and another in what was later Bohemia, to which it gave its name. The Cisalpine group, after struggling against the Romans throughout the 3rd century BC, was subdued and made a Latin colony in 191 BC. The second group, which joined with another Celtic tribe, the Helvetii, to invade Gaul, was defeated in 58 BC by Julius Caesar. He allowed the survivors to settle in Gaul between the

Liger (Loire) and Elaver (Allier) rivers. The remaining Boii south of the Danube River were exterminated by Burebistas of Dacia about 50 BC, and those in Bohemia were expelled by the Marcomanni tribe in 8 BC.

boil, also called **FURUNCLE**, or **FURUNCULOSIS**, a staphylococcus skin infection characterized by an inflamed nodular swelling filled with pus, located at the site of a hair follicle. The lesion is painful and feels hard to the touch; healing begins after the pus is discharged. Boils are usually located in hairy body areas exposed to friction and maceration, such as the back of the neck, the face, armpits, buttocks, and groin. A sty is a boil located at the base of an eyelash. A carbuncle is an aggregation of adjoining boils with several centers of pus collection.

Existing skin disorders that lead to scratching may favour the entrance of the staphylococci into hair follicles, with resulting boil formation. Any general lowered state of health may also predispose individuals to furunculosis, although the condition also affects healthy people. Some individuals seem more susceptible to boils than others, and in them the boils tend to recur. Ordinarily treatment is unnecessary, other than the use of measures to keep the affected area clean and protected from further infection. In more severe cases, antibiotics are usually effective. When boils occur in a patient at a hospital in which penicillin-resistant staphylococcal infections are endemic, they may constitute a serious medical problem, particularly when the patients are aged or debilitated.

Boileau(-Despréaux), Nicolas (b. Nov. 1, 1636, Paris—d. March 13, 1711, Paris), poet and leading literary critic in his day, known for his influence in upholding classical standards in both French and English literature.

He was the son of a government official who had started life as a clerk. Boileau made

Boileau, oil painting after Hyacinthe Rigaud; in the Musée National de Versailles et des Triansons, France
Cliche Musees Nationaux

good progress at the Collège d'Harcourt and was encouraged to take up literary work by his brother Gilles Boileau, who was already established as a man of letters.

He began by writing satires (c. 1658), attacking well-known public figures, which he read privately to his friends. After a printer who had managed to obtain the texts published them in 1666, Boileau brought out an authenticated version (March 1666) that he toned down considerably from the original. The following year he wrote one of the most success-

ful of mock-heroic epics, *Le Lutrin*, dealing with a quarrel of two ecclesiastical dignitaries over where to place a lectern in a chapel.

In 1674 he published *L'Art poétique*, a didactic treatise in verse, setting out rules for the composition of poetry in the classical tradition. At the time, the work was considered of great importance, the definitive handbook of classical principles. It strongly influenced the English Augustan poets Dr. Johnson, John Dryden, and Alexander Pope. It is now valued more for the insight it provides into the literary controversies of the period.

In 1677 Boileau was appointed historiographer royal and for 15 years avoided literary controversy; he was elected to the Académie Française in 1684. Boileau resumed his disputatious role in 1692, when the literary world found itself divided between the so-called ancients and moderns (see ancients and moderns, the quarrel of). Seeing women as supporters of the moderns, Boileau wrote his antifeminist satire *Contre les femmes* ("Against Women," published as *Satire x*, 1694), followed notably by *Sur l'amour de Dieu* ("On the Love of God," published as *Eptre xii*, 1698).

Boileau did not create the rules of classical drama and poetry, although it was long assumed that he had—a misunderstanding he did little to dispel. They had already been formulated by previous French writers, but Boileau expressed them in striking and vigorous terms. He also translated the classical treatise *On the Sublime*, attributed to Longinus. Ironically, it became one of the key sources of the aesthetics of Romanticism.

boiler, also called **STEAM GENERATOR**, apparatus designed to convert a liquid to vapour. In a conventional steam power plant, a boiler consists of a furnace in which fuel is burned, surfaces to transmit heat from the combustion products to the water, and a space where steam can form and collect. A conventional boiler has a furnace that burns a fossil fuel or, in some installations, waste fuels. A nuclear reactor can also serve as a source of heat for generating steam under pressure.

Boilers were built as early as the 1st century AD by Hero of Alexandria but were used only as toys. Not until the 17th century was serious consideration given to the potential of steam power for practical work. The first boiler with a safety valve was designed by Denis Papin of France in 1679; boilers were made and used in England by the turn of the 18th century. Early boilers were made of wrought iron; as the advantages of high pressure and temperature were realized, manufacturers turned to steel. Modern boilers are made of alloy steel to withstand high pressures and extremely high temperatures.

Most conventional steam boilers are classed as either fire-tube or watertube types. In the fire-tube type, the water surrounds the steel tubes through which hot gases from the furnace flow. The steam generated collects above the water level in a cylindrically shaped drum. A safety valve is set to allow escape of steam at pressures above normal operating pressure; this device is necessary on all boilers, because continued addition of heat to water in a closed vessel without means of steam escape results in a rise in pressure and, ultimately, in explosion of the boiler. Fire-tube boilers have the advantage of being easy to install and operate. They are widely used in small installations to heat buildings and to provide power for factory processes. Fire-tube boilers are also used in steam locomotives.

In the watertube boiler, the water is inside tubes with the hot furnace gases circulating outside the tubes. When the steam turbogenerator was developed early in the 20th century, modern watertube boilers were developed in response to the demand for large quantities of steam at pressures and temperatures far exceeding those possible with fire-tube boilers.

The tubes are outside the steam drum, which has no heating surface and is much smaller than in the fire-tube boiler. For this reason, the drum of the watertube boiler is better able to withstand higher pressures and temperatures. A wide variety of sizes and designs of watertube boilers are used in ships and factories. The express boiler is designed with small water tubes for quick generation of steam. The flash boiler may not require a steam drum, because the tubes operate at such high temperatures that the feed water flashes into steam and superheats before leaving the tubes. The largest units are found in the central-station power plants of public utilities. Units of substantial size are used in steel mills, paper mills, oil refineries, chemical plants, and other large manufacturing plants.

Boilermaker, The (boxer): see Jeffries, James Jackson.

boiling, the cooking of food by immersion in water that has been heated to near its boiling point (212° F [100° C] at sea level; at higher altitudes water boils at lower temperatures, the decrease in boiling temperature being approximately one degree centigrade for each 1,000 ft [300 m]). Water-soluble substances, such as sugar and salt, raise the boiling point of the water).

Boiling is used primarily to cook meats and vegetables. The extent of cooking varies according to individual taste and regional or traditional dictum; in the cookery of the U.S. South, for example, the boiling of vegetables is usually protracted, with a soft consistency and a blend of flavours in combined ingredients considered desirable. In the *nouvelle cuisine* of France, on the other hand, Chinese influence dictates minimal boiling or steaming to preserve fresh colour, texture, and flavour.

A number of specific terms apply to methods of cooking with hot water. Scalding is accomplished in water heated to around 185° F (85° C), usually in a double boiler, which conducts the heat of the water, contained in a bigger pan, to a smaller pan containing the food, thus avoiding contact between food and water. This technique is commonly used to prepare milk for breads and custards. At just above the scalding temperature, water begins to circulate visibly and to shiver; at this point, foods, notably eggs and fish, may be poached. At the simmering point, variously specified but generally approaching the boiling temperature, the surface of the water breaks into small bubbles; simmering, in a covered or open pan, is commonly used to prepare soups, stews, and pot roasts. In blanching, boiling water is poured over vegetables, fruits, or nutmeats in order to loosen the outer skin. Parblanching or parboiling consists in immersing the food in cold water and then bringing it slowly to a simmer or boil.

Steaming comprises two related techniques, both used primarily for the cooking of vegetables. In the first, the food is placed on a rack above a shallow portion of water, heated to the boil, in a covered pan; this method is valued for its preservation of colour, texture, flavour, and nutrients. The second technique, called pressure cooking, requires a tightly sealed, often latched, vessel, in which characteristically tough or long-cooking foods may be subjected to steam cooking under high pressure. The classic New England boiled dinner, consisting of corned beef cooked with cabbage, carrots, potatoes, and onions, is traditionally boiled in the conventional manner but may be adapted readily to pressure cooking.

boiling point, temperature at which the pressure exerted by the surroundings upon a liquid is equalled by the pressure exerted by the vapour of the liquid; under this condition, addition of heat results in the transformation of the liquid into its vapour without raising the temperature.

At any temperature a liquid partly vaporizes into the space above it until the pressure exerted by the vapour reaches a characteristic value called the vapour pressure of the liquid at that temperature. As the temperature is increased, the vapour pressure increases; at the boiling point, bubbles of vapour form within the liquid and rise to the surface. The boiling point of a liquid varies according to the applied pressure; the normal boiling point is the temperature at which the vapour pressure is equal to the standard sea-level atmospheric pressure (760 mm [29.92 inches] of mercury). At sea level, water boils at 100° C (212° F). At higher altitudes the temperature of the boiling point is lower. *See also* vaporization.

Boilly, Louis-Léopold (b. July 5, 1761, La Bassée, France—d. Jan. 4, 1845, Paris), prolific painter known for his genre scenes of

"Self-Portrait," oil on canvas by Louis-Léopold Boilly, 1795; in the Museum of Fine Arts, Lille, Fr.

By courtesy of the Musée des Beaux Arts, Lille, France

Parisian life and society during the Revolution and the French Empire. He is also noted for his pioneering use of lithography.

The son of a sculptor, Boilly painted portraits for a living before moving to Paris in 1785. There he began to paint the detailed anecdotal pictures of fashionable scenes that were to make him famous. He began exhibiting at the Salon in 1791 and gained the favour of the new republican regime with his painting "The Triumph of Marat," a flattering view of the revolutionary leader Jean-Paul Marat. Over the next 40 years Boilly painted a large number of works depicting the most varied aspects of everyday life in Paris. Such paintings as "The Studio of Isabey" (1798), "Arrival of the Stagecoach" (1803), "The Studio of Houdon" (1804), and "Departure of the Conscripts" (1808) show his considerable skill at handling crowd scenes. In 1823 Boilly produced his first lithographs, his humorous series "Grimaces." Altogether he executed about 500 genre paintings and some 5,000 small portraits.

Boina, short-lived kingdom of the Sakalava people in western Madagascar. The Sakalava, who originated in southern Madagascar, migrated up the west coast in the mid-17th century under the leadership of Andriandahifotsy. When he died, one of his sons succeeded to the rule of southwestern Madagascar (the kingdom of Menabé).

The other son, Adriamandisoarivo, continued the migration northward and established his rule over a second Sakalava kingdom, Boina. At his death about 1710, Boina covered the broad coastal plain between the Manambalo and Mahajamba rivers and collected tribute from neighbouring states. Some disintegration followed his death, but Boina

regained its cohesion under Queen Ravahiny (d. 1808). It allied with the French in opposition to the Sakalava's traditional rival, the Merina of the central plateau. Competition among Ravahiny's 12 sons divided the kingdom in the early 19th century and opened the path to conquest by the Merina before 1850.

Boise, capital and largest city of Idaho, U.S., and the seat of Ada county. It lies along the Boise River in the southwestern part of the state. Because mountains to the north protect it from Canadian blizzards, Boise has relatively mild winters, as well as hot, dry summers.

Boise was named by early 19th-century French-Canadian trappers for the tree-lined river (French *boisé*, "wooded") that provided relief for travelers crossing the desolate Snake River Plain. Following the 1862 gold rush to the Boise River basin, Fort Boise was established (July 4, 1863), and a community developed to provide services for the nearby mines. Its location at the crossroads of the Oregon Trail and the routes to the Boise Basin and Owyhee mines ensured Boise's early growth, and it became the capital of Idaho in 1864. After 1902 the Boise Irrigation Project built nearby Arrowrock Dam and several other dams on the Boise River to provide the region with water storage and recreational facilities. Agricultural expansion and the growth of a commercial lumber industry contributed to Boise's rapid growth in the early 20th century. One of the world's largest construction companies also grew up there. The city's diversified industries now include agriculture (fruit, sugar beets, and livestock), lumbering, electronics, and wholesale trade and trucking. Federal and state government agencies also provide much local employment.

State Capitol, Boise, Idaho

Alan Picam from Grant Helman

The city is the headquarters of the Boise National Forest, which is dotted with abandoned mines and ghost towns. Boise State University was founded in 1932 as a junior college. Inc. 1864. Pop. (1994 est.) city, 145,987; (1995 est.) Boise City MSA, 360,341.

Boise National Forest, national forest in southwestern Idaho, U.S., divided into two segments. The principal part lies east of the North Fork of the Payette River and is roughly diamond-shaped, with maximum dimensions of about 109 miles (175 km) north-south and 55 miles (89 km) east-west. To the west and separated from it by the valley of the North Fork of the Payette River is a narrow outlying part of the forest, about 37 miles (60 km) north-south and 12 miles (19 km) east-west at its widest point; most of it, however, is much narrower.

The main portion of the forest is generally steep and mountainous, decreasing somewhat in elevation toward the Boise River valley in the southwest. The rugged Sawtooth Range covers much of the eastern part; the highest elevation within the forest is Big Baldy, 9,722 feet (2,963 m) above sea level. The Middle and South forks of the Salmon River, the Middle Fork of the Payette River, and all three forks of the Boise River, have their sources in the forest.

Following the discovery of gold north of Boise in 1862, numerous mining communities sprang up in the locality. Some of the mining towns, however, died out and are now ghost towns of interest to tourists.

Fishing, hunting (bear, deer, elk, mountain goat), hiking, and rafting on the Middle Fork of the Salmon River are all popular. Parts of both the Frank Church Wilderness (formerly Idaho Primitive Area) and the Sawtooth Wilderness Area are in the forest; these scenic wilderness areas, where commercial exploitation is forbidden, are kept virtually roadless. Bogus Basin Ski Area is a winter-sports centre, 10 miles (16 km) north-northeast of Boise, which is the forest headquarters. Set up in 1908, the forest has an area of 4,140 square miles (10,722 square km).

Boise River, river formed by the confluence of the Middle Fork and North Fork branches, southeast of Idaho City in Boise National Forest, Idaho, U.S. It flows generally westward through Arrowrock and Lucky Peak reservoirs and through the city of Boise to join the Snake River at the Oregon line after a course of about 95 miles (150 km). Dams along the river include Lucky Peak, Arrowrock, and Anderson Ranch (on the South Fork). The name is from a French word meaning "wooded."

Boisguillebert, Pierre Le Pesant, sieur (lord) de (b. 1646, Rouen, France—d. 1714, Rouen), French economist who was a precursor of the Physiocrats and an advocate of economic and fiscal reforms for France during the reign of Louis XIV.

Boisguillebert was opposed to the economic policy of Jean-Baptiste Colbert, finance minister to Louis XIV, who attempted to increase the manufacturing potential of France by keeping agricultural prices at a low level in the hope that low-wage goods would be an incentive to industry. Like his Physiocratic successors, Boisguillebert thought that national wealth was dependent on the prosperity of agriculture. He was an agricultural protectionist, but his belief in the natural order of economic and social relationships and his opposition to the medieval economic restrictions that had proliferated brought him close to a *laissez-faire* position. In fiscal reform he advocated direct rather than indirect taxes; reform of the *taille*, a direct tax from which the French kings derived the major part of their revenue; and a 10 percent income tax. For his views and his support of the disgraced Sébastien de Vauban, another advocate of reform, Boisguillebert was dishonoured and for a time exiled.

Boismortier, Joseph Bodin de (b. Dec. 23, 1689, Thionville, France—d. Oct. 28, 1755, Roissy-en-Brie), prolific French composer of instrumental music in addition to cantatas, ballet-operas, and other vocal music. His first works appeared in Paris, in 1724, and by 1747 he had published more than 100 works in a variety of vocal and instrumental combinations.

His music, particularly for the voice, was extremely popular, and he became rich without the aid of patrons. Boismortier was the first French composer to use the Italian concerto form. He also wrote the first French solo

concerto for any instrument, a concerto for cello, viol, or bassoon (1729). Much of his music is for the flute, for which he also wrote an instruction method (now lost).

Boisrobert, François Le Metel, seigneur de (lord of) (b. 1589, Caen, Fr.—d. March 30, 1662, Paris), prolific dramatist, irreligious churchman, and practical benefactor of the French world of letters who was a founding member of the Académie Française.

A Norman Huguenot lawyer's son, he became a Catholic in the 1620s and began to take holy orders. His wit and effrontery won him the favour of Cardinal de Richelieu, and he was given a canonry at Rouen (1634) and an abbacy in Burgundy (1638)—posts in which he gave offense during his rare attendances. Meanwhile, he had published a paraphrase of the Psalms (1627); a novel, *Histoire indienne d'Anaxandre et d'Orazie* (1627; *History of Anaxander* . . . , 1657); and a tragicomedy, *Pyrandre et Zysimène* (1633); as well as anthologies of poems eulogizing King Louis XIII and Richelieu (1634–35). He used his influence with Richelieu not only to procure subsidies for other writers but also to promote the establishment of the Académie Française.

When Louis XIII heard from his own intriguing favourite, the Marquis de Cinq-Mars, that Boisrobert had made sexual advances to Richelieu's pages, he ordered Richelieu to dismiss him (1641). Under the next regime, Boisrobert's wit made little appeal to Cardinal Mazarin, and his blasphemies offended the Jesuit entourage of the queen mother, Anne of Austria. Hence, his last 20 years were mainly occupied with dramaturgy. His plays are largely forgotten except by students of the 17th-century French theatre.

Boito, Arrigo, original name ENRICO GIUSEPPE GIOVANNI BOITO, pseudonym TOBIA GORRIO (b. Feb. 24, 1842, Padua, Lombardy-Venetia—d. June 10, 1918, Milan), Italian

Boito, portrait by an unknown artist

poet and composer acclaimed for his opera *Mefistofele* and his librettos after Shakespeare for Giuseppe Verdi's *Otello* and *Falstaff*.

The son of an Italian painter of miniatures and a Polish countess, Boito attended the Milan Conservatory and travelled to Paris on a scholarship. There he met Verdi, for whom, in 1862, he wrote the text of the *Hymn of the Nations*. When war broke out in 1866, he joined Garibaldi's volunteers. While working on *Mefistofele*, he published articles championing German and vigorously attacking Italian music and musicians. Verdi was deeply offended by his remarks. By 1868, when *Mefistofele* was produced at Milan, Boito's polemics had provoked so much hostility that a near riot resulted, and the opera was withdrawn after two performances. A much-revised version, produced at Bologna in 1875, has remained in the Italian repertory. Of the several operas based on Goethe's *Faust*, Boito's *Mefistofele* is perhaps the most faithful to

the spirit of the play. The libretto is of particularly high quality. Somewhat influenced by Beethoven and Wagner, the opera was unconventional for its day, both in its then unusual harmonies and in its rejection of some of the conventions of Italian opera. Boito's second opera, *Nerone*, occupied him for nearly 50 years; completed after his death by Vincenzo Tommasini and Arturo Toscanini, it was produced in Milan in 1924, but, despite its grand design and spectacle, it lacked the musical character that distinguished *Mefistofele*.

Boito and Verdi were reconciled in 1873, and Boito undertook the revision of the libretto of Verdi's *Simon Boccanegra*. His masterly versions of *Otello* and *The Merry Wives of Windsor* (the libretto for *Falstaff*) stimulated the imagination of the aged composer. Boito also wrote texts for several other composers, including Amilcare Ponchielli (*La gioconda*), and published a volume of verses (under the pseudonym Tobia Gorrio) and several novels.

Bojador, Cape, also spelled CAPE BOUJOUR, extension of the West African coast into the Atlantic Ocean, now part of the Western Sahara. Located on a dangerous reef-lined stretch of the coast, its Arabic name, *Abū Khaṭar*, means "the father of danger." It was first successfully passed by the Portuguese navigator Captain Gil Eanes in 1434. Subsequently the Portuguese exploited the region, particularly for slaves. After 1450 the area was disputed by both Spain and Portugal. Spain finally gained the region in 1860 by the Treaty of Tetuan with Morocco, and in 1884 officially annexed it. A lighthouse was built on the cape in the early 20th century to aid shipping. After Spain withdrew from the Western Sahara in 1976, Morocco claimed the cape, built a desalination plant and barracks for a military garrison there, and made the settlement the capital of the newly created province of Boujdour. A paved road links Cape Bojador with El-Aaiún, to the north.

Bojer, Johan (b. March 6, 1872, Orkesdalsoren, near Trondheim, Nor.—d. July 3, 1959, Oslo), Norwegian novelist, internationally popular in the 1920s because his works dramatized topical problems of the day. He is best remembered in his own country for novels depicting folk life in the fishing-farming communities of the Lofoten Islands: *Den siste viking* (1921; *Last of the Vikings*, 1923) and *Folk ved sjøen* (1929; *Folk by the Sea*, 1931), perhaps his finest work. Both of these works are epic in conception and contain remarkable passages of description.

Born in a fisherman's hut, Bojer grew up in extreme poverty but enjoyed early success as a writer. For many years he lived abroad, in France, Italy, Germany, and England. His reputation in the English-speaking world was established with *Den store hunger* (1916; *The Great Hunger*, 1918). He also wrote an ambitious novel about America's Norwegian immigrants, *Vor egen stamme* (1924; *The Emi-*

Bojer

grants, 1925). Bojer's international popularity survived into the 1940s.

Bojo Guksa, secular name CHI-NUI (b. 1158, Korea—d. 1210, Korea), Buddhist priest who founded the Chogye-jong (Chogye Sect), now one of the largest Buddhist sects in Korea. It is derived from Ch'an, the Chinese form of Buddhism, known as Sōn in Korea and as Zen in Japan.

Bojo became a Buddhist follower at the age of eight and entered the priesthood at 25, when he passed the Korean national service examination. He was much influenced by the doctrine of sudden enlightenment taught by the Chinese Ch'an Buddhist master Hui-neng (638–713); and in 1190 Bojo, together with several of his colleagues, set up a new organization to counter the elaborate ritualistic practices that had crept into Korean Buddhism. In 1200 he moved to the Songkwang-sa (Songkwang Temple) in Mt. Chiri, where he established the Chogye-jong. A form of Sōn Buddhism, the Chogye-jong stressed the importance of studying the *Avatamsaka-sūtra* (*Garland Sutra*) and of meditation. Bojo taught that the ultimate goal of Buddhism is to acquire the essential calmness of mind, free from external influence. He expressed this doctrine in his last and most famous writing, "A Commentary on the Fa-chi-pieh-hang-lu."

Bok, Bart J(an) (b. April 28, 1906, Hoorn, Neth.—d. Aug. 7, 1983, Tucson, Ariz., U.S.), Dutch-born American astronomer known for his work on the structure and evolution of the Milky Way Galaxy and for his study of "Bok globules," small dark clouds observable against the background of bright nebulae. Bok suggested that these globules may be condensed clouds of interstellar gas and dust in the process of contracting into stars.

Bok studied at the universities of Leiden and Groningen (Ph.D. 1932). He then pursued an academic career of research and teaching at Harvard University (1929–57), the Australian National University (1957–66), and the University of Arizona (1966–74), remaining at Arizona as professor emeritus; he had become a U.S. citizen in 1938. He served as director of the Mount Stromlo Observatory (1957–66) in Australia and as director of the Steward Observatory (1966–70) in Arizona. With his wife, Priscilla F. Bok, he wrote the classic work *The Milky Way* (1941; 5th ed., 1981). Bok served as vice president of the International Astronomical Union (1970–76) and as president of the American Astronomical Society (1972–74).

Bok, Edward (William) (b. Oct. 9, 1863, Den Helder, Neth.—d. Jan. 9, 1930, Lake Wales, Fla., U.S.), innovative American editor in the field of periodical journalism for women; during his 30-year stewardship of the *Ladies' Home Journal* (1889–1919), he effected important reforms and helped shape contemporary American culture.

Growing up in a poor immigrant family in Brooklyn, N.Y., Bok worked as an office boy for the Western Union Telegraph Co., attended night school, entered book publishing, and (at the age of 24) became advertising manager of *Scribner's Magazine*. In 1886 he established the Bok Syndicate Press, for which he developed, as a regular newspaper feature, a full page of reading material for women. The striking success of the "Bok page" led to his elevation to the editorship of the *Ladies' Home Journal* in Philadelphia. Bok devised magazine departments to inform and advise women on almost every subject; he campaigned for women's suffrage, sleeping-car improvement, wildlife conservation, and clean cities and towns; he opposed roadside billboards, public drinking cups, and power-company encroachment at Niagara Falls, N.Y. His announcement in 1892 that he would accept no more patent medicine advertising opened the way

Edward Bok, photograph by Pirie MacDonald, 1909

for a crusade that enlisted other editors and culminated in the enactment of the Pure Food and Drug Act (1906). His boldest venture was to break the taboo against the printed mention of venereal disease. By 1917 readers of the magazine were sending him nearly 1 million queries annually for public reply.

Bok's autobiography, *The Americanization of Edward Bok* (1920), was awarded the Pulitzer Prize in 1921. He devoted the rest of his life to working on behalf of civic improvement and world peace.

Bokāro, in full BOKĀRO STEEL CITY, city and metropolitan area, north-central Jharkhand state, northeastern India. It lies along the Dāmodar River, just west of one of India's largest iron and steel plants. Construction of the steelworks began in 1967, and the first blast furnace was inaugurated in 1972. The plant was built with Soviet aid and was completed in the 1980s. Major coalfields are nearby. The city was built to provide housing and other community facilities for the plant's employees and is connected by road and rail with Calcutta (Kolkata) to the southeast. Pop. (1991) city, 333,683; metropolitan area, 398,890.

Bokassa, Jean-Bédél, also called BOKASSA I (b. Feb. 22, 1921, Bobangui, Oubangui-Chari, French Equatorial Africa [now in Central African Republic]—d. Nov. 3, 1996, Bangui, Central African Republic), African military leader who was president of the Central African Republic (1966–77) and self-styled emperor of his Central African Empire (1977–79).

The son of a village chief, Bokassa attended local mission schools before joining the French army in 1939. He distinguished himself in the French conflict in Indochina, and by 1961 he had achieved the rank of captain. At the request of President David Dacko, Bokassa left the French armed forces to head the army of the newly independent Central African Republic. In 1966 Bokassa used his position as supreme military commander to overthrow Dacko and declare himself president of the republic. In that capacity he became known for his autocratic and unpredictable policies, and his government was characterized by periodic reshuffles in which the power of the presidency was gradually increased.

In 1977, emulating his hero, Napoleon I, Bokassa crowned himself Emperor Bokassa I in a lavish ceremony that cost about \$200 million and effectively bankrupted the already-impooverished Central African Republic. Bokassa renamed his country the Central African Empire. His reign was short-lived, however. Following the substantiation of international charges that Bokassa had personally participated in a massacre of 100 schoolchildren by his Imperial Guard, French paratroops carried out a military coup against him that reestablished the republic and reinstated Dacko as president (September 1979). Bokassa went into exile, first traveling to Côte d'Ivoire but later settling in France.

Bokassa was sentenced in absentia to death in 1980, but he inexplicably chose to return to the Central African Republic in 1986. He was

arrested and put on trial, and in 1987 he was found guilty of the murders of the schoolchildren and other crimes (although he was acquitted of charges of cannibalism). His death sentence was subsequently commuted, and he was freed in 1993.

Boké, town and port, western Guinea. It lies along the Nuñez River, near the Atlantic coast. The nation's most important bauxite-producing area lies north of Sangarédi, 50 miles (80 km) east-northeast of Boké.

Once a collecting point for slaves, the town of Boké became a French trading post in 1865 and exported peanuts (groundnuts), coffee, and wild rubber from 1870 to 1914. Navigation impediments and the development of Conakry's port greatly reduced Boké's importance as a port, however. The town is now the chief market centre (rice, fish, cattle, oranges, and palm oil and kernels) for the region's Landuma, Fulani, Nalu, Mikifore, and Baga peoples. Pop. (latest est.) 33,205.

Bokenam, Osbern, Bokenam also spelled BOKENHAM (b. Oct. 6, 1393?, Old Buckenham?, Norfolk, Eng.—d. c. 1447), English poet and friar best known as the author of a verse collection entitled *Legends of Holy Women*.

Little is known of Bokenam's life. He traveled often to Italy, living for several years in Venice and later making pilgrimages to Rome and other cities. He made his home, however, in an Augustinian convent in Suffolk. At least two works in addition to the legends have been attributed to Bokenam.

The work on which his reputation stands is an approximately 10,000-line poem written in the Middle English Suffolk dialect. It consists of three stanza forms—a 10-syllable rhymed couplet, ottava rima, and a seven-line alternately rhymed stanza—in which Bokenam relates the legends of 12 women saints and of the 11,000 virgins of the legend of Saint Ursula. The prologues to the individual legends are more lively than the legends themselves, which are closely translated from Latin originals. The only surviving copy of the manuscript is in the British Library.

Bokenam was familiar with the work of John Lydgate, an English devotional poet, and is thought to have been inspired by Geoffrey Chaucer's *Legend of Good Women*, but his chief source was the *Legenda aurea* (*Golden Legend*) of Jacobus de Voragine.

Bokhara (city, Uzbekistan): see Bukhara.

Bokhara rug, Bokhara also spelled BUKHARA, any of the predominantly red-coloured floor coverings handwoven by peoples of Russian Turkistan (Turkmenistan and

Princess Bokhara rug (Hatchlu) from Russian Turkistan, late 19th century; in a New York state private collection

In a New York state private collection, photograph, Otto E. Nelson

Uzbekistan). Many of the rugs have been marketed through the city of Bukhara (Bokhara) in Uzbekistan. They are primarily the product of Tekke Turkmens but also are made by Salors, Sariqs, Yomuts, and Ersaris (see Ersari carpet; Tekke carpet; Salor rug; Yomut carpet). The prayer, or door, rugs of these tribes, known as Hatchlu rugs, used to be sold as Princess Bokharas, and high-quality Tekke carpets were sold as Royal Bokharas. The various tribes also produce pile-faced bags, panels of several sizes, door surrounds, extremely long and narrow ornamental tent bands, and flat-woven rugs of several types. Bokhara rugs now come also from eastern Iran, Afghanistan, and Pakistan.

Bokn Fjord, Norwegian BOKNAFJORDEN, inlet of the North Sea in Rogaland fylke (county), southwestern Norway. At its mouth, between the southern tip of Karm Island and the northern tip of the Tunegenes Peninsula, it is 12 miles (20 km) wide. Bokn Fjord proper extends inland for about 28 miles (45 km). Its principal branches include Skjold Fjord and Sandeid Fjord to the north, Sauda Fjord and Hyls Fjord to the northeast, and Lyse Fjord and Høgs Fjord to the southeast. It is dotted by many islands and islets. Among the more important are the Kvits Islands in the centre of the fjord's entrance; Bokn, inside the north entrance; Finn and Rennes islands, in the middle of the fjord; and Ombo, near its head. The city of Stavanger is the only large settlement along Bokn Fjord.

Boksburg, town and diversified industrial and mining centre, Gauteng province, South Africa, 5 miles (8 km) east of Johannesburg. Established in 1887 as the administrative centre of the East Rand with the discovery of gold and coal in the area, it has become one of the most important gold-producing towns on the Witwatersrand. It was incorporated as a town in 1903. Boksburg manufactures a wide variety of industrial and consumer goods, among them electric motors, cranes, and glazed ceramics. Gold mining also continues, mostly through the sinking of extremely deep shafts. The town, which is surrounded by residential suburbs, is a popular resort for sailing and swimming. Pop. (1996) 260,905.

bokuseki (Japanese: "ink trace"), Chinese (Wade-Giles romanization) MO-CHI, or (Pinyin) MOJI, calligraphic style of the Buddhist sects known as Zen in Japan and Ch'an in China. This calligraphic form sprang directly from the transplantation during the 12th and 13th centuries of Ch'an Buddhism to Japan, in which country it became known as Zen. *Bokuseki* became a part of the major artistic flowering associated with Zen Buddhism during the Muromachi period (1338–1573), at which time calligraphy was regarded as an essential cultural accoutrement of a distinguished Zen monk. *Bokuseki* characters were written with the brush in a bold and assertive style. They often comprise a phrase or evocative saying written by a Zen master to educate his disciple or please an important visitor. Many such works eventually became highly valued collector's items, appreciated both for their aesthetic appeal and for their historical associations. The most admired *bokuseki* in Japan were produced by the Zen monks Musō Soseki (1275–1351), Sesson Yūbai (1290–1346), and Tesshū Tokusai (fl. 1342–66).

bola, also called BOLAS (Spanish: "balls"; from *boleadoras*), South American Indian weapon, primarily used for hunting, consisting of stone balls, usually in a group of three, attached to long, slender ropes. In hunting rhea, guanaco, and other animals in open country, the bola is whirled like a sling, then thrown parallel to the ground to entwine the quarry's legs. Bolas

were also used by the gauchos of Argentina and Uruguay to catch cattle.

Bolama, port town, on the northeast side of Bolama Island, Guinea-Bissau. Bolama Island and town lie between mainland Guinea and the Bijagós Archipelago. The town served as the capital of Portuguese Guinea until 1941, when it was replaced by Bissau. In the late 1860s the island was claimed by Britain, but President Ulysses S. Grant of the United States, acting as arbitrator, awarded the island to Portugal. Since the 1940s the town has declined in importance and population. Pop. (latest est.) 3,332.

Bolān Pass, important natural gateway through the Central Brāhui Range in Balochistān province, Pakistan, connecting Sibi with Quetta by road and railway. For centuries it has been a route for traders, invaders, and nomadic tribes between India and higher Asia. It comprises a series of long, narrow valleys or gorges and extends for 55 miles (89 km) from Rindli in the south to Darwāza near Kolpur in the north. Its widest point (16 miles [26 km]) is in the Laleji Plain south of Mach. The Nāri-Bolān Canal Project provides for the irrigation of about 24,000 acres (9,700 hectares) by means of damming the monsoon flow of the Bolān River in the Sibi Plain.

Bolāngir, city, western Orissa state, eastern India. The city was formerly the capital of the princely state of Patna. It is a marketplace for agricultural products (mainly rice) and a handicraft centre. Rajendra College (established 1943) and Sailasri palace, the Patna ruler's residence, are located there. Pop. (1991) 69,920.

Bolcom, William, in full WILLIAM ELDEN BOLCOM (b. May 26, 1938, Seattle, Wash., U.S.), American composer, pianist, and teacher whose compositions encompass many idioms, from popular cabaret songs to more traditional classical scores.

Bolcom graduated from the University of Washington in 1958 and studied composition with Darius Milhaud at Mills College (1958–61) and with Milhaud and Olivier Messiaen at the Paris Conservatory. After continuing his studies at Stanford University (D.M.A., 1964), he taught or was composer-in-residence at a number of schools before accepting a position at the University of Michigan (from 1973).

Bolcom, 1990

© Peter Yates

Throughout these years Bolcom developed his compositional abilities, attempting to break down what he saw as the artificial barriers between popular and "serious" music. He produced compositions of great diversity, including *Dynamite Tonight* (1963), a "cabaret opera"; *12 Etudes* for piano (1959–66); *Open House* (1975), a song cycle based on poems by Theodore Roethke; *Graceful Ghost Rag* (1971), one of several ragtime compositions;

and the much-acclaimed, William Blake-inspired *Songs of Innocence and Experience* (1956–82). From 1971 Bolcom and his third wife, mezzo-soprano Joan Morris, performed concerts of American popular songs. Much of their repertoire has been recorded.

Bolden, Buddy, byname of CHARLES BOLDEN (b. 1868, New Orleans, La., U.S.—d. Oct. 4, 1931, New Orleans), cornetist and semilegendary founding father of jazz. He was said by many jazz musicians, including the great trumpeter Louis Armstrong, to have been one of the most powerful musicians ever to play jazz.

Little is known about the details of Bolden's career, but it is documented that he was a barber and that from 1895 to 1899 he led a band that included the cornetist Bunk Johnson. The acknowledged king of New Orleans lower musical life, Bolden often worked with six or seven different bands simultaneously. In 1906 his emotional stability began to crumble, and on June 5, 1907, he was committed to the East Louisiana State Hospital, from which he never emerged.

Boldewood, Rolf, pseudonym of THOMAS (ALEXANDER) BROWNE (b. Aug. 6, 1826, London, Eng.—d. March 11, 1915, Melbourne, Vic., Australia), romantic novelist best known for his *Robbery Under Arms* (1888) and *A Miner's Right* (1890), both exciting and realistic portrayals of pioneer life in Australia.

Taken to Australia as a small child, Boldewood was educated there and then operated a large farm in Victoria for some years. He later worked in the New South Wales and Victoria goldfields as a police magistrate and goldfields commissioner. Adopting a pseudonym, he first wrote short stories, then composed his memoirs (*Old Melbourne Memories*, 1884), and finally wrote about 20 novels between 1878 and 1906.

bolero, lively Spanish dance in $\frac{3}{4}$ time with a strongly marked rhythm. The dancers, either singly or as couples, execute brilliant

By courtesy of the Biblioteca Nacional, Madrid

and intricate steps to the rhythmic accompaniment of their castanets. Distinctive features are the *paseo* ("walk"), *bien parado* ("sudden stop"), and various beating steps (battements). An outstanding musical example is Maurice Ravel's *Bolero* (1928) for orchestra. The Latin-American bolero is a slow, romantic rumba danced with simple steps.

Boleslav (Czech), English BOLESŁAW, BOLESŁAS, or BOLESLAUS, name of Bohemian rulers grouped below chronologically and indicated by the symbol ●.

● **Boleslav I**, byname BOLESŁAW THE CRUEL, Czech BOLESŁAW KRUTÝ (d. July 15, 967), Přemyslid prince of Bohemia from 929, who

established the basis of the medieval Czech state.

After instigating the murder of his elder brother, Prince Wenceslas I (St. Wenceslas), Boleslav became ruler of Bohemia. He made Prague the effective administrative centre of his domain, promoted the spread of Christianity, and added the territories of Moravia, Slovakia, and Silesia to his domain. After being attacked by the Holy Roman emperor Otto I (950), he was forced to recognize the German king as his suzerain. His feudal ties remained largely formal, however, and Bohemia was able to retain its autonomy. Several years later, Boleslav cooperated with Otto in combating the invasion of the Magyars and directed a Bohemian contingent against them at the Battle of Lechfeld (955).

● **Boleslav II**, byname BOLESŁAW THE PIOUS, Czech BOLESŁAV Pobožný (d. Feb. 7, 999), prince of Bohemia (967–999), the son and successor of Boleslav I. He successfully continued his father's work by further consolidating the supremacy of the Czechs over the other Bohemian tribes and by founding monasteries, nunneries, and capitular churches.

Boleslav II secured the establishment of the bishopric of Prague in 973 or 974, under the metropolitan authority of the archbishops of Mainz. He treacherously but completely destroyed the Slavnikovci, the only princely rivals of the Přemyslid dynasty in Bohemia, in 995. He was usually loyal to his suzerains, the Holy Roman emperors Otto I, II, and III, whom he helped in their conflicts with the Polish princes, though his support of the rebellious duke of Bavaria, Henry the Wrangler, caused Otto II to lead punitive expeditions against him in 975 and 977–978.

● **Boleslav III**, byname BOLESŁAW THE RED, or THE BLIND, Czech BOLESŁAV RYŠAVÝ, or SLEPÝ (d. 1035/37), prince of Bohemia 999 to 1002 and again in 1003, the eldest son and successor of Boleslav II. Troubles in Bohemia drove him to flee in 1002 first to Germany and then to Poland. He made a brief return in 1003 with Polish help, murdered his enemies, and was again expelled. Falling into the hands of Boleslav I of Poland, he was blinded and kept in prison until his death.

Bolesław (Polish), English BOLESŁAW, BOLESŁAS, or BOLESLAUS, name of Polish rulers grouped below chronologically and indicated by the symbol ●.

● **Bolesław I**, byname BOLESŁAW THE BRAVE, Polish BOLESŁAW CHROBRY (b. 966/967—d. June 17, 1025), duke (from 992) and then (from 1024) first king of Poland, who expanded his country's territory to include Pomerania, Lusatia, and, for a time, the Bohemian princely lands and made Poland a major European state. He also created a Polish church independent of German control.

Son of Mieszko I, the first of the Piast dukes, and the Bohemian princess Dobrawa (Dubravka), Bolesław I inherited the principality of Great Poland (Wielkopolska, between the Oder and the Warta rivers) upon his father's death (992). He conquered Pomerania (on the Baltic Sea) in 996 and seized Kraków (formerly a Bohemian possession) soon afterward. He ransomed the relics of the martyred St. Adalbert, bishop of Prague, from the pagan Prussians and buried the relics at Gniezno. The Holy Roman emperor Otto III, who had been Adalbert's student and Bolesław's ally since 992, attended the ceremony (March 1000) and marked the occasion by personally crowning Bolesław king of Poland. With Pope Sylvester II's approval, the emperor granted Poland its own archdiocese, with Gniezno as its seat. Bolesław then reorganized Poland's church structure, making it a national church directly under papal jurisdiction and independent of German ecclesiastical control.

After Emperor Otto III's death (1002),

Boleslaw seized the imperial lands of Lusatia and Misnia (Meissen) and the principality of Bohemia. These actions started a series of three wars between him and the German king Henry II; it lasted until 1018, when, by the Treaty of Bautzen, Boleslaw retained Lusatia and Misnia and Henry II won Bohemia. Boleslaw's expansionist policy continued. When he defeated Grand Prince Yaroslav I the Wise of Kiev in battle (July 21, 1018) and placed his own son-in-law (and Yaroslav's brother), Svyatopolk, on the Kievan throne, his control extended from the western tributaries of the middle Elbe to the eastern reach of the Western Bug River. Though recognized as king by Otto III in 1000, Boleslaw sought to strengthen his position and his independence from imperial control by being crowned again by the archbishop of Gniezno (Dec. 25, 1024).

• **Boleslaw II**, byname **BOLESŁAW THE BOLD**, or **THE GENEROUS**, Polish **BOLESŁAW ŚMIĄŁY**, or **SZCZODRY** (b. 1039—d. 1081), king of Poland from 1058 to 1079.

Boleslaw assumed the rule of Poland on the death of his father, Casimir I the Restorer, in 1058. During the struggle between the German kings and the papacy, Boleslaw was able to restore the international position of Poland. He helped Béla I to obtain the Hungarian crown (1060) against the Germans' protégé and refused to pay the tribute for Silesia that his father had paid to the Czechs. In 1069 he intervened on behalf of a relative by marriage, Iziaslav, to give him the throne of the principality of Kiev. Boleslaw and Pope Gregory VII had common interests both in Hungary and against the German king Henry IV, and Boleslaw was recognized as king of Poland in the presence of papal legates in 1076. Catastrophe followed a second intervention in Kiev (1077): Polish nobles, with German and Czech support, rebelled, and among them was the bishop of Kraków, Stanislaus, who was accused of treason against the sovereign. Boleslaw had him put to death on April 11, 1079. The exact cause of the subsequent internal revolt is not clear, but the king had to flee from Poland, taking his son with him, and died in exile, traditionally at Ossiach in Carinthia or Wilten in Tirol.

• **Boleslaw III**, byname **BOLESŁAW THE WRY-MOUTHED**, Polish **BOLESŁAW KRZYWOUSTY** (b. Aug. 20, 1085—d. Oct. 28, 1138), prince of Poland who introduced into his country the senioriate system, by which the eldest son received the major part of the royal inheritance. He also converted the Pomeranians to Christianity.

Son of Władysław I Herman, ruler of Poland, and Judith of Bohemia, Boleslaw III and his illegitimate elder half brother, Zbigniew, each ruled a Polish province during their father's lifetime. Boleslaw III succeeded to his father's princely title (no Polish ruler assumed the title of king from 1082 to 1296) in 1102 and spent the next several years fighting Zbigniew for control of the country. After repelling an invasion of Silesia (1109) by the German king Henry V, Boleslaw, who had exiled Zbigniew in 1107, recalled him in 1112; soon, however, he accused Zbigniew of treason and had him blinded. Zbigniew died soon thereafter.

For the next 22 years (1113–35) Boleslaw sought control of Poland's former province of Pomerania; he conquered Eastern Pomerania in 1122 but did not secure Western Pomerania until he had sworn fealty to the Holy Roman emperor Lothair II in 1135. Boleslaw sent missionaries into Pomerania, converted the pagan tribes there to Christianity, and integrated the people into the Polish state. He then enacted legislation to secure Pomerania and Silesia for his eldest son and lesser provinces for his younger sons. The senioriate

system, a halfway measure between primogeniture and equal distribution among all male heirs, was devised to satisfy all princely heirs; yet it caused dissension and eventually led to the disintegration of the state.

Bolesławski, Richard, Boleslawski also spelled **BOLESŁAWSKI**, original name **RYŚARD ŚRZEDNICKI** (b. Feb. 4, 1889, Warsaw, Pol.—d. Jan. 17, 1937, Los Angeles, Calif., U.S.), motion-picture and stage director, best known for his work in such popular American films of the 1930s as *Rasputin and the Empress* (1932), *Clive of India* (1935), and *Les Misérables* (1935).

His stage career began in 1906 as an actor with the Moscow Art Theatre. In 1915, during World War I, he joined the 1st Polish Regiment of Lancers as a cavalry officer but left in 1918 to become a cameraman in the Polish war with the Bolsheviks. He emigrated to the United States and became stage director for the American Laboratory Theatre in New York City, staging such plays as *The Vagabond King* (1925), *White Eagle* (1927), *Ballyhoo* (1927), and *Mr. Moneypenny* (1928). In 1929 he went to Hollywood, where he directed many successful films, including the acclaimed 1935 production of *Les Misérables*.

Boleslawski described his experiences in World War I in his two autobiographical books, *Way of the Lancer* and *Lances Down* (both 1932). He also wrote *Acting: The First Six Lessons* (1933).

Boletaceae, a family of fungi (division Mycota) of the order Polyporales, in which the fruiting structures bear pores rather than gills (as in the Agaricales). Some edible mushrooms

(Top) *Boletus zelleri*, (bottom) *Suillus pictus*

(Top) Larry C. Moon—Tom Stack & Associates, (bottom) Charles Barrows

are included in the family's more than 250 cosmopolitan species. They usually can be found in the woods during hot, rainy periods.

Several of the 50 species of the genus *Boletus* are edible. The undersurfaces range from red to brown in colour. The cepe (*B. edulis*) is found in woods and groves of trees during July and August. The 50 species of *Suillus* form mycorrhizal associations (nutritional "partnerships") between the filaments of the fungus and the roots of certain trees.

Boleyn, Anne (queen of England); see Anne Boleyn.

Bolgary, formerly **BOLGAR**, **BULGAR**, or **BOLGARY VELIKIE**, ancient city and capital of the medieval state of Bolgariya Volga-Kama. The ruins of medieval Bolgary are near the present village of Bolgary, Tatarstan republic, in western Russia. Archaeological excavations on the site of the city began in 1870. The earliest settlement on the site of Bolgary dates to about AD 500. In the second half of the 13th century, Bolgary became the most important trade and craft centre of the Golden Horde. In 1361 Bolgary was destroyed by the Golden Horde khan Bulak-Timur. A number of stone structures from the 13th and 14th centuries have been preserved.

Bolgatanga, town, northern Ghana, on the Great North Road. The town is actually a dispersed settlement of mud-walled compounds, each surrounded by fields and spread over an area of about 160 square miles (410 square km). The cultivation of staple crops and stock raising are the chief occupations. The busy market in Bolgatanga is noted for colourful basketry. Pop. (1984 prelim.) 31,500.

Bolger, James Brendan (b. May 31, 1935, Oponake, North Island, New Zealand), New Zealand farmer and politician who served as prime minister of New Zealand from Oct. 27, 1990.

Bolger was born to newly arrived Irish Roman Catholic immigrants who had taken up dairy farming in Taranaki province. He left school at age 15 to help his parents on their farm. His first involvement with politics was with a local branch of Federated Farmers. Bolger moved to central North Island in 1963, established a farm of his own, and from that base became vice president of Federated Farmers Waikato (provincial) division and won election to Parliament with the National Party from 1972. After Bolger stood for three years in opposition to Norman Kirk's one-term Labour government, he was appointed under secretary both for agriculture and fisheries and for Maori affairs by the new prime minister, Robert Muldoon.

As labour minister in the next two Muldoon governments, he championed a bold assault on compulsory unionism. He made unsuccessful challenges for the posts of deputy leader in 1981 and leader in 1984 before replacing Jim McLay as party leader in 1986. The following year he failed to upset David Lange in the August triennial elections. The National Party won the 1990 elections by a landslide.

Bolingbroke, Henry: see Henry IV under Henry (England).

Bolingbroke, Henry Saint John, 1st Viscount, Baron Saint John of Lydiard Tregoze (b. Sept. 16, 1678, probably Wiltshire, Eng.—d. Dec. 12, 1751, Battersea, near London), prominent Tory politician in the reign of Queen Anne of England and, later, a major political propagandist in opposition to the Whig Party led by Sir Robert Walpole.

Early career. He was possibly educated at a Dissenting academy rather than at Eton and the University of Oxford, as has been claimed. In 1698–99 he traveled in Europe and in 1700 married Frances Winchcombe. In 1701 he entered Parliament, where he soon won a reputation by his superb oratory and his support of partisan Tory measures, including attacks on the previous Whig ministry and on the Protestant Dissenters, the Whigs' staunchest allies. His conduct soon brought him to the notice of the government, and, after he was made secretary at war (1704), he was converted, temporarily, to the moderate policies of Robert Harley, one of Queen Anne's principal ministers. For four years he worked hard to provide the Duke of Marlborough with troops and equipment for the War of the

Spanish Succession against France and then resigned with Harley (February 1708) when they failed to prevent the Whigs from dictating government policy. Failing to gain a seat in the 1708–10 Parliament, he urged Harley to ally with the Tory Party as the best means to defeat the Whigs.

Bolingbroke, oil painting attributed to Alexis-Simon Belle, probably 1712; in the National Portrait Gallery, London

By courtesy of the National Portrait Gallery, London

In 1710 St. John became northern secretary of state in Harley's new ministry, but he soon emerged as an opponent of Harley's moderation and a rival to his authority. His efforts to control the government's policies and to supplant Harley (after 1711 the earl of Oxford) were largely unsuccessful. Oxford had initiated secret peace negotiations with France, but, even after he had learned of these and had forced his way into the discussions, St. John (after 1712 Viscount Bolingbroke) was not able to dictate the terms that were finally settled at the Treaty of Utrecht (1713). In Parliament, Bolingbroke was no more successful in leading a Tory rebellion against Oxford. He won over some Tories by such partisan measures as the Schism Act (1714), which aimed at depriving the Dissenters of their schools, but he failed to persuade the majority to support his leadership and was unable to give the Tories a clear lead on the disputed succession to Queen Anne. Oxford was eventually dismissed on July 27, 1714, but the Queen's death, on August 1, ruined Bolingbroke's hopes of replacing him.

Exile in France. Dismissed from office by George I and fearing impeachment because of his role in the peace negotiations with France and his intrigues with the Jacobites (the supporters of James III, the Old Pretender), Bolingbroke fled to France (March 1715) and became the Old Pretender's secretary of state in July. This enabled the British government to pass an act of attainder against him by which his property and civil liberties were taken away. As a result, Bolingbroke's political future depended upon a successful Jacobite rebellion. Despite Bolingbroke's hard work, the attempted Jacobite rising in 1715 was a dismal failure. Amidst bitter recriminations, Bolingbroke was dismissed by the Old Pretender and at once sought to ingratiate himself with the Whig government in England. In 1717 he wrote a *Letter to Sir William Wyndham* (not published until 1753) to defend his ac-

tions since 1710 and to persuade the Tories to abandon the Jacobite cause. Not surprisingly, he found it difficult to persuade men to forget his recent conduct.

Forced to remain in exile, Bolingbroke sought other outlets for his talents. Mixing with aristocrats and scholars, including Voltaire, he embarked on biblical, historical, and philosophical studies and wrote several works, including *Reflections upon Exile and Reflections Concerning Innate Moral Principles*. Shortly after the death of his first wife, he married a French widow, the Marquise de Villette (1719).

Return to England. After years of petitioning the British government and of trying to assist it with his limited influence at the French court, Bolingbroke was pardoned in 1723. He did not, however, resettle in England until 1725, when an act allowed him to buy a small estate at Dawley, near London; his attainder was never fully reversed, and he was unable to regain his peerage or reclaim his seat in the Lords. He imputed this exclusion from parliamentary life to the animosity of Sir Robert Walpole. Though his own frustrated ambition clearly motivated his long campaign against Walpole's political ascendancy, he was also concerned by the way Walpole appeared to monopolize power by the excessive use of bribery and corruption. While charges of such behaviour were exaggerated, there was enough truth in them to build up a formidable opposition to Walpole. At the centre of a literary circle that included Jonathan Swift, Alexander Pope, and John Gay, Bolingbroke waged an influential propaganda campaign. His major contributions to *The Craftsman*, an opposition journal, were the "Remarks on the History of England" (1730–31) and "A Dissertation upon Parties" (1733–34), both of which sought to end the old Whig–Tory disputes and to weld the disparate elements of the opposition to Walpole into a new Country Party, which would protect the independence of Parliament against the encroachments of a corrupt government.

Despite occasional successes, Bolingbroke was unable to bring down Walpole or create a united opposition party. In 1735 he retreated to France, where he continued his studies in philosophy and history, lamenting his countrymen's lack of patriotism in the struggle against Walpole. After he made a short visit to England in 1738, his hopes were revived when he learned of a new opposition party that was gathering at Leicester House around George II's son Frederick, prince of Wales. For this group, he wrote *The Idea of a Patriot King*. It was his most famous work, but it offered no real solution to the problems of defeating Walpole or of creating a "patriot" party. In any event, Prince Frederick did not live to become king, and Walpole's final defeat, in 1742, was not engineered by Bolingbroke.

In his last years, Bolingbroke lacked any real political influence, though he still made vain efforts to create a patriot ministry. He was further embittered by his discovery, in 1744, that Alexander Pope had secretly printed 1,500 copies of *The Idea of a Patriot King* for publication. When, in 1749, Bolingbroke published a corrected version of this work, he was bitterly attacked for taking the opportunity to reveal Pope's earlier breach of faith. Bolingbroke's failing health was further undermined by his distress at his wife's death (March 1750).

Bolingbroke was also a historian of some talent. Intelligent and widely read, he was also noted for his handsome appearance, graceful manners, and brilliant conversation. Clear and forceful in speech and in print and imperious in temperament, he captivated some of the finest minds of his age. On the other hand, he was a notorious libertine and a poor manager of men who tended to lose his nerve in a crisis, and his unscrupulous ambition betrayed him into serious political errors and gained him

a reputation for treachery. Though he died a neglected figure, the posthumous publication of his works in 1754 stirred considerable controversy. His unorthodox religious views were at last made public and were denounced on all sides. Modern scholars have paid much less attention to his philosophical works, but he is widely regarded as one of the best contemporary analysts of the politics of the Whig supremacy. (H.T.D.)

Bolívar, department, northwestern Colombia, bounded northwest by the Caribbean Sea, west by the Río Cauca, and east by the Río Magdalena. Much of its area of 10,030 sq mi (25,978 sq km) consists of hot, humid, forested lowlands. The department produces livestock, sugarcane, tobacco, cotton, cereals, coffee, and forest products. Mineral resources include gold, coal, and oil. Bolívar's main industries (textiles, petroleum refining, and beverages) and foreign commerce are centred in the departmental capital of Cartagena (*q.v.*). Transportation includes the Río Magdalena, roads linking Bolívar with neighbouring departments and other areas to the south, and air services to all parts of Colombia. Pop. (1997 est.) 1,843,630.

Bolívar, province, central highland Ecuador, almost entirely in the western cordillera (mountains) of the Andes. Formed from part of Los Ríos province in 1884, Bolívar has an area of 1,546 sq mi (4,003 sq km) and lies between the Cordillera de Guaranda on the west and Mt. Chimborazo, the highest peak of the Ecuadorian Andes (20,561 ft [6,267 m]), on the east. It is drained by the Río Chimbo. From its forests come valuable timber and cinchona (a source of quinine); cultivated crops include cereals, potatoes, sugarcane, tobacco, oranges, and coffee. Corn (maize) is extensively cultivated on large haciendas (estates). Beef cattle and hog raising are important. There are known deposits of mercury and salt near Guaranda (*q.v.*), the provincial capital, but they are little exploited.

The Roman Catholic Church has organized urban and rural development programs in the province. Pop. (2000 est.) 184,000.

Bolívar, state, southeastern Venezuela, bounded north by the Orinoco River, south by Brazil and the Venezuelan territory of Amazonas, east by Guyana, and west by the Orinoco River and Colombia. It is the largest (area 91,892 sq mi [238,000 sq km]) and potentially one of the richest states of Venezuela. Northern Bolívar consists of rolling hills; in the far south are groups of high plateaus and mesas, including the region of La Gran Sabana, the site of Angel Falls (*q.v.*). In between is jungle, largely uninhabited and unexplored, pierced by the valleys of the Caroní, Paragua, Caura, and many smaller rivers.

The Caroní River is one of the world's largest sources of hydroelectric power. A large power project is in operation at the Macagua Dam, near the mouth of the Caroní; at Guri, 80 mi (130 km) upstream, is one of the world's largest hydroelectric projects. Other projects on the Caroní have been planned.

At the confluence of the Caroní and the Orinoco lies the planned industrial and commercial city of Ciudad Guayana (*q.v.*), which has a national steel mill, an aluminum plant, and several other mills. The city is the largest urban complex in the southern three-fourths of the country.

Bolívar contains most of Venezuela's iron ore deposits (*see* Bolívar, Cerro). Other minerals exploited are diamonds, gold, coal, lime, manganese, nickel, bauxite, and kaolin. A small amount of farming is carried on in the north. Transportation is poorly developed in most of the state. The navigable waterways, railroads, and nearly all the first-class highways are in the north, near Ciudad Guayana and Ciudad Bolívar (*q.v.*), the state capital. Pop. (1997 est.) 1,207,527.-

Bolívar, Cerro, hill of iron ore in north central Bolívar state, southeastern Venezuela.

Cerro Bolívar, Venezuela

Georges de Steinheil

Discovered in 1947, the hill is $\frac{3}{4}$ mi (1.2 km) wide, 4 mi long and rises 1,650 ft (500 m) above the surrounding grasslands in the Guiana Highlands. With San Isidro, to the south, it is one of the most important mineral finds in the 20th century. Cerro Bolívar is thought to contain more than 250,000,000 tons of high-grade ore, a mixture of hematite, limonite, and a small percentage of magnetite, with an average of more than 50 percent iron. The ore is mined year-round by open-cut methods and sent by rail to Puerto Ordaz 90 mi (120 km) to the northeast at the confluence of the Caroní and the Orinoco, for loading into oceangoing vessels. Millions of tons are shipped annually to the United States, Europe, and Japan. Some ore is used domestically at Ciudad Guayana. Ciudad Piar was established to house the employees of the mine.

Bolívar, Simón, byname THE LIBERATOR, Spanish EL LIBERTADOR (b. July 24, 1783, Caracas—d. Dec. 17, 1830, near Santa Marta, Colom.), South American Creole soldier and

Colombia), Peru, and Upper Peru (Bolivia). He was president, actually dictator, of both Colombia (1821–30) and Peru (1823–29).

The son of a Venezuelan aristocrat of Spanish descent, Bolívar was born to wealth and position. His father having died when the boy was three and his mother six years later, his uncle administered his inheritance and provided him with tutors. At the age of 16, Bolívar was sent to Europe to complete his education. For three years he lived in Spain and in 1801 married the daughter of a Spanish nobleman, with whom he returned to Caracas. The young bride died of yellow fever less than a year after her marriage. In 1804, when Napoleon was approaching the pinnacle of his career, Bolívar returned to Europe. In Paris he re-met a former childhood tutor, Simón Rodríguez, who guided him to the writings of such European rationalist thinkers as Locke, Hobbes, Buffon, d'Alembert, and Helvetius as well as Voltaire, Montesquieu, and Rousseau. The idea of independence for Hispanic America took root in Bolívar's imagination, and, on a trip to Rome, standing on the heights of the Monte Sacro, he made a vow to liberate his country. In 1807 he returned to Venezuela by way of the United States, visiting the eastern cities.

Independence movement. The Latin-American independence movement was launched a year after Bolívar's return, as Napoleon's invasion of Spain unsettled Spanish authority. Bolívar himself participated in many conspiratorial meetings, and on April 19, 1810, the Spanish governor was officially deprived of his powers and expelled from Venezuela. A junta took over. To obtain help, Bolívar was sent on a mission to London, where he arrived in July. His assignment was to explain to England the plight of the revolutionary colony, to gain recognition for it, and to obtain arms and support. Although he failed in his negotiations on all these counts, he did foster the cause of the revolution by persuading the exiled Francisco de Miranda, who in 1806 had attempted to liberate Venezuela single-handedly, to return to Caracas and to assume command of the independence movement.

Venezuela was in ferment. In March 1811 a national congress met in Caracas to draft a constitution. After long deliberation, it declared Venezuela's independence on July 5, 1811. Bolívar now entered the army of the young republic and was placed in charge of Puerto Cabello, a port vital to Venezuela. Treasonable action by one of Bolívar's officers opened the fortress to the Spanish forces, and Miranda, the commander in chief, entered into negotiations with the Spanish commander in chief. An armistice was signed (July 1812) which left the entire country to the mercy of Spain. Miranda was turned over to the Spaniards—some authorities say at Bolívar's instigation—and spent the rest of his life in Spanish dungeons.

Determined to continue the struggle, Bolívar obtained a passport to leave the country and went to Cartagena in New Granada (present-day Colombia). There he published the first of his great political statements, *El Manifiesto de Cartagena*, in which he urged the revolutionary forces to destroy the power of Spain in Venezuela.

Bolívar now emerged as the champion of strong government for the nascent republics of Hispanic America and was named commander of an expeditionary force whose task was to liberate Venezuela. In a sweeping hard-fought campaign he vanquished the Spaniards in six pitched battles and regained control of the capital. On Aug. 6, 1813, he entered Caracas, was given the title of liberator, and assumed political dictatorship.

But the war of independence was just beginning. In 1814 Bolívar was once more defeated by the Spanish, who had converted the *llaneros*, or cowboys, led by José Tomás Boves,

into an undisciplined but savagely effective cavalry that Bolívar was unable to repulse. Boves captured Caracas in 1814 and subjected the city to terrible atrocities. Thus ended the second Venezuelan republic. Bolívar narrowly escaped Miranda's fate. After some more sporadic warfare, he fled to Jamaica.

In exile he wrote the greatest document of his career: *La Carta de Jamaica* ("The Letter from Jamaica"), in which he outlined a grandiose panorama from Chile and Argentina to Mexico. "The bonds," wrote Bolívar, "that united us to Spain have been severed." He proposed constitutional republics throughout Hispanic America, modelled on the government of Great Britain, with a hereditary upper house, an elected lower house, and a president chosen for life. The last provision, to which Bolívar clung throughout his career, constituted the most dubious feature of his political thinking.

Liberation of New Granada. By 1815 Spain had sent to its seditious colonies the strongest expeditionary force that had ever crossed the Atlantic. Its commander was Pablo Morillo. Since neither Great Britain nor the United States would promise aid, Bolívar turned to Haiti, a small republic that had freed itself from French rule, where he was given a friendly reception, as well as money and weapons.

Three years of indecisive defeats and victories followed. In 1817 Bolívar decided to set up headquarters in the Orinoco region, which had not been devastated by war and from which the Spaniards could not easily oust him. He engaged the services of several thousand foreign soldiers and officers, mostly British and Irish, established his capital at Angostura (now Ciudad Bolívar), began to publish a newspaper, and established liaison with the revolutionary forces of the plains, including one group led by José Antonio Páez and another group led by Francisco de Paula Santander. In the spring of 1819 he conceived his master plan of attacking the Spanish viceroyalty of New Granada.

Bolívar's attack on New Granada will always be considered one of the most daring in military history. The route of the small army (about 2,500 men, including the British legion) led through flood-swept plains and icy mountains, over routes that the Spanish considered impassable. The Spaniards were taken by surprise, and in the crucial Battle of Boyacá on Aug. 7, 1819, the bulk of the royalist army surrendered to Bolívar. Three days later he entered Bogotá. It was the turning point in the history of northern South America.

Indefatigably Bolívar set out to complete his task. He appointed Santander vice president in charge of the administration and in December 1819 made his appearance before the congress that had assembled in Angostura. Bolívar was made president and military dictator. He urged the legislators to proclaim the creation of a new state: the republic of Gran Colombia, and three days later La República de Colombia was established. It was a federation and, since two of its three departments, Venezuela and Quito (Ecuador), were still under royalist control, it was only a paper achievement. Bolívar knew, however, that victory was finally within his reach. A revolution in Spain had forced the Spanish king to recognize the ideals of liberalism on the home front, and his action quite naturally discouraged the Spanish forces in South America. Bolívar persuaded Morillo to open armistice negotiations, and the two warriors met in a memorable encounter at Santa Ana, signing, in November 1820, a treaty that ended hostilities for a six-month period. When fighting was resumed, Bolívar found it easy, with his superior manpower, to defeat the Spanish forces in Venezuela. The

Bolívar, detail of an engraving by C.G. Childs

statesman who led the revolutions against Spanish rule in New Granada (renamed Colombia, or Gran Colombia, in 1819 and including Venezuela and Ecuador as well as

Battle of Carabobo (June 1821) opened the gates of Caracas, and Bolívar's Venezuelan homeland was at last free. In the autumn of the same year a congress convened in Cúcuta to draft a constitution for Colombia. Its provisions disappointed Bolívar. Although he had been elected president, he thought the constitution too liberal in character to guarantee the survival of his creation. As long as more urgent assignments claimed his attention, however, he was willing to put up with its weak structure. Leaving the administration to Santander, he asked permission to continue his military campaign.

At the end of a year, Ecuador was liberated. In this campaign Bolívar was assisted by the most brilliant of his officers, Antonio José de Sucre. While Bolívar engaged the Spaniards in the mountains that defended the northern access to Quito, capital of modern Ecuador, Sucre marched from the Pacific coast to the interior. At Pichincha on May 24, 1822, he won a victory that freed Ecuador from the Spanish yoke. On the following day the capital fell, and Bolívar joined forces with Sucre on June 16.

It was in Quito that the Liberator met the great passion of his life, Manuela Sáenz, an ardent revolutionary who freely admitted her love for Bolívar and accompanied him from the battlefields to the presidential palace.

Liberation of Peru. The territory of Gran Colombia, comprising what is now Colombia, Venezuela, and Ecuador, had now been completely recovered from Spain and its new government recognized by the United States. Only Peru remained in the hands of the Spaniards. It was the Peruvian problem that brought Bolívar and the Argentinian revolutionary José de San Martín together. San Martín had done for the southern part of the continent what Bolívar had accomplished for the north. In addition, he had already entered Lima and proclaimed Peru's independence. But the Spanish forces retreated into the highlands, and San Martín, unable to follow them, decided to consult with Bolívar. On July 26, 1822, the two men met in the port city of Guayaquil, Ecuador. Apparently San Martín came to request military aid from Bolívar, and in addition he wanted to reach an understanding on problems of boundaries and the political future of Latin America. There was scant sympathy between the two men owing to differences in their outlook and personality, however, and San Martín's failure to influence Bolívar was almost a foregone conclusion. On his return from Guayaquil, San Martín resigned his office in Lima and went into exile. Whether he took this action out of a wish to give Bolívar a free hand or out of a sense of personal frustration is still not clear.

The avenue that would lead to Bolívar's ultimate ambition was now open. In September 1823 he arrived in Lima. The Spanish army occupied the mountains east of Lima, and its position was considered to be unassailable. Bolívar systematically assembled troops, horses, mules, and ammunition to form an army, and in 1824 he moved out of the temporary capital in Trujillo and ascended the high cordillera country. The first major battle took place at Junín and was easily won by Bolívar, who then left the successful termination of the campaign to his able chief of staff, Sucre. On Dec. 9, 1824, the Spanish viceroy lost the battle of Ayacucho to Sucre and surrendered with his entire army.

Bolivia. Bolívar was now president of Gran Colombia and Peru. Only a small section of the continent—Upper Peru—was still defended by royalist forces. The liberation of this region fell to Sucre, and in April of 1825 he reported that the task had been terminated. The new nation chose to be called Bolivia

after the name of the Liberator. For this child of his genius, Bolívar drafted a constitution that showed once more his authoritarian inclinations: a lifetime president, a legislative body without power, and a highly restricted suffrage. Bolívar was devoted to his own creation, but, as the instrument of social reform that he had envisaged, the constitution was a failure.

Bolívar had now reached the high point of his career. His power extended from the Caribbean to the Argentine-Bolivian border. He had conquered severe illness, which during his sojourn in Peru had made him practically an invalid for months at a time. Another of his favourite projects, a league of Hispanic-American states, came to fruition in 1826. He had long advocated treaties of alliance between the American republics, whose weakness he correctly apprehended. By 1824 such treaties had been signed and ratified by the republics of Colombia, Peru, Mexico, Central America, and the united Provinces of Río de la Plata. In 1826 a general American congress convened in Panama. Compared with Bolívar's original proposals, it was a fragmentary affair, since only Colombia, Peru, Central America, and Mexico sent representatives. The four nations who attended signed a treaty of alliance and invited all other nations to adhere to it. A common army and navy were planned, and a biannual assembly representing the federated states was projected. All controversies among the states were to be solved by arbitration. Despite its meagre results, the congress of Panama provided an important example for future hemispheric solidarity and understanding in South America.

But Bolívar was aware that his plans for hemispheric organization had met with only limited acceptance. His contemporaries thought in terms of individual nation-states, Bolívar in continents. In the field of domestic policy he continued to be an authoritarian republican. He thought of himself as a rallying point and anticipated civil war as soon as his words should no longer be heeded. Such a prophecy, made in 1824, was fulfilled in 1826.

Civil war. Venezuela and New Granada began to chafe at the bonds of their union in Gran Colombia. The protagonists in each country, Páez in Venezuela and Santander in New Granada, opposed each other, and at length civil war broke out. Bolívar left Lima in haste, and most authorities agree that Peru was glad to see the end of his three-year reign and its liberation from Colombian influence. In Bogotá, Bolívar found Santander upholding the constitution of Cúcuta and arguing that Páez be punished as a rebel. But Bolívar was determined to preserve the unity of Gran Colombia and was therefore willing to appease Páez, with whom he became reconciled early in 1827. Páez bowed to the supreme authority of the Liberator, and in turn Bolívar promised a new constitution that would do justice to Venezuela's desire for regional independence. He took over the presidency of Gran Colombia and called for a national convention that met in April 1828. Bolívar refused to influence the elections, with the result that the liberals under the leadership of Santander gained the majority. Bolívar had hoped that the constitution of Cúcuta would be revised and presidential authority strengthened, but the liberals blocked any such attempts. A stalemate developed. Arguing that the old constitution was no longer valid and that no new one had taken its place, Bolívar assumed dictatorial powers in Gran Colombia. A group of liberal conspirators invaded the presidential palace on the night of September 25, and Bolívar was saved from the daggers of the assassins only by the quick-wittedness of Manuela Sáenz. But, though this attempt on his life had failed, the storm signals increased. Bolívar's precarious health began to fail. Peru invaded Ecuador with the intention of annexing Guayaquil.

Once more Sucre saved Ecuador and defeated the Peruvians at Tarqui (1829). A few months later, one of Bolívar's most honoured generals, José María Córdoba, staged a revolt. It was crushed, but Bolívar was disheartened by the continued ingratitude of his former adherents. France, England, and the United States tried to intervene in the domestic affairs of the country. In the fall of 1829, Venezuela seceded from Gran Colombia.

Reluctantly, Bolívar realized that his very existence presented a danger to the internal and external peace of the nations that owed their independence to him, and on May 8, 1830, he left Bogotá, planning to take refuge in Europe. Reaching the Atlantic coast, he learned that Sucre, whom he had trained as his successor, had been assassinated. Bolívar's grief was boundless. The projected trip to Europe was canceled; and, at the invitation of a Spanish admirer, Bolívar journeyed to his estate near Santa Marta. Ironically his life ended in the house of a Spaniard, where, toward the end of 1830, he died of tuberculosis.

Bolivia, officially REPUBLIC OF BOLIVIA, Spanish REPÚBLICA DE BOLIVIA, landlocked country of west-central South America, covering an area of 424,164 square miles (1,098,581 square km). Its administrative capital is La Paz; its constitutional (or judicial) capital is Sucre. Bolivia lies wholly within the tropics and is bordered on the north and east by Brazil, on the southeast by Paraguay, on the south by Argentina, on the southwest by Chile, and on the west by Peru. The population was estimated at 6,993,000 in 1988.

A brief treatment of Bolivia follows. For full treatment, see MACROPAEDIA: Bolivia.

Bolivia

For current history and for statistics on society and economy, see BRITANNICA BOOK OF THE YEAR.

The land. Bolivia may be divided into three major physiographic regions. The southwestern highlands, or Altiplano (High Plateau), with elevations of between 12,000 and 12,500 feet (3,600 and 3,800 m), is a large interior basin that extends through southwestern Bolivia and is enclosed by the second physiographic region, the western (Cordillera Occidental) and eastern (Cordillera Oriental, or Cordillera Real—a name sometimes applied to the northern extension of the Oriental) branches of the Andes mountain chain. Much of the eastern slope of the Cordillera Oriental is a heavily forested belt of rugged terrain, with many deep river valleys and gorges separated by high ridges. (This region is called the Yungas in the north and the Valles in the south). The Cordillera Occidental, less dramatic in relief, is a high plateau bordered by volcanoes rising above 20,000 feet (6,100 m). The country's highest peak (Mount Sajama), at 21,463 feet (6,542 m), lies about 100 miles (160 km) southwest of La Paz. A very active seismic region is centred less than 100 miles north of Sucre; much seismic activity has been recorded there in recent years, with extreme damage following an earthquake in September 1958. The third region is the Oriente, a lowland region that comprises the northern and eastern two-thirds of the country. It ranges from tropical rain forests in the northern Llanos, through a humid subtropical central zone, to the grasslands of the Bolivian Chaco with their semiarid climate in the southeast.

The Altiplano region, a basin of interior drainage—*i.e.*, not reaching the sea—contains Lake Titicaca, the highest commercially navigable body of water in the world (at 12,500 feet [3,810 m]) and one of South America's largest bodies of fresh water (3,200 square miles [8,300 square km]). The unevenness of rainfall on the Altiplano region led to a major expansion of irrigated land there during the 1970s. The confluence of the Oriente region's many northward-flowing rivers with Brazil's Madeira River contributes more than 10 percent of the total discharge of the Amazon River system, the world's largest. The Oriente's huge lowland basin is sparsely populated, though, for, while it contains arable land, extensive seasonal flooding and its relative inaccessibility to the transportation routes of the more populous highlands to the west have hindered development.

Bolivia's rainfall varies from little or no precipitation in the Cordillera Occidental in the southwest to more than 60 inches (1,530 mm) in the humid rain forests of the Oriente in the far northeast. The entire southern part of the country has little or no rainfall for at least four to six months each summer. The more densely populated La Paz and Lake Titicaca areas in the northern Altiplano average about 23 inches (580 mm) of rainfall annually, with the dry season lasting only several months. Annual temperature variations are related primarily to changes in elevation. The lowlands and the intermontane valleys average about 77° F (25° C), the more elevated regions about 50° F (16° C). The annual temperatures of the lowland region (Oriente) vary little, averaging from 73° to 80° F (23° to 27° C).

Only 3 percent of Bolivia's land area is considered arable. About one-fourth of the country is pastureland supporting the distinctive Andean ruminants, the guanaco, llama, alpaca, and vicuña, at higher elevations and cattle in parts of the lowland Oriente region.

On the cold, bleak, windswept Altiplano, vegetation is generally scarce, consisting mostly of grasslands with scattered small trees and bushes. Paradoxically, this highland plateau is the most densely populated region of the country because of sufficient rainfall there for agriculture, the presence there of important

mines, and its relative proximity to Chilean and Peruvian ports. More than half of Bolivia is forested, ranging from the great temperate forests of the intermontane valleys to the wide variety of tropical trees found in the upper reaches of the Amazon River basin in the northern part of the Oriente region. Among the teeming animal life of the rain forests, the anaconda, caiman, sloth, and jaguar (now endangered) are typical. The rhea, puma, and marsh deer are found in the grasslands and scrub forests to the south of the rain forests.

Bolivia has rich mineral deposits in the Altiplano region, including large reserves of antimony, tungsten, and tin and commercially valuable quantities of zinc, lead, copper, silver, gold, and sulfur.

The people. The population of Bolivia consists of three principal ethnic groups: the Indians, the mestizos (of mixed Indian and Spanish descent), and the descendants of the Spanish. The Indians are the descendants of two major groups, the Aymara and the Quechua, and also comprise a number of smaller Amazonian and Andean forest tribes; the great majority of Indians are farmers or mine, factory, and construction workers. Spanish is Bolivia's primary language, but the Indian languages, especially Aymara and Quechua, are still widely used and have been declared official languages together with Spanish. The mestizos have traditionally devoted themselves to handicrafts, trades, or small business in the cities. Since the initiation of major social reforms in 1952, a considerable proportion of this group has had access to schools, colleges, and universities, and thus to the professions. The descendants of the Spaniards have historically formed the country's ruling elite: landowners, mine owners and other businessmen, and professionals. Since the 1940s the Spanish descendants have increasingly intermarried with the mestizos, however, and the division between these two groups has become less clearly defined.

The Roman Catholic religion has the adherence of nearly 95 percent of the population. In the Indian communities of the Altiplano, some of the characteristics of pantheistic pre-Columbian religion have survived. Protestant denominations make up a small minority of the population, and there are also small groups of Jews and Muslims.

Bolivia has a relatively high annual rate of population growth, owing to a birth rate that is the highest in South America. It also has the highest registered death rate in South America. More than two-fifths of the population is less than 15 years of age. Bolivia is one of the least urban countries of Latin America; about 50 percent of its population lives in rural areas. La Paz, located on the Altiplano, is the largest city.

The economy. Bolivia has a developing, mixed economy based primarily upon the production of natural gas, tin, and other minerals, together with livestock raising, the production of agricultural foodstuffs, and some industry. The gross national product (GNP) per capita, which had a negative real growth rate in the mid-1980s, is one of the lowest in South America. Annual growth of the real GNP was 2.3 percent during the 1970s but became negative in the early and mid-1980s. Agriculture accounts for about one-fourth of the GNP and employs about half of the labour force. Potatoes and cereals, mainly corn (maize), rice, wheat, and barley, are the principal crops. Bananas, oranges, and cassava are also major food crops, and sugarcane, coffee, cotton, cacao, and tobacco are major cash crops. Coca, the source of the drug cocaine, grown in the intermontane valleys north and east of La Paz, is also an important cash crop, though grown to supply the illegal international drug market. The principal livestock are sheep, cattle, goats, and pigs; besides these there are also indigenous domesticated animals, the llama, alpaca, and cavy (a type of guinea pig).

Most of Bolivia's forests are concentrated in the northern and eastern Oriente region, where there are large stands of virgin tropical forests. The forestry industry has remained largely underdeveloped, however.

The mining sector, although producing less than one-tenth of the GNP, accounts for about 90 percent of the value of Bolivia's export earnings. The country is a major producer of tin, antimony, and tungsten. Petroleum production is about equal to domestic demand; natural gas is also produced and has become Bolivia's leading legal export by value. More than two-thirds of the country's electric power production is generated by hydroelectric power stations, and the remainder by thermal plants. Political turmoil, a paucity of processing industries, and inadequate internal transport have hindered the maximization of output and profit from Bolivia's mineral industries.

Manufacturing also remains underdeveloped, contributing somewhat less than one-fifth of the GNP and employing about one-tenth of the work force. Important products include foodstuffs (flour, refined sugar, and coffee), cement, footwear, furniture, and textiles; smelted nonferrous metals, mining equipment, and refined petroleum also are produced. Construction is also underdeveloped.

Tourism in Bolivia is centred on Lake Titicaca in the Altiplano region, where Inca ruins, Spanish colonial buildings, the natural beauties of the lake, and skiing in the Andes all attract visitors.

During the 1950s and '60s most of the larger Bolivian mining and industrial enterprises were nationalized, and the government regulated development through five-year economic plans. Since the mid-1980s, however, the policy has been reversed, and the private sector has been viewed as the major development force. The principal labour federation is the Central Obrera Boliviana (COB), whose member unions are grouped by industry. Bolivia's labour unions, especially its well-organized tin miners, have a history of clashes with Bolivia's successive governmental regimes.

Bolivia is one of South America's poorest nations. The scarcity of foreign investment, a lack of internal savings, and governmental instability, mismanagement, and corruption have hindered the development of the country's industry and agriculture. Bolivia experienced five years of minimal or negative economic growth by the mid-1980s, and inflation reached an estimated 14,000 percent. The subsequent introduction of monetary and wage controls, the removal of subsidies, and the introduction of a near-floating exchange rate helped reduce the annual rate of inflation.

Bolivia is a member of the United Nations and its agencies. It also belongs to the Organization of American States, the Latin American Integration Association, the Andean Group, and the Latin American Economic System.

The country's railways are mostly nationalized and are operated by the Bolivian National Railways (Empresa Nacional de Ferrocarriles). Only a small proportion of Bolivia's road network is paved, and, excepting the highway to Santa Cruz, all paved roads are concentrated in the Altiplano and the Andes valleys regions. There are some 9,000 miles (14,500 km) of navigable inland waterways, and, through agreements negotiated with Paraguay, Brazil, and Argentina, landlocked Bolivia has duty-free access to Atlantic ports. There are international airports at La Paz and Santa Cruz.

Bolivia's main trading partners are Argentina, the United States, Brazil, Germany, the United Kingdom, and Japan. Its principal exports are natural gas, tin, zinc, coffee, silver, and tungsten, and its principal imports are industrial raw materials, consumer goods, in-

dustrial machinery and equipment, and transport equipment.

Government and social conditions. Bolivia is an independent republic whose political life has been frequently dominated by the military. According to the 1947 constitution, the government is led by a popularly elected president and cabinet. Legislative authority is vested in a 157-member National Congress (Congreso Nacional), consisting of a Chamber of Deputies and a Senate. The president and members of the legislature are elected for four-year terms; the president may not be immediately reelected. The judiciary is headed by a 12-member Supreme Court appointed by the Congress.

Bolivia suffers from relatively poor health conditions. Serious diseases such as typhoid fever, tuberculosis, and malaria still infect significant numbers of people. Malnutrition is also a problem. The infant mortality rate is one of the highest in South America, and the average life expectancy is about 64 years. There is a shortage of doctors, and housing conditions in many parts of Bolivia are also still relatively primitive.

The government offers free education in primary and secondary schools. Primary education for children between the ages of 6 and 14 years is officially compulsory. Government programs have helped improve literacy rates, and more than four-fifths of the population is now literate. The largest of Bolivia's institutions of higher education is the Higher University of San Andrés, located in La Paz.

Bolivia's news media are usually subject to governmental censorship during times of military rule. Newspapers are privately owned. Among Bolivia's most powerful radio stations is the government-operated Radio Illimani—the Voice of Bolivia. Television programming falls within the province of the state-run television-broadcasting agency; the University Television Service (Televisión Universitaria) presents educational programs.

Cultural life. The remarkable achievements of the Andean cultures of western Bolivia, notably the Tiwanaku (Tiahuanaco) and the Inca and their successors, beginning in the 1st millennium AD, are displayed in the National Museum and the National Museum of Archaeology, both in La Paz, and in the Tiwanaku Regional Museum. These museums display architecture, metalwork, pottery, stone carvings, and textiles. Folk expression in music and dance flourishes in Bolivia and is seen especially in local festivals celebrating a wedding, a wake, or the birthday of a local patron saint. Development of literature and the fine arts was relatively slow until the early 20th century, when writers and artists began creating works of uniquely Bolivian expression. A major concern was the social problems of Bolivia's poor, especially the Indians, manifest in the works of the novelist Alcides Arguedas, the poet Franz Tamayo, the painter Guzmán de Rojas, and the sculptors Marina Nuñez del Prado and Hugo Almaraz. Art inspired by native themes or motifs can be seen in Bolivia's many art museums, most located in La Paz.

History. The earliest history of Bolivia is not well-known. Early cultures probably brought about the domestication of the potato and the llama. Sometime after AD 600, high culture centred on Tiwanaku, a ceremonial centre about 30 miles (48 km) south of Lake Titicaca. It left monumental structures as evidence of its achievements. After 1200, the Tiwanaku culture was succeeded by numerous small, Aymara-speaking kingdoms, which predominated throughout Bolivia until well into the Spanish period.

The more westerly Quechua-speaking Inca peoples incorporated the Aymara into their empire in the late 15th century and called the

resulting province Kollasuyo but left the native language and culture basically intact. However, the Inca did establish Quechua-speaking colonies throughout the area.

Spain invaded the Inca empire in 1532. Before the end of that century, Spain had established the cities of Charcas (now Sucre), La Paz, Santa Cruz, and Villa de Oropeza (Cochabamba) and had begun to exploit the silver wealth of Potosí. Bolivia, then known as the Audiencia of Charcas (Upper Peru) in the Viceroyalty of Peru, flourished in the 17th century. For a time, Potosí was the largest city in the Americas; Charcas, because of its academies and university, was known as the "Athens of America." By the end of the 17th century, however, the mineral wealth had begun to dry up. Severe economic depression followed the Wars of Independence in the early 1800s, and when Bolivia entered nationhood, it was economically undeveloped.

Talk of independence began as early as 1809, but not until the victory of Simón Bolívar's lieutenant, Antonio José de Sucre, over Spanish forces at Ayacucho (Peru) in 1824 did the fight for independence gain full support. In 1825 the Spanish forces were finally defeated by Sucre.

Independent Bolivia's political history was, almost from the beginning, marked by insurrection and instability. A short-lived union with Peru failed in 1839, and the Atacama province was lost to Chile during the War of the Pacific (1879–83). In 1880 a period of civilian rule began that lasted until 1936. The disastrous Chaco War of 1932–35, a border war with Paraguay for control of the Chaco Boreal, shattered Bolivia. The ensuing proliferation of political parties in the 1940s made government stability nearly impossible to achieve, but in April 1952 an alliance of mine workers, peasants, and other groups overthrew the current military regime and began the Bolivian National Revolution, which nationalized the tin-mining sector, granted universal suffrage for the first time, distributed land to many of Bolivia's Indians, and partially freed them from their traditionally servile status.

In the late 1950s, some of the social programs inaugurated in the 1952 revolution were suspended. Instability continued through the following decades. Following a bloody coup in 1980, the military government was responsible for widespread murders and human rights abuses, acts that were mainly carried out by militant fascists (including ex-Nazis) and other paramilitary groups. A civilian president was again elected in 1982. The economy was plagued by hyperinflation, bank closings, and enormous losses incurred by state-owned mines. In addition, strong El Niño weather patterns caused disastrous crop failures. With the legitimate economy failing, cocaine trafficking became a major source of foreign exchange.

In 1985 the government implemented drastic economic reforms, devaluing the currency while increasing gasoline prices, freezing wages, and eliminating price supports. In the 1990s controlling interests in many state-owned companies were sold and a major natural gas pipeline between Bolivia and Brazil was opened. By 2000 the government had stabilized the economy, and it had made significant progress in its controversial struggle against coca growers.

Bolkiah Mu'izzaddin Waddaulah, Haji Hassanal (b. July 15, 1946, Brunei Town [now Bandar Seri Begawan], Brunei), 29th sultan of Brunei.

Hassanal Bolkiah was the eldest son of Sultan Sir Haji Omar Ali Saifuddin. He was educated privately and later attended the Victoria Institution in Kuala Lumpur, Malaysia, and the Royal Military Academy at Sandhurst, Eng. In 1961 he was named crown prince, and when Sir Omar abdicated six years later, Hassanal Bolkiah became sultan on Oct. 5, 1967,

his coronation taking place on Aug. 1, 1968. For the next decade, however, his father remained the power behind the throne. After the death of his mother in 1979, his father withdrew from public affairs, and the sultan took the dominant role in the administration of Brunei. In anticipation of independence from Britain, he began to create a native bureaucracy, replacing British expatriates in the civil service with Bruneians, and he cracked down on corruption.

After having held Brunei as a protectorate for 95 years, the British formally withdrew on Jan. 1, 1984. Acting as prime minister and as the minister of defense and of finance, Hassanal Bolkiah continued to rule under a state of emergency declared by his father in 1962. One of the world's richest individuals, the sultan derived his fortune from Brunei's oil and gas.

Böll, Heinrich (Theodor) (b. Dec. 21, 1917, Cologne—d. July 16, 1985, near Bonn), German writer, winner of the Nobel Prize for Literature in 1972. Böll's ironic novels on the travails of German life during and after World War II capture the changing psychology of the German nation.

Böll was called into labour service in 1938 and then served six years as a private and corporal in the German army, fighting on the Russian and other fronts. Böll's wartime experiences were central to the art of a writer who remembered the "frightful fate of being a soldier and having to wish that the war might be lost." After the war he settled in his native Cologne.

Böll's first stories were published in 1947. In his first novels, *Der Zug war pünktlich* (1949; *The Train Was on Time*) and *Wo warst du Adam?* (1951; *Adam, Where Art Thou?*), he describes the grimness and despair of soldiers' lives. The uneasiness of reality is explored in *Das Brot der frühen Jahre* (1955; *The Bread of Our Early Years*) and in *Billard um halb zehn* (1959; *Billiards at Half-Past Nine*), which, with its interior monologues and flashbacks, is his most complex novel. In the popular *Ansichten eines Clowns* (1963; *The Clown*), the protagonist deteriorates through drinking. Böll's other writings include *Und sagte kein einziges Wort* (1953; *Acquainted with the Night*) and *Ende einer Dienstreise* (1966; *End of a Mission*), in which the trial of a father and son lays bare the character of the townspeople. In his longest novel, *Gruppenbild mit Dame* (1971; *Group Portrait with Lady*), Böll presented a panorama of German life from the world wars to the 1970s through the accounts of the many people who have figured in the life of his middle-aged "lady," Leni Pfeiffer. *Die verlorene Ehre der Katharina Blum* (1974; *The Lost Honour of Katharina Blum*) attacked modern journalistic ethics as well as the values of contemporary Germany. *Was soll aus dem Jungen bloss werden?, oder, Irgendwas mit Büchern* (1981; *What's to Become of the Boy?, or Something to Do with Books*) is a memoir of the period 1933–37.

A Christian and a pacifist, Böll developed a highly moral but individual vision of the society around him. A frequent theme of his was the individual's acceptance or refusal of personal responsibility. Böll used austere prose and frequently sharp satire to present his anti-war, nonconformist point of view. He was widely regarded as the outstanding humanist interpreter of his nation's experiences in World War II.

boll weevil (*Anthonomus grandis*), the most serious cotton pest in North America, a beetle of the insect family Curculionidae (order Coleoptera). The size of the adult boll weevil varies according to the amount of food it receives during its larval stage, but it averages about 6 mm (¼ inch), including the long, curved snout, which is about one-half the body length. The light yellow of the newly emerged adult boll weevil changes to gray or black in several weeks.

Boll weevil (*Anthonomus grandis*)
Harry Rogers

In the spring, adult boll weevils emerge from a partly dormant state and deposit between about 100 and 300 eggs in cotton buds or fruit. The females do not deposit their eggs in cotton bolls already visited by another female at least until most of the bolls are infested. An average of two or three weeks is required for an egg to develop into an adult.

The larvae live entirely within the cotton boll, destroying not only the seeds but also the surrounding fibres. Because the larvae and pupae remain inside the cotton bolls for their entire period of development, the application of insecticides at this time is useless. The boll weevil occurs in North America in almost every area where cotton is cultivated. It entered the United States from Mexico in the 1890s, causing much damage. It is estimated that between 3,000,000 and 5,000,000 bales of cotton are destroyed annually by this pest.

Bollandist, member of a small group of Belgian Jesuits who edit and publish the *Acta Sanctorum*, the great collection of biographies and legends of the saints, arranged according to their feast days. The idea was conceived by Heribert Rosweyde, a Jesuit who intended to publish, from early manuscripts, 18 volumes of lives of the saints with notes attached. After his death in 1629, Jean Bolland (1596–1665) organized a group that continued to gather material and extended the scope of the work. Publication began in Antwerp in 1643 with the two January volumes. From 1659 Daniel van Papenbroeck, perhaps the outstanding Bollandist, collaborated. This is considered the golden age of the group.

After the suppression of the Society of Jesus in 1773, the work of the Bollandists was continued, first at Antwerp, then at Brussels, and finally at Tongerlo, north of Louvain. In 1794 the French Revolutionary armies invaded Belgium, and the work stopped. After the reestablishment of the Society of Jesus in Belgium, the work began again in 1837, and activities were brought more into line with the progress of historical methods. Besides the 67 folio volumes of the *Acta Sanctorum*, the Bollandists publish a quarterly review, *Analecta Bollandiana*, established in 1882; a bulletin of recent hagiographical publications; and inventories of texts previously published.

Bollingen Prize, award for achievement in American poetry, originally conferred by the Library of Congress with funds established in 1948 by the philanthropist Paul Mellon. An admirer of the psychoanalyst Carl Jung, Mellon named the prize after the Swiss town where Jung spent his summers. In 1949 the first award was made for *The Pisan Cantos* to Ezra Pound, who was then under indictment for treason in World War II for his broadcasts from Italy, which were anti-Semitic and pro-Fascist. A bitter controversy ensued in the press, and the Library of Congress was requested by a congressional committee to disassociate itself from the award. In 1950 it was transferred to the Yale University Library, under the auspices of which it has since been

administered. Originally annual, it became biennial in 1964. In 1961 the Bollingen Foundation also established a prize for translation.

bollworm, any larva of various moths (order Lepidoptera), including the pink bollworm of the family Gelechiidae (see gelechiid moth) and some *Heliothis* species. The larvae of the corn earworm (*q.v.*; *Heliothis zea*), a member of the family Noctuidae, feed on the corn kernels near the tip of the ear. Because the larvae of this pest also burrow into tomatoes and cotton bolls, in addition to a variety of plants, they are sometimes known as tomato fruitworms or cotton bollworms.

Bollworms cause widespread damage. Other plants attacked by the bollworm include peas, alfalfa, beans, soybeans, flax, peanuts, and other commercial crops. The pests can be controlled by natural parasites, early crop planting, trap crops and devices, insecticides, and targeted bacteria that infect the larvae. Sterilized moths have been released in some areas to reduce populations of the pink bollworm.

Bollywood, Indian moviemaking industry that began in Bombay (now Mumbai) in the 1930s and developed into an enormous film empire.

After early Indian experiments in silent film, in 1934 Bombay Talkies, launched by Himansu Rai, spearheaded the growth of Indian cinema. Over the years several classic genres emerged from Bollywood: the historical epic, notably *Mughal-e-Azam* (1960); the curry western, such as *Sholay* (1975); the courtesan film, such as *Pakeezah* (1972), which highlights stunning cinematography and sensual dance choreography; and the mythological movie, represented by *Jai Santoshi Maa* (1975).

Megastars, rather than the plots, were often the driving force behind the films. Beginning in 1936, when Ashok Kumar and Devika Rani emerged as the first major star pair, the Indian public developed an insatiable appetite for news about their screen heroes. This interest continued with such male actors as Raj Kapoor, Dilip Kumar, and Dev Anand in the 1950s and '60s, Rajesh Khanna in the '70s, Amitabh Bachchan in the '80s, and Shahrukh Khan in the '90s. Popular female icons included Madhubala in the 1950s, Mumtaz in the '60s, Zeenat Aman in the '70s, Hema Malini in the '80s, and Madhuri Dixit and Kajol in the '90s.

At the turn of the 21st century, Bollywood produced as many as 1,000 feature films annually in all of India's major languages and in a variety of cities, and international audiences began to develop among Asians in the U.K. and in the U.S. Standard features of Bollywood films continued to be formulaic story lines, expertly choreographed fight scenes, spectacular song-and-dance routines, emotion-charged melodrama, and larger-than-life heroes.

Bologna, Latin BONONIA, city, capital of Bologna province and of Emilia-Romagna region, in northern Italy, north of Florence, between the Reno and Savena rivers. It lies at the northern foot of the Apennines, on the ancient Via Aemilia, 180 ft (55 m) above sea level. Originally the Etruscan Felsina (*q.v.*), it was occupied by the Gallic Boii in the 4th century BC and became a Roman colony and municipium (Bononia) c. 190 BC. It was subject to the Greek exarchate of Ravenna (6th century) and then passed to the papacy. It was occupied by the Visigoths, Huns, Goths, and Lombards after the barbarian invasions. After a feudal period, Bologna became a free com-

mune in the early 12th century. The conflict between the Guelphs and the Ghibellines (two parties in medieval Italian politics) led to the city's domination by a series of signori (lords)—the Pepoli, Visconti, Bentivoglio—before it was incorporated into the Papal States by Pope Julius II in 1506. Thereafter it enjoyed more than three centuries of peace and prosperity. Papal rule was interrupted only by a brief period of French control (1797–1814) before Bologna was garrisoned by the Austrians (1849–60) and was united to the Kingdom of Italy in 1860. Occupied by German troops during World War II, it suffered heavy bombardment.

The arcaded streets of the central part of the city, built on the old Roman town, still preserve a medieval aspect, characterized by the leaning Asinelli and Garisenda towers (300 ft [91 m] and 150 ft, respectively, and both built in 1109–19). Among numerous medieval palaces (palazzi) the most notable are the Palazzi Comunale (town hall), Podestà, Mercanzia (chamber of commerce), and Re Enzo. The Palazzo Bevilacqua (1477–82), with a magnificent inner courtyard, is one of the finest in Bologna. The seat of an archbishop, the city has many magnificent churches, including San Petronio (begun 1390, never completed), where the emperor Charles V was crowned by Pope Clement VII (1530); San Francesco (1236–63); San Domenico, formed in 1221 to house the tomb of the saint; the Baroque San Pietro Metropolitan cathedral; and Santa Maria dei Servi. San Stefano is the name given to a group of four Romanesque churches of the 11th to 13th centuries erected on the ruins of a pagan temple.

San Procolo Church, Bologna, Italy
Ralph Bartholomew—Shostal/EB Inc

The University of Bologna (*q.v.*), one of the oldest and most famous in Europe, dates from the 11th century. It had no fixed location until the Archiginnasio Palace was erected under Pius IV (1562); the university moved to the Palazzo Cesari in 1803. Famous natives of Bologna include Guglielmo Marconi, inventor of radiotelegraphy, and the popes Gregory XIII, Gregory XV, Lucius II, and Benedict XIV. Bologna is noted for its great communal and university libraries and others with special collections. The Civic Museum, founded in 1712 and accommodated since 1881 in the Palazzo Galvani, contains important remains of past civilizations. The art gallery houses a fine collection of paintings of the Bolognese school, as well as Raphael's "St. Cecilia."

Bologna is of paramount importance as a road and rail centre through which must pass most traffic between central and southern Italy and the north. Until World War I the city was chiefly dependent upon agriculture based on the surrounding fertile plain. Although still an important agricultural market and food-pro-

cessing centre, Bologna also has developed into an important industrial centre; its chief manufactures include agricultural machinery, electric motors, motorcycles, railway equipment, chemicals, and shoes. Pop. (1994 est.) mun., 394,969.

Bologna, Giovanni da: see Giambologna.

Bologna, University of, Italian UNIVERSITÀ DEGLI STUDI DI BOLOGNA, one of the oldest and most famous universities in Europe, founded in the Italian city of Bologna in the 11th century. It became in the 12th and 13th centuries the principal centre for studies in civil and canon law and attracted students from all over Europe. Since it then had no fixed site or student housing, scholars of like nationality formed free associations, or guilds, to secure protections that they could not claim as citizens. The organizations formed at Bologna became models for modern universities. In 1158 Emperor Frederick I Barbarossa granted privileges to scholars of Bologna that were eventually extended to all Italian universities.

The students at Bologna were mostly mature men; as the civil law and canon law were at first the only branches of study, they attracted men already filling office in some department of the church or state—archdeacons, heads of schools, canons of cathedrals, and like functionaries. About the year 1200 the faculties of medicine and philosophy (or liberal arts) were formed. The medical faculty became famous in the 13th century for reviving the practice of human dissection, which had not been used in Europe since Roman times. The faculty of science was developed in the 17th century, and in the 18th century women were admitted as students and teachers.

After a period of decline, Bologna was reorganized in 1860 and resumed its place among Italy's foremost universities. The contemporary university includes faculties of jurisprudence, political science, letters and philosophy, medicine, and engineering.

Bologna stone, any of the dense, silvery white stones first found (1603) on Mount Paderno, near Bologna, by an Italian cobbler-chemist, Vincenzo Cascariolo, who synthesized from them a luminescent material that glowed at night after being exposed by day to the Sun. Originally thought to be the philosopher's stone that was believed capable of transmuting base metals into gold, Bologna stone ultimately was shown to be the mineral barite, barium sulfate.

Bolognese school, in the most restricted sense, the works produced and the theories expounded by the late 16th- and early 17th-century Italian painters Lodovico Carracci and his cousins, the brothers Agostino and Annibale Carracci. Although each was different in temperament and inclination, the three Carraccis cooperated in a number of early works, especially fresco cycles. Disturbed by the excesses of the Mannerist painters, they took it upon themselves to reform art through a process of research and experiment. Professing the superiority of direct observation, they drew from the actual model. Their clear, simple, direct pictures fit well the demands of the Counter-Reformation that in religious art there be no barriers between observer and object. About 1585 the cousins formed the Accademia degli Incamminati ("Academy of the Progressives") in order to foster their ideas and to train young painters.

The activity of the Bolognese school caught the attention of Cardinal Odoardo Farnese, and Annibale was invited to Rome in 1595 to decorate first the ceiling of the Camerino and later that of the Galleria in the Palazzo Farnese. A short time later Agostino joined

"Christ Appearing to St. Peter on the Appian Way" ("Domine, Quo Vadis?"), oil painting by Annibale Carracci, Bolognese school, c. 1601; in the National Gallery, London

By courtesy of the trustees of the National Gallery, London, photograph, A. C. Cooper, Ltd.

his brother, as did a number of the Carracci pupils, among them Domenichino, Guido Reni, Albani, and Lanfranco. The result was that what had hitherto been an essentially regional movement became the most influential force in Italian Baroque painting. The complex of painted episodes on the vault of the Farnese Galleria, showing the loves of the pagan gods and goddesses, became the new "academy" and greatly influenced later masters. In addition to his work in the Palazzo Farnese, Annibale Carracci is credited with establishing the rules for the heroic landscape.

Lodovico never went to Rome but remained in Bologna, where he continued to paint until his death. In 1622 Guido Reni returned to Bologna and became the leading painter there, and the Bolognese school after his arrival was ruled by Reni's tempered classicism.

bolometer, instrument for measuring radiation by means of the rise in temperature of a blackened metal strip in one of the arms of a resistance bridge. In the first bolometer, invented by the American scientist Samuel P. Langley in 1880, a Wheatstone bridge was used along with a galvanometer that produced a deflection proportional to the intensity of radiation for small deflections. A later bolometer consists of four platinum gratings (each of which is made of a series of strips) inserted in the arms of a resistance bridge; two of these gratings, in opposite arms of the bridge, are placed one behind another, so that the openings of one are opposite the strips of the other and are exposed to the radiation, the other opposite pair being shielded; this arrangement doubles the effect on the galvanometer and also compensates for any extraneous temperature changes. Changes in temperature as small as 0.0001°C may be detected in this way.

The spectrum bolometer consists of a single strip set on edge, in an arm of a bridge. It is used for exploring the distribution of intensity of radiation in a spectrum.

Boloven Plateau, French PLATEAU DES BOLOVENS, fertile, gently rolling upland, southern Laos. The plateau lies east of Pakxé between the Mekong River and the western foothills of the southern Annamese Cordillera (Chaîne Annamitique). Basically a large, basaltic lava extrusion, about 3,500 feet (1,100 m) in elevation, the saucer-shaped upland is highest on its northern and southern

rims, where peaks rise 5,194 feet and 3,058 feet above sea level. Directly in the path of the June-to-November southwest monsoon, the Boloven receives annually more than 160 inches (4,000 mm) of rainfall, the heaviest in Laos. The plateau is sparsely populated by the Loven, Nha Huen Sovei, and Sou of the Lao-Theung (Mon-Khmer) peoples. Though the region is reputed to have rich soil, it has been plagued by civil wars, poor transportation, and plant disease. The Muang Pakxong-Saravan (Salavan) highway crosses the plateau. Much of the region still remains in brush and tall grass. Some spices, notably cardamom, are raised for export, as is coffee. Pagodite, a stone used in carving, is mined.

Bolsena, town, Viterbo *provincia*, Lazio (Latium) *regione*, central Italy. It is situated on the northeast bank of Lake Bolsena (ancient Lacus Volturnensis), just southwest of Orvieto. It occupies the site of the ancient Etruscan town of Volsinii (*q.v.*). After the latter was razed by the Romans in 265 BC, the inhabitants moved to another site, perhaps at modern Orvieto.

Bolsena is famous for the miracle of 1263, when a Bohemian priest, skeptical about the doctrine of transubstantiation (the conversion of the eucharistic bread and wine into the substance of the body and blood of Christ), was convinced of its truth by the miraculous appearance of drops of blood on the Host he was consecrating at mass on an altar in the crypt of the 11th-century Church of Santa Cristina. In the Vatican the marvel is commemorated by Raphael's fresco "The Miracle at Bolsena" in the Stanza d'Eliodoro. In commemoration of the miracle, Pope Urban IV instituted the Feast of Corpus Christi ("Body of Christ") and built Orvieto Cathedral, which houses the blood-stained altar cloth. The Church of Santa Cristina and the Chapel of the Miracle in the town's catacombs contain statues by the 14th- and 15th-century Della Robbia family. The town has a 10th- and 13th-century castle and a small museum of Etruscan and Roman remains.

Market gardening, fishing, and wine and oil production are the principal economic activities. Pop. (1993 est.) mun., 4,076.

Bolshaya Sovetskaya Entsiklopediya, English GREAT SOVIET ENCYCLOPEDIA, major encyclopaedia of the former Soviet Union.

The first edition, which appeared in 65 volumes from 1926 to 1947, had lost its official approval by the time it was completed. A second edition, begun in 1949, was published in 50 volumes from 1950 to 1958. Although written from a Marxist-Leninist point of view, it is considered less biased than the first edition. One complete volume of the second edition was devoted to the Soviet Union. A supplemental volume (no. 51) contains political biographies (chiefly of persons "rehabilitated" after having been purged during the Stalin era), tables of weights and measures, currencies, and so on.

A third edition of 30 volumes, published according to a decree of the Central Committee of the Communist Party of the Soviet Union (1967), printed in smaller type and containing generally shorter, more tightly edited articles, appeared from 1970 to 1978. A name index appeared in 1981. The Macmillan Company of New York City and London issued an English translation of the third edition in 1973-83. After 1974, the Soviets entered into translation and publishing agreements with Italian, Greek, Spanish, Latin-American, and Bangladesh publishers.

Bolshevik (Russian: "One of the Majority"), plural BOLSHÉVIKS, or BOLSHÉVIKI, member of a wing of the Russian Social-Democratic Workers' Party (*q.v.*), which, led by Lenin, seized control of the government in Russia (October 1917) and became the dominant

political power. The group originated at the party's second congress (1903) when Lenin's followers, insisting that party membership be restricted to professional revolutionaries, won a temporary majority on the party's central committee and on the editorial board of its newspaper *Iskra*. They assumed the name Bolsheviks and dubbed their opponents the Mensheviks ("Those of the Minority").

Although both factions participated together in the Russian Revolution of 1905 and went through periods of apparent reconciliation (about 1906 and 1910), their differences increased. The Bolsheviks continued to insist upon a highly centralized, disciplined, professional party. They boycotted the elections to the First State Duma (Russian parliament) in 1906 and refused to cooperate with the government and other political parties in subsequent Dumas. Furthermore, their methods of obtaining revenue (including robbery) were disapproved of by the Mensheviks and non-Russian Social Democrats.

In 1912 Lenin, leading a very small minority, formed a distinct Bolshevik organization, decisively (although not formally) splitting the Russian Social-Democratic Workers' Party. His determination to keep his own faction strictly organized, however, had also alienated many of his Bolshevik colleagues, who had wished to undertake nonrevolutionary activities or who had disagreed with Lenin on political tactics and on the infallibility of orthodox Marxism. No outstanding Russian Social Democrats joined Lenin in 1912.

Nevertheless, the Bolsheviks became increasingly popular among urban workers and soldiers in Russia after the February Revolution (1917), particularly after April, when Lenin returned to the country, demanding immediate peace and that the workers' councils, or Soviets, assume power. By October the Bolsheviks had majorities in the Petrograd (St. Petersburg) and Moscow Soviets; and when they overthrew the Provisional Government, the second Congress of Soviets (devoid of peasant deputies) approved the action and formally took control of the government.

Immediately after the October Revolution, the Bolsheviks refused to share power with other revolutionary groups, with the exception of the Left Socialist Revolutionaries; eventually they suppressed all rival political organizations. They changed their name to Russian Communist Party (of Bolsheviks) in March 1918; to All-Union Communist Party (of Bolsheviks) in December 1925; and to Communist Party of the Soviet Union in October 1952.

Bolshevik Revolution, the second of two revolutions that occurred in Russia in 1917, and so called because it placed the Bolsheviks in power. See Russian Revolution of 1917.

Bolshoi Ballet, also spelled BOLSHOY BALLET (Russian: "Great Ballet"), leading ballet company of Russia (and the Soviet Union), famous for elaborately staged productions of the classics and children's ballets that preserve the traditions of 19th-century classical dance. The Bolshoi Ballet took that name in 1825, when the new Bolshoi Theatre in Moscow took over the ballet company of its predecessor, the Petrovsky Theatre, which had been established in 1776. The company's style, later called "the Moscow style," gradually emerged, more spontaneous and influenced by Russian folklore than the traditional style that was the hallmark of the St. Petersburg companies.

Throughout the 19th century, such prominent choreographers as Marius Petipa, Carlo Blasis, and Arthur Saint-Léon staged productions at the Bolshoi Theatre. After a period of decline at the end of the 19th century, Aleksandr Gorsky was appointed maître de ballet in 1900. He once again shaped a first-rate company and introduced the realism in scenery and costume that has since charac-

terized the group's productions. By the 1960s the Bolshoi Ballet was one of the world's foremost ballet companies. Yuri Grigorovich was the company's artistic director from 1964 to 1995. The Bolshoi ballet school has officially been known since 1961 as the Moscow Academic Choreographic School.

Bolshoi Theatre, Russian BOLSHOY TEATR, leading theatre company for ballet and opera in Russia. The original group, which was made up of several smaller troupes, was organized in Moscow in the mid-1770s, performing primarily at the mansion of Count R.I. Vorontsov. In 1780 the first permanent theatre building in Moscow was opened as the company's home, but it burned in 1805. A year later the Bolshoi (Russian: "Great") Theatre was made a government institution, and a new building was opened in 1825. It, too, was destroyed by fire, in 1853, but it was rebuilt and enlarged in 1856 to accommodate an audience of more than 2,000. By the end of the 19th century the Bolshoi's operatic and ballet productions of Russian and other European works were influencing the performing arts throughout the Western world. In 1924 a smaller auditorium was added to the theatre complex, and in 1961 the Kremlin Palace of Congresses, with a capacity of about 6,000, was acquired as a third performing space for bigger productions.

The company was kept intact during the Russian Revolution of 1917, both world wars, and the dissolution of the Soviet Union in 1990-91. Since the mid-1950s the opera and ballet troupes have traveled extensively.

Bolsover, district, county of Derbyshire, England. It takes its name from the principal town in an area of agricultural land interspersed with small coal-mining settlements. The district's administrative headquarters are in Mansfield, across the Nottinghamshire border. One of Britain's major smokeless fuel plants is located at Bolsover. New industries have been sought to compensate for the contraction of coal-mining employment in the locality. Important remnants of the preindustrial era include the 17th-century Bolsover Castle, which commands the River Doe Lea valley. Hardwick Hall, which was built in the late 16th century by Elizabeth, dowager countess of Shrewsbury (Bess of Hardwick), is now the property of the National Trust. Area 62 square miles (160 square km). Pop. (1991 prelim.) 69,000.

bolt, mechanical fastener that is usually used with a nut for connecting two or more parts. A bolted joint can be readily disassembled and reassembled; for this reason bolts or screw fasteners are used to a greater extent than any other type of mechanical fastener and have played an important part in the development of mass-produced articles and steel structures.

The bolt, which forms part of the connection shown in the Figure, consists of a head and a cylindrical body with screw threads along a portion of its length. The nut is the female member of the pair, having internal threads to match those of the bolt. Washers are often used to prevent loosening and crushing. See also nut; washer.

Bolt

Bolt, Robert, in full ROBERT OXTON BOLT (b. Aug. 15, 1924, near Manchester, Eng.—d. Feb. 20, 1995, near Petersfield, Hampshire), English screenwriter and dramatist noted for his epic screenplays.

Bolt began work in 1941 for an insurance company, attended Manchester University in 1943, and then served in the Royal Air Force and the army during World War II. After earning a B.A. in history at Manchester University in 1949, he worked as a schoolteacher until 1958, when the success of his play *Flowering Cherry* (London, 1957), a Chekhovian study of failure and self-deception, enabled him to leave teaching. Bolt's most successful play was *A Man for All Seasons*, a study of the fatal struggle between Henry VIII of England and his lord chancellor, Sir Thomas More, over issues of religion, power, and conscience. The play drew intense acclaim in productions at London (1960) and New York City (1961).

Bolt wrote the screenplays for director David Lean's epic films *Lawrence of Arabia* (1962) and *Doctor Zhivago* (1965) and then adapted *A Man for All Seasons* for director Fred Zinnemann's motion-picture version of the play in 1966. His other screenplays included *Ryan's Daughter* (1970), which was directed by Lean; *Lady Caroline Lamb* (1972), which Bolt himself directed; *The Bounty* (1984); and *The Mission* (1986). The most successful of Bolt's later plays was *Vivat! Vivat Regina!* (1970).

bolt action, type of breech mechanism that was the key to the development of the truly effective repeating rifle. The mechanism combines the firing pin, a spring, and an extractor, all housed in a locking breechblock. The spring-loaded firing pin slides back and forth inside the bolt, which itself is the breechblock. The bolt is moved back and forth, and partially rotated, in the receiver by a projecting handle with a round knob. One or more lugs at the front or rear of the bolt (or at both) fit into slots in the receiver and lock the bolt firmly in place against the base of the cartridge chamber when the rifle is to be fired. As the bolt is thrust forward, it pushes a cartridge into the chamber and cocks the piece. The trigger releases the spring-driven firing pin inside the bolt. After firing, the extractor on the head of the bolt removes the spent cartridge and ejects it. The bolt moves a new cartridge from the magazine and repeats the process.

Some bolt actions lock without rotating. Straight-pull bolts are used in the Canadian Ross, the Austrian Mannlicher, and the Swiss Schmidt-Rubin rifles. Bolts that turn to lock have been standard in the Krag-Jorgensen, Lee-Enfield, Springfield, and Lebel rifles, among others.

Bolton, borough and district, area of Greater Manchester, England. The district has an area of 54 square miles (140 square km).

The town of Bolton is at the hub of the district, which lies in the northwest of the Manchester conurbation and rises in the north to the Pennine foothills. By the 16th century Bolton was known for woolen textiles, but by the 18th century cotton had replaced wool, and the production of yarns and fabrics was increasing. Samuel Crompton, a native of Bolton, invented in 1779 the spinning mule, which revolutionized spinning, and Bolton's first spinning mill was opened in 1780. By the mid-19th century Bolton was an important centre for textiles and coal mining as well as papermaking, bleaching, engineering, and a range of other industries.

The cotton industry has contracted in the 20th century, and the industrial structure has diversified so that by the 1960s engineering employed most workers in the borough. William Hesketh Lever, the first Lord Leverhulme, was born in Bolton in 1851. Both

Firwood Fold, where Samuel Crompton was born, and Hall I'th'Wood, a manor house where he later lived, are preserved, the latter as a museum. Pop. (2001) 261,035.

Bolton, Edmund, Bolton also spelled BOLTTON (b. 1575?—d. 1633?), English historian, antiquarian, and poet whose lyrics are among the best in the miscellany *Englands Helicon* (1600), a widely known anthology of late 16th-century lyric and pastoral poetry.

Bolton was educated at Cambridge and the Inner Temple, London. He obtained a minor position at court but was debarred from public office because of his Roman Catholicism, and he tried to support himself by writing. A friend of William Camden and other scholars, he petitioned James I to form a royal academy, but the king died before giving formal sanction. His plans to write official histories of England and London also failed, and Bolton, after imprisonment for recusancy, seems to have died in poverty. His most considerable works are the history *Nero Caesar* (1624) and *Hypercritica*, a treatise on the writing of history in which he reviews contemporary authors.

Bolton, Guy (Reginald) (b. Nov. 23, 1884, Broxbourne, Hertfordshire, Eng.—d. Sept. 5, 1979, London), American playwright and librettist perhaps best known for his witty and articulate librettos, on which he collaborated with such notables as P.G. Wodehouse, George Middleton, and Fred Thompson.

The son of American parents, Bolton studied architecture before he began writing plays. Bolton's first play appeared on Broadway in 1911, but it was not until he began contributing to Broadway musicals that his fame spread. In collaboration with Wodehouse and others, Bolton turned out scripts that were enhanced with music by composers such as Jerome Kern, George Gershwin, and Cole Porter. Among his finer works are *Oh, Boy!* (1917; with Wodehouse, music by Kern), *Oh, Lady! Lady!* (1918; with Wodehouse, music by Kern), *Sally* (1920; with music by Kern), *Lady, Be Good!* (1924; with Fred Thompson, music by the Gershwins), *Oh, Kay!* (1926; with Wodehouse, music by the Gershwins and Howard Dietz), and *Anything Goes* (1934; with Wodehouse, Howard Lindsay, and Russell Crouse, music by Cole Porter). Bolton also wrote for a number of London productions. He is considered an instrumental contributor to the development of the musical.

Boltwood, Bertram Borden (b. July 27, 1870, Amherst, Mass., U.S.—d. Aug. 15, 1927, Hancock Point, Maine), American chemist and physicist whose work on the radioactive decay of uranium and thorium was important in the development of the theory of isotopes.

Boltwood was a member of the Yale faculty from 1897 until 1900, when he established a consulting firm of mining engineers and chemists in partnership with the American chemist Joseph Hyde Pratt. Boltwood grew interested in radioactivity and, in 1904, showed that many of the radioactive elements decay into other radioactive elements. He discovered ionium, now called thorium-230. In 1905 he proposed that lead is the final decay product of uranium and two years later developed a method of determining the age of some rocks by measuring the ratio of lead and uranium. Additional methods of radiometric dating that followed revolutionized estimates of the age of Earth and proved invaluable in archaeology.

In 1910 Boltwood became professor of radiochemistry at Yale University. Overwork led to a nervous breakdown, and intermittent depression culminated in his suicide.

Boltzmann, Ludwig Eduard (b. Feb. 20, 1844, Vienna, Austria—d. Sept. 5, 1906, Duino, Italy), physicist whose greatest achieve-

ment was in the development of statistical mechanics, which explains and predicts how the properties of atoms (such as mass, charge, and structure) determine the visible properties of matter (such as viscosity, thermal conductivity, and diffusion).

After receiving his doctorate from the University of Vienna in 1866, Boltzmann held professorships in mathematics and physics at Vienna, Graz, Munich, and Leipzig.

In the 1870s Boltzmann published a series of papers in which he showed that the second law of thermodynamics, which concerns energy exchange, could be explained by applying the laws of mechanics and the theory of probability to the motions of the atoms. In so doing, he made clear that the second law is essentially statistical and that a system approaches a state of thermodynamic equilibrium (uniform energy distribution throughout) because equilibrium is overwhelmingly the most probable state of a material system. During these investigations Boltzmann worked out the general law for the distribution of energy among the various parts of a system at a specific temperature and derived the theorem of equipartition of energy (Maxwell-Boltzmann distribution law). This law states that the average amount of energy involved in each different direction of motion of an atom is the same. He derived an equation for the change of the distribution of energy among atoms due to atomic collisions and laid the foundations of statistical mechanics.

Boltzmann was also one of the first continental scientists to recognize the importance of

Boltzmann, lithograph by Rudolf Fenzl, 1898

By courtesy of the Bild Archiv, Osterreichische Nationalbibliothek, Vienna

the electromagnetic theory proposed by James Clerk Maxwell of England. Though his work on statistical mechanics was strongly attacked and long-misunderstood, his conclusions were finally supported by the discoveries in atomic physics that began shortly before 1900 and by recognition that fluctuation phenomena, such as Brownian motion (random movement of microscopic particles suspended in a fluid), could be explained only by statistical mechanics.

Boltzmann constant (symbol k), a fundamental constant of physics occurring in nearly every statistical formulation of both classical and quantum physics. The constant is named after Ludwig Boltzmann, a 19th-century Austrian physicist, who substantially contributed to the foundation and development of statistical mechanics, a branch of theoretical physics. Having dimensions of energy per degree of temperature, the Boltzmann constant has a value of 1.380662×10^{-23} joule per kelvin (K), or 1.380662×10^{-16} erg per kelvin.

Boltzmann distribution law: see Maxwell-Boltzmann distribution law.

Bolu, city, northwestern Turkey. It is situated at 2,434 feet (742 m) above sea level on the southern slopes of a bare hill. The region was once part of the Hittite empire and became the kingdom of Bithynia in the 5th century

BC. At nearby Eskihisar are ruins of the ancient Bithynium, a flourishing town of Asia Minor and—as birthplace of the Roman emperor Hadrian's favourite, Antinous—recipient of many privileges during that emperor's reign (AD 117–138). Taken by the Ottoman Turks about 1325, Bolu is the reputed home of the legendary Turkish folk hero Köroğlu. The modern city is the seat of a women's teacher-training college and a school of forestry, and its industries produce leather products. Pop. (2000 prelim.) 84,565.

Bólu-Hjálmar (Icelandic folk poet): see Jónsson, Hjálmar.

bolus, food that has been chewed and mixed in the mouth with saliva. Chewing helps to reduce food particles to a size readily swallowed; saliva adds digestive enzymes, water, and mucus that help chemically to reduce food particles, hydrate them for taste, and lubricate them for easy swallowing. The term bolus applies to this mixture of food and solutions until they are passed into the stomach. Once the bolus reaches the stomach, mixes with gastric juices, and becomes reduced in size, the food mass becomes known as chyme.

Bolyai, Farkas (b. Feb. 9, 1775, Bolya, near Nagyszében, Hung. [now Sibiu, Rom.]—d. Nov. 20, 1856, Marosvásárhely, Hung. [now Tirgu Mures, Rom.]), Hungarian mathematician, poet, and dramatist who spent a lifetime trying to prove Euclid's (fifth) postulate that parallel lines do not meet. In the process, while studying at the University of Göttingen, he became a close friend of the noted German mathematician Carl F. Gauss, with whom he corresponded until Gauss's death in 1855.

In 1804 Bolyai took a position with the Evangelical-Reformed College at Marosvásárhely, where he taught until his retirement in 1853. Almost completely isolated from the scientific world, he worked tirelessly on the parallel line postulate and, in 1804, sent a proof to Gauss. Gauss pointed out a flaw, and Bolyai continued his pursuit. During moments of despair he sought refuge in writing poetry, music, and drama. His dramatic works include *Öt Szomorjáték, Irta egy Hazafi* (1817; "Five Tragedies, Written by a Patriot") and *A Párisi Pár* (1818; "The Paris Process").

In 1829 Bolyai finished his most important work, *Tentamen Juventutem Studiosam in Elementa Matheseos Purae Introducendi* (1832; "An Attempt to Introduce Studious Youth to the Elements of Pure Mathematics"). A rigorous and systematic exposition of geometry, arithmetic, algebra, and analysis, the work was largely unappreciated by his contemporaries.

Bolyai, János (b. Dec. 15, 1802, Kolozsvár, Hung. [now Cluj, Rom.]—d. Jan. 27, 1860, Marosvásárhely, Hung. [now Tirgu Mures, Rom.]), Hungarian mathematician and one of the founders of non-Euclidean geometry—geometry that does not include Euclid's axiom that only one line can be drawn parallel to a given line through a point not on the given line.

Although Bolyai knew nothing of mathematics at the age of 10, by the age of 13 he had mastered calculus and analytic mechanics under the tutelage of his father, the distinguished mathematician Farkas Bolyai. He also became an accomplished violinist at an early age and later was renowned as a superb swordsman. He studied at the Royal Engineering College in Vienna (1818–22) and served in the army engineering corps (1822–33).

The elder Bolyai's fanatic preoccupation with proving Euclid's parallel axiom infected his son, and, despite his father's warnings, János persisted in his own search for a solution. In 1820 he concluded that a proof was probably impossible and began developing a geometry that did not depend on Euclid's axiom. In 1823 he sent his father a draft of "Appendix

Scientiam Spatii Absolute Veram Exhibens" ("Appendix Explaining the Absolutely True Science of Space"), a complete and consistent system of non-Euclidean geometry.

Before his work was published, Bolyai found that he had largely been anticipated by Carl Gauss of Germany. This was a profound blow to Bolyai, even though Gauss had no claim to priority since he had never felt enough confidence in his findings to publish them. Bolyai allowed the "Appendix" to be published with his father's *Tentamen Juventutem Studiosam in Elementa Matheseos Purae Introducendi* (1832; "An Attempt to Introduce Studios Youth to the Elements of Pure Mathematics"), but the essay went unnoticed by other mathematicians. In 1848 he discovered that N.I. Lobachevsky had published an account of virtually the same geometry in 1829.

Although Bolyai continued his mathematical studies, the importance of his work was never recognized in his lifetime. In addition to work on his non-Euclidean geometry, he developed a geometric concept of complex numbers as ordered pairs of real numbers.

Bolza, Oskar (b. May 12, 1857, Bergzabern, Rhenish Palatinate [Germany]—d. July 5, 1942, Freiburg im Breisgau, Ger.), German mathematician and educator who was particularly noted for his work on the reduction of hyperelliptic to elliptic integrals and for his original contributions to the calculus of variations.

Bolza studied at the University of Berlin and received his doctoral degree in 1886 at the University of Göttingen. He accepted a minor position at Johns Hopkins University, Baltimore, Md., in 1889 and within a year was appointed associate in mathematics at Clark University, Worcester, Mass. In 1893 Bolza joined the department of mathematics at the newly established University of Chicago. In 1910 he returned to Germany as honorary professor of mathematics at the University of Freiburg, where he remained until his death.

Bolza lectured extensively in both the United States and Europe on the calculus of variations and, in 1904, published a treatise, *Lectures on the Calculus of Variations* (revised and translated by him into German as *Vorlesungen über Variationsrechnung*, 1908), which became a classic in the field. Several of his papers published in 1913 and 1914 developed an original variational problem known as the problem of Bolza, which combines the earlier problems of J.-L. Lagrange and C.G.A. Mayer into a generalized statement. Bolza's later lectures on his function theory and integral equations were collected by William V. Lovitt and published in 1924 as *Linear Integral Equations*.

Bolzano, German BOZEN, capital (since 1927) of Bolzano-Bozen *provincia*, in the Trentino-Alto Adige *regione* of northern Italy. The city lies at the juncture of the Talvera (Talfer) and Isarco (Eisack) rivers just northeast of their confluence with the Adige (Etsch), north of Trento. It is surrounded on three sides by mountains and opens to the south onto a floodplain that is intensively cultivated with vineyards, fruits, and vegetables. Bolzano is sheltered from cold north winds by the surrounding mountains and in consequence is both an agricultural and a tourist centre.

Nothing is known of a settlement at the site before the Middle Ages. Held by the counts of Bavaria from 680, Bolzano was given with the rest of the diocese to the bishop of Trent by Conrad II in 1027. Because the city lay along the important trade route from Verona and Trento north to Austria, it was fought over by the bishops of Trent and the counts of Tirol until it was ceded to the counts in 1531. It passed to Bavaria with the rest of the Tirol in 1805 and was united to Austria in 1809 as a result of the rebellion led by the Tirolean patriot Andreas Hofer. Bolzano belonged to the Austrian Empire from 1813 until Italy ac-

quired it in 1918 at the end of World War I. By this time the city's inhabitants had long been largely German-speaking. In the interwar period Italy's fascist government attempted to Italianize the city and *provincia* by bringing large numbers of Italian settlers into the area, but Bolzano's German-speaking majority continued after World War II to demand either annexation by Austria or more cultural autonomy within Italy; the Italian government granted the latter in legislation in 1947 and 1969.

Bolzano was heavily bombed during World War II but was afterward restored, and it preserves its Austrian architectural character. Notable landmarks of the old town include the cathedral; the 14th- and 15th-century parish church; the former Dominican monastery with a frescoed cloister and chapels; and the 14th-century Franciscan church. The 13th-century Mareccio (Maretsch) Castle (with five later towers) houses the municipal archives, and the Roncolo (Runkelstein) Castle contains murals of chivalric subjects from about 1400. There is a music conservatory and a civic museum.

A tourist and commercial centre, Bolzano has electrometallurgical and engineering industries and manufactures vehicles and textiles. Other industries include winemaking and the processing of fruits and other food products grown in the adjacent floodplain. Pop. (1991 prelim.) mun., 98,233.

Bolzano, Bernhard (b. Oct. 5, 1781, Prague, Bohemia, Austrian Habsburg domain [now in Czech Republic]—d. Dec. 18, 1848, Prague), Bohemian mathematician and theologian who provided a more detailed proof for the binomial theorem in 1816 and suggested the means of distinguishing between finite and infinite classes.

Bolzano graduated from the University of Prague as an ordained priest in 1805 and was immediately appointed professor of philosophy and religion at the university. Within a matter of years, however, Bolzano alienated many faculty and church leaders with his teachings of the social waste of militarism and the needlessness of war. He urged a total reform of the educational, social, and economic systems that would direct the nation's interests toward peace rather than toward armed conflict between nations. Upon his refusal to recant his beliefs, Bolzano was dismissed from the university in 1819 and at that point devoted his energies to his writings on social, religious, philosophical, and mathematical matters.

Bolzano held advanced views on logic, mathematical variables, limits, and continuity. In his studies of the physical aspects of force, space, and time he proposed theories counter to those suggested by the German philosopher Immanuel Kant. Much of his work remained unpublished during his lifetime and did not have wide impact until the late 19th and early 20th centuries, when a number of his conclusions were arrived at independently.

Bolzano's published works include *Der binomische Lehrsatz* (1816; "The Binomial Theorem"), *Rein analytischer Beweis* (1817; "Pure Analytic Proof"), *Functionenlehre* (1834; "Functions Model"), *Wissenschaftslehre*, 4 vol. (1834; "Scientific Model"), *Versuch einer neuen Darstellung der Logik*, 4 vol. (1837; "An Attempt at a New Presentation of Logic"), and *Paradoxien des Unendlichen* (1851; "Paradoxes of Infinity").

Boma, formerly LOMBI, or EMBOMMA, city and port on the Congo (Zaire) River estuary, southwestern Zaire. It lies 60 miles (100 km) from the Atlantic Ocean. One of the nation's oldest communities, it was a trading centre and slave market before the middle of the 19th century. In 1886 Boma became the capital of the Congo Free State, later the Belgian Congo, until replaced by Léopoldville (now Kinshasa) in 1926. Boma is the terminus of a railroad to

Tshela and is the outlet for palm oil, bananas, and timber from the forest area of Mayumbe to the north. Pop. (1991 est.) 246,207.

bomb, a container carrying an explosive charge that is fused to detonate under certain conditions (as upon impact) and that is either dropped (as from an airplane) or set into position at a given point. In military science, the term "aerial bomb" or "bomb" denotes a container dropped from an aircraft and designed to cause destruction by the detonation of a high-explosive bursting charge or incendiary or other material. Bombs differ from artillery shells, missiles, and torpedoes in that the latter are all propelled through the air by a man-made agency, while bombs travel to their targets through the force of gravity alone. A major distinction must also be made between conventional bombs and atomic and thermonuclear bombs, which have a far greater destructive capacity. (See atomic bomb; thermonuclear bomb.)

The typical conventional bomb is a streamlined cylinder that consists of five major parts: an outer casing, the inner explosive material, devices such as fins to stabilize the bomb in flight, one or more fuzes to ignite the bomb's main charge, and a mechanism for arming the fuze or preparing it to explode. The outer case is most commonly made of metal and has a point at its tip, or nose. The explosive charge in most conventional bombs usually consists of TNT, RDX, ammonium nitrate, or other high explosives in combination with each other. The fin assembly at the tail end of the bomb enables it to fall through the air nose-first, by the same principle as the feathers on an arrow.

Bombs can be classified according to their use and the explosive material they contain. Among the most common types are blast (demolition), fragmentation, general purpose, antiarmour (armour-piercing), and incendiary (fire) bombs. Demolition bombs rely on the force of the blast to destroy buildings and other structures. They are usually fitted with a time-delay fuze, so that the bomb explodes only after it has smashed through several floors and is deep inside the target building. Fragmentation bombs, by contrast, explode into a mass of small, fast-moving metal fragments that are lethal against personnel. The bomb case consists of wire wound around an explosive charge. General-purpose bombs combine the effects of both blast and fragmentation and hence can be used against a wide variety of targets. They are probably the commonest type of bomb used. Armour-piercing bombs have a thick case and a pointed tip and are used to penetrate armoured or hardened targets such as warships and bunkers. Bombs of the aforementioned types generally range in size from 100 to 3,000 pounds (45 to 1,360 kg). The largest bomb ever regularly used was the British "Grand Slam" type, which weighed 22,000 pounds (10,000 kg) and was used in World War II.

Incendiary bombs are of two main types. The burning material of the intensive type is thermite, a mixture of aluminum powder and iron oxide that burns at a very high temperature. The casing of such a bomb is composed of magnesium, a metal that itself burns at a high temperature when ignited by thermite. Intensive-type incendiaries are designed to set buildings afire by their intense heat. The other type of incendiary bomb is a thin-walled container of napalm, or jellied gasoline, that is used against personnel, vehicles, and flammable installations. The napalm spreads over a wide area, sticks to whatever it falls upon, and burns for a long time. Modern mixtures of napalm consist of gasoline, benzene, and a polystyrene thickener.

All of the aforementioned bomb types were used in World War II. Newer types include cluster and fuel-air explosive (FAE) bombs. Cluster bombs consist of an outer casing containing dozens of small bomblets; the casing splits open in midair, releasing a shower of bomblets that explode upon impact. Cluster bombs have both fragmentation and anti-air capabilities. Fuel-air explosives are designed to release a cloud of explosive vapour a short distance above the ground; the violent combustion of this fuel creates an overpressure that can detonate buried enemy mines, thus clearing the way for a ground advance.

Aiming bombs has always been the most challenging part of aerial bombing, since the bomber must choose a point at which to release the bomb from a moving aircraft so that its trajectory intersects a target on the ground. The paths traversed by the plane and the bomb can be calculated mathematically, but the person who releases the bomb must act within seconds. The use of mechanical and radio targeting devices by a specially trained aircraft crewman called a bombardier solved this problem during World War II.

Smart, or homing, bombs can be guided to their targets with an even higher degree of accuracy. Such bombs are fitted with small wings and adjustable fins that give the bomb some in-flight maneuverability by means of gliding. The bomb's nose is fitted with a small laser or TV-camera guidance system which provides data on the target's location to a computer, which then sends signals to actuators that adjust the bomb's wing and fin surfaces as needed to keep the bomb on track to the target. In the laser system, a beam of laser light is directed at the target from an aircraft, and the bomb's laser sensors pick up the reflected beam and follow it down to the target. A TV-guidance unit fitted onto a bomb is locked onto the target by an aircraft and then transmits continuous pictures of the target either to a computer in the bomb or to the aircraft crew, either of whom can guide the bomb directly onto its target.

Several types of fuzes are used in bombs. Impact fuzes, historically the most common type, are set in the bomb's nose and detonate upon impact, setting off the main charge. A time fuze, by contrast, acts after a controlled delay. Another type, the proximity fuze, senses when a target is close enough to be destroyed by the bomb's explosion. The sensor is typically a small radar set that sends out signals and listens for their reflections from nearby objects. Most bomb fuzes are armed at the moment of the bomb's release from the aircraft, or just before, so that fuzed bombs cannot explode while being loaded or while being transported to their target. This last-moment arming is achieved by simple mechanical means, most commonly a small pinwheel on the bomb that turns as the air rushes past the falling projectile, and thereby arms the fuze.

Bombs first assumed military importance with the rapid development of zeppelins and aircraft in World War I, but the tonnages dropped in that conflict were insignificant, largely because the carrying capacity of the aircraft was so small. World War II saw the use of larger bombs in much greater numbers; more than 1.5 million tons of bombs were dropped by the Allies on Germany alone. Similar tonnages of bombs were used by the United States in the Korean and Vietnam wars, but by the time of the Persian Gulf War (1990), tonnages had dropped owing to the increased use of highly accurate smart bombs.

bomb, in volcanology, unconsolidated volcanic material that has a diameter greater than 32 mm (1.25 inches) and forms from clots of wholly or partly liquid lava ejected during a

volcanic explosion, solidifying during flight. The final shape is determined by the initial size, viscosity, and flight velocity of the magma. Some, called spindle bombs, are shaped like a football or spindle of thread; others, called cow-dung or pancake bombs, may be flattened; and still others are ribbon-shaped.

If bombs are still molten or plastic when they land, a characteristic of those formed during the relatively weak explosions of mafic (ferromagnesian) magma, they may partly fuse to form agglutinate. If their outer surfaces are partly solidified, impact may produce bread-crust bombs with a cracked skin. A rock deposit composed of bombs cemented (not fused) together is called agglomerate.

Bombacaceae, the bombax or kapok family of flowering trees and shrubs, in the mallow order (Malvales), comprising 27 genera. It is allied to the mallow family (Malvaceae), to which the cotton plant belongs, and is charac-

Shaving-brush tree (*Pseudobombax ellipticum*)
Walter Dawn

teristic of the tropics. Bombacaceae members' flowers are often large and showy. The family includes: *Adansonia digitata*, the African baobab (*q.v.*); the genus *Bombax* with 8 species, including the red silk-cotton tree (*B. ceiba*); the genus *Pseudobombax* with 20 species, including the shaving-brush tree (*P. ellipticum*); and *Ceiba*, with 10 species, the fruits of which produce the kapok (*q.v.*) of commerce. *Ochroma lagopus* is the South American balsa (*q.v.*), noted for its very light wood, and the Malayan *Durio zibethinus* bears the noted durian (*q.v.*) fruit, remarkable for its distinctive odour and large size.

bombard, French BOMBARDE, German PUMHART, or POMMER, double-reed wind instrument belonging to the shawm family; its name is derived from a piece of artillery of the 14th century. By the 16th century shawms were constructed in all sizes, ranging from soprano to double bass. Although the higher-pitched instruments retained the name shawm, the lower-pitched versions became known as bombards. In Brittany, the bombard is played in duet with a bagpipe.

bombasine (textile); see bombazine.

bombax cotton, also called TREE COTTON, or VEGETABLE DOWN, seed floss of various trees of the *Bombax* genus of the Bombacaceae family; the plants grow in tropical countries and are cultivated in the West Indies and Brazil. The seed floss's individual fibres, soft and ranging from pale yellow to brown in colour, are about 0.5 to 3.25 cm (0.25 to 1.25 inches) long and 20 to 40 microns (a micron is about 0.00004 inch) in diameter. Unlike the fibres of common commercial cotton (*Gossypium*), bombax cotton fibres grow from the side of the seedpod instead of from the seed itself. Although sometimes mixed with

common-cotton fibres for spinning, bombax cotton is weaker and less elastic and contains the woody plant substance lignin, making it unsatisfactory for use alone as a textile fibre. The floss is used primarily as wadding and upholstery material.

Plants producing bombax cotton include *Bombax septenatum*, yielding the strongest and longest fibres, ranging from 2 to 3 cm in length, and *B. ceiba*, with fibres about 1 to 1.5 cm long, both growing in tropical areas of the Western Hemisphere, where the floss is sometimes called ceiba cotton or *paina limpa*. In southern Asia and Africa the fibres of *B. malabarica*, called simal cotton, or red silk cotton, in India, are about 1 to 2 cm long. The term tree cotton is also sometimes applied to floss obtained from *Gossypium arboreum*, a plant species growing chiefly in Asia.

Bombay, Marāṭhī MUMBAI, city, capital of Mahārāshtra state, India, and the nation's chief financial and commercial centre. It is India's principal port on the Arabian Sea and is one of the largest and most densely populated cities in the world.

A brief treatment of Bombay follows. For full treatment (including a map), see MACROPAEDIA: Bombay.

Bombay city occupies a group of former islands off the Konkan Coast that are united by landfills and breakwaters. Known as Bombay Island, the site is joined on the north with the larger island of Salsette, which is connected with the mainland to the east. Bombay Island itself consists of a low-lying plain between ridges of low hills. The city is flanked by Bombay Harbour to the east and the Arabian Sea to the west; Back Bay forms the southwestern contour. The climate is hot and humid most of the year, with the rainy season lasting from June to September. The coolest season is from December to February.

Bombay is the economic hub of India. The cotton-textile industry, on which its traditional prosperity is founded, is still important. The city's manufacturing is diversified and includes the production of chemicals, automobiles, and silk and artificial fibres; machinery and equipment firms and printing houses are also numerous. The Reserve Bank of India, the State Bank of India, and the Bombay Mint are located there, as is the country's leading stock exchange. Much of India's international trade moves through the city's port.

The city's high population growth rate has created serious overcrowding, housing shortages, and pollution. The poverty of many residents is reflected in Bombay's slum areas, which are among the largest in India. By necessity, the metropolitan area has expanded northward past Thāna, and a "twin city" on the mainland opposite Bombay has arisen to relieve some of the urban pressures.

Bombay's educational and cultural life reflects its cosmopolitan and polyglot population. The University of Bombay (1857) and the Indian Institute of Technology offer higher education. Also located there are the Haffkine Institute for bacteriological research; the Bharatiya Vidya Bhavan (Palace of Indian Learning) for the promotion of education, art, and culture; the Prince of Wales Museum of Western India; and the Tata Institute of Fundamental Research. Perhaps no other Indian city matches Bombay in the wide scope of its cultural and entertainment facilities. It is the centre of India's thriving film industry and is host to concerts, festivals, and dance performances reflecting the influences of both Eastern and Western culture.

Traffic inside Bombay, despite two suburban electric-train systems, is highly congested because of a growing number of private automobiles and taxis. The city is linked by road and rail to all the major cities of India. Sahar International Airport (1981), located in Sahar village on Salsette Island, handles foreign flights,

and ferry service connects Bombay to mainland cities. The city, which officially changed its name to the Marāṭhī Mumbai in 1995, is India's major western harbour. Area, metropolitan area (Greater Bombay), 233 square miles (603 square km). Pop. (2001 prelim.) metropolitan area (Greater Bombay), 11,914,398.

Bombay (Mumbai), University of, one of India's first modern universities, established by the British in 1857. Originally an affiliating and degree-granting body, the university later added teaching to its functions. With the establishment of regional universities in the state in 1948–50, it was designated a federal university, with jurisdiction over numerous colleges and postgraduate institutions in the metropolitan area of Greater Bombay. The university has faculties of arts, science, technology, law, medicine, commerce, dentistry, fine arts, and Indian medicine. In the late 20th century it had about 222,700 full-time students. The primary language of instruction is English.

Bombay duck (*Harpodon nehereus*), fish of the family Harpodontidae, found in estuaries of northern India, where it is widely used as a food fish and, when dried, as a condiment. The Bombay duck grows to a length of about 41 cm (16 inches) and is a dull, translucent gray or brown in colour with small, dark speckles. It has a large mouth, a forked tail, and large pectoral and pelvic fins. Several related species, also belonging to the genus *Harpodon*, are found from Africa to Australia and New Guinea.

bombazine, also spelled BOMBASINE, textile, usually black in colour, with a silk warp and worsted weft, or filling, woven in either plain or twill weave. Cheaper grades are woven with a rayon warp and worsted or cotton weft. Bombazine was originally made exclusively of silk and in a variety of colours, but the usual colour gradually became standardized as black because of its principal use in garb of mourning and of persons in religious orders. It was woven with silk warps and worsted wefts.

Bombazine was produced in ancient China and Japan, Elizabethan England, and in Italy, France, Spain, and England during the 18th and 19th centuries. Mantillas for winter wear in Spain and Latin America are frequently made of black bombazine.

bomber, military aircraft designed to drop bombs on surface targets. Aerial bombardment can be traced to the Italo-Turkish War, in which early in December 1911 an Italian pilot on an observation mission reached over the side of his airplane and dropped four grenades on two Turkish targets. During World War I the Germans used their rigid airships, known as Zeppelins, as strategic bombers in raids on England. These were soon replaced by faster biplanes, particularly the twin-engined Gotha G.IV and the huge, four-engined Staaken R.VI, which carried two tons of bombs. Bomber airplanes were soon developed by the other major combatant nations. Tactical bombing was carried out on the battlefield by smaller aircraft such as the French Voisin, which carried some 130 pounds (60 kg) of small bombs that the observer simply picked up and dropped over the side.

Early bombers, being guided by crude nautical navigation techniques and carrying bombs in open racks, lacked the accuracy and bombloads to do extensive damage, but with the shift in the 1930s to faster, more powerful aircraft of all-metal, monoplane construction, air power began to assume an important role in warfare. The first new type to gain prominence was the dive bomber, which makes a steep dive toward the target before releasing its bombs. In Germany's invasions of Poland and France early in World War II, the Stuka dive bomber opened the way for German armoured columns by shattering enemy ground defenses and terrorizing civilians. Germany's

strategic bombing of Britain (1940) was conducted by its Junkers, Heinkel, and Dornier lines of bombers, while Britain relied at first on the Wellington and the Soviet Union began making its Tupolev bombers. These twin-engined medium bombers were superseded later in the war by four-engined heavy bombers, particularly the British Halifax and Lancaster and the U.S. B-17 Flying Fortress, B-24 Liberator, and B-29 Superfortress. Flying in streams hundreds of aircraft strong, these planes attacked railroad facilities, bridges, factories, and oil refineries and killed tens of thousands of civilians in firebombings of such cities as Dresden, Hamburg, and Tokyo (1944–45).

The pressure of war accelerated improvement. The early Wellington bombers caught fire when their fuel tanks were hit; as a result, self-sealing gas tanks were universally adopted. Accuracy in bombing raids was at first negligible, but new bombsights, radio navigation, and radar sighting were by war's end enabling Allied bombers to drop their bombs on targets accurately at night and from altitudes over 20,000 feet (6,100 m). Although Allied bombers were heavily armed with machine guns, they were shot down in crippling numbers by radar-directed German fighters until late in 1944, by which time the P-51 Mustang long-range fighter could escort them deep into enemy airspace. The height of the heavy bomber's technical development during the war was reached by the United States in the B-29, which carried 20,000 pounds (9,000 kg) of bombs and was defended by 10 .50-calibre machine guns. Single B-29s dropped atomic bombs on the Japanese cities of Hiroshima and Nagasaki at war's end. Doubt was subsequently cast on whether the Allied strategic bombing of Germany had actually succeeded in destroying that nation's war-fighting capacity, but the two atomic bombings did help compel a Japanese surrender, and for the next 15 years the nuclear-armed bomber was regarded as the world's ultimate weapon.

Bombers after World War II gained increased speed by jet propulsion, and their nuclear bombloads played a principal role in the superpowers' strategic thinking during the Cold War. Medium-range bombers such as the U.S. B-47 Stratojet, the British Vulcan, and the Soviet Tu-16 Badger threatened to annihilate major cities with atomic or thermonuclear bombs in the event of war in Europe. The United States and the Soviet Union threatened each other directly with the eight-engined B-52 Stratofortress and the turboprop-powered Tu-95 Bear, respectively, which could reach intercontinental ranges with in-flight refueling from aerial tankers. These bombers carried little defensive armament and avoided fighters and antiaircraft guns by flying as high as 50,000 feet (15,200 m). But beginning in the 1960s this tactic was rendered doubtful by the development of high-altitude, radar-guided, surface-to-air missiles. At the same time, strategic bombers' role as offensive weapons was being usurped by nuclear-armed ballistic missiles of increasing accuracy. Britain abandoned such bombers altogether, while the United States and the Soviet Union switched to a new generation of aircraft equipped with variable wings. The two countries developed the medium-range F-111 and Tu-26 Backfire and the long-range B-1 and Tu-160 Blackjack, respectively. These planes were designed to slip under early-warning radar at low level and to approach military targets using terrain-following radars and inertial-guidance systems. They could carry gravity bombs (nuclear or conventional), air-launched cruise missiles, or air-launched ballistic missiles. Late 20th-century efforts to evade increasingly sophisticated radar early-warning systems culminated in the United States' B-2 Advanced Technology Bomber. This craft used "stealth" materials and shapes to reduce its radar reflectivity, but its enormous cost (and the end of the Cold

War) raised anew the post-World War II questions of the value of strategic bombers compared with that of ballistic missiles.

Bombycillidae, songbird family, order Passeriformes, that includes waxwings (see waxwing), the silky flycatchers (the best known of which is the phainopepla, *Phainopepla nitens*), and the little-known gray hypocolius of southwest Asia. The waxwing species are irregularly distributed across the Northern Hemisphere, but the silky flycatchers are limited to North and Central America. Most bom-

Bohemian waxwing (*Bombycilla garrulus*)

John Markham

bycillids have tapering crests; distinctive wing markings; and a short, rather broad bill. All are arboreal. Most live chiefly on fruit, especially berries; silky flycatchers, however, may take insects on the wing, and all bombycillids catch insects to feed to their nestlings. Some authorities include the palm-chat (*q.v.*) in this family.

Bomi Hills (Liberia): see Vaitown.

Bomu River, also called MBOMOU, in the Central African Republic, headstream of the Ubangi River. The Bomu River rises 30 miles (50 km) northwest of Doruma, Congo (Kinshasa), and flows 450 miles (725 km) west, forming, together with the Ubangi, the frontier between Congo and the Central African Republic. Its course takes it in a wide curve through savannas, past Bangassou, to join the Uele River at Yakoma, where it forms the Ubangi River. Its lower course contains rapids. The Bomu was discovered from the north in 1877 by a Greek, P. Potagos. Wilhelm Junker, a German explorer from Moscow, navigated its upper course, and in 1910–11 a French expedition made a complete hydrographic survey of the river.

Bon, also called BON MATSURI, or URABON, one of the most popular annual festivals in Japan, observed July 13–15 (August 13–15 in some places), honouring the spirits of deceased family ancestors and of the dead generally. It is, along with the New Year festival, one of the two main occasions during the year when the dead are believed to return to their birthplaces. Memorial stones are cleaned, community dances performed, and paper lanterns and fires are lit to welcome the dead and to bid them farewell at the end of their visit.

The word Urabon was probably derived from the Sanskrit Avalambana (All Souls Day), a Buddhist ceremony based on the *Aralambana-sūtra* (*Urabon-kyō* in Japanese). The sutra relates the story of Maudgalāyana, a disciple of the Buddha, who secured his mother's release from hell by having monks offer food, drink, and shelter to the spirits of his ancestors. Though observed as a Buddhist festival,

store. In 1876 the shop was given a new building, with skylighted interior courts, designed

provoked an insurrection (August 1328) led by the Gonzaga, who ousted the Bonacolsi from power and killed first Passerino and then his sons and nephews.

Bon odori, dance for the dead, from the hand scroll "Twelve Months of the Year," Tosa school, c. 1700; in the collection of Richard Gale

By courtesy of Richard Gale, photograph, Minneapolis Institute of Arts

Bon is not exclusively so and reflects the ancient theme of close continuity in Japanese religious life between the living and the dead.

Bon, indigenous religion of Tibet that, when absorbed by the Buddhist traditions introduced from India in the 8th century, gave Tibetan Buddhism much of its distinctive character.

The original features of Bon seem to have been largely magic-related; they concerned the propitiation of demonic forces and included the practice of blood sacrifices. Later, there is evidence of a cult of divine kingship, the kings being regarded as manifestations of the sky divinity (reformulated in Buddhism as the reincarnation of lamas); an order of oracular priests (their counterpart, the Buddhist soothsayers); and a cult of the gods of the atmosphere, the earth, and subterranean regions (now lesser deities in the Buddhist pantheon).

In the 8th and 9th centuries, struggles took place between the ruling house of Tibet, whose members sided with Buddhism, and the powerful noble families, who sided with Bon. Enabled by deliberate Buddhist concern for written works, Bon was developed into a systematized religion with specific doctrine and a sacred literature. Although any serious Bon claims to religious supremacy were ended by the late 8th-century persecution by King Khrisong Detsen, it was never completely destroyed and continues to survive both in the aspects of Tibetan Buddhism that are mentioned above and as a living religion on the northern and eastern frontiers of Tibet.

Bon, Cape, Arabic *RA'S AṬ-ṬĪB*, peninsula of northeastern Tunisia, 20 miles (32 km) wide and protruding 50 miles (80 km) into the Mediterranean Sea between the Gulf of Tunis and Khalij (gulf) al-Ḥammāmāt (Hammamet). Cape Bon was the site of the surrender of more than 250,000 Germans and Italians to the Allies in 1943. A region of hills and fertile plains, with a Mediterranean climate and adequate rainfall, it is noted for its irrigated market gardens, orchards (especially oranges), and olive groves. Cape Bon also has important vineyards, fishing ports, beach resorts, and natural gas deposits. Main centres include Nābul (Nabeul), a pottery and handicraft centre; Qulaybiyah (Kélibia), a fishing port; and al-Ḥammāmāt (Hammamet), a fishing port and beach resort.

Bon Marché (French: "Good Buy"), department store in Paris, founded as a small shop in the early 19th century. By about 1865 it had become the world's first true department

store. In 1876 the shop was given a new building, with skylighted interior courts, designed

by the engineer Alexandre-Gustave Eiffel and architect Louis-Auguste Boileau.

Bona (Algeria): see Annaba.

Bona Dea (Latin: "Good Goddess"), in Roman religion, deity of fruitfulness, both in the earth and in women. She was identified with various goddesses who had similar functions. The dedication day of her temple on the Aventine was May 1. Her temple was cared for and attended by women only, and the same was the case at a second celebration, at the beginning of December, in the house of a sovereign magistrate. Wine and myrtle were taboo, and her victim was a sow (*porca*) called *damium*. The goddess herself was also known as Damia and her priestess as *damiatrix*. These names are almost certainly Greek, and it is highly probable that the Greek cult of Damia was grafted onto the original cult of the Roman goddess Bona Dea.

Bonacolsi FAMILY, Italian family in despotic control of the cities of Mantua (1276–1328), Modena (1312–26), and Carpi (1317–26). The first member recorded in Mantua was Otolino de Bonacosa in 1168. His son Gandolfo became console in 1200, and his grandson Martino was rector (1233).

The signoria (lordship) of the Bonacolsi was first established by Pinamonte (died 1293), who allied himself with other powerful families to eliminate his rivals and finally seized power by driving out the podesta (feudal mayor) and his supporters (1276). After transferring control of Mantua from the pro-papist Guelf party to the pro-imperial Ghibelline party, Pinamonte conquered several Guelf cities (1275–79).

In 1291 Pinamonte was forced to yield power to his son Bardellone, who later poisoned him. Proclaiming himself captain general and perpetual rector, Bardellone pursued an anti-Ghibelline policy until he, in turn, was overthrown in 1299 by his nephews Guido (died 1309) and Rinaldo, also called Passerino (died 1328). Guido ruled until his death, having named Passerino his successor in 1308.

Taking power without opposition, Passerino raised the family to its greatest power. The emperor Henry VII (1269–1313) recognized him as signore (lord) of Mantua with the title of imperial vicar (1311). Passerino expanded the area under his control to include Modena and Carpi. He secured important positions for his sons Filippo (died 1303), bishop of Trento, Tagino (died 1302), and Zagnino, podesta of Verona (1274–77).

The tyrannical rule of the Bonacolsi finally

provoked an insurrection (August 1328) led by the Gonzaga, who ousted the Bonacolsi from power and killed first Passerino and then his sons and nephews.

Bonaire, second largest island of the Netherlands Antilles, the westernmost group of the Lesser Antilles in the Caribbean Sea. It is 111 square miles (288 square km) in area and lies 50 miles (80 km) north of the Venezuelan coast and 20 miles east of Curaçao. The northern part is hilly, with a peak, Mount Brandaris, 787 feet (240 m) high, while the southern part is flat with desert-like vegetation. The adjacent island, Little Bonaire (3 square miles), is uninhabited, but its sandy white beaches are popular with skin divers. The temperature averages 82° F (28° C); the fresh and dry easterly trade winds bring less than 20 inches (500 mm) of rain a year.

Bonaire served in colonial times as a slave market, supplying slaves to the plantation economy of Curaçao. Most of the population is descended from black slaves, while the remainder are various admixtures of native American Indian, Spanish, and Dutch. The vast majority are Roman Catholic. The island has control of local matters through an Island Council, an Executive Council, and a lieutenant governor. The island sends one member elected by direct vote to the Netherlands Antilles legislature (Staten) in the national capital of Willemstad (Curaçao).

Farming on the arid island provides food only for local consumption; the only export crop, aloes, does not require irrigation. Drinking water is provided by the government desalination plant. Tons of salt from the extensive salt flats are exported annually from the deepwater port at Kralendijk. The only other industry includes a small clothing factory and local handicrafts for the increasing numbers of tourists. A tourist attraction is the colourful flocks of birds that congregate over the salt flats. The brilliant pink flamingos, a protected species, are the pride of the island and inspired the name of the local airport (Flamingo Airport). Some 70 percent of the island's surface is coral limestone, from which

Gotto Lake on Bonaire, Netherlands Antilles
Arthur Griffin—EB Inc.

the capital, Kralendijk, meaning "coral dike," derives its name; Kralendijk is a small, quiet town with some fine examples of Dutch colonial architecture. Pop. (1981) 8,753.

Bonaiuti, Andrea di (Florentine painter): see Andrea da Firenze.

Bonald, Louis-Gabriel-Ambroise, vicomte de (viscount of) (b. Oct. 2, 1754, Le Monna, near Millau, Fr.—d. Nov. 23, 1840, Le Monna), political philosopher and statesman who, with the French Roman Catholic thinker Joseph de Maistre, was a leading apologist for Legitimism, a position contrary to the values of the French Revolution and favouring monarchical and ecclesiastical authority.

Mayor of Millau from 1785 to 1789, Bonald became president of the district of Aveyron's administration in 1790 but resigned the next year in protest against the Civil Constitution of the Clergy. Passed by the new Constituent

Bonald, portrait engraving, c. 1820

Assembly of the nation, that reform was rejected by the pope, most of the French clergy, and King Louis XVI for the restraints that it put upon the Roman Catholic church in France. Emigrating to Heidelberg, Bonald was soon condemned by the revolutionary Directory for his highly royalist *Théorie du pouvoir politique et religieux* (1796; "Theory of Political and Religious Power"). In 1797 he returned to France, where he wrote his *Essai analytique sur les lois naturelles de l'ordre social* (1800; "Analytical Essay on the Natural Laws of Social Order"); *Du divorce* (1801); and *Législation primitive considérée... par les seules lumières de la raison*, 3 vol. (1802; "Primitive Legislation Considered... by the Light of Reason Alone").

After the exile of Napoleon and the restoration of the Bourbon monarchy in 1814, Bonald became a member of the council of public instruction (1814), was nominated to the Académie Française (1816), and was created vicomte (1821) and peer (1823). During these years he wrote *Réflexions sur l'intérêt général de l'Europe* (1815; "Reflections on the General Interest of Europe") and *Démonstration philosophique du principe constitutif de la société* (1830; "Philosophical Demonstration of the Formative Principle of Society"). With the advent of the July Revolution of 1830, Bonald resigned his peerage and retired to the château Le Monna.

Henry Moulinié's *De Bonald* appeared in 1915, and Mary Hall Quinlan's *Historical Thought of the Vicomte de Bonald* appeared in 1953.

Bonanza Creek, stream in the western Yukon Territory, Canada, rising near Dawson and flowing 20 mi (32 km) northwest to the Klondike River. In it gold was found by George Washington Carmack on Aug. 17, 1896, setting off the gold rush of that year into the Klondike Valley. The creek, formerly called Rabbit Creek, was renamed Bonanza Creek to mark Carmack's strike. *See also* Klondike River.

Bonaparte FAMILY, Italian BUONAPARTE, a family made famous by Napoleon I (*q.v.*), emperor of the French (1804–1814/15). The French form Bonaparte was not commonly used, even by Napoleon, until after the spring of 1796. The original name was Buonaparte, which was borne in the early Middle Ages by several distinct families in Italy. One of these, which settled at Florence before the year 1100, was divided in the 13th century into the two branches of San Miniato and Sarzana. A member of this latter, Francesco Buonaparte, emigrated in the middle of the 16th century to Corsica, where his descendants continued to occupy themselves with the affairs of law and the magistracy.

Napoleon's Corsican parents were Carlo Maria and Maria Letizia Buonaparte (*qq.v.*). Joseph, their third child and the first to survive, was born in 1768, Napoleon in 1769, and nine other children, six of whom survived, in subsequent years: Lucien (1775); Élisa (1777); Louis (1778); Pauline (1780); Caroline (1782);

and Jérôme (1784). Louis's son, Charles-Louis, became emperor of the French as Napoleon III (1852–70). The Bonaparte name survived in descendants of Lucien, Louis, and Jérôme into the late 20th century.

Bonaparte, Carlo Maria (father of Napoleon): *see* Buonaparte, Carlo Maria.

Bonaparte, (Marie-Annonciade-)Caroline, original Italian MARIA NUNZIATA CAROLINA BUONAPARTE (b. March 25, 1782, Ajaccio, Corsica—d. May 18, 1839, Florence), queen of Naples (1808–15), Napoleon's youngest sister and the wife (1800) of Joachim Murat (*q.v.*).

As a result of her ambitious and intriguing nature, her husband became governor of Paris, marshal of France (1804), grand duke of Berg and of Cleves (1806), lieutenant of the emperor in Spain (1803), and king of Naples (1808). Her relations with Napoleon became strained as she associated herself with the shifting allegiances of her husband in 1814–15, which led ultimately to Murat's fall and execution in 1815. Thereafter, Caroline took refuge in Trieste, taking the title comtesse de Lipona.

Bonaparte, Charles Joseph (b. June 9, 1851, Baltimore, Md., U.S.—d. June 28, 1921, Baltimore), American lawyer and grandson of Jérôme Bonaparte, youngest brother of Napoleon; he became one of Pres. Theodore Roosevelt's chief "trust-busters" as U.S. attorney general.

After graduating from Harvard Law School (1872), Bonaparte began the practice of law in Baltimore in 1874. He was active in organizations advocating municipal and civil service reform, which gained him the admiration of Roosevelt, who was then a member of the U.S. Civil Service Commission. Upon Roosevelt's accession to the presidency, Bonaparte served as secretary of the navy (1905–06) and as attorney general (1906–09). In the latter post he established the Federal Bureau of Investigation (originally the Bureau of Investigation) and prosecuted numerous antitrust suits, most notably that which resulted in the dissolution in 1911 of the American Tobacco Company.

Bonaparte, Charles-Louis-Napoléon: *see* Napoleon III.

Bonaparte, Charles-Lucien, PRINCIPE (prince) DI CANINO E DI MUSIGNANO (b. May 24, 1803, Paris, France—d. July 29, 1857, Paris), scientist, eldest son of Napoleon I's brother Lucien. His publication of *American Ornithology*, 4 vol. (1825–33), established his scientific reputation. In 1848–49, when he took part in the political agitation for Italian independence against the Austrians, his scientific career experienced a brief hiatus, and he was forced to leave Italy in July 1849. He went to Holland and then to France. His principal works are a general zoological conspectus, *Conspectus systematis ornithologiae, mastozoologiae, reptologiae et amphibologiae, ichthyologiae* (1850); a work on hummingbirds, *Tableau des oiseaux-mouches* (1854); and one on extinct birds, *Ornithologie fossile* (1858).

Bonaparte, (Marie-Anne-)Élisa, original Italian MARIA ANNA ELISA BUONAPARTE (b. Jan. 3, 1777, Ajaccio, Corsica—d. Aug. 7, 1820, Sant'Andrea, near Trieste), Napoleon I's eldest sister to survive infancy.

She was married on May 1, 1797, to Félix Baciocchi, a member of a Corsican noble family. Napoleon gave her the principality of Piombino in March 1805 and the principality of Lucca in the following June and finally, in March 1809, made her grand duchess of Tuscany. Her pride and ability had great influence on the administration and on Italian affairs. Her relations with Napoleon were frequently strained; in 1813–14 she abetted Joachim Murat in his enterprises. After her brother's fall she retired, with the title of contessa

(countess) di Compignano, first to Bologna and afterward to Sant'Andrea near Trieste.

Bonaparte, Jérôme, original Italian ROLAND BUONAPARTE (b. Nov. 15, 1784, Ajaccio, Corsica—d. June 24, 1860, Villegenis, France), king of Westphalia, marshal of France, and Napoleon I's youngest brother, the only one whose career stretched into the second French empire of Louis-Napoléon (later Napoleon III). It was through Jérôme that the Bonaparte line extended into the U.S.; his eldest son, Jérôme, established residence there.

A member of the consular guard from 1800, Jérôme was transferred to the navy soon after he was wounded in a duel. He cruised in the West Indies, where he left his ship and went to the United States; there he married (Dec. 24, 1803) Elizabeth (or Elisa) Patterson, whom he brought to Europe in 1805. Napoleon ordered Elizabeth excluded from his states, but Jérôme remained, taking command of a small squadron in the Mediterranean. He then took part in the campaign of 1806. An imperial decree annulled the Patterson marriage. The Emperor then married Jérôme to Princess Catherine of Württemberg and made him king of Westphalia. In the Russian campaign of 1812 Jérôme failed in his assigned mission and was returned to Kassel, Ger.

In 1813, on the fall of the Napoleonic regime in Germany, Jérôme returned to France. He commanded a division on the French left wing at Waterloo and attacked with great pertinacity. On Napoleon's second abdication Jérôme left France, not returning until 1847 when, after the rise of his nephew Louis-Napoléon, he became, successively, governor of the Invalides, marshal of France, and president of the Senate.

Bonaparte, Joseph, original Italian GIUSEPPE BUONAPARTE (b. Jan. 7, 1768, Corte, Corsica—d. July 28, 1844, Florence), lawyer, diplomat, soldier, and Napoleon I's eldest surviving brother, who was successively king of Naples (1806–08) and king of Spain (1808–13).

Like his brothers, Joseph embraced the French republican cause and, with the victory of Corsican patriot Pasquale Paoli, was forced to leave Corsica to seek refuge in France. In 1796 he accompanied Napoleon in the early part of his Italian campaign and had some part in the negotiations with Sardinia that led to the armistice of Cherasco. He then took part in the French expedition for the recovery of Corsica and assisted in the reorganization of the island. He was appointed by the Directory minister to the court of Parma (1797) and then to Rome. Late in 1797 he returned to Paris and became one of the members for Corsica in the Council of Five Hundred.

Joseph did little in the coup d'état of 18 Brumaire (Nov. 9, 1799). He was a member of the Council of State and of the Corps Législatif, and he concluded at Mortfontaine a convention with the United States (1800). He also presided over negotiations leading to the Treaty of Lunéville with Austria (1801); and he was one of those who represented France in discussions with the British envoy, Lord Cornwallis, that led to the treaty of Amiens (1802), which marked Napoleon's total pacification of Europe. A year later, however, relations between England and France were severed, and Joseph's diplomatic efforts proved to have been in vain.

On the question of the consolidation of Napoleon's power as first consul for life (Aug. 1, 1802) with the power to nominate his own successor, the brothers disagreed. As Napoleon had no heir, Joseph as eldest brother claimed to be recognized as heir, while Napoleon wished to recognize the son of Louis Bonaparte. On the proclamation of the French

empire (May 1804) the friction became acute. Joseph refused Napoleon's offer to make him king of Lombardy if he would waive all claim of succession to the French throne.

After acting for a year as chief of the French government while Napoleon was in Germany, Joseph was sent to Naples to expel the Bourbon dynasty (1806). Proclaimed king of Naples by imperial decree later the same year, he abolished the relics of feudalism, reformed the monastic orders, and reorganized the judicial, financial, and educational systems.

From 1808 Napoleon became increasingly dissatisfied with Joseph's conduct. Called away from Naples to become king of Spain, Joseph was forced to leave Madrid hastily when Spanish insurgents defeated French forces at Baylen. He was reinstated by Napoleon at the close of 1808 and thereafter was kept in a subordinate position that led him on four occasions to offer to abdicate.

On March 30, 1814, when the troops of the Allies reached Paris, Joseph fled, having left Marshal Marmont to make a truce with the assailants of Paris if they should be in overpowering strength. He played only an insignificant role in the Hundred Days (1815). After Napoleon's surrender at Rochefort, Joseph went to the United States and in 1830 pleaded for the recognition of the claims of Napoleon's son, the Duke of Reichstadt, to the French throne. He afterward visited England and for a time resided in Genoa and then in Florence, where he died.

Bonaparte, Joséphine: *see* Joséphine.

Bonaparte, (Maria-)Letizia (mother of Napoleon): *see* Buonaparte, Letizia.

Bonaparte, Louis, original Italian LUIGI BUONAPARTE, also called (from 1810) COMTE (count) DE SAINT-LEU (b. Sept. 2, 1778, Ajaccio, Corsica—d. July 25, 1846, Livorno, Italy), French soldier and Napoleon I's third surviving brother. As king of Holland (1806–10) he guarded the welfare of his subjects. His unwillingness to join the Continental System brought him into conflict with the Emperor.

After attending military school at Châlons, Louis accompanied Napoleon on the Italian campaign of 1796–97 and acted as his aide-de-camp in Egypt in 1798–99. In 1802 Napoleon as first consul married him to Joséphine's daughter Hortense de Beauharnais; the forced union led to deplorable results springing from Louis's violent jealousy of his wife and his growing resentment toward Napoleon for not allowing the couple to divorce. In 1804 Louis was raised to the rank of general and the following year became governor of Paris.

Napoleon proclaimed Louis king of Holland on July 5, 1806. From the first, the Emperor reproached him for being too easy on his subjects. By 1809 Napoleon was considering annexing Holland in order to arrest the trade the Dutch secretly conducted with England. In 1810, failing to negotiate successfully with either England or Louis, the Emperor dispatched French troops against the Dutch capital. Louis abdicated and fled his kingdom, which on July 9 Napoleon annexed to France.

Styling himself the comte de Saint-Leu, Louis lived for some time in Bohemia, Austria, and Switzerland. He spent his later life in Italy, largely occupied with literary pursuits. He wrote *Documents historiques et réflexions sur le gouvernement de la Hollande*, 3 vol. (1820; *Historical Documents and Reflections on the Government of Holland*, 1820), and two partial works, *Marie, ou les peines de l'amour*, 2 vol. (1812; *Marie; or, the Hollanders*, 1815), and *Le Retour* (1846; "The Return").

Bonaparte, (Napoléon-Eugène-)Louis (b. March 16, 1856, Paris—d. June 1, 1879, near Ulundi, Zululand), French prince imperial,

the only son of Napoleon III by Empress Eugénie.

He was a delicate boy, but when the Franco-German War of 1870 broke out his mother sent him to the army. After the first defeats he had to flee from France with the Empress and settled in England at Chislehurst, completing his military education at Woolwich. On his father's death (Jan. 9, 1873) the Bonapartists proclaimed him Napoleon IV, and he became the official pretender. The Bonapartist leaders thought that he should win his crown by military prestige, and he was persuaded to attach himself as a volunteer to the British expedition to Zululand in February 1879. While out on reconnaissance with a few troopers he was surprised by Zulus and killed at Ulundi. His body was brought back to England and buried at Chislehurst.

Bonaparte, Louis-Lucien (b. Jan. 4, 1813, Thorngrove, Worcestershire, Eng.—d. Nov. 3, 1891, Fano, Italy), philologist, politician, and third son of Napoleon's second surviving brother, Lucien Bonaparte.

He passed his youth in Italy and did not go to France until 1848, when he served two brief terms in the Assembly as representative for Corsica (1848) and for the Seine (1849). He played no direct part in the coup d'état of Dec. 2, 1851, of his cousin Napoleon III. Although he was named senator and prince, he took only a small part in politics. He devoted himself to the study of English dialects. He also published some notable works on the Basque language.

Bonaparte, Lucien, original Italian LUCIANO BUONAPARTE (b. May 21, 1775, Ajaccio, Corsica—d. June 29, 1840, Viterbo, Italy), Napoleon I's second surviving brother who, as president of the Council of Five Hundred at Saint-Cloud, was responsible for Napoleon's election as consul on 19 Brumaire (Nov. 10, 1799).

Educated in France, Lucien returned to Corsica in 1789 and became an outspoken speaker in the Jacobin Club at Ajaccio. He urged his brothers to break with the Corsican patriot Pasquale Paoli, and he headed a Corsican deputation that went to France to denounce Paoli and to solicit aid against him. In the south of France he worked hard for the Jacobin cause. The coup d'état of Thermidor (July 1794) compelled him to accept a small post at St.-Chamans. There he was arrested and imprisoned until Napoleon procured his release and found him a post as commissioner in the French army in Germany. Lucien disliked the army and was sent to Corsica. In 1798 he entered the Council of Five Hundred as deputy for Corsica. He was president of that body on 18–19 Brumaire (Nov. 9–10, 1799), when Napoleon overthrew the national councils at the palace of Saint-Cloud. By refusing to put the vote of outlawry, for which the majority of the council clamoured, by his opportune closing of the sitting, and by appealing to the soldiers outside to disperse "the representatives of the dagger," Lucien turned the scale in favour of his brother.

This event, the chief event of Lucien's life, was fatal to the cause of democracy of which he had been the most eager exponent. In one of his earlier letters to his brother Joseph, Lucien stated that he had detected in Napoleon "an ambition not altogether egotistic but which surpassed his love for the general weal; . . . in case of a counterrevolution he would try to ride the crest of events." This suspicion became a dominant feeling, and the relations between Lucien and Napoleon became strained during the Consulate (1799–1804). Lucien believed that Napoleon's growing ambition for power was jeopardizing the cause of democracy. He accepted office as minister of the interior but was soon deprived of it because of political and personal differences with the first consul. Napoleon next appointed him ambas-

sador to the court of Madrid (1800), where he again fell into disfavour. He returned to Paris and again opposed Napoleon's schemes. The breach was completed when Lucien was secretly married to Mme Joubertou (Alexandrine de Bleschamps) despite Napoleon's express prohibition. Lucien's first wife, Christine Boyer, had died in 1800, and Napoleon had wanted him to marry the Spanish infanta Maria Luisa, the widow of Louis, king of Etruria. Ordered to leave France, Lucien lived in Italy.

In December 1807 Napoleon sought to come to an arrangement by which Lucien would be made a French prince, provided that he would agree to have his marriage annulled. Lucien refused and left for the U.S. He was captured at sea by the British and taken to England, where he lived under light surveillance until his return to Rome in 1814. He offered Napoleon his help during the Hundred Days (1815), stood by his side in Paris, and was the last to defend Napoleon's prerogatives at the time of his second abdication. The rest of Lucien's life was spent in Italy. His publications include an epic, *Charlemagne ou L'Église délivrée* (1814; "Charlemagne; or, The Church Delivered"); *La Vérité sur les Cent-Jours* (1835; "The Truth about the Hundred Days"); and *Mémoires*, of which only the first volume appeared (1836).

Bonaparte, Napoléon: *see* Napoleon I.

Bonaparte, Napoléon-François-Charles-Joseph: *see* Reichstadt, Napoléon-François-Charles-Joseph, Herzog von.

Bonaparte, Napoléon-Joseph-Charles-Paul, also called (from 1852) PRINCE NAPOLÉON-JÉRÔME (b. Sept. 9, 1822, Trieste—d. March 17, 1891, Rome), youngest son of Jérôme Bonaparte, Napoleon I's youngest brother, and his second wife, Catherine of Württemberg. In 1852 he was named heir presumptive to the throne of the Second Empire.

After the French Revolution of 1848, he was elected to the National Assembly as a representative of Corsica and assumed the name of Jérôme. Notwithstanding his ostensible opposition to the coup d'état of 1851 on the establishment of the empire, he was designated successor to the throne, as Prince Napoléon-Jérôme, if Napoleon III should die childless. Associating mainly with men of progressive ideas, he represented at court liberal opinion against the empress Eugénie.

In 1854 he took part in the Crimean campaign as general of a division. (About this time he became known as "Plon Plon," supposedly because soldiers who fought under his command thought him a coward and nicknamed him "Plomb-plomb" or "Craint-plomb," meaning "Fear-lead.") Returning to France, he undertook the direction of the national exhibition for the international exhibition of 1855. In 1858 he was appointed minister for the colonies and Algeria. He found his political activity was diverted into a different channel by his sudden marriage in 1859 to the princess Maria Clotilde of Savoy, daughter of Victor Emmanuel II, the king of Sardinia. When the war for the liberation of Italy broke out, Prince Napoléon-Jérôme commanded the French corps that occupied Tuscany.

In the last years of the Second Empire Prince Napoléon-Jérôme lost all his official dignities as the result of several indiscreet speeches. After the fall of the empire he lived in comparative retirement until, in 1879, the death of Napoleon III's son made him direct heir to the Napoleonic succession. As the Bonapartist pretender he was unfortunate and inglorious, and before his death he was virtually deposed in favour of his elder son, Napoléon-Victor-Jérôme (1862–1926). The latter became the recognized Bonapartist pretender on his father's death in 1891.

Bonaparte, (Marie-)Pauline, original Italian MARIA PAOLA BUONAPARTE (b. Oct. 20, 1780, Ajaccio, Corsica—d. June 9, 1825, Florence), second sister of Napoleon to survive infancy, the gayest and most beautiful of his sisters.

She married Gen. C.V.E. Leclerc (1772–1802), a staff officer of Napoleon, in 1797 and accompanied him to San Domingo. When Leclerc died of yellow fever she returned to Paris. She then married Prince Camillo Borghese (Nov. 6, 1803) and went with him to Rome, but soon tired of him, and returned to Paris, where her behaviour caused some scandal. In 1806 she received the title of duchess of Guastalla. Her offhand treatment of Napoleon's new empress, Marie-Louise, led to her removal from court in 1810. Nevertheless, she went with her mother to Elba in 1814 and is said to have expressed a wish to share Napoleon's exile in St. Helena. She died of cancer in Florence in 1825. Canova's statue of her as Venus reclining on a couch is well known.

Bonaparte, Pierre-Napoléon (b. Oct. 11, 1815, Rome—d. April 7, 1881, Versailles, Fr.), French prince (after 1851) and son of Napoleon I's brother Lucien Bonaparte.

A self-proclaimed republican after 1848 and deputy for Corsica, Bonaparte was reconciled to his cousin Napoleon III after the latter's coup d'état in 1851. With this the republicans abandoned the Prince, and he had little effect on the politics of his time. His killing of the journalist Victor Noir in January 1870 hastened the already rising tide of republican and radical agitation directed against the Second Empire in its final months. The incident was the result of a controversy with another journalist, Paschal Grousset, who had sent Noir to invite the Prince to engage in a duel. The Prince was acquitted of murder by a special high court of justice at Tours. His *Souvenirs, traditions et révélations* appeared in 1876.

Bonaparte weasel: see stoat.

Bonapartist, French BONAPARTISTE, any of the 19th-century supporters of Napoleon I and Napoleon III and of their political theories and policies. The Bonapartist party advanced the claims of the Bonaparte family throughout the century and, though never completely united, believed in an autocratic government run with the presumed consent of the people.

After Napoleon I's abdication (1814), many of his followers turned to his son, Napoleon II, named as his successor; and after Napoleon I's exile to St. Helena (1815) and death (1821), they tried vainly to rally around Napoleon II (by then duke of Reichstadt), who, however, was being held virtual prisoner by the Austrian Habsburgs and was in ill health (he died in 1832). The Bonapartists, in any case, were poorly organized; and the memories of Napoleon's failures were too recent for them to secure power.

Nevertheless, a cult began to surround Napoleon Bonaparte after his death, and within a few years he was being promoted as the saviour of the common man and a political genius of the first order. Napoleon I's tyranny was being forgotten or glossed over as the memory of it grew dimmer, and instead his "glory," which contrasted so strikingly with the timidity and dullness of the bourgeois monarchy of Louis-Philippe, was lauded nostalgically. This sentiment left the way open for his nephew, Louis-Napoléon, an able propagandist, who gave all his energies to winning the throne of France. The failure of the Orléanists under Louis-Philippe and of the republicans under the Second Republic to satisfy the needs and demands of the French people gave Louis-Napoléon the opening he needed, and in December 1848 the Bonapartists garnered enough votes to elect him president. Within three years he was able to dissolve the parliament, arrest his enemies,

and have himself voted dictatorial powers. In November 1852 he was elected emperor of the French.

Bonapartism differed somewhat under Louis-Napoléon (Napoleon III from Dec. 2, 1852), who sought to establish a liberal empire and avoid war. (He nevertheless got the nation involved in a series of foreign adventures—the Crimean War, the wars of Italian independence, the Mexican empire, and the fateful Franco-German War that led to his downfall in 1870.) During this period of Napoleonic power, the Bonapartists split into two factions. First, there were the conservatives surrounding Napoleon III, who encouraged the participation of the Catholic Church in education and rural organization, a laissez-faire attitude toward business and investment, and a strong central government working through approval of policy by plebiscite and an ostensibly independent system of local government. Second, there were the radicals, anticlericals all, who held to the republican ideals of universal suffrage, with real power exerted through the leadership of the Bonapartes.

The death (1873) of Napoleon III after his overthrow and the early death of his son, Louis, the prince imperial (1879), left the party split even worse under Napoléon-Jérôme Bonaparte (Napoleon III's first cousin) and the latter's elder son Napoléon-Victor—respectively leaders of the radicals and the conservatives. They continued to elect representatives but slowly lost members to the emerging parties of the Third Republic. When Napoléon-Jérôme died in 1891, the Bonapartist party effectively ceased to exist.

Bonard, Louis-Adolphe (b. March 27, 1805, Cherbourg, Fr.—d. March 31, 1867, Amiens), French admiral who served as the first official military governor of Cochinchina (the name given by Westerners to southern Vietnam).

Entering service in the French Navy in 1825, Bonard was promoted to lieutenant in 1835, captain in 1842, and was commissioned vice admiral in 1862. He was captured by Algerians after a shipwreck in 1830 and later helped quell an insurrection in Tahiti. He was put in command of French territory in Oceania in 1849. In 1853 he was named governor of French Guiana in South America.

On Nov. 29, 1861, Bonard was put in command of French forces in Cochinchina and charged with governing the French territories there. He captured the province of Bien Hoa that December, and Vinh Long province fell to him in March 1862. On June 5 he went to Saigon to negotiate a peace treaty with the representative of the court of Annam (central Vietnam). Under its terms Bonard secured for France the provinces of Gia Dinh, Dinh Tuong, and Bien Hoa as well as the island of Poulou Condore (modern Con Son). The Vietnamese emperor Tu Duc reluctantly signed the treaty in April 1863.

During his administration, Bonard established a military hospital in Saigon. He pursued a moderate course in the realm of colonial policy; his immediate concern was the relationship between the French administrators and the Vietnamese people. He hoped to govern Cochinchina indirectly, with the French ruling through the intermediary of native officials under the nominal direction of a few competent French officers; and toward this end he tried to reinstate Vietnamese mandarins, who had been removed from their posts. But the mandarins chose not to cooperate; their pride and hostility kept most of them from returning to their posts. Bonard set up schools to teach his officers the Vietnamese language. He also installed French in the curriculum of native schools, striving to bridge the communication gap between the French and the Vietnamese.

Bonard's policies were unpopular with Frenchmen in Cochinchina, especially with

the missionaries. He had to satisfy both the indigenous peoples and the French colonists, and whatever he did for one group was almost certain to annoy the other. His conciliatory attitude toward the mandarins was the subject of stringent criticism from the missionaries, who considered the mandarins the symbol of the indigenous culture, particularly of Confucianism and Buddhism, both obstacles to Christianity.

In 1862–63 the dissatisfied mandarins led the Vietnamese people in revolt; only with considerable difficulty was the insurrection put down. After the uprising had subsided and the peace treaty with Tu Duc had been secured, Bonard returned with the treaty to France on April 30, 1863. He had full intentions of resuming his position in Indochina, but poor health prevented his return. He was named préfet of Cherbourg early in 1867.

Bonaventure, SAINT, Italian SAN BONAVENTURA, original name GIOVANNI DI FIDANZA (b. c. 1217, Bagnoregio, Papal States—d. July 15, 1274, Lyon; canonized April 14, 1482; feast day July 15), leading medieval theologian, minister general of the Franciscan order, and cardinal bishop of Albano. He wrote several works on the spiritual life and recodified the constitution of his order (1260). He was declared a doctor (teacher) of the church in 1587.

St. Bonaventure, detail of a fresco by Benozzo Gozzoli; in the church of S. Francesco, Montefalco, Italy

Ainari—Art Resource/EB Inc

He was a son of Giovanni of Fidenza, a physician, and Maria of Ritella. He fell ill while a boy and, according to his own words, was saved from death by the intercession of St. Francis of Assisi. Entering the University of Paris in 1235, he received the master of arts degree in 1243 and then joined the Franciscan order, which named him Bonaventure in 1244. He studied theology in the Franciscan school at Paris from 1243 to 1248. His masters, especially Alexander of Hales, recognized in him a student with a keen memory and unusual intelligence. He was also under the tutelage of John of La Rochelle. After their deaths (1245) he studied further under Eudes Rigault and William of Meliton. He was later probably influenced by the Dominican Gueric of Saint-Quentin.

By turning the pursuit of truth into a form of divine worship, he integrated his study of theology with the Franciscan mode of the mendicant life. In 1248, he began to teach the Bible; from 1251 to 1253 he lectured on the *Sentences*, a medieval theology textbook by Peter Lombard, an Italian theologian of the 12th century, and he became a master of theology in 1254, when he assumed control of the Franciscan school in Paris. He taught there

until 1257, producing many works, notably commentaries on the Bible and the *Sentences* and the *Breviloquium* ("Summary"), which presented a summary of his theology. These works showed his deep understanding of Scripture and the Church Fathers—principally St. Augustine—and a wide knowledge of the philosophers, particularly Aristotle.

Bonaventure was particularly noted in his day as a man with the rare ability to reconcile diverse traditions in theology and philosophy. He united different doctrines in a synthesis containing his personal conception of truth as a road to the love of God. In 1256 he defended the Franciscan ideal of the Christian life against William of Saint-Amour, a university teacher who accused the mendicants (friars who wandered about and begged for their living) of defaming the Gospel by their practice of poverty and who wanted to prevent the Franciscans and their fellow mendicants, the Dominicans, from attaining teaching positions. Bonaventure's defense of the Franciscans and his personal probity led to his election as minister general of the Franciscans in 1257.

Founded by St. Francis according to strict views about poverty, the Franciscan order was at that time undergoing internal discord. One group, the Spirituals, disrupted the order by a rigorous view of poverty; another, the Relaxati, disturbed it by a laxity of life. Bonaventure used his authority so prudently that, placating the first group and reproving the second, he preserved the unity of the order and reformed it in the spirit of St. Francis. The work of restoration and reconciliation owed its success to Bonaventure's tireless visits, despite delicate health, to each province of the order and to his own personal realization of the Franciscan ideal. In his travels, he preached the Gospel constantly and so elegantly that he was recognized everywhere as a most eloquent preacher. As a theologian, he based the revival of the order on his conception of the spiritual life, which he expounded in mystical treatises manifesting his Franciscan experience of contemplation as a perfection of the Christian life. His *Journey of the Mind to God* (1259) was a masterpiece showing the way by which man as a creature ought to love and contemplate God through Christ after the example of St. Francis. Reversed by his order, Bonaventure recodified its constitutions (1260), wrote for it a new *Life of St. Francis of Assisi* (1263), and protected it (1269) from an assault by Gerard of Abbeville, a teacher of theology at Paris, who renewed the charge of William of Saint-Amour. He also protected the church during the period 1267–73 by upholding the Christian faith while denouncing the views of unorthodox masters at Paris who contradicted revelation in their philosophy.

Bonaventure's wisdom and ability to reconcile opposing views moved Pope Gregory X to name him cardinal bishop of Albano, Italy, in May 1273, though Bonaventure had declined to accept appointment to the see of York, England, from Pope Clement IV in 1265. Gregory consecrated him in November at Lyon, where he resigned as minister general of the Franciscans in May 1274. At the second Council of Lyon he was the leading figure in the reform of the church, reconciling the secular (parish) clergy with the mendicant orders. He also had a part in restoring the Greek church to union with Rome. His death, at the council, was viewed as the loss of a wise and holy man, full of compassion and virtue, captivating with love all who knew him. He was buried the same day in a Franciscan church with the pope in attendance. The respect and love that was held for Bonaventure is exemplified in the formal announcement of the council: "At the funeral there was much sor-

row and tears; for the Lord has given him this grace, that all who saw him were filled with an immense love for him." His exemplary life as a Franciscan and the continual influence of his doctrine on the life and devotion of the Western church won for him a declaration of sanctity by Pope Sixtus IV; he was designated a doctor of the church by Sixtus V.

Modern scholars consider him to have been one of the foremost men of his age, an intrepid defender of human and divine truth, and an outstanding exponent of a mystical and Christian wisdom.

The critical edition of St. Bonaventure's works is *Opera omnia*, 10 vol. (1882–1902). Translations of his works by Jose de Vinck are "The Journey of the Mind to God," in vol. 1 of *The Works of Bonaventure* (1960); and vol. 2, *Breviloquium* (1963). (J.F.Q.)

BIBLIOGRAPHY. Studies of his doctrine and life (with bibliographies) are Étienne Gilson, *The Philosophy of St. Bonaventure* (1938, reissued 1965); Jacques Guy Bougerol, *Introduction to the Works of Bonaventure* (1964); David Tracy (ed.), *Celebrating the Medieval Heritage: A Colloquy on the Thought of Aquinas and Bonaventure* (1978); and Timothy Johnson, *The Soul in Ascent: Bonaventure on Poverty, Prayer, and Union with God* (2002, rev. ed. of *Iste panper clannavit: Saint Bonaventure's Mendicant Theology of Prayer*, 1990).

Bonaventure Island, French ÎLE BONAVENTURE, island in Gaspésie-Îles-de-la-Madeleine region, eastern Quebec province, Canada. The island lies in the Gulf of St. Lawrence off Percé at the end of the Gaspé Peninsula. Although only 2.5 miles (4 km) long, its rocky cliffs provide sanctuary for thousands of nesting gannets from April to November, in addition to auks, gulls, kittiwakes, and guillemots. It was originally named Bonne Aventure by Jacques Cartier, the French navigator-explorer, and was settled by Captain Peter Duval, a Jersey (Channel Islands) sea captain and privateer. In 1971 the provincial government purchased the island, which in 1985 was declared a conservation park.

Boncourt, Louis-Charles-Adélaïde Chamisso de: see Chamisso, Adelbert von.

bond, in finance, a loan contract issued by local, state, or national governments and by private corporations specifying an obligation to return borrowed funds. The borrower promises to pay interest on the debt when due (usually semiannually) at a stipulated percentage of the face value and to redeem the face value of the bond at maturity in legal tender. Bonds usually indicate a debt of substantial size and are issued in more formal fashion than promissory notes, ordinarily under seal. Contract terms are normally found in the indenture, an agreement between the borrower and a trustee acting on behalf of the bondholders. Interest on bonds is most often collectible through the presentation of numbered coupons, which the holder clips from the bond; a coupon is usually printed and attached to the bond for every interest date throughout the life of the bond.

When bonds are sold, interest accrued since the previous interest-due date is added to the sale price. Most bonds are payable to the bearer and are thus easily negotiable, but it is usually possible to have the bond registered and thus made payable only to the named holder. The great majority of bonds are callable, meaning that the issuer can redeem them at his option, upon appropriate notice, well before maturity. Maturity, or due, dates for bonds normally run from five to 30 years.

Government bonds may be backed by the taxing power of the government unit issuing the bond, or they may be revenue bonds, backed only by the revenue from the specific projects—e.g., toll roads, airports, waterworks—to which they are committed. Corporate bonds may be secured by a lien against real estate (mortgage bonds) or other property,

such as equipment (equipment obligations) owned by the borrower. If the bond is unsecured, it is known as a debenture bond.

Bond ratings are grades given to bonds based on the creditworthiness of the government, municipality, or corporation issuing them. The ratings are assigned by independent rating agencies (in the United States the largest are Standard & Poors and Moody's Investors Services), and they generally run from AAA to D. Bonds with ratings from AAA to BBB are regarded as "investment grade"—i.e., suitable for purchase by banks and other fiduciary institutions. Bonds with ratings below BBB are considered "junk," or high-yield, bonds; they are often issued by new or speculative companies. Although the risk of default for junk bonds is great, they offer higher rates of interest than more secure bonds.

bond, in masonry, systematic arrangement of bricks or other building units composing a wall or structure in such a way as to ensure its stability and strength. The various types of bond may also have a secondary, decorative function.

Bonding may be achieved by overlapping alternate courses (rows or layers) in brickwork, by using metal ties, and by inserting units vertically so they join adjacent courses. A bond course of headers (units laid with their ends toward the face of the wall) can be used to bond exterior masonry to backing masonry. Headers used in this manner may also be called throughstones, or perpendes. Units laid with their lengths parallel to the face of a wall are called stretchers.

Among the more common types of bond are the English bond, in which bricks are laid in alternating courses of stretchers and headers; the Flemish, or Dutch, bond, which consists of headers and stretchers laid alternately within each course, each header being centered over the stretcher below it; and the American bond, in which only every fifth or sixth course consists of headers, the rest being stretchers.

Bond, Julian, in full HORACE JULIAN BOND (b. Jan. 14, 1940, Nashville, Tenn., U.S.), U.S. legislator and black civil-rights leader, best known for his fight to take his duly elected seat in the Georgia House of Representatives.

The son of prominent educators, Bond attended Morehouse College in Atlanta (B.A., 1971), where he helped found a civil-rights group and led a sit-in movement intended to desegregate Atlanta lunch counters.

In 1960 Bond joined in creating the Student Nonviolent Coordinating Committee (SNCC), and he later served as communications director for the group. In 1965 he won a seat in the Georgia state legislature, but his endorsement of a SNCC statement accusing the United States of violating international law in Vietnam prompted the legislature to refuse to admit him.

The voters in his district twice reelected him, but each time, the legislature barred him. Finally, in December 1966, the U.S. Supreme Court ruled the exclusion unconstitutional, and Bond was sworn in on Jan. 9, 1967.

At the Democratic National Convention in 1968, Bond led an insurgent group of delegates that won half the Georgia seats. He seconded the nomination of Eugene McCarthy and became the first black man to have his name placed in nomination for the vice presidential candidacy of a major party. Younger than the minimum age required for the position under the Constitution, however, Bond withdrew his name.

Bond served in the Georgia House of Representatives from 1967 to 1975 and in the Georgia Senate from 1975 to 1987. In 1986 he ran unsuccessfully for a seat in the U.S. House of Representatives. In addition to his legislative activities, Bond served as president, and then as president emeritus, of the Southern Poverty Law Center. He was also a longtime board

member of the National Association for the Advancement of Colored People (NAACP), becoming their chairman in 1998.

Bond, Sir Robert (b. Feb. 25, 1857, St. John's, Nfd. [Canada]—d. March 16, 1927, Whitbourne), leader of the Liberal Party in Newfoundland and prime minister of the British colony from 1900 to 1909.

Bond was elected to the Newfoundland House of Assembly in 1882. He became speaker in 1884 and colonial secretary in 1889 in the Liberal ministry.

As prime minister, Bond made major concessions to outside capital to stimulate home economy. Consequently, the London *Daily Mail* established at Grand Falls a paper mill that led to development of logging as Newfoundland's major industry. He resigned in 1909 after disagreeing with the British governor over procedure following the deadlocked election in 1908 and formed an alliance with a radical fishermen's union, but his influence declined and he retired in 1914. He was knighted in 1901.

Bond, William Cranch (b. Sept. 9, 1789, Falmouth, District of Maine, Mass. [now Port-

William Cranch Bond

land, Maine], U.S.—d. Jan. 29, 1859, Cambridge, Mass.), American astronomer who, with his son George Phillips Bond (1825–65), discovered Hyperion, the eighth satellite of Saturn, and an inner ring called Ring C, or the Crepe Ring.

Largely self-educated, Bond became interested in astronomy after observing the solar eclipse of 1806. He independently discovered many comets and was appointed the first astronomical observer at Harvard College in 1840. He became the first director of the Harvard Observatory in 1847 and was elected associate of the Royal Astronomical Society two years later, the first American so honoured. In 1848 Bond undertook extensive studies of the Orion Nebula and Saturn and discovered Hyperion. He made the first recognizable daguerreotype of the Moon and of Vega (α Lyrae) in 1850 and the first recognizable photographic print of the Moon in 1857.

Bond albedo: *see* albedo.

Bonde, Gustaf, Friherre (Baron) (b. Feb. 4, 1620, Esplunda, Swed.—d. May 25, 1667, Hamburg [Germany]), statesman and one of the regents ruling Sweden during the minority of the Swedish king Charles XI, whose fiscal policies foreshadowed the king's later key reforms.

After becoming governor of the province of Södermanland (1648) and a privy councillor (1653), Bonde was chosen lord treasurer and a member of the regency council (1660). He reduced state expenditures and presented a plan to make Sweden independent of foreign subsidies by pursuing a policy of peace, economic development, and repossession of royal lands.

Bonde's budget of 1662, which embodied these principles, later served as a guide to Charles XI. But the majority of the regency

council preferred the ambitious financial and foreign policies of the chancellor Magnus Gabriel De la Gardie and helped him sabotage

Bonde, detail from an oil painting by D.K. Ehrenstrahl; in Vibyholm Castle, Sweden

Bonde's economic programs. After the collapse of the public finances during Sweden's wasteful war with Bremen (1655), Bonde withdrew from further political disputes.

Bondfield, Margaret (Grace) (b. March 17, 1873, Chard, Somerset, Eng.—d. June 16, 1953, Sanderstead, Surrey), trade-union leader and the first woman to attain cabinet rank in Great Britain.

Bondfield had little schooling. Starting as a draper's assistant at 14, she found conditions miserable and joined the National Union of Shop Assistants at its formation. In 1899 she was the only woman delegate to the Trades Union Congress, and she became its first woman chairman in 1923. In 1923 she also was elected a Labour Party member of the House of Commons. Re-elected in 1929, she became minister of labour in Ramsey MacDonald's second administration but was defeated in the 1931 election. She retired from trade-union work in 1938. She was appointed

Margaret Bondfield

Elliott and Fry

a companion of honour in 1948, and her autobiography, *A Life's Work*, was published in 1949.

Bondi, Sir Hermann (b. Nov. 1, 1919, Vienna, Austria—d. Sept. 10, 2005, Cambridge, Eng.), British mathematician and cosmologist who, with Fred Hoyle and Thomas Gold, formulated the steady-state theory of the universe.

Bondi received an M.A. from Trinity College, Cambridge. During World War II he worked in the British Admiralty (1942–45). He then taught mathematics at Cambridge (1945–54) and at King's College, London (1954–85; emeritus 1985); he served as master of Churchill College, Cambridge, from 1983 to 1990. Bondi combined his academic career with active involvement in public service. He was director general of the European Space Research Organization (1967–71), the chief scientific adviser to the British ministry of defense (1971–77), chief scientist of the department of energy (1977–80), and chairman of the Natural Environment Research Council (1980–84).

In 1948 Bondi, Hoyle, and Gold advanced their cosmological theory of a steady-state universe, which postulates that the universe is the same everywhere and for all time. This means that as the universe expands, new matter would have to be created to balance this expansion. The theory of an eternal, steady-state universe, with no specific origin, has fallen into disrepute since the discovery (1961) of cosmic background radiation (*i.e.*, a faint glow of radio radiation emanating from all directions in space), which strongly suggests that the universe began at some definable moment with a violent explosion of an extremely dense and intensely hot mass of material.

Works by Bondi include *Cosmology* (1952; reissued 1960), *The Universe at Large* (1960), *Relativity and Commonsense* (1964), and *Assumption and Myth in Physical Theory* (1967). He was made a fellow of the Royal Society in 1959 and a Knight Commander of the Bath in 1973. His autobiography, *Science, Churchill, and Me*, was published in 1990.

Bondoukou, town, eastern Côte d'Ivoire. It is situated at the intersection of roads from Ghana, Burkina Faso, and Abidjan, the national capital. An early trade centre of the Kulango (Koulango, Pakhalla, N'Gora) people, Bondoukou was captured in the late 15th century by the Brong (Abron), an Akan people from the west. The Abron were converted to Islām by Diula (Dioula) traders from the north, who founded a Qur'anic university and made the town a Muslim cultural centre. The kingdom of Bondoukou was part of the Ashanti union from the mid-18th century to 1874. In 1941 the king of Bondoukou led thousands of his people into the Gold Coast (now Ghana) to join General Charles de Gaulle's Free French forces.

The town is the chief trade and tourist centre of the region, which includes the 2,223,000-acre (900,000-hectare) Bouna Game Reserve. Pop. (latest census) 33,051.

Bonds, Barry, in full BARRY LAMAR BONDS (b. July 24, 1964, Riverside, Calif., U.S.), professional baseball player. In addition to being a great all-around player, Bonds broke the single-season home-run record by hitting 73 home runs in 2001.

Bonds was born into a baseball family. His father, Bobby Bonds, was an outfielder for the San Francisco Giants; his cousin was baseball great Reggie Jackson; and his godfather was the legendary Willie Mays, who was a teammate of Bobby Bonds. Barry Bonds excelled at baseball from early childhood. He was drafted by the Pittsburgh Pirates in 1985 and joined the Pirates' major league roster in 1986.

Bonds garnered numerous Gold Glove awards for his play in left field but was best known as an extremely productive hitter. In 2004 he became only the third major league player to hit more than 700 home runs in his career, and he became the major league all-time walks leader. Bonds was also an excellent base runner, reaching in 2003 the plateau of 500 career stolen bases. He was voted the National League's Most Valuable Player (MVP) seven times (1990, 1992–93, 2001–04), the first player in either league to win the award more than three times.

Bonds became a free agent in 1992 and signed with the San Francisco Giants. In 2001 he hit 73 home runs, breaking Mark McGwire's 1998 record of 70 home runs on Oct. 5, 2001. On Aug. 9, 2002, Bonds hit his 600th career home run, becoming only the fourth player to accomplish this feat. In 2004 his personal trainer was indicted by federal authorities for illegal distribution of steroids, leading to speculation that Bonds may have used the performance-enhancing drugs.

bone, rigid body tissue consisting of cells embedded in a hard intercellular matrix.

A brief treatment of bone follows. For full treatment, see *MACROPAEDIA: Supportive and Connective Tissues*.

Bone exists in vertebrates only. Bone has many functions—it serves as a structural frame to support the body; it enables movement by providing a point of attachment for the muscles and by serving as a system of levers; it protects the brain, spinal cord, and the soft internal organs; it houses the blood-forming system (red bone marrow); and it acts as a reservoir for the mineral calcium, which is vital to many body processes.

Composition. The intercellular matrix of bone consists of an organic component—the fibrous connective protein collagen—and an inorganic component—crystals formed by the calcium, phosphate, and carbonate minerals. These two components are intimately bound, with the mineral crystals wrapped around and embedded among the collagen fibres. The hard mineral crystals provide great compressional strength, making bone an excellent load-bearing material. The collagen fibres add elasticity and high tensile strength, enabling bone to withstand tension forces.

The living material of the bone, the bone cells, account for only 1 to 5 percent of the total bone volume in the adult skeleton. Bone cells are of four basic types: (1) osteoblasts, which are located on the external and internal surfaces of the bone and serve to create new intercellular matrix; (2) osteoclasts, which also reside on bone surfaces but which serve to resorb and thus destroy bone matrix; (3) osteocytes, which are derived from osteoblasts that have become embedded within the intercellular matrix, and which serve to maintain the bone as a living tissue; and (4) undifferentiated bone mesenchymal cells, which are found chiefly on the membrane that covers the outside of the bone (the periosteum) and within the internal spaces of the bone, and which form new osteoblasts or osteoclasts.

Structure. Most bones, and especially the long bones, are made up of two types of structure. The shafts, or diaphyses, are formed of compact bone; the expanded ends, or epiphyses, usually include a vaulted structure of spongy, or cancellous, bone, with a thin cortex, or outer layer, of compact bone; this arrangement serves to transfer weight and stress from the shafts of the bones to the joints.

The haversian system, or osteon, is the unit of structure of compact bone. This is irregularly cylindrical and branching, of microscopic size, with thick walls and a narrow central canal, carrying one or more small blood vessels, and is usually oriented in the long axis of the bone. The walls of the osteons are made up of concentric layers, or lamellae, of collagen and mineral crystals. The haversian system, in addition to being arranged around a central canal, includes large numbers of lacunae, or small spaces, which house the osteocytes and are interconnected by a network of canaliculi, or minute canals. The canaliculi are the channels through which the fluids derived from the blood reach and nourish the bone tissue.

Cancellous bone lacks osteons; it is composed of a complex system of cavities and intersecting plates and spicules called trabeculae. The trabeculae are arranged along the stress lines of the bone, thereby giving cancellous bone great strength.

Bone formation. Bone formation, also called ossification, is the process by which new bone is produced. Ossification begins about the third month of fetal life in humans and is completed by late adolescence. The process takes two general forms, one for compact bone, and the other for cancellous bone.

Bone of the first type begins in the embry-

onic skeleton with a cartilage model, which is gradually replaced by bone. Osteoblasts within the cartilage secrete a matrix material called osteoid, a gelatinous substance made up of collagen and mucopolysaccharide, an organic glue. Soon after the osteoid is laid down, inorganic salts are deposited in it to form the hardened material recognized as bone. The cartilage cells die out and are replaced by osteoblasts clustered in ossification centres. Bone formation proceeds outward from these centres. Most short bones have a single ossification centre near the middle of the bone; long bones of the arms and legs typically have three, one at the centre of the bone and one at each end. Ossification of long bones proceeds until only a thin strip of cartilage remains at either end; this cartilage, called the epiphyseal plate, persists until the bone reaches its full adult length and is then replaced with bone.

The flat bones of the skull and other cancellous bones are not preformed in cartilage like compact bone, but begin as fibrous membranes consisting largely of collagen and blood vessels. Osteoblasts secrete the osteoid into this membrane to form a sponge-like network of trabeculae. The new bone formation radiates outward from ossification centres in the membrane. There are several ossification centres in the skull; at birth, bone formation is incomplete and soft spots can be felt between these centres. The lines where the new bone from adjacent centres meets form cranial sutures visible on the surface of the adult skull.

Bone remodelling. Both processes of ossification produce immature bone with a comparatively random pattern of bone deposition. A process of destruction and regeneration, called bone remodelling, follows to organize the bone into more orderly units that give the mature bone greater strength.

Destruction, or resorption, of bone by osteoclasts allows the bone, which is inhibited by its inorganic component from growing by cell division like other tissues, to alter size and shape as it grows to adult proportions. Osteoclasts act on the inner surfaces of bones, in the marrow cavity and the spaces of cancellous bone, to widen these cavities; they also act on the outer surfaces to reduce bony processes, such as the epiphyseal swellings at the ends of the long bones of the arm and leg. Osteoclast activity takes place behind the epiphyseal growth zone to reduce former swellings to the width of the lengthening shaft. Within the bone, osteoclastic destruction helps to convert immature bone (often called woven bone) into mature compact bone by clearing long tubular spaces that will serve as centres for the development of osteons.

While the osteoclasts resorb bone at various sites, osteoblasts make new bone to maintain the skeletal structure. During childhood, bone formation outpaces destruction as growth proceeds. After skeletal maturity is reached, the two processes maintain an approximate balance. Osteoclasts create cavities much faster than osteoblasts make new bone, so there are usually many more of the bone-forming cells in a bone system than osteoclasts, and new bone synthesis proceeds more gradually. As osteocytes behind the growth zones at the ends of the long bone destroy the old epiphyseal swellings, osteoblasts ahead of the zone create a new epiphysis. Within each of the tubular spaces cleared by osteoclasts inside the bone, the osteoblasts follow along, laying down a layer of new bone to form the mature osteon, narrowing the channel to the size of the blood vessel that runs through it. Between the areas of osteoclastic and osteoblastic activity is a cement line containing bone matrix material, which delineates the zones of resorption and new bone formation.

Bone formation takes place in areas where bone undergoes the greatest stress. Therefore, a bone that is underutilized, such as a leg that is immobilized, is prone to resorption.

Bone remodelling not only alters the architecture of the bone, it also enables the body to regulate the levels of calcium ions in the blood and interstitial fluid. These calcium levels must remain within a fairly tight range in order to ensure the proper functioning of nerve transmission, the integrity and permeability of cellular membranes, and the ability of the blood to clot. Bone contains about 99 percent of the body's calcium. When fluid calcium levels fall too low, parathyroid hormone stimulates osteoclast activity and the subsequent release of calcium into the bloodstream. When fluid calcium levels rise excessively, the hormone calcitonin inhibits resorption, thereby restricting the release of calcium from the bones. It is necessary to have a healthy intake of calcium to maintain the body's calcium reserve; otherwise, the calcium levels in the body become dependent on the resorption of bone tissue. Vitamin D is also essential, for it makes possible the body's use of ingested calcium.

Bone disorders. The susceptibility to bone diseases alters with age. Children suffer mainly from abnormal bone development. Young adults are prone to rheumatoid arthritis and spinal difficulties, such as scoliosis. The elderly are vulnerable to metabolic disorders that affect the composition of bone, as well as to osteoarthritis and other joint disorders and to circulatory problems that affect bone health.

Many bone diseases are related to the composition and scale of bone tissue. When a bone has much more bone tissue than average, it is termed osteosclerosis; when there is less, it is called osteopenia. If bone suffers from a lack of mineral content, it is called rickets in children and osteomalacia in adults. The afflicted bones become malleable and vulnerable to deformities. In children, this condition is often the result of vitamin D deficiency. Of all bone diseases, osteoporosis, a generalized osteopenia, is the most common. This disease primarily affects the aged and is more serious in women than men. Osteoporosis is responsible for many of the fractures encountered by the elderly. Another disease that most often afflicts the elderly is Paget's disease, characterized by bone deformity and calcium imbalance.

Bone cells are killed by a lack of blood supply; this tissue death is termed necrosis or osteonecrosis. It can be brought on by injury, the blockage of an artery, circulatory problems, the administration of corticosteroid hormones for the treatment of another affliction, or by a disease of the metabolic system. Osteomyelitis refers to a bone infection, which can be picked up through an open wound, or from an infection elsewhere in the body. Tumours can also develop in bone tissue. Primary tumours are confined to bone and may or may not be malignant. Metastatic (or secondary) tumours originate in other parts of the body and are always malignant. Congenital bone diseases refer to abnormalities which are present at birth; some are genetically transferred but most occur due to problems during pregnancy or delivery.

Bone fractures are the result of a force greater than the strength and resistance of the bone. Age and disease are factors which determine whether a given force will cause a fracture. The bones of a child are elastic, those of a young adult are most able to resist force, and those of the aged are brittle and vulnerable to fracture. Fractures are not always the result of a single act of force but can occur over time, as stress or fatigue fractures. In bone tissue, with its abundance of blood vessels, there is bleeding and swelling at the location of the fracture. The fracture begins to heal at the moment it occurs, unless the supply of blood is insufficient, an infection sets in, or the fragments of bone are separated.

There are many methods used for the treatment of bone diseases and injuries. Traction offsets the strain of muscles on the skeletal system, while also helping to set fractures. Internal fixation, or osteosynthesis, utilizes screws, pins, plates, and wires to secure bones while healing. Arthroplasty involves the surgical replacement of a bone or joint to facilitate normal movement. Arthrodesis is a surgical procedure to remove joint cartilage, aimed at immobilizing a joint or removing infected tissue. Epiphysiodesis fuses the end of a bone (epiphysis) to its shaft, precluding further growth, when matching bones are of unequal length. Tendon transfer is used to replace a damaged tendon or to change the movement of a joint. The transplanting of bone chips, usually from the patient's own skeleton, aids in bone formation and adds to a bone's stability while healing. Amputation is necessary when there is massive injury, tumour, disease of the arterial system, or gross irregularities in bone development.

bone, necrosis of: *see* osteonecrosis.

bone and shell script: *see* chia-ku-wen.

bone cancer, disease characterized by uncontrolled growth of cells of the bone. Primary bone cancer—that is, cancer that arises directly in the bone—is relatively rare. Most cancer that involves the bone has spread (metastasized) from other tissues in the body through the blood or lymphatic systems. Different types of bone tissue give rise to different types of primary bone cancer. Osteosarcoma develops from cells that form the bone, and Ewing's tumour of the bone (Ewing's sarcoma) develops from immature nerve tissue within the bone. Both types most commonly affect males between 10 and 20 years of age. Chondrosarcoma, which forms in cartilage tissue, principally affects persons over age 50. More than one-half of the cases of primary bone cancer, even once-deadly types, can now be treated successfully.

Only a small portion of bone cancer cases are associated with known risk factors, which include exposure to radiation or chemotherapy, Paget's disease, and rare hereditary syndromes such as hereditary retinoblastoma. The majority of cases seem to occur randomly in otherwise healthy individuals.

The most common symptom of bone cancer is pain or tenderness over the affected bone. Bone tumours often are not noticed until minor trauma causes significant pain and disability that leads to further investigation. This association has led to the mistaken conclusion that traumatic injuries can cause bone cancer. Other symptoms that can occur include bone fractures, decreased mobility of a joint, fever, fatigue, and anemia. These symptoms are not specific to bone cancer and can be the result of other, benign processes.

Preliminary investigation of a bone tumour can include a blood test for the enzyme alkaline phosphatase. As bone cancer grows, the amount of the enzyme in the blood increases dramatically, but it can also increase for other reasons. X-ray imaging can be very helpful in making a diagnosis. The images will show whether a tumour is creating bone tissue or destroying normal bone tissue. Images can also be obtained by computed tomography (CT scans), magnetic resonance imaging (MRI), and a type of radioisotope scanning commonly called a bone scan. The final diagnosis of cancer, however, requires the removal of a portion of the tumour for examination under a microscope.

The prognosis of bone cancer depends on both the type of cancer and the extent to which it has spread. Bone cancer most frequently spreads to the lungs, but it may also spread to other bones and only rarely to other tissues. Overall, the prognosis for long-term

survival has improved to more than 50 percent, including cases in which the tumour has spread to other parts of the body. Of the different types of primary bone cancer, chondrosarcoma has the best prognosis and osteosarcoma the worst.

Treatment in some cases requires a combination of surgery, chemotherapy, and radiation. In some cases, surgery requires the amputation of the involved limb. In other cases, it may be possible to remove only a portion of the bone and replace it with a prosthesis or bone graft. Chemotherapy may be given before or after surgery. If a patient has a known risk factor for bone cancer, such as Paget's disease, careful screening may help detect and treat the cancer in its early stages.

bone china, hybrid hard-paste porcelain containing bone ash. The initial development of

Spode bone china potpourrier, Staffordshire, c. 1825; in the Victoria and Albert Museum, London

By courtesy of the Victoria and Albert Museum, London, photograph EB Inc.

bone china is attributed to Josiah Spode the Second, who introduced it around 1800. His basic formula of six parts bone ash, four parts china stone, and three and a half parts china clay remains the standard English body. Hard porcelain is strong but chips fairly easily and, unless specially treated, is usually tinged with blue or gray. Somewhat easier to manufacture, bone china is strong, does not chip easily, and has an ivory-white appearance.

Shortly after its introduction, the formula for bone china was being utilized by Spode's competitors—Minton, Coalport, Davenport, Derby, Worcester, and the Herculaneum factory at Liverpool. Later entrants in the field

Wedgwood bone china plate, Staffordshire, 1815–20; in the Victoria and Albert Museum, London

By courtesy of the Victoria and Albert Museum, London, photograph EB Inc.

were New Hall in 1810, Wedgwood in 1812, and Rockingham in 1820. Quality, as much as form and decoration, varied from factory to factory; some tended, after about 1820, toward brilliant colour, lavish gilding, and overcrowded design; others produced tasteful, simply ornamented tableware. Since much early bone china was issued unmarked, speculative attribution has been inevitable. Bone china is most popular for table services in England and the United States.

bone conduction, the conduction of sound through the bones of the skull. Two types of bone conduction are recognized. In compressional bone conduction, high-pitched sounds cause the segments of the skull to vibrate individually. The vibrations, by compressing the bony case of the inner ear, stimulate the sensory cells that are involved in perceiving sound waves in the air. In inertial bone conduction, low-pitched sounds vibrate the entire skull, causing it to move while the suspended sensory parts of the inner ear remain at rest. The effect is the perception of sound, just as if airborne compressional waves were moving those sensory parts while the skull was stationary.

bone lace (type of lace): *see* bobbin lace.

bone marrow, also called MYELOID TISSUE, soft, gelatinous tissue that fills the cavities of the bones. Bone marrow is either red or yellow, depending upon the preponderance of vascular (red) or fatty (yellow) tissue. In humans, the red bone marrow forms all of the blood cells with the exception of the lymphocytes, which are produced in the marrow and reach their mature form in the lymphoid organs. Red bone marrow also contributes, along with the liver and spleen, to the destruction of old red blood cells. Yellow bone marrow serves primarily as a storehouse for fats but may be converted to red marrow under certain conditions, such as severe blood loss or fever. At birth and until about the age of seven, all human marrow is red, as the need for new blood formation is high. Thereafter, fat tissue gradually replaces the red marrow, which in adults is found only in the vertebrae, hips, breastbone, ribs, and skull and at the ends of the long bones of the arm and leg; other cancellous, or spongy, bones and the central cavities of the long bones are filled with yellow marrow.

Red marrow consists of a delicate, highly vascular fibrous tissue containing reticular cells, which differentiate into various blood cells. Reticular cells first become precursors or stem cells of various kinds; rubroblasts give rise to the red blood cells (erythrocytes), and myeloblasts become the granulocytes, a type of white blood cell. Platelets, small blood cells involved in clotting, form from giant marrow cells called megakaryoblasts. The new blood cells are released into the sinusoids, large thin-walled vessels that drain into the veins of the bone. In mammals, blood formation in adults takes place predominantly in the marrow. In lower vertebrates a number of other tissues may also produce blood cells, while in reptiles and amphibians some blood cells are formed in the bloodstream itself. In humans the red blood cells and the platelets undergo no further development or growth after leaving the marrow. *See also* blood cell formation.

Because the white blood cells produced in the bone marrow are involved in the body's immune defenses, marrow transplants have been used to treat certain types of immune deficiency. The sensitivity of marrow to damage by radiation and some anti-cancer drugs accounts for the tendency of these treatments to impair immunity.

Examination of the bone marrow is helpful in diagnosing certain diseases, especially those related to blood and blood-forming organs, because it provides information on iron stores and the site of blood production. Bone marrow aspiration, the direct removal of a small amount (about 1 ml) of bone marrow, is accomplished by suction through a hollow needle. The needle is usually inserted into the sternum, or breastbone, in adults, and into the upper part of the tibia, the larger bone of the lower leg, in children. The necessity for a bone marrow aspiration is ordinarily based on previous blood studies and is particularly useful in providing information on various stages of immature blood cells. Disorders in which bone marrow examination is of special diagnostic value include leukemia, multiple myeloma, Gaucher's disease, unusual cases of anemia, and other hematological diseases.

bonefish, also called BANANA FISH, or LADYFISH (*Albula vulpes*), marine game fish of the family Albulidae (order Elopiformes). It

Bonefish (*Albula vulpes*)
Batchelor-Farwig—EB Inc

inhabits shallow coastal and island waters in tropical seas and is admired by anglers for its speed and strength. Maximum length and weight are about 76 cm (30 inches) and 6.4 kg (14 pounds). The bonefish has a deeply notched caudal fin (near the tail) and a small mouth beneath a pointed, piglike snout. It grubs on the bottom for worms and other food. The shafted bonefish (*Dixonina nemoptera*) is the only other species of the family.

Boner, Edmund (English bishop): see Bonner, Edmund.

Boner, Ulrich, Latin ULRICH BONERIUS (fl. 1324–49), Swiss writer and Dominican monk, whose collection of fables in verse was the first book to be printed in the German language (Bamberg, 1461).

Boner, known to have been of a Bernese family, is mentioned in records between 1324 and 1349. He compiled and translated his collection of fables for Johann von Ringgenberg, his Bernese patron. The form that Boner used was referred to as *bischaft* or *bispiel* ("examples"), and each of the tales includes a moral. Written in Middle High German, the collection was probably completed in about 1350.

The fables were entitled *Der Edelstein* ("The Precious Stone"), because precious stones were said to cast a spell and Boner hoped that his tales would do the same. Although he named only two of his sources—Aesop's *Fables* and the fables of Flavius Avianus (a 4th-century Latin writer)—it is clear that he also drew on other material. Many manuscripts of the collection existed, and further evidence of its popularity can be noted in its having been chosen as one of the first manuscripts to be printed.

boneset, also called THOROUGHWORT, any of about 500 species of herbaceous plants comprising the genus *Eupatorium* of the composite family (Asteraceae), native primarily to tropical America. The North American plant known as boneset is *E. perfoliatum*, also

known as aguaveed and Indian sage. It is common in wet places and is a coarse, rough, hairy perennial about 0.6 to 1.8 m (2 to 6 feet) high. Its lance-shaped, toothed, and wrinkled leaves are joined together at their bases around the stem. In August the plants bear small, tubular, white flowers in numerous heads that form a flat and branched cluster.

Several species are known as joe-pye-weed, especially *E. dubium*, native to the eastern coastal plain. Sweet joe-pye-weed (*E. purpureum*), spotted joe-pye-weed (*E. maculatum*), and hollow joe-pye-weed (*E. fistulosum*) are found in wet thickets and meadows of the northern and central United States. Most joe-pye-weeds have clusters of fuzzy pink or purple flowers. White snakeroot, or white sanicle (*E. rugosum*), contains a toxic alcohol that causes trembles—muscular tremors, weakness, and constipation often leading to death—when eaten by animals; ingestion of the meat or dairy products of livestock so afflicted causes in humans an acute illness known as milk sickness, which is characterized by weakness, vomiting, and constipation. Boneset tea is a folk remedy for fever.

Bonet, Juan Pablo (b. 1560, Torres de Berrellen, Spain—d. 1620, Torres de Berrellen), Spanish cleric and educator who pioneered in the education of the deaf.

Bonet developed one of the earliest and most successful methods for educating the deaf and improving both the verbal and the nonverbal communications skills of deaf-mutes. Bonet's multidimensional approach, which he detailed in *Reducción de las letras y arte para enseñar a hablar a los mudos* (1620; "Teaching Mutes to Speak Through the Conquest of Letters and Art"), used every technique available. Beginning with the study of written words, Bonet taught the phonetic values of the letters, emphasizing the correct positioning of the lips and tongue needed for clear articulation. He also taught manual signs and a finger alphabet.

Bonfils, Frederick Gilmer (b. Dec. 21, 1860, Troy, Mo., U.S.—d. Feb. 2, 1933, Denver, Colo.), publisher who made the *Denver Post* into a crusading newspaper of nationwide prominence in the United States.

Bonfils entered the U.S. Military Academy in 1878 but resigned in 1881. With Harry H. Tammen (1856–1924) he purchased the *Post* in 1895. They dedicated the paper to "the

Bonfils
The Denver Post Historical Collection

service of the people" and conducted spirited crusades against crime and corruption; above the door of the *Post* building they inscribed "O Justice, when expelled from other habitations, make this thy dwelling place." Their exposés often involved them in lawsuits, and in 1900 an irate lawyer attempted to kill them. Under their direction, the *Post* became and remains an influential and widely circulated newspaper.

Bong Range, mountain chain, west central Liberia, West Africa, extending for about 25 miles (40 km) in a northeast–southwest direction at elevations averaging from 600 to 1,000

feet (180–300 m). Its highest point, however, is 2,116 feet. The range is the source of the Farmington River. Since the mid-1960s its iron-ore deposits have been worked by the German-Liberian Mining Corporation (Delimco) and shipped via the company railroad to the Port of Monrovia (50 miles southwest).

Bongars, Jacques, SEIGNEUR (lord) DE BAULDRY ET DE LA CHESNAYE (b. 1554, Orléans, Fr.—d. July 29, 1612, Paris), French diplomat and classical scholar who compiled a history of the Crusades.

A Huguenot, Bongars studied in Germany, Italy, and Constantinople. From 1586 Henry of Navarre (later King Henry IV of France) sent him on missions to obtain men and money from the German princes and from Queen Elizabeth I of England. As French minister in Germany (1593–1610) he tried to unite Protestant princes in a league with King James I of England at its head.

Bongars published an annotated edition of the Roman historian Justin's works in 1581 and a French translation of the letters of Aristænetus in 1597. He was interested, however, not only in ancient writings but also in medieval chronicles. His collection of historical works on Hungary (1600) was followed, in 1611, by the far more important *Gesta Dei per Francos* ("God's Work Through the Franks"), a collection of contemporary accounts of the Crusades. An edition of his letters, in Latin, appeared in 1647, a French translation in 1668–70. His diary of his journey to Constantinople was printed in 1874.

Bongo, also spelled BUNGU, a people once extensive in the southwestern area of present-day Sudan, now found in small, scattered settlements south and east of Wau. They speak a Central Sudanic language of the Chari-Nile branch of the Nilo-Saharan family. Because they were separated by miles of bush, the various Bongo subgroups were only loosely affiliated; this lack of cooperation was decisive in their decimation by waves of invaders from the 18th century on. Chiefs had little authority although they were consulted in important legal and social matters. The Bongo now live along roads, subsist largely on the cultivation of sorghum, eleusine, sesame, and tobacco, and raise chickens and a few sheep and goats. Famed as hunters, they spend each dry season hunting and fishing, using poisoned arrows and spears, nets, traps, and snares. Noted also for their metalwork, the Bongo supplied neighbouring peoples with iron tools until imported iron replaced locally smelted iron ore.

bongo, also called BROAD-HORNED ANTELOPE (*Boocercus*, or *Taurotragus euryceros*), large, brightly coloured antelope, family Bovidae (order Artiodactyla). Shy, swift, and elusive, the bongo frequents dense forests of central Africa, living in small groups or in pairs. It stands about 1.3 m (51 inches) at the shoulder and has an erect mane running the length of the back. Both sexes bear heavy, spirally twisted horns. The male is reddish brown to dark mahogany brown with black underparts, black and white legs, white head

Bongo (*Boocercus euryceros*)
Tom McHugh—Photo Researchers

markings, and narrow, vertical white stripes on the body. The female is similarly marked, but usually a brighter reddish brown.

bongo drum, also called BONGO, one of a pair of small Afro-Cuban drums played with the fingers, used principally in Latin-American dance music (in which they are usually tuned a fifth apart, as C-G). Bongo drums are yoked in pairs, and the two heads (about 5 inches [13 centimetres] and about 7 inches [18 centimetres] across) are nailed or rod tensioned. The drum "shells" are wooden and open at one end. In Cuban folk music several other drums are also called bongos.

Bongor, town, seat of Mayo-Kebbi *préfecture*, southwestern Chad, on the Logone River opposite Dana, Cameroon. It has health, educational, and other service centres for the surrounding agricultural region. It lies in Chad's cotton-growing area, and in the 1970s there was some controlled irrigation near the town as part of an effort to develop the rice-growing potential of the Logone floodplain. During the dry season, the area's wells and pools attract nomads from north of Lake Chad. Bongor has an airport, and the Logone is seasonally navigable between Bongor and N'Djamena. Pop. (1993) 20,448.

Bonham's Case (1610), case decided by Sir Edward Coke, chief justice of the Court of Common Pleas, in which he asserted the supremacy of the common law in England, noting that the prerogatives of Parliament were derived from and circumscribed by precedent. He declared that "when an act of parliament is against common right or reason, or repugnant, or impossible to be performed, the common law will control it and adjudge such act to be void." Coke had already applied this doctrine to acts of the king and, in this case, was extending it to parliamentary legislation.

Bonheur, Rosa, original name MARIE-ROSA-LIE BONHEUR (b. March 16, 1822, Bordeaux, Fr.—d. May 25, 1899, Melun), painter and sculptor famed for the remarkable accuracy and detail of her portrayals of animals. Toward the end of her career these qualities were accentuated by a lighter palette and the use of a highly polished surface finish reminiscent of the famed 17th-century Dutch painter of animals, Paulus Potter.

She was first trained by her father, Raymond Bonheur, an art teacher, and later by Léon Cogniet in Paris. Bonheur was a regular Salon exhibitor from 1841 onward. "The Horse Fair," one of her Salon pieces exhibited in 1853, was acquired in 1887 by Cornelius Vanderbilt for a record sum and became one of her most widely reproduced works. Bonheur was unconventional for her time. She wore trousers, smoked cigarettes, and for a time kept a lioness and would paint only wild animals. In 1865 she became the first woman

to receive the Grand Cross of the Légion d'Honneur.

bonheur du jour, small, dainty writing table, introduced in the 1760s, which became one of the most popular varieties of French 18th-century furniture. A block of storage compartments, set along the back of the top and often partly enclosed, incorporates a drawer, cupboards, and shelves and is sometimes topped by a decorative brass or ormolu gallery. High, slender legs are often joined by a shelf that acts as a stretcher, and the frieze (decorative horizontal band) contains a drawer. Some *bonheurs du jour* are fitted with toilet accessories.

Bonheur du jour of sycamore wood with ormolu mounts and inlaid plaques of Sèvres porcelain, French, second half of the 18th century; in the Victoria and Albert Museum, London

By courtesy of the Victoria and Albert Museum London: Jones Collection

The finest examples are decorated with intricate marquetry veneers and are mounted with ormolu and sometimes with plaques of Sèvres porcelain. The earliest represent some of the finest examples of the transition between the curved lines of the Louis XV style and the more severe, straight lines of the Louis XVI style. Although most later pieces are rectangular, the early form is sometimes oval and normally has slightly curved cabriole legs.

Bonhoeffer, Dietrich (b. Feb. 4, 1906, Breslau, Prussia, Ger.—d. April 9, 1945, Flössenberg, Bavaria), German Protestant theologian, important for his support of ecumenism and his view of Christianity's role in a secular world. His involvement in a plot to overthrow Adolf Hitler led to his imprisonment and execution. His *Prisoner of God: Letters and Papers from Prison*, published posthumously in 1951, is perhaps the most profound document of his convictions.

Early training. Bonhoeffer grew up amid the academic circles of the University of

Berlin, where his father, Karl Bonhoeffer, was professor of psychiatry and neurology. From 1923 to 1927 he studied theology at the universities of Tübingen and Berlin. At Berlin he was influenced by the historical theologians Adolf von Harnack, Reinhold Seeberg, and Karl Holl but also was strongly attracted by the new "theology of revelation" being propounded elsewhere by Karl Barth. His concern to relate himself critically to Barth is seen in his doctoral thesis, *Sanctorum Communio* (1930; *The Communion of Saints*, 1963), in which he tried to combine a sociological and a theological understanding of the church, and in *Akt und Sein* (1931; *Act and Being*, 1962), in which he traces the influence of transcendental philosophy and ontology, Kantian and post-Kantian theories of knowledge and of being, on Protestant and Catholic theologies.

After serving in 1928–29 as assistant pastor of a German-speaking congregation in Barcelona, he spent a year as an exchange student at Union Theological Seminary in New York City. On his return to Germany in 1931 he took up an appointment as lecturer in systematic theology at the University of Berlin.

Opponent of the Nazis. From the first days of the Nazi accession to power in 1933 he was involved in protests against the regime, especially its anti-Semitism, and despite another 18-month absence when he served as pastor of two small German congregations in London (1933–35), Bonhoeffer became a leading spokesman for the Confessing Church, the centre of German Protestant resistance to the Nazi regime. In 1935 he was appointed to organize and head a new seminary for the Confessing Church at Finkenwald (Pomerania), which continued in disguised form until 1940,

Bonhoeffer, 1939

despite its proscription by the political authorities in 1937. Here he introduced the practices of prayer, private confession, and common discipline described in his book *Gemeinsames Leben* (1939; *Life Together*, 1954). From this period also dates *Nachfolge* (1937; *The Cost of Discipleship*, 1948, rev. ed., 1959), a study of the Sermon on the Mount in which he attacked the "cheap grace" being marketed in Protestant (especially Lutheran) churches—i.e., an unlimited offer of forgiveness, which in fact served as a cover for ethical laxity. It was in this rigorous and even ascetic guise (to which his later theme of "Christian worldliness" provides a contrast if not a contradiction) that Bonhoeffer first became widely known. His views on international affairs at this time were close to pacifism.

After attending the ecumenical conference at Cambridge in 1931, Bonhoeffer was appointed a European youth secretary of the World Alliance for Promoting International Friendship through the Churches, and he re-

"The Horse Fair," oil on canvas by Rosa Bonheur, 1853–55; in the Metropolitan Museum of Art, New York City

By courtesy of the Metropolitan Museum of Art, New York: gift of Cornelius Vanderbilt, 1887

mained an active participant in ecumenical affairs despite the increasingly nationalistic mood in Germany. In his efforts to interpret to Christians elsewhere the significance of the German Church struggle, he found a sympathetic advocate in G.K.A. Bell, bishop of Chichester, Eng. Bonhoeffer's own involvement took an increasingly political character after 1938, when his brother-in-law, the jurist Hans von Dohnanyi, introduced him to the group seeking Hitler's overthrow. In 1939 he considered taking refuge in the United States but returned after only two weeks in New York City, writing to his sponsor, the theologian Reinhold Niebuhr, that "I will have no right to participate in the reconstruction of Christian life in Germany after the war if I do not share the trials of this time with my people." Despite the restrictions imposed on him, Bonhoeffer was able to continue his work for the resistance movement under cover of employment in the Military Intelligence Department, which in fact was a centre of the resistance. In May 1942 he flew to Sweden to convey to the British government, through Bishop Bell, the conspirators' proposals for a negotiated peace; these hopes were thwarted, however, by the Allies' "unconditional surrender" policy. Bonhoeffer was arrested on April 5, 1943, and imprisoned in Berlin. Following the failure of the attempt on Hitler's life on July 20, 1944, the discovery of documents linking Bonhoeffer directly with the conspiracy led to his further interrogation and eventual execution. Bonhoeffer never married, his engagement having been announced just before his imprisonment.

Ethical and religious thought. During the years 1940-43 Bonhoeffer worked intermittently on a volume on Christian ethics but completed only fragments, which were published posthumously (*Ethik*, 1949; *Ethics*, 1955). Abjuring all "thinking in terms of two spheres,"—i.e., any dualistic separation of the church and the world, nature and grace, the sacred and the profane—he called for a unitive, concrete ethic founded on Christology (doctrines about the person and work of Christ), an ethic in which labour, marriage, and government are to be viewed dynamically as divinely imposed tasks or functions ("mandates") rather than orders of creation. Bonhoeffer welcomed the rapprochement of Christianity and humanism in the face of modern tyrannies and urged a recovery of the concept of "the natural" in Protestant thought. The prison writings, published in 1951 (*Widerstand und Ergebung: Letters and Papers from Prison*, 1955, rev. ed., 1972), are of interest both for the remarkable richness of cultural and spiritual life that they display and for the theological themes developed especially in the letters to Bonhoeffer's friend and later editor and biographer, Eberhard Bethge. Reviewing the history of secularization in the West since the Renaissance, Bonhoeffer asked whether man's increasing ability to cope with his problems without the hypothesis of God may not indicate the obsolescence of the "religious premise" upon which Christianity has hitherto been based. Rather than looking for gaps in human knowledge or accenting human weaknesses as a basis for apologetics, he asserted that the church ought to affirm man's maturity in a "world come of age." The stripping off of "religion," in the sense of otherworldliness and preoccupation with personal salvation, Bonhoeffer suggested, will in fact free Christianity for its authentic this-worldliness in accordance with its Judaic roots. The church should give up its inherited privileges in order to free Christians to "share in God's sufferings in the world" in imitation of Jesus, "the man for others." These ideas have subsequently been influential in movements for the

reform of church and ministry; in the "Honest to God" debate initiated by John A.T. Robinson, the bishop of Woolwich, Eng.; in efforts to propound a "secular Christianity" or "the secular meaning of the Gospel"; in the "death of God" controversy of the 1960s; and, from a different perspective, in the articulation of a "theology of hope."

The chief works by Bonhoeffer in addition to those already mentioned are *Creation and Fall: A Theological Interpretation of Genesis 1-3* (1933; Eng. trans. 1959) and the collected shorter writings, *Gesammelte Schriften*, 5 vol. (2nd ed., 1965-69), selections from which have been published in English translation under the titles *No Rusty Swords* (1965), *Christ the Center* (1966; British title, *Christology*), and *The Way to Freedom* (1966). (F.S.)

BIBLIOGRAPHY. The definitive biography is Eberhard Bethge, *Dietrich Bonhoeffer* (1967; Eng. trans. 1970). Symposia dealing with Bonhoeffer's thought are: M.E. Marty (ed.), *The Place of Bonhoeffer* (1962); R.G. Smith (ed.), *World Come of Age* (1967); and Peter Vorkink (ed.), *Bonhoeffer in a World Come of Age* (1968). Other major studies include: J.D. Godsey, *The Theology of Dietrich Bonhoeffer* (1960); J.A. Phillips, *Christ for Us in the Theology of Dietrich Bonhoeffer* (1967; British title, *The Form of Christ in the World*, 1967); William Kuhns, *In Pursuit of Dietrich Bonhoeffer* (1967); and Larry L. Rasmussen, *Dietrich Bonhoeffer: Reality and Resistance* (1972).

Bonhomme Richard and Serapis, engagement between (Sept. 23, 1779), in U.S. War of Independence, notable American naval victory, won off the east coast of England by Capt. John Paul Jones. Challenged by a large combined French and Spanish fleet, the British Navy was too preoccupied to prevent American interference with its merchant marine in the Atlantic. Operating from French bases, Jones led a small fleet around the British Isles from August to October 1779.

Sighting two enemy ships of war conveying merchantmen loaded with naval stores, Jones's "Bonhomme Richard" engaged the British frigate "Serapis," commanded by Capt. Richard Pearson, in a memorable 3½-hour duel. The American commander answered a challenge to surrender early in the battle with the famous quotation, "I have not yet begun to fight!" The slaughter on both sides was great; an estimated 300 Americans and uncounted British were killed or wounded. Despite the fact that his ship was sinking (later Jones moved his command to the "Serapis"), Jones outlasted his adversary and forced a surrender.

Articles are alphabetized word by word, not letter by letter

Boniface, Latin BONIFATIUS, or BONIFACIUS, name of Roman Catholic popes and antipopes, grouped below chronologically and indicated by the symbol ●.

● **Boniface I, SAINT** (b. Rome—d. Sept. 4, 422, Rome; feast day September 4), pope from 418 to 422, whose reign was markedly disrupted by the faction of the antipope Eulalius.

Boniface was a priest, believed to have been ordained by Pope St. Damasus I and to have served Pope St. Innocent I at Constantinople.

When Boniface was chosen pope by a majority of the Roman electors, his rival Eulalius, a deacon, was simultaneously chosen by a clerical faction. The two claims and the fifth schism that resulted caused chaos in Rome. Eulalius lost the support of the West Roman emperor Flavius Honorius for violating an agreement that both claimants leave Rome pending a council's decision.

Boniface's reentry into Rome ended the 15-week schism. Thereafter his pontificate was noted for his peaceful, yet firm, diplomacy and for his zealous support of Bishop St. Augustine of Hippo, particularly in the fight

against Pelagianism (*q.v.*), a heresy that denied original sin.

● **Boniface II** (b. Rome—d. Oct. 17, 532, Rome), pope from 530 to 532. Of Gothic descent, he was the first Germanic pontiff.

He was an archdeacon under Pope Felix IV, who designated him as his successor. Fearing Ostrogothic domination, however, the majority of the Roman clergy elected the deacon Dioscorus of Alexandria. Both popes were consecrated, and the resulting schism was terminated by Dioscorus' death (October 14). Boniface convoked three Roman synods; in that of 530 he received the submission of his opponents; in the first of 531 he proposed the right of a pope to select his successor; in the second of 531 he annulled the succession arrangement. He solemnly approved the conciliar decrees of the second Council of Orange (France), which condemned Semi-Pelagianism, the heretical belief in the power of man's innate will to seek God.

● **Boniface III** (b. Rome—d. Nov. 12, 607, Rome), pope from Feb. 19 to Nov. 12, 607. He was a deacon of the Roman Church when Pope St. Gregory I the Great sent him in 603 as a legate to Constantinople, where he obtained from the Byzantine emperor Phocas an edict recognizing the see of Rome as the head of all the churches.

● **Boniface IV, SAINT** (b. Valeria, Italy—d. May 8, 615, Rome; feast day May 8), pope from 608 to 615.

Possibly a student of Pope St. Gregory I the Great in Rome, he was a deacon of the Roman Church when elected pope. Receiving permission from Byzantine emperor Phocas, he converted the Roman Pantheon into the church of Sta. Maria Rotonda (May 13, 609). In 610 Boniface presided over the Council of Rome for the restoration of monastic discipline; it was attended by St. Mellitus, the first bishop of London, by whom Boniface sent letters and instructions to St. Lawrence, archbishop of Canterbury, and to King St. Aethelberht of Kent.

Boniface's pontificate was plagued, politically and ecclesiastically, by the Monophysites whose heretical bishops cooperated with invaders of the Byzantine Empire led by Heraclius, exarch of Africa. A schism in Istria caused by a condemnation of Nestorianism at the second Council of Constantinople (553) led Abbot St. Columban to reprimand Boniface for supporting the council's decision. Boniface died in monastic retirement and was buried in St. Peter's, Rome.

● **Boniface V** (b. Naples—d. Oct. 25, 625, Rome), pope from 619 to 625. He succeeded St. Deusdedit after the papacy had been vacant for more than a year and was faced with the task of organizing an Italy war-torn by Eleutherius, exarch of Ravenna. In endeavouring to apply canon law to civil law, he established the right of asylum. He also greatly helped the spread of Christianity in England, especially in Northumbria, by encouraging, through letters, the saintly missionaries evangelizing the Britons.

● **Boniface VI** (b. Rome—d. April 19, 896, Rome), pope in April 896. He was a subdeacon when he was elected to succeed Formosus. Boniface either died of gout or was murdered by Stephen VI, who became the next pope. A central figure during a dark period in papal history (896-898) revolving around the death of Pope Formosus, Boniface was denounced at a Roman council held by Pope John IX in 898.

● **Boniface VII**, original name FRANCO (b. Rome—d. July 985, Rome), pope, or antipope, from June to July 974 and from August 984 to July 985; he owed his rule to the support of the Crescentii, a powerful and unscrupulous Roman family.

A cardinal deacon, he ordered the murder of his predecessor, Benedict VI, and was installed by Crescentius I. Later, however, he was expelled at the behest of Otto II, the Holy Roman emperor, and was replaced on the papal throne by Benedict VII. Otto died shortly after Benedict's successor, John XIV, was elected pope, and the Crescentii attempted to regain control of the papacy. They summoned Boniface (984) from his refuge in Constantinople, where he had fled with the church treasury; on his return he imprisoned, and presumably murdered, John. A reign of intrigue ensued, which ended with Boniface's murder by a vengeful Roman mob.

• **Boniface VIII**, original name BENEDICT CAETANI (b. c. 1235–40, Anagni, Papal States—d. Oct. 11, 1303, Rome), pope from 1294 to 1303, the extent of whose authority was vigorously challenged by the emergent

Boniface VIII, detail of a fresco by Giotto, c. 1300; in the church of S. Giovanni in Laterano, Rome
Anderson—Alinari from Art Resource/EB Inc

powerful monarchies of western Europe, especially France. Among the lasting achievements of his pontificate were the publication of the third part of the *Corpus Juris Canonici*, the *Liber Sextus*, and the institution of the Jubilee of 1300, the first Holy Year.

Early life and election to the papacy. Benedict Caetani was born of an old and influential Roman family. He studied law in Bologna and then for many years held increasingly important functions in the papal government. Martin IV made him cardinal-deacon of St. Nicholas in Carcere Tulliano in 1281; under Nicholas IV he became cardinal-priest of St. Martin in Montibus in 1291. As papal legate to a church council in Paris from 1290 to 1291, he succeeded in delaying the outbreak of renewed war between France and England and in bringing about peace between France and Aragon. It was Cardinal Benedict Caetani who confirmed the unhappy pope Celestine V in his wish to resign and then, after he had succeeded him as Boniface VIII, found it advisable to intern the old man in the castle of Fumone, where he soon died. Although Celestine died of natural causes, the death was open to suspicion and incriminating aspersions by Boniface's enemies. Among those who carried on the propaganda and opposition against Boniface were many of the Franciscan "Spirituals" (members of the order founded by St. Francis of Assisi who followed a literal observance of his rule of poverty), including the poet Iacopone da Todi, some of whose poems were written during his imprisonment by Boniface.

The two principal international conflicts that

existed from the beginning of Boniface's pontificate were that between France and England concerning Guyenne and Flanders, and that between the kingdoms of Naples and Aragon concerning the island of Sicily, which, after much provocation, had broken away from the Neapolitan king, disregarding papal feudal overlordship. Boniface finally, though unwillingly, accepted the independence of the island kingdom under Frederick of Aragon. His attempts to stop hostilities between Edward I of England and Philip IV of France, however, became enmeshed with another important problem, the increasing tendency of these warring monarchs to tax the clergy without obtaining papal consent. Although the desire of the late-medieval rulers to tax the wealth of their clergy has been defended and can perhaps be understood, the practice was unquestionably contrary to the canon law (ecclesiastical law) of the time. That Boniface refused to look on inactively while the struggle between France and England, which he was trying to terminate, was being financed at the cost and to the prejudice of the church and the papacy is not surprising. In 1296 he issued the bull *Clericis Laicos*, which forbade under the sanction of automatic excommunication any imposition of taxes on the clergy without express license by the pope. This bull had some effect in England, chiefly because of its support by the archbishop of Canterbury, Robert Winchelsey; but in France there was no strong defender of papal prerogative against the concerted action of the King and his civil lawyers.

Conflicts with Philip IV of France. Philip IV countered or even forestalled the publication of *Clericis Laicos* with an order forbidding all export of money and valuables from France and with the expulsion of foreign merchants. Although these measures were a serious threat to papal revenues, they alone probably would not have forced Boniface to the far-reaching concessions that he had to grant the French king within the year, concessions that almost amounted to revocation of *Clericis Laicos*. The necessity of coming to terms was primarily the result of an insurrection against Boniface by a section of the Colonna family, a powerful anti-papal Roman family that included two cardinals, culminating in the armed robbery of a large amount of papal treasure in May 1297. A year of military action against the Colonna followed, which ended with their unconditional surrender. They were absolved from excommunication but were not reinstated in their offices and possessions; they therefore rebelled again and fled; some of them went to Philip, with whom they had conspired, perhaps, even before the issue of *Clericis Laicos*.

Boniface's first conflict with the French king was followed by an apparent reconciliation, which was emphasized by the Pope's canonization of Philip's holy ancestor Louis IX. A second conflict, which broke out in 1301 around the trumped-up charges against a southern French bishop, Bernard Saisset of Pamiers, and his summary trial and imprisonment, proved to be irreconcilable. Now the King threatened and meant to destroy one of the most fundamental gains that the papacy had made and maintained in the great struggles of the last two centuries: papal, rather than secular, control of the clergy. The Pope could not compromise here, and in the bull *Ausculta Fili* ("Listen Son") he sharply rebuked Philip and demanded amends, especially the release of the Bishop, who had appealed to Rome. Instead, the King's chancellor, Pierre Flotte, was allowed to circulate a distorted extract of the bull and thus to prepare public opinion for the great assembly of the States General (the legislative body of France) in April 1302, in which nobles and burghers enthusiastically, and the clergy reluctantly, supported the King.

Boniface, nevertheless, appears to have had good reason to hope for a favourable termi-

nation of the conflict, because Philip's army was shortly afterward disastrously defeated by a league of Flemish townspeople and because the German king and prospective emperor, Albert I of Habsburg, was ready to give up his French alliance if the Pope would recognize the contested legitimacy of his rule. This recognition was granted early in 1303 in terms that exalted the ideal and traditional, though rarely realized, harmonious relationship between the papacy and the Holy Roman Empire. This empire now was said by the Pope to possess—under ultimate papal supremacy—an overlordship over all other kingdoms, including France. In November 1302 Boniface had issued an even more fundamental declaration concerning the position of the papacy in the Christian world, the bull *Unam Sanctam* ("One Holy"), which has become the most widely known of all papal documents of the Middle Ages because of its allegedly radical and extreme formulation of the content of the papal office. The bull as a whole is indeed a strong but not a novel invocation of the supremacy of the spiritual over the temporal power. Nevertheless, the old Gelasian doctrine that both powers are distinct and both are from God is clearly stated, and in the final dogmatic sentence the Pope speaks not of the temporal power but of the human creature as the object of the papal plenitude of power, submission to which is said to be necessary for salvation.

Meanwhile in France, Philip IV's councillor Guillaume de Nogaret had taken Flotte's place as the leader of an actively anti-papal royal policy. Philip was supported in this policy by other enemies of the Pope, including the legate whom Boniface had dispatched to France in these critical months and who betrayed his master, the French cardinal Jean Lemoine (Johannes Monachus). Many unjustified accusations against Boniface, ranging from unlawful entry into the papal office to heresy, were raised against him at a secret meeting of the King and his advisers held in the Louvre at Paris; these accusations were to be taken up and elaborated upon later during the posthumous trial against the Pope pursued by Philip IV. Shortly after the Louvre meeting, at which Nogaret had demanded the condemnation of the Pope by a general council of the church, Nogaret went to Italy to stir up, if possible, rebellion against the Pope.

Boniface's capture. He was unsuccessful in this attempt, but when he learned that Boniface was about to publish a new bull announcing Philip's excommunication, Nogaret, with the assistance of Sciarra Colonna—a bold member of the powerful family—and with the connivance of some of the cardinals, decided to capture the Pope at Anagni, where the Pope was spending the summer. In this he succeeded through the momentary complicity of the local leaders of the city of Anagni, who, however, after two days changed their minds, rescued the Pope, and thus frustrated whatever further plans Nogaret may have had. During these two days Boniface, whom Sciarra Colonna would have killed but for Nogaret's wish to drag the Pope before a council, was probably physically ill-treated. He bore everything with great courage and patience. Boniface returned to Rome physically and mentally broken and died soon after.

During his reign, the so-called *Liber Sextus* ("Sixth Book") of the *Corpus Juris Canonici* (*Corpus of Canon Law*) was published. The Jubilee Year of 1300 was commemorated in a painting by Giotto, a fragment of which still survives in the basilica of S. Giovanni in Laterano. Boniface's sepulchre came from the workshop of Arnolfo di Cambio; his sarcophagus with his reclining statue is in the Vatican grottoes. Of the numerous memorial statues

erected in his honour by himself or others—and later used by his enemies to brand him as an idolater—several still survive. They are visual evidence for the fact, known also from other sources, that Boniface VIII extended the height of the papal tiara and increased the number of crowns that circle the tiara from one to two and perhaps to three, which is their number in modern times.

Assessment. The violent attack on Boniface VIII marks the first open rejection of papal spiritual dominance by the rising national monarchies of the West and, above all, by France. Boniface's assertions of papal plenitude of power did not go beyond those of his predecessors in the 13th century. They were in fact more moderate than, for instance, those of Innocent IV and were in any case well within the range of the opinions gradually elaborated in the schools of theology and canon law in the period between the age of Gregory VII, the great 11th-century reformer, and that of Boniface. Boniface's failure was not caused by any novelty of his views or claims but by changed circumstances, by his inability or unwillingness to gauge their significance adequately, and, last but not least, by his own character: conscious of his superior intellect and at the same time tormented by illness, he was impulsive to the point of imprudence and short-tempered to the point of uncharitableness. It was his exaggerated harshness against the Colonna—whose hatred for the Caetani pope was largely the result of conflicting interests of the two families—as well as his shortsighted underestimation of the ruthlessness of Philip IV of France and his helpers that led to the coalition of these two disparate forces and to the Pope's downfall. Boniface VIII's personal failings, however, can in no way exculpate Philip IV the Fair and his ministers, who used forgery, defamation, intimidation, and finally violence against the Pope.

BIBLIOGRAPHY. An excellent biography is T.S.R. Boase, *Boniface VIII* (1933). The following studies are concerned specifically with Boniface's quarrel with the French king Philip IV: A.F.J.P.M. de Lévis-Mirepoix, *Le Conflit entre la Papauté et le roi de France, 7 Septembre 1303* (1969); J. Rivère, *Le Problème de l'église et de l'état au temps de Philippe le Bel* (1926); and C.T. Wood, *Philip the Fair and Boniface VIII* (1967). Boniface's correspondence and promulgations may be studied in *Les Registres de Boniface VIII*, ed. by G.A.L. Digard et al., 4 vol. (1884-1939).

• **Boniface IX**, original name PIETRO TOMACELLI (b. c. 1355, Naples—d. Oct. 1, 1404, Rome), pope from 1389 to 1404; he was the second pontiff to rule in Rome during the Western Schism (1378-1417).

Created cardinal deacon early in life and cardinal priest by Urban VI in 1385, he succeeded Urban, whose disputed election was the

Boniface IX, detail from a statue, 14th century; in the basilica of St. Paul Outside the Walls, Rome

Ainari—Art Resource/EB Inc

original cause of the rupture between Rome and Avignon over legal claimants to the papal throne. Boniface, viewing the Schism as a political problem, resorted to all possible means of raising money in order to win allies against the Avignon antipopes Clement VII (whom he excommunicated) and Clement's successor, Benedict XIII. He not only failed to end the breach, but he also aroused hostility by his high-handed methods to raise the large sums of money required for his campaigns.

Boniface, SAINT, Latin BONIFATIUS, original name WYFRID, or WYNFRITH (b. c. 675, Wessex, England—d. June 5, 754, Dokkum, Frisia; feast day June 5), English missionary and reformer, often called the Apostle of Germany for his role in the Christianization of

St. Boniface baptizing converts into the German Church; detail from a manuscript from Fulda Abbey, 10th-11th century; in the Staatsbibliothek Bamberg (MS. Lit. 1)

By courtesy of the Staatsbibliothek Bamberg

that country. Boniface set the church in Germany on a firm course of undeviating piety and irrefragable conduct. In his letters and in the writings of his contemporaries, he appears as a man of purpose and dedication, an innovator with a powerful though willful personality.

Boniface belonged to a noble family of Wessex, England. He received an excellent education in the Benedictine abbeys of Adescancastre (Exeter) and Nhutselle (Nursling, between Winchester and Southampton) and became a Benedictine monk, being ordained priest at about the age of 30. From 716 to 722 he made two attempts to evangelize the Frisian Saxons on the Continent but was balked by their king, Radbod. On his return to England he learned that his abbot had died and that he had been elected in his stead—an honour he declined in favour of a second attempt at a missionary career. In 718 he accompanied a group of Anglo-Saxon pilgrims to Rome, where Pope Gregory II entrusted him with a mission to the pagans east of the Rhine, asking him only to use the Roman formula for Baptism, rather than the Celtic, and to consult with Rome on major problems arising from his work. Gregory II changed Wynfrid's name to Boniface. In the meantime, Radbod had died (719), and Boniface returned to Frisia to assist his countryman Bishop Willibrord in his missionary activities. In 722 he went to Hesse, where he established the first of many Benedictine monasteries as a means of consolidating his work.

So great was his success that he was called to Rome, where Gregory consecrated him a missionary bishop. The Pope also provided him with a collection of canons (ecclesiastical regulations) and letters of recommendation to such important personages as Charles Martel, master of the Frankish kingdom, whose protection was essential to Boniface's success.

It was the pagan awe of Martel's name that allowed Boniface to destroy the sacred oak of the Germanic god Thor at Geismar.

For 10 years (725-735) Boniface was active in Thuringia, converting pagans and renewing the faith of Christians who had been converted earlier by Irish missionaries, whose haphazard methods of evangelization were henceforth to be the bane of Boniface's life. He met opposition, he said, "from ambitious and free-living clerics" whom he pursued relentlessly, even when they appealed to the popes. On a later occasion, Pope Zachary was forced to moderate the zeal of Boniface, who requested not only excommunication but also solitary confinement for two "heretical" missionaries, Adalbert and Clement the Irishman—sentences that the Pope avoided imposing by deliberate delay. Boniface's handling of missionaries whose methods he deplored sheds light on his personality and temperament: he turned immediately to Rome, he expected prompt and ruthless action, and he seems at times to have been excessively severe in his judgments.

Boniface's career was assisted in a unique and moving way by his brother and sister Benedictines from England. They supported him by gifts and encouraged him by their faithful love, expressed in letters that were delightful in their openness and humanity. Their final expression of love for him was to cast their lots with him in Germany, where they formed the nucleus of four monasteries that served as centres of civilized Christian life.

Ordered by Pope Gregory III (731-741) to organize the church in Bavaria, Boniface initially established four bishoprics there. His work had far-reaching political repercussions, for his Christianization of Bavaria paved the way for the ultimate incorporation of the country into the Carolingian Empire. After 740 he added another see in Bavaria and also created three in central Germany. Aided by his new suffragan bishops—for such they were, in fact, though his appointment as archbishop of Mainz came later (751)—Boniface undertook the reform of the Frankish clergy and, wherever possible, of Irish missionaries. Between 740 and 745, five synods were convened for this purpose. In 747 a reforming council was held for the entire Frankish kingdom with the wholehearted collaboration of Carloman and Pepin, the sons and heirs of Charles Martel. Though Charles had protected Boniface, he had, at the same time, given church land to his magnates and used the discipline of the church as a means of taming recalcitrant Germanic tribes. Carloman and Pepin, on the other hand, made the decisions of the council of 747 binding in Frankish law.

Boniface's life ended in martyrdom at the hands of a band of pagan Frisians, who killed him as he was reading the Scriptures to Christian neophytes on Pentecost Sunday. Boniface had asked to be buried at Fulda, the monastery he had entrusted (744) to his Bavarian disciple Sturm. There his body rests in a magnificent baroque sarcophagus.

Organizer, educator, and reformer, Boniface profoundly influenced the course of intellectual, political, and ecclesiastical history in Germany and France throughout the Middle Ages. He unified the missionary movement by bringing it under the control of Rome. Through his monasteries, which furnished bishops and teachers for many generations, he significantly improved the quality of life in the Frankish kingdom.

Boniface OF QUERFURT, SAINT: see Bruno of Querfurt, Saint.

Boniface OF SAVOY (b. c. 1207—d. July 14, 1270, Sainte-Hélène, Savoy), archbishop of Canterbury who, because he was a foreigner and because he attempted to remedy the financial disarray of his see, won the enmity of the English clergy. He succeeded in repaying a portion of the immense debt incurred by his predecessor, Edmund of Abingdon, and is also remembered for the hospital he founded at Maidstone, Kent.

A son of the Count of Savoy, Boniface entered the Carthusian order in his childhood. He was elected bishop of Belley in Burgundy in 1234. After his niece married King Henry III of England, Boniface was, through the King's influence, chosen in 1241 to serve as archbishop of Canterbury. Circumstances prevented him from taking office until 1244; at that time he also made his first visit to England. Discovering that the see of Canterbury was deeply in debt, he proposed sweeping economies, including the abolition of certain church offices and the exacting of contributions from tenants and clergy.

Late in 1244 he left England to attend the Council of Lyon, where he obtained permission from Pope Innocent IV to institute further measures to raise funds for the see, among them the levying of contributions throughout the province. Upon returning to England in 1249, he came into conflict with local diocesan officials who refused to recognize his authority. In one instance, the dispute erupted into violence and resulted in the excommunication of the Bishop of London. Boniface left for Rome in 1252, to be present in his own defense at proceedings brought against him by his English opponents. A compromise was reached, and Boniface returned to England during the period from 1265 to 1269; he set out on a crusade with King Edward I but died en route. His feast day, July 14, is celebrated in Savoy and by the Carthusians.

Bonifacio, town, Corse-du-Sud *département*, Corse region, France, just west of Cap Perusato, southernmost point of the island of Corsica, giving its name to the strait (7.5 mi [12 km] wide) separating Corsica from the northern tip of Sardinia. The town is perched on a narrow limestone peninsula about 1 mi long that parallels the coast and forms a natural harbour. Founded about AD 828 as a defense against pirates, the town was taken from

Pisa at the end of the 12th century by the Genoese. Traditionally it has remained Genoese, the inhabitants speaking Genoese dialect and refusing to adopt such Corsican customs as the vendetta. Not linked to the rest of the island by rail, Bonifacio trades by sea, mostly with Sardinia, in cereals, wine, and cork. Pop. (1999) 2,661.

Bonifacio, Andres (b. Nov. 30, 1863, Manila—d. May 10, 1897, Mt. Buntis, Phil.), Philippine patriot, founder and leader of the nationalist Katipunan society, who instigated the revolt of August 1896 against the Spanish.

Bonifacio was born of poor parents in Manila and had little formal education, working as a messenger and warehouse keeper before becoming involved in revolutionary activity. He was, however, well-read. Unlike the nationalist poet and novelist José Rizal, who wanted to reform Spanish rule in the Philippines, Bonifacio advocated complete independence from Spain. In 1892 he founded the Katipunan in Manila, modelling its organization and ceremony on that of the Masonic order. The Katipunan at first grew slowly, but by 1896 it had an estimated 100,000 members and branches not only in Manila but also in central Luzon and on the islands of Panay, Mindoro, and Mindanao. Its members were mostly workers and peasants; the urban middle class supported reform rather than revolution.

In August 1896 Bonifacio led the long-planned insurrection on Luzon; but his forces were defeated by Spanish troops, and he was forced to retreat to Montalban in the north, while Emilio Aguinaldo, one of his lieutenants, carried on resistance. As the Spanish systematically routed the *insurrectos*, it became increasingly clear that Bonifacio was an ineffective military leader. In March 1897 a convention at Tejeros named Aguinaldo, rather than Bonifacio, president of a new Philippine republic. Refusing to recognize the convention, Bonifacio tried to establish his own rebel government. In April 1897 Aguinaldo had Bonifacio arrested and tried for treason; he was executed by a firing squad.

Bonin Islands, Japanese OGASAWARA-GUNTŌ, about 30 volcanic islands and islets in the central Pacific Ocean, 500 mi (800 km) southeast of Japan. They can be divided into three main groups: Chichijima-rettō (Beechey Group: Ani-jima, Chichi-jima), Mukojima-rettō (Parry Group: Muko-jima), and Hahajima-rettō (Baily Group: Haha-jima). The highest point (1,500 ft [450 m]) is on Haha-jima. A part of Tokyo Metropolis (*to*) before World War II, they were afterward placed under U.S. military control until returned to Japan in 1968. They are now under a common administration with Minami-Torishima (Marcus

Island) and the Volcano Islands (Kazan-rettō). The largest island, Chichi-jima (9.5 sq mi [25 sq km]), has the best anchorage, Futami-byōchi (Port Lloyd Harbour).

Discovered by the Spanish navigator Ruy Lopez de Villalobos in 1543, the islands, which command a strategic position astride the Pacific approaches to East Asia, were vaguely claimed by the U.S. (1823) and Britain (1825) but were formally annexed by Japan (1876). Only 11 percent of their total land area (28 sq mi) is arable, the remainder being hilly and forested. Valuable stands of timber include cedar, rosewood, ironwood, boxwood, sandalwood, and white oak. Whaling is conducted offshore. Pop. (1995 prelim.) 2,809.

Bonington, Richard Parkes (b. Oct. 25, 1801, Arnold, near Nottingham, Nottinghamshire, Eng.—d. Sept. 23, 1828, London), English Romantic painter, known for his landscapes and historical scenes. His style attracted many imitators in both England and France, and he exercised an influence out of all proportion to his brief life.

At Calais, Fr. (c. 1817), Bonington learned the watercolour tradition of the English painter Thomas Girtin. He became acquainted with the French painter Eugène Delacroix in Paris. Bonington entered the École des Beaux-Arts, Paris (1819), and joined the atelier of Baron Gros, who had departed from the rigid classicism of the influential Jacques-Louis David. Bonington's bright watercolours, a novelty in Paris, financed sketching tours in Normandy, Picardy, and Flanders (1821–23). He showed at the Paris Salon in 1822 and at the famous Salon of 1824 with John Constable, Sir Thomas Lawrence, and others, where he won a gold medal. With Delacroix he studied Constable, and together they went to England (1825), where Bonington learned something of Turner's skill. More important, both were affected by the English fashion for painting scenes from history. In his subsequent historical pictures, he evolved in oil a new synthesis of Flemish and Venetian techniques. His works were exhibited in London (1826, 1828) and won immediate popularity.

As a master of the Romantic movement and as a technical innovator in oil and watercolour, Bonington was influential in England and France. His gifts as a draftsman were high; as a colourist, good. He also showed his talent in the new medium of lithography, illustrating Sir Walter Scott. A. Dubuisson's *Richard Parkes Bonington, His Life and Work* was translated by C.E. Hughes (1924). There is also a study by A. Shirley, *Bonington* (1940).

bonito (*Sarda*), tuna-like, schooling fish of the tuna and mackerel family, Scombridae (order Perciformes). Bonitos are swift, predacious

Atlantic bonito (*Sarda sarda*)

Painting by Richard Ellis

fishes found worldwide. They have striped backs and silvery bellies and grow to a length of about 75 centimetres (30 inches). Like tunas, they are streamlined, with a narrow tail base, a forked tail, and a row of small finlets behind the dorsal and anal fins. Bonitos are of both commercial and sporting value. Three species are generally recognized: *S. sarda* of the Atlantic and Mediterranean; *S. orientalis* of the Indo-Pacific; and *S. chilensis* of the Pacific.

The leaping bonito (*Cybiosarda elegans*) is a

related Indo-Pacific food and sport fish. The oceanic bonito is the skipjack tuna (see tuna).

Bonivard, François (b. 1493, Seyssel, Savoy [France]—d. 1570, Geneva [Switzerland]), Genevan patriot, the hero of Lord Byron's poem "The Prisoner of Chillon."

Bonivard's real character and history are very different from the legendary account that Byron popularized. After succeeding his uncle as head of the Cluniac priory of St. Victor, near Geneva, he began to oppose the encroachments made by Charles III, duke of Savoy, and the bishop of Geneva against that city's liberties. He was imprisoned by the duke at Grolée from 1519 to 1521, lost his priory, and became more and more anti-Savoyard. In 1528, supported by the city of Geneva, he took up arms against those who had seized his ecclesiastical revenues; in 1530, however, he was imprisoned in the castle of Chillon, where he was kept underground from 1532 until he was released in 1536.

Becoming a Protestant, Bonivard obtained a pension from Geneva. In 1542 he began compiling his *Chroniques de Genève*, a history of Geneva from the earliest times. His manuscript was submitted to the Reformer John Calvin for correction in 1551 but was not published until 1831. He also wrote *De l'ancienne et nouvelle police de Genève* (1555; "The Old and New Government of Geneva").

Bonn, city, North Rhine–Westphalia *Land* (state), Germany. The city is located on the Rhine River, about 15 miles (24 km) south of Cologne. From 1949 to 1990 it was the provisional capital of West Germany, and it

The University of Bonn
O.J. Troisfontaines—Shostal Assoc.

served as the seat of the German federal government from 1990 until 1999/2000, when the government completed its move to Berlin (designated the capital in 1991).

The oldest settlement known by the name of Bonn was a river crossing discovered by Roman legionaries in the 1st century BC. The settlement itself probably disappeared soon afterward, but its name was continued in Castra Bonnensia, a fortress built by the Romans in the 1st century AD. Castra Bonnensia survived the breakup of the Roman Empire as a civilian settlement, and in the 9th century it became the Frankish town of Bonnburg.

Bonn grew in importance from the 13th century, becoming the capital of the Electorate and Archbishopric of Cologne, which was then a sovereign state in its own right. This era ended in 1794, when the French Revolutionary forces occupied the city. In 1815 Bonn was awarded to Prussia by the Congress of Vienna. There was little development until the second half of the 19th century, when the city became a fashionable residential town. It was severely damaged during World War II. Development was accelerated after 1949, when

Bonn was chosen as the provisional capital of West Germany, and in 1969 it was amalgamated with the towns of Bad Godesberg and Beuel and several small parishes.

Those responsible for economic development in the late 19th century did their utmost to keep large industries out to preserve the city's attractions as a residential town for the rich. As a result, Bonn developed only limited light industry. Typical products were laboratory equipment, switchgear, organs, and flags. By far the most important employer was the service industry, which included the many organizations associated with Bonn's function as a capital. Agricultural products are supplied mainly by the neighbouring villages.

The federal legislative bodies (Bundestag and the Bundesrat) and the executive offices of the federal president and chancellor all were located in Bonn during its period as the capital, and it also accommodated a large number of foreign embassies, regional institutions, and local and regional courts. Although Berlin became the capital, Bonn continued to be the site of a number of federal institutions; the service sector still dominates the city's economy. National and international travel facilities, provided mainly by the Federal Railways and by Cologne Airport, are well developed.

As Ludwig van Beethoven's birthplace, Bonn is devoted to the promotion of the musical arts. It maintains a municipal orchestra and arranges numerous national and international concerts. The Beethovenhalle, a modern concert hall, is the centre of Bonn's musical life.

Prominent historic buildings are the cathedral, a Romanesque basilica (11th–13th century) surmounted by five towers, of which the central one (315 feet [96 m] high) is a landmark in the Rhine River valley, and the old village churches of Muffendorf (10th century), Vilich (11th century), and Schwarz Rheindorf (12th century). The former Electoral Palace (now the Rhenish Friedrich Wilhelm University of Bonn [founded 1786]) and the Poppelsdorf Palace, with its botanical gardens, along with the city's beautiful avenues and parks, are reminders of the electoral and archiepiscopal capital. Recreational areas include the forests of Venusberg, Kreuzberg, Kottenforst, and Ennert on the southern and western fringes of the city. Beyond the city, the mountain country of the Westerwald and the Eifel are within easy reach. Pop. (2002 est.) city, 306,016.

Bonnard, Pierre (b. Oct. 3, 1867, Fontenay-aux-Roses, France—d. Jan. 23, 1947, Le Cannet), French painter and printmaker, member of the group of artists called the Nabis and afterward a leader of the Intimists; he is generally regarded as one of the greatest colourists of modern art. His intimate, sunlit domestic interiors and still lifes include "The Dining Room" (1913) and "Bowl of Fruit" (c. 1933).

After taking his baccalaureate, Bonnard studied law at the insistence of his father, and for a short time in 1888 he worked in a government office. In the meantime he attended the École des Beaux-Arts, but, failing to win the Prix de Rome (a prize to study at the French Academy in Rome), he transferred to the Académie Julian, where he came into contact with some of the major figures of the new artistic generation—Maurice Denis, Ker-Xavier Roussel, Paul Sérusier, Édouard Vuillard, and Félix Vallotton. In 1890, after a year's military service, he shared a studio in Montmartre with Denis and Vuillard. Later they were joined by the theatrical producer Aurélien-Marie Lugné-Poe, with whom Bonnard collaborated on productions for the Théâtre de l'Oeuvre, in Paris. At this time he became influenced by Japanese prints, which had earlier attracted the Impressionists.

During the 1890s Bonnard became one of the leading members of the Nabis, a group of artists who specialized in painting intimate

"Flowering Almond Tree," oil on canvas by Bonnard, 1946; in the National Museum of Modern Art, Paris

domestic scenes as well as decorative curvilinear compositions akin to those produced by painters of the contemporary Art Nouveau movement. Bonnard's pictures of charming interiors lighted by oil lamps, nudes on voluptuous beds, and Montmartre scenes made him a recorder of France's Belle Époque. It was typical of his humour and taste for urban life at the time that he illustrated *Petites Scènes familiaires* and *Petit Solfège illustré* (1893), written by his brother-in-law Claude Terrasse, and executed the lithograph series *Quelques Aspects de la vie de Paris* ("Aspects of Paris Life"), which was issued by the art dealer Ambroise Vollard in 1899. He also contributed illustrations to the celebrated avant-garde review *La Revue blanche*. A new phase in book illustration was inaugurated with Bonnard's decoration of the pages in Paul Verlaine's book of Symbolist poetry, *Parallèlement*, published by Vollard in 1900.

Bonnard's ability as a large-scale decorator is sometimes overlooked, in view of his more quiet, domestic paintings in the Intimist style. But about 1906 he painted "Pleasure, Study, Play, and the Voyage," a series of four decorations made to resemble tapestries, for the salon of Misia Natanson. These pictures show that he was an heir to the French grand tradition of pictorial design that may be traced to Charles Le Brun, the director of all artistic activity under Louis XIV, and François Boucher, the most fashionable painter in the mid-18th century.

By about 1908 Bonnard's Intimist period had concluded. A picture such as "Nude Against the Light" (1908) was painted not only on a bigger scale but also with broader and more colouristic effects. Because of his increasing interest in landscape painting, he had begun painting scenes in northern France. In 1910 he discovered the south of France, and he became the magical painter of this region. The Mediterranean was considered by many of the period to be a source of French civilization. Bonnard was eager to emphasize the connections between his art and France's classical heritage. This was evident in the pose of certain of his figures, which hark back to ancient Hellenistic sculpture. He was also enamoured of the colouristic tradition of the 16th-century Venetian school. "The Abduction of Europa" (1919), for example, is in a direct line of descent from the work of Titian.

The subjects of Bonnard's pictures are simple, but the means by which he rendered such familiar themes as a table laden with fruit or a sun-drenched landscape show that he was one of the most subtle masters of his day; he was particularly fascinated with tricks of perspective, as the Postimpressionist painter Paul Cézanne had been. In "The Dining Room" (1913), for example, he employed different levels of perspective and varied the transitions of tone, from warm to cool.

By about 1915 Bonnard realized that he had tended to sacrifice form for colour, so from that point until the late 1920s he painted nudes that reflect a new concern for structure without losing their strong colour values. In the 1920s he undertook a series of paintings on one of his most famous themes—a nude in a bath. From the end of the 1920s onward, the subject matter of his pictures hardly varied—still lifes, searching self-portraits, seascapes at Saint-Tropez on the Riviera, and views of his garden at Le Cannet, near Cannes, where he had moved in 1925 after marrying his model and companion of 30 years, Maria Boursin. These are paintings intense with colour.

The chronological order of Bonnard's paintings is difficult to determine, for he would make sketches in pencil or colour and then use them as the basis for several pictures on which he would work simultaneously. When working in the studio, he would rely on his memory of the subject and constantly retouch the surface, building up a mosaic of colours. It is impossible, therefore, to give more than approximate dates for many of his works. In 1944 Bonnard illustrated a group of early letters, which were published in facsimile under the appropriate title of *Correspondances. Formes et couleurs*.

(D.Su.)

Newman (ed.), *Bonnard: The Late Paintings* (1984); Françoise Heilbrun and Philippe Négau, *Pierre Bonnard Photographs and Paintings* (1988); and Colta Ives, Helen Giambruni, and Sasha M. Newman, *Pierre Bonnard: The Graphic Work* (1989).

Bonnat, Léon, in full LÉON-JOSEPH-FLORENTIN BONNAT (b. June 20, 1833, Bayonne, France—d. Sept. 8, 1922, Monchy-St-Éloi), notable French portrait painter and teacher.

Bonnat studied under Federico Madrazo in Madrid and, sponsored by the city of Bayonne, under Léon Cogniet in Paris. His earlier works are religious paintings in which his study of Spanish Baroque art is evident. His later and better-known portrait series was begun in 1875. In these he drew inspiration from Velázquez and the Spanish realists. His subjects included Adolphe Thiers, Victor Hugo, Hippolyte Taine, Louis Pasteur, J.-A.-D. Ingres, and other contemporaries. He painted about 200 portraits, most of them featuring photographically accurate draftsmanship and subdued colouring.

In 1888 Bonnat became professor of painting at the École des Beaux-Arts and became its director in 1905. His excellent and wide-ranging art collection is part of the Bonnat Museum in Bayonne.

Bonne, François de: see Lesdiguières, François de Bonne, Duke de.

Bonnefoy, Yves (b. June 24, 1923, Tours, France), perhaps the most important French poet of the latter half of the 20th century. Bonnefoy was also a respected critic and scholar, as well as a fine translator.

Bonnefoy's father was a railroad employee, his mother a teacher. After studying mathematics at the University of Poitiers, the young poet moved to Paris, where he came under the influence of the Surrealists. His first poetry collection, *Du mouvement et de l'immobilité*

de Douve (1953; *On the Motion and Immutability of Douve*) explored the relation of poetry to life. In Bonnefoy's thought, poetry might be said to be a closed universe that only lives when it is shattered by an intuition of the "real world." He spoke of poetry as at its best expressing "du temps transfiguré par l'instant" ("time transfigured by the moment"), a conceptual, progressive world shattered and enlivened by an instant's intuition brought by a ray of sun or other phenomenon of the natural world. His own poetry beautifully illustrated his thought in several volumes, including *Ce qui fut sans lumière* (1987; *In the Shadow of Light*) and *Début et fin de la neige* (1991; *The Beginning and End of Snow*).

Bonnefoy held the chair in comparative poetics at the Collège de France between 1981 and 1994. His criticism explored painting as well as literature, and several of his essays were brought together in the English-language volume *The Lure and the Truth of Painting* (1995). He also compiled the *Dictionnaire des mythologies et des religions des sociétés traditionnelles et du monde antique* (1981; "Dictionary of Mythologies and Religions of Traditional Societies and the Ancient World," Eng. trans. *Mythologies*).

Bonner, Edmund, Bonner also spelled BONER (b. c. 1500—d. Sept. 5, 1569, London, Eng.), bishop of London who supported Henry VIII's antipapal measures but rejected the imposition of Protestant doctrine and worship during the reigns of Edward VI and Elizabeth I. For centuries Bonner, on the basis of evidence from his contemporary, the Protestant martyrologist John Foxe, was characterized as a monster who enjoyed burning Protestants at the stake during the reign of the Roman Catholic Mary I.

Bonner became an outstanding Oxford lawyer, and from 1532 to 1543 he served Henry VIII on various foreign embassies, including several to Pope Clement VII to plead for an annulment of Henry's marriage to Catherine of Aragon. Having supported Henry when the king took control of the English church, Bonner was made bishop of London in 1540. But upon the accession of Edward VI, Bonner felt he could no longer accept royal supremacy in religious matters. He was deprived of his London bishopric and imprisoned from 1549 to 1553. Restored to his see after the accession of Mary Tudor, he was rebuked for his reluctance to intensify the prosecution of Protestants in London, but subsequently he became actively involved. At the beginning of Elizabeth's reign he refused to acknowledge her supremacy over the English church, and he spent the last 10 years of his life in the Marshalsea Prison in London.

Bonner Durchmusterung (BD), English BONN SURVEY, star catalog showing the positions and apparent magnitudes of 324,188 northern stars. Compiled at Bonn under the direction of the German astronomer F.W.A. Argelander, it required 25 years' work and was published in 1859–62 and the accompanying charts in 1863. The catalog, which consisted of 325,037 stars in 1989, was periodically updated and reissued. Cf. Córdoba Durchmusterung.

Bonnet, Charles (b. March 13, 1720, Geneva, Switzerland—d. May 20, 1793, near Geneva), Swiss naturalist and philosophical writer who discovered parthenogenesis (reproduction without fertilization) and developed the catastrophe theory of evolution.

Though Bonnet was a lawyer by profession, his favourite pursuit was natural science. Concentrating first on entomology, he studied the habits of the aphid and found that the female insect was able to reproduce without fertilization by the male. In 1742 he discovered that caterpillars and butterflies breathe through pores, which he named stigmata. Bonnet next

turned to botany, studying the structures and functions of leaves.

Approaching blindness forced him to change his emphasis once more, this time to philosophy. Affected by his observation of the aphid,

Charles Bonnet, lithograph by J.-H. Deville, 1843, after a portrait by J. Juel
By courtesy of the Bibliothèque Nationale Suisse, Bern

Bonnet argued, in *Considérations sur les corps organisés* (1762; "Considerations on Organized Bodies"), that each female organism contains within its germ cells (*i.e.*, eggs) an infinite series of preformed individuals, leading to an immortality and immutability of species. He responded to fossil evidence of extinct species with *La Palingénésie philosophique* (1769; "The Philosophical Revival"), in which he theorized that the Earth periodically suffers universal catastrophes, destroying most life, and that the survivors move up a notch on the evolutionary scale. Bonnet was the first to use the term *evolution* in a biological context. His *Essai de psychologie* (1754) and *Essai analytique sur les facultés de l'âme* (1760; "Analytical Essay on the Powers of the Soul") anticipated physiological psychology.

Bonnet, Georges-Étienne (b. July 23, 1889, Bassillac, France—d. June 18, 1973, Paris), leader in the French Radical-Socialist Party and minister of foreign affairs immediately preceding World War II, who was a prominent supporter of appeasement of Nazi Germany.

Bonnet studied at the Sorbonne, graduating in law and political science. His marriage to the niece of a prominent politician launched his political career. After minor ministerial and legal positions, he was elected to the Chamber of Deputies (1924–28 and 1929–40). Appointed undersecretary of state in 1925, he continued to serve in high ministerial positions throughout the 1930s and was named ambassador to the United States in 1936.

Georges-Étienne Bonnet, 1943
H. Roger-Viollet

After the defeat of Léon Blum's Popular Front government in 1937, Bonnet was named finance minister under Camille Chautemps. In April 1938 he became foreign minister under Édouard Daladier and supported the Munich Agreement, which allowed

Adolf Hitler to occupy the Czech Sudetenland. Bonnet continued to pursue a program of appeasement until the outbreak of World War II in September 1939, when he was demoted to justice minister. He left that post on the resignation of Daladier in March 1940. Bonnet supported the Vichy regime, and was appointed to the National Council (1941–42). Yet he refused other office and left France before the Allied invasion. Expelled from the Radical Party in 1944, he was readmitted in 1952 only to be expelled again in 1955 for his opposition to Pierre Mendès-France. Later, he was again elected to the Chamber of Deputies (1956–68). *Le Quai d'Orsay* (1961) is a book of memoirs.

Bonnet Carre Spillway, also called BONNET CARRE FLOODWAY, emergency floodway in St. Charles parish, southeastern Louisiana, U.S. Located about 30 miles (50 km) upstream from New Orleans, it is designed to divert water from the Mississippi River to Lake Pontchartrain. The spillway consists of a concrete dike along the east (left) bank of the Mississippi and the spillway itself, a broad lowland that extends northeastward for about 6 miles (10 km) to the lake and is contained by levees. The dike is some 7,700 feet (2,350 metres) long and contains 350 bays, or weirs, which are opened and closed by means of timbers. When fully opened, the spillway can divert some 250,000 cubic feet (7,100 cubic metres) of water per second.

The spillway was built in 1929–31 by the U.S. Army Corps of Engineers. It became part of the federal Mississippi River and Tributaries Project, a flood-control program for the Mississippi basin to replace the levee system constructed in the 18th and 19th centuries. The spillway has saved New Orleans from considerable damage during floods since the weirs were first opened in 1937. The corps maintains and operates the dike structure under the direction of the federal Mississippi River Commission.

bonnet monkey (*Macaca radiata*), macaque of southern India named for the thatch of long hair forming a cap, or "bonnet," on the head. The bonnet monkey is grayish brown with a hairless pink face. It is about 35–60 cm (14–24 inches) long, excluding its long tail. Adult fe-

Bonnet monkeys (*Macaca radiata*)

males weigh about 4 kg (9 pounds), adult males 6.7 kg (15 pounds). This agile monkey sometimes raids gardens or stores of food.

bonnet shell, any of certain small marine mollusks of the helmet shell (*q.v.*) group.

Bonneville, Benjamin-Louis-Eulalie de (b. April 14, 1796, Paris or nearby, Fr.—d. June 12, 1878, Fort Smith, Ark., U.S.), U.S. army engineer and frontiersman who gained contemporary fame as an explorer of the Rocky Mountains. Historical reevaluation of his activities, however, has virtually destroyed the romanticized, heroic image of him that had been established chiefly through the author Washington Irving's editing of his journals, *The Adventures of Capt. Bonneville, U.S.A., in the Rocky Mountains and the Far West* (1837).

Bonneville, Lake, prehistoric lake, formed about 30,000 years ago (late in the Pleistocene Epoch), that at high water covered an estimated 20,000 square miles (52,000 square km), embracing much of what is now the western half of Utah and parts of Nevada and Idaho in the United States. Surviving remnants are the freshwater Utah Lake and the saline Great Salt and Sevier Dry lakes. Deposits from its tributaries created deltas and canyon mouths where all of Utah's principal cities have been built and where most of the state's irrigable land is found. The Great Salt Lake in the northwestern part of the Lake Bonneville region is today the site of major chemical industries that use its brines to produce potassium sulfate and sodium sulfate as well as salt. To the southwest is the Great Salt Lake Desert, covering about 4,000 square miles (10,000 square km) and including the Bonneville Salt Flats.

Bonneville Salt Flats, stretch of barren salt flats covering about 100 square miles (260 square km) in Tooele county, northwestern Utah, U.S., east of Wendover. The flats, part of the Great Salt Lake Desert, are a remnant of the bed of an ancient lake formed about 30,000 years ago late in the Pleistocene Epoch and named for B.-L.-E. de Bonneville, an explorer and fur trader. The site of Bonneville Speedway, the extremely level, smooth flats are as solid as concrete by the summer's end and are ideally suited for speed trials; several world automobile and motorcycle speed and endurance records have been established there.

Bonnie Prince Charlie: see Charles Edward, the Young Pretender.

Bonny, formerly called IBANI or UBANI, town and Atlantic oil port situated in Rivers state, southern Nigeria. It lies along the Bonny River (an eastern tributary of the Niger River) 6 miles (10 km) upstream from the Bight of Biafra. A traditional trading centre (fish, salt, palm oil, and palm kernels) of the Ijo people, it was the capital of the 15th- to 19th-century kingdom of Bonny and reached its height in the reign of the Pepple dynasty (18th and early 19th centuries). The economy of both the city and the kingdom was based on the sale of slaves to European traders. It was one of the largest slave-exporting depots of West Africa. When slave trade was ended, Bonny became a major exporter of palm products. It remained an important port until 1916, when it was eclipsed by Port Harcourt, 35 miles (56 km) upstream.

Since 1961 it has been the chief shipper of oil from the Niger River delta, and in 1964 its harbour was enlarged to accommodate vessels of up to 35-foot (11-metre) draft. The port has numerous storage tanks for the oil brought in by pipelines. Pop. (latest est.) 9,186.

Bonny, Bight of (Atlantic Ocean): see Benin, Bight of.

Bono, Akan state of West Africa from the 15th to the 18th century, located between the forests of Guinea and the savannas of The Sudan in what is now Brong-Ahafo Region in the Republic of Ghana.

Bono was probably founded about 1450, and its rise was undoubtedly connected with the developing gold trade of Bighu, a Malian Muslim or Dyula commercial centre 40 miles (64 km) to the northwest. From there Muslim traders came to Bono soon after its foundation, and many members of the royal household were later converted to Islam.

The kings of Bono are said to have played a major role in the gold-mining industry: both Obunumankoma (fl. c. 1450–75) and 'Ali Kwame (fl. c. 1550–60) are thought to have introduced new mining techniques from the western Sudan to the Akan fields, while Owusu Aduam (fl. c. 1650) is reported to have completely reorganized the industry. From the Akan fields the gold passed through the entrepôts of the western Sudan along the trade routes of the Sahara to the terminal ports of North Africa and from there to Europe and elsewhere. Bono engaged in wars with Jakpa of Gonja and was finally subjugated by Opoku Ware of Ashanti in 1722–23.

bonobo (*Pan paniscus*), also called PYGMY CHIMPANZEE, an ape that until 1933 was regarded as a subspecies of the chimpanzee (*P. troglodytes*). The bonobo is found only in lowland rainforests along the Congo River in Congo (Kinshasa). Closely resembling the chimpanzee in physical appearance and mode of life, the bonobo is more slender, with longer limbs, a narrower chest, and a rounder head with a flatter face. They are slightly lighter than chimpanzees—males weigh around 39 kg (86 pounds) and females about 31 kg (67 pounds) but both stand about 115 cm (3.8 feet) tall when erect.

Bonobos feed mostly in trees and descend to the ground to move to other trees. They eat mostly fruit, herbs, and roots, supplementing their diet with invertebrates, such as caterpillars and earthworms. Unlike chimpanzees, bonobos do not hunt monkeys but instead play with and groom them. Furthermore, the phenomena of infanticide, cannibalism, and lethal invasion seen among chimps have never been observed among bonobos. The egalitarian and peaceful bonobo society may be a result of reduced competition for food, which is plentiful.

Bonobos are active during the day, moving on all fours by knuckle-walking. They build sleeping nests at night. Communities of bonobos usually numbering 30–80 individuals occupy a home range of 12–20 square km (7–22 square miles) or larger. Each community is itself composed of smaller "parties" who forage together but whose membership is continually changing. Bonobo females and their young form the core of most groups, and males tend to follow mature females. Males groom and share food least frequently with other males, whereas females groom and share food mostly with other females. Female bonobos are sexually active for more of the time than female chimpanzees; they bear offspring at roughly five-year intervals and resume copulation within a year of giving birth.

Owing largely to illegal hunting and human destruction of its habitat, the bonobo is an endangered species. At the turn of the 21st century their population was estimated at fewer than 40,000.

Bonomi, Ivanoe (b. Oct. 18, 1873, Mantua, Italy—d. April 20, 1951, Rome), statesman who served terms as Italian prime minister before and after the Fascist regime of Benito Mussolini and who led the anti-Fascist movement during World War II.

Elected to Parliament in 1909 as Socialist deputy for Mantua, he was expelled from the

Bonomi
B. Pellegrini

Socialist Party in 1912 with the reform leader Leonida Bissolati for his moderate, democratic views, joining the Reformist Socialist group. During World War I he served as a volunteer and became war minister in 1920 in the government of Giovanni Giolitti, negotiating the Treaty of Rapallo between Italy and Yugoslavia. Made prime minister in July 1921, with a coalition government, he was unable to control Fascist and Socialist excesses and resigned in February 1922, retiring from politics after Benito Mussolini's accession to power. In 1940 he joined the anti-Fascist movement, becoming its leader in 1942. After Mussolini's fall on July 25, 1943, he headed the national committee of anti-Fascist groups and, after the liberation of Rome (June 9, 1944), was designated prime minister by the National Committee of Liberation. The committee, however, soon began to press for a more vigorous policy, and Bonomi resigned on Nov. 26, 1944, to be reinstated shortly after through the intervention of the British government.

Bonomi laid the foundations of Italy's economic and administrative reconstruction and began the reorganization of the army. On June 12, 1945, he resigned in favour of Ferruccio Parri, but, as chairman of the Constituent Assembly's committee for treaties, took part in the council of foreign ministers at Paris in 1946. From 1948 until his death he served as president of the Senate.

Bononcini, Giovanni, Bononcini also spelled BUONONCINI (b. July 18, 1670, Modena, Duchy of Modena—d. July 9, 1747, Vienna), composer, chiefly remembered as Handel's rival in England. He studied with his father, composer and theoretician Giovanni Maria

Giovanni Bononcini, drawing by Joseph Symphon the Younger
The Andre Meyer Collection—J. P. Ziolo

Bononcini, and later at Bologna. Precocious musical gifts won him his first appointment, as a cellist, in 1687, and he soon became *maestro di cappella* of S. Giovanni in Monte. He moved to Rome about 1691 and in 1698,

after a brief period in Venice, settled in Vienna with his brother, the composer Antonio Maria Bononcini.

In 1720 he was invited to London by the new operatic organization, the Royal Academy of Music. His rivalry with Handel and their backing by opposed political and social factions ended in defeat for Bononcini. His backers were a group of noblemen; Handel was backed by the king. A three-act opera, *Muzio Scevola*, was looked upon as a public competition, with Bononcini and Handel composing the second and third acts, respectively. Handel was judged the winner. This reverse and others led to Bononcini's loss of support.

Eight of his operas were produced in London, the most successful being *Astarto*, *Crispo*, and *Griselda*. Other compositions of this period include an anthem on the death (1722) of the Duke of Marlborough and harpsichord and chamber music. In the early 1730s he went to Paris, leaving England in disgrace after submitting to the Academy of Ancient Music as his own composition a madrigal actually written by Antonio Lotti. His last work, *Te Deum*, was written in Vienna in the 1740s.

Though he was a prolific and gifted composer, Bononcini's abilities are dwarfed by comparison with Handel's. Only in opera, where both used the same highly conventionalized idiom, are the two men comparable. Nonetheless, Bononcini achieved a simple and fluent melodic style and the ability to write well for his singers.

bonsai (Japanese: "tray-planted"), living dwarf tree or trees or the art of training and growing them in containers.

Bonsai pine
Judith Groffman

Bonsai specimens are ordinary trees and shrubs, not hereditary dwarfs; they are dwarfed by a system of pruning roots and branches and training branches by tying with wire. The art originated in China, where, perhaps over 1,000 years ago, trees were cultivated in trays, wooden containers, and earthenware pots and trained in naturalistic shapes. Bonsai, however, has been pursued and developed primarily by the Japanese. The first Japanese record of dwarfed potted trees is in the *Kasuga-gongen-genki*, a picture scroll by Takashina Takakane (1309).

The direct inspiration for bonsai is found in nature. Trees that grow in rocky crevices of high mountains, or that overhang cliffs, remain dwarfed and gnarled throughout their existence. The Japanese prize in bonsai an aged appearance of the trunk and branches and a weathered character in the exposed upper roots. These aesthetic qualities are seen to embody the philosophical concept of the mutability of all things.

Bonsai may live for a century or more, and be handed down from one generation to another as valued family possessions. Aesthetics of scale call for short needles on conifers and relatively small leaves on deciduous trees. Small-flowered, small-fruited varieties of trees

are favoured. Open space between branches and between masses of foliage are also important aesthetically. In diminutive forests the lower portions of the trunks should be bare.

Good bonsai specimens are usually hardy species that can be kept outdoors the year round wherever winters are mild. They can be brought into the house occasionally for appreciation and enjoyment. In Japan they are customarily displayed in an alcove or on small tables in a living room and later returned to their outdoor bonsai stands.

The selection of the appropriate container in which to cultivate a bonsai is an essential element of the art. Bonsai pots are usually earthenware, with or without a colourful exterior glaze. They may be round, oval, square, rectangular, octagonal, or lobed and have one or more drainage holes in the bottom. Containers are carefully chosen to harmonize in colour and proportion with the tree. If the container is rectangular or oval, the tree is planted not quite halfway between the midpoint and one side, according to the spread of the branches. In a square or round container the tree is placed slightly off centre, except for cascade types, which are planted toward the opposite side of the container from which they overhang. Bonsai are trained to have a front, or viewing side, oriented toward the observer when on exhibit.

Miniature bonsai range up to 2 inches (5 centimetres) in height, and, started from seeds or cuttings, take three to five years to come to quality stage. They may live several decades. Small bonsai, 2 to 6 in. in height, require 5 to 10 or more years to train. Medium bonsai, 6 to 12 in. in height, or average bonsai, up to about 2 feet (60 centimetres), can be produced in as little as three years.

Naturally dwarfed trees collected in the wild frequently fail to adapt to cultivation as bonsai because of the severe shock brought about by the change of environment and substrate.

Bonsai must be repotted every one to five years, depending on the species and extent of root growth. Gradual root pruning during transplanting in subsequent years reduces the size of the soil ball so that the tree can ultimately go into the desired small and shallow container. Water is provided as frequently as for other plants; liquid fertilizer is also used. Pruning and nipping of shoots is performed through the growing season.

A bonsai industry of considerable size exists as part of the nursery industry in sections of Japan; the technique is also pursued on a small industrial scale in California.

Bonstetten, Karl Viktor von, also called CHARLES VICTOR VON BONSTETTEN (b. Sept. 3, 1745, Bern—d. Feb. 3, 1832, Geneva), Swiss writer (in both French and German) of wide cosmopolitan interests and outlook.

Of a conservative and patrician family, Bonstetten for 12 years had to resist being

Bonstetten, lithograph by P.E. Bovet, after a portrait by Munier

By courtesy of the Bibliothèque Nationale Suisse, Bern

forced into the traditional career of municipal magistrate. Instead he studied Horace and Jean-Jacques Rousseau, traveled abroad, and cultivated friendships in the liberal intellectual circles of Geneva (1763–67), Leiden, England, France, Germany, and Italy. After his return to Bern and his father's death (1773), he at last entered provincial politics. He became an enlightened administrator, first of Saanen (1779), then of Nyon (1787), and, finally, a judge in the canton of Ticino (1795–97). After the French invasion and the collapse of the ancien régime in 1798, he went to Denmark, spending three years there before settling in Geneva. His charm and cosmopolitan temperament made him an outstanding member of the international elite and are revealed in his wide correspondence and in various books, which were forerunners of modern comparative studies of national characteristics. The best of them is *L'Homme du midi et l'homme du nord; ou, l'influence des climats* (1824; "The Man of the Midi and the Man of the North; or, The Influence of Climates"). He also wrote philosophical works and autobiographical sketches.

bontebok, antelope that is classed as a type of sassaby (*q.v.*).

Bontebok National Park, national park in Western Cape province, South Africa. It occupies 12 square miles (32 square km) in the Breë (Breede) River valley south of the Langeberg mountains. The park, established in 1931, was moved to its present site in 1960. It is a reserve for the rare bontebok antelope and small numbers of other antelope, including the rebeok, springbok, grysbok, and duiker.

Bontecou, Lee (b. Jan. 15, 1931, Providence, R.I., U.S.), American artist whose work ranged from dark, dramatic abstract constructions to softer, transparent natural forms, evoking a correspondingly broad range of response.

After studying in New York City at the Art Students League, she exhibited, in 1960, at the Leo Castelli Gallery in New York, where she became one of the first female artists Castelli represented. In that show Bontecou presented her first assemblages of canvas stretched and tied over a structure of welded steel rods. Initially, her constructions took on the organic forms of fantastical birds and animals, before developing a more abstracted, machinelike aesthetic. The fabrics she used in her work came from old conveyor belts, laundry bags, and knapsacks, reinforcing the combination of biomorphic and man-made construction. Soon after, Bontecou added a dark opening to the centre of her relief constructions that became the focus of speculative interpretation by critics. Loosely associated with the second generation of Abstract Expressionists, Bontecou intentionally created works that functioned as both painting and sculpture.

In 1964 she received an important commission to create a large wall relief for the New York State Theater at Lincoln Center, entitled *1964*. Bontecou created an armature that formed two winglike structures spanning 20 feet (6 metres), made from a Plexiglas turret of a World War II bomber and other molded and abstracted shapes. In 1966 she won the first prize from the National Institute of Arts and Letters.

In the late 1960s Bontecou gave birth to a daughter, an event that dramatically transformed her work toward a gentler aesthetic, including fluid creations of natural forms, such as fish and giant flowers, often using plastic that reflects rather than absorbs light. She also began to focus on drawing and printmaking in the 1970s.

Bontempelli, Massimo (b. May 12, 1878, Como, Italy—d. July 21, 1960, Rome), Italian

poet, novelist, dramatist, and critic whose "magic realism" developed from Futurism.

First a teacher, Bontempelli wrote some traditional poetry, later adopted the antitraditional, anarchic literary doctrine of the Futurists, and ultimately developed his own point of view, which he expressed particularly in his review *900* (founded 1926). European in outlook (one foreign editor was James Joyce), *900* sought a middle ground between the extremes of traditionalism and the literary avant-garde.

Bontempelli followed his early poetry with novels and plays noted for their intelligence and quixotic humour. *La vita intensa* (1920; "The Intense Life"), an early Futuristic novel, was followed by more independent works. His *L'amante fedele* (1953; "The Faithful Lover"), a collection of surrealist stories, won Italy's highest literary award, the Strega Prize.

Bontempelli's best dramas are *Siepe a nord-ovest* (performed 1923; "Barrier to the Northwest") and *Nostra dea* (performed 1925; "Our Goddess"). A particularly striking play is *La guardia alla luna* (performed 1916; "Guarding the Moon"), the story of a woman who blames the moon for her child's death and climbs a mountain to try to kill it. Bontempelli also wrote literary and music criticism.

Bontemps, Arna, in full ARNA WENDELL BONTEMPS (b. Oct. 13, 1902, Alexandria, La., U.S.—d. June 4, 1973, Nashville, Tenn.), American writer who depicted the lives and struggles of black Americans.

After graduating from Pacific Union College, Angwin, Calif., in 1923, Bontemps taught in New York and elsewhere. His poetry began to appear in the influential black magazines *Opportunity* and *Crisis* in the mid-1920s. His first novel, *God Sends Sunday* (1931), about a jockey who was good with horses but inadequate with people, is considered the final work of the Harlem Renaissance. The novel was dramatized as *St. Louis Woman* (1946), in collaboration with the poet Countée Cullen. Bontemps' next two novels were about slave revolts—in Virginia in *Black Thunder* (1936) and in Haiti in *Drums at Dusk* (1939). In 1943 he went to Fisk University, Nashville, Tenn., where he served as head librarian for more than two decades.

Bontemps, 1939

Yale Collection of American Literature, Beinecke Rare Book and Manuscript Library, Yale University, and the Estate of Carl Van Vechten, Joseph Solomon, executor, photograph, Carl Van Vechten

Bontemps also wrote many nonfiction works on black American history for younger readers and edited several anthologies of black American poetry and folklore.

BIBLIOGRAPHY. Kirkland C. Jones, *Renaissance Man from Louisiana* (1992).

Bonus Army (1932), gathering of 12,000 to 15,000 World War I veterans who, with their wives and children, converged on Washington,

D.C., demanding immediate bonus payment for wartime services, to alleviate the economic hardship of the Great Depression. Adjusted Compensation certificates, or bonuses, had been voted by Congress in 1924 but were not scheduled for full payment until 1945. In an effort to force early lump-sum payment of these urgently needed benefits, the Bonus Army, sometimes called the "Bonus Expeditionary Force," converged on the nation's capital in the summer of 1932; they moved into abandoned shacks below the Capitol and set up shanties and tents along the Anacostia River. Despite inadequate housing, sanitation, and food, the movement's leader, Walter W. Waters, managed to maintain order and to oust agitators. The bonus bill was defeated in Congress, however, and most of the veterans left for home discouraged. The rest, variously estimated at 2,000 to 5,000, over the next few weeks engaged in protests and near-riots, producing an atmosphere of restlessness and threats of turbulence. Local authorities requested that President Herbert Hoover intervene. Troops led by Brigadier General Perry L. Miles, accompanied by General Douglas MacArthur, the U.S. Army chief of staff, drove out the demonstrators and destroyed their encampments, using tanks and tear gas. One veteran was shot to death, and several veterans and policemen were wounded. Congress then appropriated \$100,000 to send the protesters home, and they dispersed.

Politically the event was a blow to Hoover. A second Bonus Army came in May 1933 and this time was greeted by the new president's wife, Eleanor Roosevelt, and presidential assistant Louis Howe. Although, again, no bonus legislation was passed, Congress did create the Civilian Conservation Corps, in which many of the veterans were able to find work.

In 1936 Congress finally passed, over a presidential veto, a bill to disburse almost \$2,500,000,000 in veterans' benefits.

Bonvesin DA LA RIVA (b. c. 1240, Milan [Italy]—d. c. 1315, Milan), Italian teacher, moralist, and poet, whose most important work, the vernacular poetry of *Libro delle tre scritture* (1274; "Book of the Three Writings"), described in three sections the pains of hell, the joys of heaven, and the Passion.

A member of the Humiliati (Umiliati), a Milanese monastic order, Bonvesin taught grammar and wrote many moralistic and religious works in Latin and in the vernacular. Among his more interesting works are *De quinquaginta curialitatibus ad mensam* ("Concerning Fifty Gentilities for the Table"), which provides valuable information about the social mores and etiquette of his time, and *De magnalibus urbis Mediolani* ("Concerning the Great Works of the City of Milan"), a detailed description of the topography, demography, and architecture of Milan and its environs.

bony fish, any member of the class Osteichthyes in the subphylum Vertebrata, including the great majority of living fishes and virtually all the world's sport and commercial fishes. The scientific term Pisces has also been used to identify this group. Osteichthyes excludes the jawless fishes of the class Agnatha (hagfishes and lampreys) and the cartilaginous fishes constituting the class Chondrichthyes (sharks, skates, and rays) but includes the 20,000 species and more than 400 families of modern bony fishes (infraclass Teleostei), as well as a few primitive forms. The primary characteristic of bony fishes is a skeleton at least partly composed of true bone (as opposed to cartilage). Other features include, in most forms, a swim bladder (an air-filled sac to give buoyancy), gill covers over the gill chamber, bony platelike scales, a skull with sutures, and external fertilization of eggs.

bony tongue, any of several heavy-bodied tropical river fishes, family Osteoglossidae,

covered with large, hard, mosaic-like scales except on the head. The largest member of the family, the arapaima, paiche, or pirarucu

Pirarucu (*Arapaima gigas*)

Tom Dolan—EB Inc. painted under the supervision of Loren P. Woods, Chicago Natural History Museum

(*Arapaima gigas*) of South America, may be about 2.4 metres (8 feet) long and weigh about 91 kilograms (200 pounds). It is a valuable, sinuous green fish with a reddish tail. Other bony tongues are the African *Clupisudis* (also known as *Heterotis*), the South American arawana (*Osteoglossum bicirrhosum*), and two species of the East Indian genus *Scleropages*.

booby (*Sula*), any of six or seven species of large tropical seabirds constituting the family Sulidae (order Pelecaniformes). They vary in

Red-footed booby (*Sula sula*)

Eric Hosking—Bruce Coleman Inc.

length from about 65 to 85 centimetres (25–35 inches). The red-footed booby (*Sula sula*) and the masked, or blue-faced, booby (*S. dactylatra*) are wide-ranging in the Atlantic, Pacific, and Indian oceans. The blue-footed booby (*S. nebouxii*) occurs in the Pacific from southern California to northern Peru and on the Galápagos Islands. Boobies' bills are long, their bodies cigar-shaped, and their wings long, narrow, and angular. They fly high above the ocean looking for schools of fish and squid. When prey is sighted they plunge headlong into the water in a swift, vertical drop.

Boobies nest in colonies but have a highly developed territorial sense. Many ritualized displays (e.g., head nodding and jabbing) are used to defend the individual's territory within the large breeding colony. Courtship also involves display—an elaborate dance by the male in which the feet are raised alternately several times, followed by a gesture known to ornithologists as sky-pointing (the birds extend their wings horizontally and toward the tail, raise their heads, and emit a long, continuous whistle). The eggs, usually two in number, are laid on the ground in a rudimentary nest. Boobies get their name from their tameness and lack of fear of humans; they were easily killed by early mariners, who named them boobies to denote their presumed lack of intelligence.

boogie-woogie, heavily percussive style of blues piano in which the right hand plays riffs (syncopated, repeating phrases) against a driving pattern of repeating eighth notes (ostinato bass). It began to appear at the beginning of the 20th century and was associated with the southwestern states—hence its early names, “fast Western style” and “Western rolling

blues.” Its bass figures are believed to derive from the running sequence of guitar accompaniment.

Boogie-woogie was played in honky-tonks and rent parties on the South Side of Chicago in the 1920s but gained national attention only in the late 1930s. The height of its popularity was marked by a 1938 concert in Carnegie Hall, New York City, featuring its most prominent interpreters. It declined rapidly after World War II.

Among the greatest popularizers of boogie-woogie were Jimmy Yancey, Pinetop Smith, who is generally credited with inventing the term itself, Albert Ammons, Pete Johnson, and Meade “Lux” Lewis.

boojum tree (*Idria columnaris*), tree that is the only species of its genus, in the family Fouquieriaceae. The boojum tree is an unusual plant found native only in the deserts of Baja California and Sonora, Mexico. Fan-cifully, it resembles a slender upside-down carrot, up to 15 metres (50 feet) tall and covered with spiny twigs that bear yellowish flowers in hanging clusters. As with its relative the ocotillo, the small leaves fall early, leaving the greenish stems to carry out food-producing photosynthesis. The swollen trunk base is often hollow and provides a habitat for honeybees; the wood is somewhat spongy and retains water. The boojum tree is sometimes planted in southern California and Arizona as a landscape curiosity; small plants can be grown indoors.

book, published work of literature or scholarship; the term has been defined by UNESCO for statistical purposes as a “non-periodical printed publication of at least 49 pages excluding covers,” but no strict definition satisfactorily covers the variety of publications so identified.

A brief treatment of books follows. For full treatment, see MACROPAEDIA: Publishing.

Although the form, content, and provisions for making books have varied widely during

to convey meaning. A third distinguishing feature is publication for tangible circulation. A temple column with a message carved on it is not a book nor is a sign or placard, which, though it may be easy enough to transport, is made to attract the eye of the passerby from a fixed location. Nor are private documents considered books. A book may be defined, therefore, as a written (or printed) message of considerable length, meant for public circulation and recorded on materials that are light yet durable enough to afford comparatively easy portability. Its primary purpose is to announce, expound, preserve, and transmit knowledge and information between people, depending on the twin faculties of portability and permanence. Books have attended the preservation and dissemination of knowledge in every literate society.

The papyrus roll of ancient Egypt is more nearly the direct ancestor of the modern book than is the clay tablet of the ancient Sumerians, Babylonians, Assyrians, and Hittites; examples of both date from about 3000 bc.

The Chinese independently created an extensive scholarship based on books, though not so early as the Sumerians and the Egyptians. Primitive Chinese books were made of wood or bamboo strips bound together with cords. The emperor Shih Huang Ti attempted to blot out publishing by burning books in 213 bc, but the tradition of book scholarship was nurtured under the Han dynasty (206 bc to ad 220). The survival of Chinese texts was assured by continuous copying. In ad 175, Confucian texts began to be carved into stone tablets and preserved by rubbings. Lampblack ink was introduced in China in ad 400 and printing from wooden blocks in the 6th century.

The Greeks adopted the papyrus roll and passed it on to the Romans. The vellum or parchment codex, which had superseded the

Printing books from the *Nova Reperta* (first half of the 17th century), engraving by Theodoor Galle after a drawing by Jan van der Straet c. 1550; in the British Museum

their long history, some constant characteristics may be identified. The most obvious is that a book is designed to serve as an instrument of communication—the purpose of such diverse forms as the Babylonian clay tablet, the Egyptian papyrus roll, the medieval vellum or parchment codex, the printed paper codex (most familiar in modern times), microfilm, and various other media and combinations. The second characteristic of the book is its use of writing or some other system of visual symbols (such as pictures or musical notation)

roll by ad 400, was a revolutionary change in the form of the book. The codex introduced several advantages: a series of pages could be opened to any point in the text, both sides of the leaf could carry the message, and longer texts could be bound in a single volume. The medieval vellum or parchment leaves were prepared from the skins of animals. By the 15th century paper manuscripts were common. During the Middle Ages, monasteries characteristically had libraries and scriptoria, places in which scribes copied books. The

manuscript books of the Middle Ages, the models for the first printed books, were affected by the rise of Humanism and the growing interest in vernacular languages in the 14th and 15th centuries.

The spread of printing was rapid in the second half of the 15th century; the printed books of that period are known as incunabula. The book made possible a revolution in thought and scholarship that became evident by the 16th century: the sources lay in the capacity of the press to multiply copies, to complete editions, and to reproduce a uniform graphic design along new conventional patterns that made the printed volume differ in appearance from the handwritten book. Other aspects of the printing revolution—cultural change associated with concentration on visual communication as contrasted to the oral modes of earlier times—have been emphasized by Marshall McLuhan.

In the 17th century books were generally inferior in appearance to the best examples of the art of the book in the 16th. There was a great expansion in the reading public in the 17th and 18th centuries in the West, in part because of the increasing literacy of women. Type designs were advanced. The lithographic process of printing illustrations, discovered at the end of the 18th century, was significant because it became the basis for offset printing.

In the 19th century the mechanization of printing provided the means for meeting the increased demand for books in industrialized societies. William Morris, in an effort to renew a spirit of craftsmanship, started the private press movement late in the 19th century. In the 20th century the book maintained a role of cultural ascendancy, although challenged by new media for dissemination of knowledge and its storage and retrieval. The paperbound format proved successful not only for the mass marketing of books but also from the 1950s for books of less general appeal. After World War II, an increase in use of colour illustration, particularly in children's books and textbooks, was an obvious trend, facilitated by the development of improved high-speed, offset printing.

book club, marketing service whereby potential book buyers subscribe to free periodicals describing available books, which are sold by order or by "negative option" (see below) and then distributed by mail.

The first book club, established in Germany (1919), reprinted and distributed classics. In the United States the Book-of-the-Month Club (1926) and the Literary Guild (1927) were the first such enterprises, the former distributing more than 200,000,000 new copies of fiction and nonfiction in its first 40 years, especially to areas where there were few bookstores. Book clubs—and similar marketing ventures patterned after them—usually use a technique called negative option, whereby the subscriber must exercise his right to refuse the offered special of the month by returning a refusal notice by mail; otherwise, the book is shipped and the subscriber billed automatically.

By the 1980s nearly 100 book clubs existed in the United States, most of them specialized. The larger general clubs select books judiciously, encouraging business by offering premiums to faithful subscribers, and reducing costs and prices both by marketing large editions and by printing their own editions from publishers' plates. Specialty book clubs cater to particular interests, e.g., psychology, law, religion, mystery stories, history, politics, gardening, and books for younger readers. A common incentive for attracting new members is the offer of several free or heavily discounted books; long-standing members often receive bonuses of books.

book collecting, the exercise of taste, judgment, and connoisseurship in the formation of a special kind of library. The collector's library is formed not merely for his own reference, current reading, or entertainment (though it may include all these) but rather for comprehensiveness and quality within the area it covers.

Private collections have provided the cornerstones of many of the world's great libraries. Oxford's famous library, for example, bears the name of its benefactor, Sir Thomas Bodley, and the collection formed by Charles V, king of France in the 14th century, lies at the heart of the Bibliothèque Nationale of France. Through the efforts of book collectors, basic sources of history and priceless monuments of art and literature have survived that might otherwise have been irretrievably lost. Only in very recent times have governments and institutions assumed some of the functions of preservation; and institutional collections can seldom afford the flexibility of a private library.

Much of the attraction of book collecting lies in the search and pursuit of rare copies. Yet rarity is not necessarily reflected in price. Many books are far more uncommon than Gutenberg Bibles or first folios of Shakespeare, but, when they can be found at all, they may sell for a small fraction of the price of the famous rarities.

While many collectors specialize in first editions, the approaches to collecting are varied. In general, there are three types: the author collection, the subject collection, and the cabinet collection. For an author collection, the collector sets out to gather the works of his chosen author in all the forms in which they have appeared before the public, or he may concentrate on only one phase of his career or even on only one or two of his works. The subject collection can range from a field as sweeping as a collection of classics or of American literature to books on Chess, coffee, prize-fighting, detective fiction, or the development of nuclear energy. The third kind of collector limits his library to a small group, or cabinet, of choice specimens, each the best obtainable of its type, although a particular author or subject may form the basis of his collection. Illuminated manuscripts, bookbindings, publishing styles, fine printing, book illustration, and many other topics lend themselves to this approach.

Condition is an important consideration in all types of collecting: a very great difference in value separates a superlative copy of a book from a poor or even an average one. Association is another important factor—a book annotated or otherwise inscribed by its author or containing the markings of some other prominent or interesting person who has owned and used it is particularly desirable to the collector.

The collector must know how books are produced. There are points, or distinctive variations or marks that distinguish one printing or edition from another, which must be learned.

book lung, form of respiratory organ found in certain air-breathing arachnid arthropods (scorpions and a few spiders). Each book lung consists of a series of plates that are highly vascular (i.e., richly supplied with blood vessels), parallel, and leaflike. They provide an extensive surface for the exchange of oxygen and carbon dioxide with the surrounding air. There are four pairs in scorpions and up to two in spiders, each lung being enclosed in a cavity that opens to the exterior by a small slit.

Book of ——— : see under substantive word (e.g., Mormon, Book of), except as below.

book of hours, devotional book widely popular in the later Middle Ages. The book of

hours began to appear in the 13th century, containing prayers to be said at the canonical hours in honour of the Virgin Mary. The growing demand for smaller such books for family and individual use created a prayerbook style enormously popular among the wealthy. The demand for the books was crucial to the development of Gothic illumination. These lavishly decorated texts, of small dimensions, varied in content according to their patrons' desires.

One of the most splendid examples, the *Trés Riches Heures* of the Duc de Berry, was created in northern France and the Low Countries during the 14th and 15th centuries. Now held in Chantilly at the Musée Condé, it is an excellent pictorial record of the duke's spectacular residences, with magnificent calendar pages illuminated by the Pol de Limbourg and his brothers (c. 1414–18), as well as many biblical scenes and illustrations of the lives of the saints. Other renowned examples are the *Hours* of Jeanne d'Evreux (c. 1325), now held in The Cloisters, New York City, and the *Book of Hours of Charles of Angoulême* and the *Livres d'Heures de Rohan* in the Bibliothèque Nationale in Paris.

Book of the Dead, ancient Egyptian collection of mortuary texts made up of spells or magic formulas, placed in tombs and believed to protect and aid the deceased in the hereafter. Probably compiled and re-edited during the 16th century BC, the collection included Coffin Texts dating from c. 2000 BC, Pyramid Texts dating from c. 2400 BC, and other writings. Later compilations included hymns to Re, the sun god. Numerous authors, compilers, and sources contributed to the work. Scribes copied the texts on rolls of papyrus, often colourfully illustrated, and sold them to individuals for burial use. Many copies of the book have been found in Egyptian tombs, but none contains all of the approximately 200 known chapters. The collection, literally titled "The Chapters of Coming-Forth-by-Day," received its present name from Richard Lepsius, German Egyptologist who published the first collection of the texts in 1842.

book van: see bookmobile.

bookbinding, the joining together of a number of leaves or folios (most frequently of paper, parchment, or vellum) within covers to form a codex or book, as opposed to a roll or scroll.

Bookbinding began when the codex started to replace the roll. The earliest elaborately decorated bookbindings were those produced for use on church altars. Those that survive are often magnificent examples of the jeweller's, goldsmith's, ivory carver's, or embroiderer's arts. But the typical artistic bookbinding is of decorated leather, an art first practiced in the monasteries of the Coptic Church in Egypt.

Hand bindery work includes the making of fine-tooled bindings, binding reference books and books of special economic or personal value, and the repair of rare manuscripts, early printed books, and historical documents. In machine bookbinding, casing-in, or affixing the book into its cover (case), is done entirely by semiautomatic or fully automatic machines. The sheets from the press are first folded into sections, or signatures (delivered often as folded sections of 64 pages, or as two 32-page sections, or as four 16-page sections). End sheets (or papers) may be attached to the first and last sections of the book, and systems are designed to sew sections together or fasten them by gluing (called "perfect" binding in the U.S.). Larger books, such as encyclopaedia volumes and other reference books, are usually side sewn (side-sewing machines drill holes through the books, and stitching is done through prepared holes). Other steps, many of which are often linked in automated systems, are "smashing and nipping" (in order to reduce

swell and bring the books down to uniform size), trimming, edge colouring, rounding the backs of books, jacketing and packaging, and wrapping and addressing for mailing. For paperback books, which may be produced on lines similar to those for a case-bound book, specialist binderies have developed combination units that eliminate separate handling for each operation.

bookcase, piece of furniture fitted with shelves, often enclosed by glass doors, to hold books. A form of bookcase was used in early times: the illuminated manuscript Codex Amiatinus (AD 689–716) in Florence contains an illustration of the prophet Ezra writing

The prophet Ezra seated in front of a cupboard designed to hold books, illustration from the illuminated manuscript Codex Amiatinus, 689–716; in the Biblioteca Laurenziana, Florence

By courtesy of the Biblioteca Laurenziana, Florence

in front of a cupboard with open doors and shelves holding books. Ambries (recesses in walls) were used to hold books from the earliest times, and the history of bookcases was also connected with the medieval fittings of college libraries in Britain. Even after the invention of printing, books were still such a rare luxury that they were commonly kept in a chest or on one shelf beneath a desk.

In the Bodleian Library at Oxford, presses (medieval cupboards) were abandoned in favour of shelves rising to such a height that a gallery was introduced for ease of access. This system was adopted in a number of great Palladian houses in Britain in the first half of the 18th century.

Twelve oak bookcases made for the diarist Samuel Pepys are considered the earliest dated domestic examples. The first were installed in August 1666, and they are all now in the Pepys Library at Magdalene College, Cambridge.

In Italy fine built-in bookcases with pilasters, or recessed columns, sometimes with statues or carved urns on the cornice, also made their appearance in the 17th century. At the same time, the French were the first to use bookcases in which the upper part was panelled in glass instead of wood.

In Queen Anne's reign in England (1702–14), bookcases became extremely simple, relying for effect on fine proportions and veneers. They normally had a straight front, the doors of the lower portion revealing drawers when open. Within a few years architectural characteristics such as pediments, cornices, and pilasters became prominent. This trend was less pronounced by 1750. Decoration could be elaborate, but, as Thomas Chippendale suggested in *The Gentleman and Cabinetmaker's Director* (1st edition, 1754), "all may be omit-

ted if required." By this time, too, most large examples were blockfronted.

The classical revival affected the design of bookcases from about 1770, with an emphasis on simple forms and restrained detail. Introduced in the late 18th century were small revolving bookcases, circular or square, with open shelves diminishing in diameter from bottom to top; they revolved on a central pillar resting on a base or claws.

bookkeeping, the recording of the money values of the transactions of a business. Bookkeeping provides the information from which accounts are prepared but is a distinct process, preliminary to accounting (*q.v.*).

Essentially bookkeeping provides two kinds of information: (1) the current value, or equity, of an enterprise and (2) the change in value—profit or loss—taking place in the enterprise over a given period of time. Management officials, investors, and credit grantors all require such information: management in order to interpret the results of operations, to control costs, to budget for the future, and to make financial policy decisions; investors in order to interpret the results of business operations and make decisions about buying, holding, and selling securities; and credit grantors in order to analyze the financial statements of an enterprise in deciding whether or not to grant a loan.

Traces of financial and numerical records can be found for nearly every civilization with a commercial background. Records of commercial contracts have been found in the ruins of Babylon, and accounts for both farms and estates were kept in ancient Greece and Rome. The double-entry method of bookkeeping began with the development of the commercial republics of Italy, and instruction manuals for bookkeeping were developed during the 15th century in various Italian cities.

In the late 18th and early 19th centuries, the Industrial Revolution provided an important stimulus to accounting and bookkeeping. The rise of manufacturing, trading, shipping, and subsidiary services made accurate financial records a necessity. The history of bookkeeping, in fact, closely reflects the history of commerce, industry, and government. In the second half of the 20th century, for example, the vast expansion of industrial and commercial activity required more sophisticated decision-making processes, which in turn required more sophistication in the selection, classification, and presentation of information, increasingly with the aid of computers. Taxation and government regulation became more important and resulted in increased demand for information; business firms had to have available information to support their income tax, payroll tax, sales tax, and other tax reports. Governmental agencies and educational and other nonprofit institutions also grew in size, and the demand for bookkeeping for their own operations increased.

Although bookkeeping procedures can be extremely complex, basically there are two types of books used in the bookkeeping process—journals and ledgers. A journal contains the daily transactions (sales, purchases, and so on), and the ledger contains the record of individual accounts. The daily records from the journals are entered in the ledgers. Each month, as a general rule, an income statement and a balance sheet are prepared from the trial balance posted in the ledger. The purpose of the income statement or profit-and-loss statement is to present an analysis of the changes that have taken place in the ownership equity as a result of the operations of the period. The balance sheet shows the financial condition of a company at a particular date in terms of assets, liabilities, and the ownership equity.

bookmaking, gambling practice of determining odds and receiving and paying off bets on the outcome of sporting events (particularly

horse races), political contests, and other competitions. Some Commonwealth countries (including the United Kingdom, Australia, and New Zealand), Belgium, and Germany permit the open operation of bookmaking organizations.

In the United States, however, there are probably several hundred thousand bookmakers, only a few thousand of whom (in Nevada, New York, and New Jersey), operate legally. In addition to horse racing in which the track odds are at least a base for bookmakers' odds, legal bookmaking concentrates on professional baseball, football, basketball, and boxing. Morning-line odds, established by legal bookmakers, are printed in the sports sections of newspapers throughout the United States. Illegally operating bookmakers established, before 1950, a national organization of expert observers who transmit their odds through a network of clearinghouses to individual bookmakers.

The bookmaker seeks in every case to achieve a balanced book, one in which bettors are competing against one another, so that the bookmaker will profit whichever bettor wins. For example, if one bettor bets 6 to 5 on A and another bets 6 to 5 on B in a situation where only one can win, the bookmaker will collect twelve units and pay only eleven units no matter which bettor wins. The vagaries of individual bettors and special information acquired by certain large bettors often make a truly balanced book impossible. To protect himself, therefore, the smaller bookmaker will either limit the total amount bet on a favourite or will "lay off" (re-bet) with a larger bookmaker such bets as he is not prepared conveniently to pay if he loses. Laying off has led to the creation of several large and heavily capitalized bookmaking organizations that accept only bets laid off by other bookmakers. The casual bettor is thereby assured against such losses as occurred often before the 1940s, when local bookmakers, ruined by the victory of some heavily played horse or team, defaulted and vanished.

bookmobile, also called **BOOK VAN**, or **TRAVELING LIBRARY**, shelf-lined motor van or other vehicle that carries books to rural and urban areas, establishes library service in areas that are too small to justify the creation of a stable branch, and acts as a demonstration model for communities that can afford library service and may choose to establish future stable branches. The earliest prototypes, which appeared in the 19th century in England and in the early 20th century in the United States, were horse-drawn book wagons. These provided service to individual homes, as well as to village centres.

The development of the more versatile automobile eventually made possible the commercial manufacture of specially designed, automated bookmobiles in the period after World War II. Their use spread to France, Germany, Scandinavia, the Soviet Union, Oceania, and other areas.

In a county or provincial library system, the bookmobile may serve as the only distributing agency, or as a substitute or supplement for book stations (book-deposit stops), places where books are left and picked up for readers (*e.g.*, a store, post office, etc.). It can also provide door-to-door service to widely scattered populations with great flexibility in the number of stops, the length of distance covered, and uses. Bookmobiles have been used for servicing school districts, housing visual aids, and transporting educational exhibits. In some areas of the world, bookmobile service may be extended by phone or boat; *e.g.*, Canadian libraries saw in bookmobiles a means of establishing contact with the Eskimos.

bookplate, a label with a printed design intended to indicate ownership, usually pasted inside the front cover of a book. Bookplates probably originated in Germany, where the earliest known example, dated about the middle of the 15th century, is found. The earliest dated bookplate extant is also German, from 1516. The earliest dated example by an American engraver is a bookplate for Thomas Dering in 1749.

Early armorial bookplates in 16th-century England consisted of a simple unornamented shield, symmetrically mantled helmet, crest, and a scroll beneath for the owner's name. Ornamentation waxed gradually until about 1770, when classical motifs regained favour.

Jane Patterson's bookplate designed by Robert Anning Bell, English, 1890s

By courtesy of the Victoria and Albert Museum, London

Pictorial bookplates included portraits (one by Albrecht Dürer engraved in 1524), arrangements of stacks of books, views of libraries, and landscapes. Allegorical bookplates were in favour in France during the reign of Louis XV and in England by mid-18th century. On these appeared personifications of the Christian cardinal virtues and other abstract ideas, such as truth, justice, wisdom, hope, and faith. Also introduced into the design were symbols of the interests and occupations of the book's owner, such as scales of justice, naval and military trophies, and palettes. Toward the end of the 19th century, German designers began to use nude figures as a major motif of bookplate design, and this fashion was followed in Europe and the United States. Figures were treated naturalistically, sometimes with erotic intent.

bookworm, any insect (e.g., moths, beetles) whose larval (or adult) forms injure books by gnawing the binding and piercing the pages with small holes. No single species may properly be called the bookworm because a large number of insects feed upon dry, starchy material or paper and may damage books.

Among the most widely known bookworms are the silverfish (order Thysanura) and the booklice (order Psocoptera). Termites and roaches are also frequently guilty.

Boole, George (b. Nov. 2, 1815, Lincoln, Lincolnshire, Eng.—d. Dec. 8, 1864, Ballintemple, County Cork, Ire.), English mathematician who helped establish modern symbolic logic and whose algebra of logic, now called Boolean algebra, is basic to the design of digital computer circuits.

Boole, engraving

By courtesy of the trustees of the British Museum; photograph, J.R. Freeman & Co. Ltd

Boole was given his first lessons in mathematics by his father, a tradesman, who also taught him to make optical instruments. Aside from his father's help and a few years at local schools, however, Boole was self-taught in mathematics. When his father's business declined, George had to work to support the family. From the age of 16 he taught in village schools in West Riding, Yorkshire, and opened his own school in Lincoln when he was 20. During scant leisure time he read mathematics journals in the Mechanics Institute, founded about that time for science education. There he wrestled with the *Principia* of the 17th-century English physicist and mathematician Isaac Newton, the *Traité de mécanique céleste* of Pierre-Simon Laplace, and the *Mécanique analytique* of Joseph-Louis Lagrange, both 18th- and early 19th-century French mathematicians, and began to solve advanced problems in algebra.

Boole submitted a stream of original papers to the new *Cambridge Mathematical Journal*, beginning in 1839 with his "Researches on the Theory of Analytical Transformations." These papers were on differential equations and the algebraic problem of linear transformation, emphasizing the concept of invariance. In 1844 he discussed how methods of algebra and calculus may be combined in an important paper in the *Philosophical Transactions of the Royal Society*. That same year he was awarded a medal by the Royal Society for his contributions to analysis (i.e., using algebra and calculus to deal with the infinitely large and the infinitely small). Boole soon saw that his algebra could also be applied in logic.

Developing novel ideas on logical method, and confident in the symbolic reasoning he had derived from his mathematical investigations, he published in 1847 a pamphlet, "Mathematical Analysis of Logic," in which he argued persuasively that logic should be allied with mathematics, not philosophy. He won the admiration of the English logician Augustus De Morgan, who published *Formal Logic* the same year. On the basis of his publications, Boole in 1849 was appointed professor of mathematics at Queen's College, County Cork, even though he had no university degree.

In 1854 he published *An Investigation into the Laws of Thought, on Which Are Founded the Mathematical Theories of Logic and Probabilities*, which he regarded as a mature statement of his ideas. The next year he married Mary Everest, niece of Sir George Everest, for whom the mountain is named. The Booles had five daughters.

One of the first Englishmen to write on logic, Boole pointed out the analogy between the algebraic symbols and those that can represent logical forms and syllogisms, showing how the symbols of quantity can be separated from those of operation. With Boole in 1847 and 1854 began the algebra of logic, or what

is now called Boolean algebra. It is basically two-valued in that it involves a subdivision of objects into separate classes, each with a given property. Different classes can then be treated as to the presence or absence of the same property.

Boole's original and remarkable general symbolic method of logical inference, fully stated in *Laws of Thought* (1854), enables one, given any propositions involving any number of terms, to draw conclusions, by the symbolic treatment of the premises, that are logically contained in the premises. He also attempted a general method in probabilities, which would make it possible from the given probabilities of any system of events to determine the consequent probability of any other event logically connected with the given events. In 1857 he was elected a Fellow of the Royal Society.

The influential *Treatise on Differential Equations* appeared in 1859 and was followed the next year by its sequel, *Treatise on the Calculus of Finite Differences*. Used as texts for many years, these works embody an elaboration of Boole's more important discoveries.

Boole's abstruse reasoning led to applications of which he never dreamed: telephone switching and electronic computers use binary digits, which allow a series of dual alternative routines in the mathematical sequence of instructions to these devices.

BIBLIOGRAPHY. For details about Boole's life and contributions to logic, see William Kneale, "Boole and the Revival of Logic," *Mind*, 57:149-175 (1948), with bibliography; see also "Boole" by T.A.A. Broadbent in the *Dictionary of Scientific Biography*, vol. 2 (1970); and E.T. Bell, *Men of Mathematics* (1937, reprinted 1961).

Boolean algebra, symbolic system of mathematical logic that represents relationships between entities—either ideas or objects. The basic rules of this system were formulated in 1847 by George Boole of England and were subsequently refined by other mathematicians and applied to set theory. Today, Boolean algebra is of significance to the theory of probability, geometry of sets, and information theory. Furthermore, it constitutes the basis for the design of circuits used in electronic digital computers (see digital computer).

In a Boolean algebra a set of elements is closed under two commutative binary operations that can be described by any of various systems of postulates, all of which can be deduced from the basic postulates that an identity element exists for each operation, that each operation is distributive over the other, and that for every element in the set there is another element that combines with the first under either of the operations to yield the identity element of the other.

The ordinary algebra (in which the elements are the real numbers and the commutative binary operations are addition and multiplication) does not satisfy all the requirements of a Boolean algebra. The set of real numbers is closed under the two operations (that is, the sum or the product of two real numbers also is a real number); identity elements exist—0 for addition and 1 for multiplication (that is, $a + 0 = a$ and $a \times 1 = a$ for any real number a); and multiplication is distributive over addition (that is, $a \times [b + c] = [a \times b] + [a \times c]$); but addition is not distributive over multiplication (that is, $a + [b \times c]$ does not, in general, equal $[a + b] \times [a + c]$).

The advantage of Boolean algebra is that it is valid when truth-values—i.e., the truth or falsity of a given proposition or logical statement—are used as variables instead of the numeric quantities employed by ordinary algebra. It lends itself to manipulating propositions that are either true (with truth-value 1) or false (with truth-value 0). Two such propositions can be combined to form a compound proposition by use of the logical connectives, or operators, AND or OR. (The standard

symbols for these connectives are \wedge and \vee , respectively.) The truth-value of the resulting proposition is dependent on the truth-values of the components and the connective employed. For example, the propositions a and b may be true or false, independently of one another. The connective AND produces a proposition, $a \wedge b$, that is true when both a and b are true, and false otherwise.

boomerang, curved throwing stick used chiefly by the aborigines of Australia for hunting and warfare. The aborigines used two kinds of boomerangs and many varieties of boomerang-shaped clubs. The returning boomerang (the name derives from the word used by the Turuwal tribe in New South Wales) is light, thin and well balanced, 12–30 inches (30–75 centimetres) in length, and up to 12 ounces (about 340 grams) in weight. It varies in shape from a deep, even curve to almost straight sides of an angle. The ends are twisted or skewed in opposite directions either as the boomerang is being made or after it has been heated in ashes.

The boomerang is thrown with a vigorous action in which the thrower may run a few steps to gain greater impetus. It is held at one end, above and behind the thrower's shoulder, with the concave edge to the front, and swung forward rapidly with the flatter side underneath. Just before release, added impetus is given by a strong wrist movement; it is this spin, together with the skew of the edges, which determines its unique flight pattern. If thrown downward or parallel to the ground, it sweeps upward to a height of 50 feet (15 metres) or more. When thrown so that one end strikes the ground, it ricochets into the air at terrific speed, spinning endwise. It completes a circle or oval 50 yards (45 metres) or more wide and then several smaller ones as it drops to the ground near the thrower. A figure-eight course may also be followed.

Returning boomerangs were used only in eastern and western Australia as playthings, in tournament competition, and by hunters to imitate hawks for driving flocks of game birds into nets strung from trees. The returning boomerang is generally considered to have developed from the nonreturning types, which swerve in flight.

The nonreturning boomerang is longer, straighter, and heavier than the returning variety. With it animals were maimed and killed, while in warfare it caused serious injuries and death. One type has a picklike hook at one end. Boomerang-shaped, nonreturning weapons were used by the ancient Egyptians, by Indians of California and Arizona, and in southern India for killing birds, rabbits, and other animals. •

boomslang (*Dispholidus typus*), venomous snake of the family Colubridae, the only col-

Boomslang (*Dispholidus typus*)

ubrid that is decidedly dangerous to man. Occurring in savannas throughout sub-Saharan Africa, it lies in wait in a bush or tree for chameleons and birds; the forepart of the body often extends motionless into the air.

Its body and eye colour are extremely variable, and camouflage is excellent. In defense the boomslang inflates the neck, showing the dark skin between the scales; it then may strike. It is rear-fanged, but the fangs are set relatively far forward in the mouth. The venom causes hemorrhages and is fatal to man in minuscule amounts.

Boone, city, Boone county, central Iowa, U.S., near the Des Moines River, 15 mi (24 km) west of Ames. Founded in 1865 as a railroad town, it was originally called Montana but was renamed (1871) to honour Capt. Nathan Boone, son of Daniel Boone. With the annexation in 1887 of adjacent Boonesboro (established 1848), it became the county seat. Boone Biblical College was opened in 1905 and the Boone campus of Des Moines Area Community College in 1969. The city's economy is sustained by agriculture, railroads, and light manufacturing. There are many summer camps for youth organizations in the vicinity. Ledges State Park is 4 mi south. The Kate Shelley High Bridge, 4 mi west, is one of the highest (185 ft [56 m] above the river) and longest (2,685 ft) railroad bridges in the U.S. Inc. town, 1866; city, 1868. Pop. (1990) 12,392.

Boone, town, seat of Watauga county, northwestern North Carolina, U.S., 4 mi (6 km) from the Blue Ridge Parkway atop the Blue Ridge Mountains at an altitude of 3,333 ft (1,016 m), near the Tennessee line. On the Daniel Boone Trail at the fork of the Wilderness Road, the settlement was incorporated in 1871 and named for the pioneer who, according to tradition, camped there while on a hunting trip. A noted mountain vacation spot with fishing streams and game forests, it also has a large burley tobacco market and is a beef and dairy cattle centre. Electric components, apparel, and canned foods are produced there. Boone is the seat of Appalachian State University (founded as a teachers' college in 1899), which has a collection of Appalachian artifacts in its Belk Library. An outdoor pioneer drama "Horn in the West" by Kermit Hunter has been produced each summer since 1952 in the Daniel Boone Theatre, 1 mi east. The Seven Devils Ski Area is 1 mi south. Pop. (1990) 12,915.

Boone, Daniel (b. c. Nov. 2, 1734, Berks County, Pa.—d. c. Sept. 26, 1820, St. Charles, Mo., U.S.), early American frontiersman and legendary hero who helped blaze a trail through Cumberland Gap, a notch in the Appalachian Mountains near the juncture of Virginia, Tennessee, and Kentucky.

Boone had little formal schooling but learned to read and write. As a youth he moved with his family (English Quakers) to the North Carolina frontier. Most of his life was spent as a wandering hunter and trapper.

Many white men had traversed Kentucky before Boone; hence, the legend that he was its discoverer needs qualification. Boone first went a short way through Cumberland Gap to hunt in the fall of 1767, and he and several companions returned to Kentucky to trap and hunt in 1769–71. In 1773 Boone undertook to lead his own and several other families to Kentucky, but the group was attacked by Cherokee Indians just beyond the last settlement. Two of the party, including Boone's son James, were tortured and murdered, whereupon the survivors turned back.

In March 1775 Boone and 28 companions were employed by Richard Henderson's Transylvania Company to blaze a trail through Cumberland Gap. The company planned to establish Kentucky as a 14th colony. Despite

Indian attacks, the party built the Wilderness Road, which ran from eastern Virginia into the interior of Kentucky and beyond and became the main route to the region then

Boone, portrait by Chester Harding, 1820; in the collection of the Massachusetts Historical Society
By courtesy of the Massachusetts Historical Society

known as the West. It helped make possible the immediate opening of the first settlements in Kentucky: Boonesborough, Harrod's Town, and Benjamin Logan's. In August 1775 Boone brought his wife Rebecca and their daughter to Boonesborough. They were, except for a few women who had been captured by Indians, the first white women in Kentucky, and their arrival may be said to mark the first permanent settlement there. The plan to establish the 14th colony failed, however, and Kentucky was made a county of Virginia. Boone became a captain in the county's militia and a leader in defending Boonesborough against the Indians. He was captured by Indians in 1778 and was adopted as a son by the Shawnee chief, Blackfish. After five months he escaped to warn Boonesborough settlers of an impending attack. When the attack by British soldiers and Indians came (September 1778), the settlement successfully withstood a 10-day siege.

Although a courageous and resourceful leader, Boone did not prosper. He established extensive land claims but could rarely make them good. After the American Revolution he worked as a surveyor along the Ohio River. He settled for a few years in Kanawha County, Va. (now West Virginia). Then, in 1799, he followed his son Daniel Morgan Boone to Missouri, in Louisiana Territory, where he continued to hunt and trap.

A legendary hero even at the time of his death, his fame spread worldwide when in 1823 Lord Byron devoted seven stanzas to him in "Don Juan."

BIBLIOGRAPHY. John Bakeless, *Daniel Boone* (1939, reprinted 1965); J.J. Van Noppen and I.F. Woestemeyer, *Daniel Boone, Backwoodsman* (1966).

Boonesboro, resort village, Clark county, Kentucky, U.S., on the Kentucky River, 9 mi (14 km) southwest of Winchester. It is the site of Ft. Boonesboro, built in 1775 by Daniel Boone and a company of North Carolina men under Col. Richard Henderson who had just opened Boone's Trace (an offshoot of the Wilderness Road) through the Cumberland (Mountains) Gap. The group, under a grant from the Cherokees (regarded as illegal by Britain and Virginia), claimed all the land between the Kentucky and Cumberland rivers which they called Transylvania. The Transylvania Convention held at the fort in May 1775 was the first legislative assembly west of the Appalachians. During the Revolution the settlement was under constant Indian attack.

Here took place the first marriage in Kentucky (Aug. 7, 1776), between Samuel Henderson, younger brother of the pioneer, and Betsy Caloway (who, along with her sister, Fanny, and Boone's daughter, Jemima, had just been rescued from the Indians). The fort, which was abandoned in 1778 after withstanding a Shawnee Indian attack, has been reconstructed within Fort Boonesboro State Park and includes blockhouses and a museum.

Boonville, city, seat (1818) of Cooper county, central Missouri, U.S. It lies along the Missouri River, 27 miles (43 km) west of Columbia. Settled in 1810 and named for Daniel Boone, it was enlarged as a fort during the War of 1812 and became an important trading post on the river and the Santa Fe Trail. During the American Civil War the first battle in the state was fought near Boonville, and the victory by Captain N. Lyon's Federal troops there is credited with preserving Missouri for the North. Thespian Hall (1855–57), allegedly the oldest theatre west of the Alleghenies, was used during the war as a supply depot, barracks, and hospital. Boonville is now an agriculture-trade centre with some light manufactures (electric appliances, shoes, wood products). It is the home of Kemper Military School and College (1844), the oldest military school west of the Mississippi, and the Missouri Training School for Boys (1889). Arrow Rock State Park is nearby. Inc. village, 1839; city, 1896. Pop. (2002 est.) 8,619.

Boorstin, Daniel J (oseph) (b. Oct. 1, 1914, Atlanta, Ga., U.S.—d. Feb. 28, 2004, Washington, D.C.), influential social historian and educator known for his studies of American civilization, notably his major work, *The Americans*, in three volumes: *The Colonial Experience* (1958), *The National Experience* (1965), and *The Democratic Experience* (1973; Pulitzer Prize, 1974).

Boorstin received a B.A. from Harvard University (1934) and two law degrees from the University of Oxford (1936, 1937) as a Rhodes scholar. He taught history at the University of Chicago from 1944 to 1969, writing while there *The Lost World of Thomas Jefferson* (1948), *The Genius of American Politics* (1953), and the first two volumes of *The Americans*, his analysis of American history and culture's distinctive characteristics.

From 1969 to 1973 Boorstin directed the National Museum of History and Technology at the Smithsonian Institution in Washington, D.C., and in 1975 he was appointed librarian of Congress despite the objections of several organizations, which complained that he was not a licensed librarian. Boorstin served in the post until 1987, and during his tenure public use of the Library of Congress more than doubled.

Boorstin's other works include *The Image: A Guide to Pseudo-Events in America* (1961), in which he argued that many events are staged for publicity purposes. He also wrote a trilogy—*The Discoverers* (1983), *The Creators* (1992), and *The Seekers* (1998)—that examined the history of intellectual thought. From 1983 to 1988 Boorstin was a member of *Encyclopædia Britannica's* Board of Editors.

Booth, Catherine, née MUMFORD (b. Jan. 17, 1829, Ashbourne, Derbyshire, Eng.—d. Oct. 4, 1890, Clacton, Essex), wife of the founder of the Salvation Army (William Booth), and herself an eloquent preacher and social worker.

Her father was a carriage builder and sometime Methodist lay preacher, her mother a deeply religious woman of Puritan type. Catherine, in adolescence an invalid, was educated principally at home and early acquired some competence in the theology of her day.

The family moved to London in 1844, and she became an active member of the Wesleyan Methodist Church in Brixton. When this church expelled a group of "reformers," she and her future husband joined them. They were married in 1855.

Catherine Booth was a convinced believer in women's right to preach the gospel, and her pamphlet *Female Ministry* (1859) is still cogent. She began to preach in her husband's church at Gateshead in 1860. She became a notable orator and in 1880–84 conducted highly successful meetings in the West End of London. In 1885 she took part in a campaign that secured the passing of the Criminal Law Amendment Act, designed to protect young girls by raising the age of consent.

She did not believe that the sacraments are essential to salvation. Although the evolution of the sacramental attitude of the Salvation Army must not be wholly attributed to Booth, her beliefs were undoubtedly influential.

Booth, Charles (b. March 30, 1840, Liverpool, Eng.—d. Nov. 23, 1916, Whitwick, Leicestershire), English shipowner and sociologist whose *Life and Labour of the People in London*, 17 vol. (1889–91, 1892–97, 1902), contributed to the knowledge of social problems and to the methodology of statistical measurement.

Charles Booth
The Mansell Collection

In 1866 Booth and his brother Alfred began a shipping service between Europe and Brazil. The business was reorganized as Booth Steamship Company, Ltd., in 1901, with Charles Booth as chairman. Appointed a privy councillor in 1904, he was a member of the royal commission on the poor law from 1905 to 1909.

Life and Labour is divided into three subject areas: poverty, industry, and the influences of religion. Booth described the conditions under which various social classes lived. He tried to determine the causes of poverty (of 4,076 cases, 62 percent were paid low or irregular wages; 23 percent had large families or suffered from illness; and 15 percent squandered their earnings, drank excessively, or refused to work) and to show the relationship between poverty and depravity on the one hand and regularity of income and a decent way of living on the other hand. Booth drew on his own observations and those of clergymen of long service in their parishes and consulted records of schools and charitable organizations. Concerned with the aged, Booth advocated old-age pensions for all rather than just for persons whose incomes were below a certain standard.

Booth, Edwin (Thomas) (b. Nov. 13, 1833, near Belair, Md., U.S.—d. June 7, 1893, New York City), renowned tragedian of the 19th-century American stage, best-remembered as one of the greatest performers of Shakespeare's *Hamlet*. He was a member of a famous acting family; his brother was John Wilkes Booth, the assassin of President Abraham Lincoln.

Edwin Booth, photograph by Bradley and Rulofson
By courtesy of the Theatre Collection, the New York Public Library at Lincoln Center, Astor, Lenox and Tilden Foundations

At 13 years of age Edwin became companion and chaperon to his eccentric father, the English actor Junius Brutus Booth, who in 1821 had moved to the United States, where he achieved popularity second only to that of the American actor Edwin Forrest. Traveling with his father, whom he endeavoured to keep sane and sober, Booth absorbed the rudiments of acting in the bombastic style then fashionable. He made his stage debut at the Boston Museum on Sept. 10, 1849, in the part of Tressel to his father's Richard III in an adaptation of Shakespeare's play. Two years later in New York City, when his father refused to act one night, Edwin replaced him as Richard III, giving an imitative but creditable performance.

In 1852 Edwin accompanied his father to California and, after his father's death that year, continued acting, barnstorming through California and, in 1854–55, touring Australia and the Sandwich Islands (now Hawaii). His first important appearances as a star were in Boston and New York City in 1857. Younger playgoers flocked to see him, and in 1860, in a series of brilliant performances in New York, he challenged and overcame the dramatic supremacy of the veteran Forrest.

Booth had not yet, however, overcome the unruly temperament inherited from his father. His acting was occasionally fuddled by drink. In 1860 he married the actress Mary Devlin, by whom he had one daughter. It was the double shock of Mary's death in 1863 and his failure to be at her side because he was too drunk that henceforth made him abstemious.

In 1864 Edwin Booth became comanager of the Winter Garden Theatre in New York. There, he and his brothers, Junius Brutus and John Wilkes, appeared together for the only time on Nov. 25, 1864, playing Brutus, Cassius, and Mark Antony, respectively, in Shakespeare's *Julius Caesar*. From Nov. 26, 1864, to March 22, 1865, Edwin played Hamlet for 100 consecutive nights. Thereafter, he was identified with the part, for which his looks, voice, and bearing suited him. He was slight and dark, with a musical, sympathetic voice and a natural air of reserve. His acting style, quieter than his father's had been, became increasingly sensitive and subdued.

The assassination of President Lincoln by John Wilkes Booth on April 14, 1865, was a blow from which Edwin's spirit never recovered, causing his withdrawal from the stage until January 1866.

In 1869 Booth married the actress Mary McVicker, whose nervous instability made the marriage unhappy. In the same year, he opened his own theatre in New York City. His Shakespearean and other productions were beautifully mounted, but his lack of business

acumen ultimately cost him his theatre and left him bankrupt at 40. By hard work he recouped his losses, acting from then on under the management of others.

Booth first acted in London in 1861. When he revisited England in 1880, his appearances at London's Princess Theatre were near failures until Henry Irving, star and manager of the much superior Lyceum Theatre, invited him to costar at the Lyceum in what proved a memorable engagement, the two actors alternating as Othello and Iago. In 1882, the year after his wife's death, Booth again played England and the next year toured Germany, where the acclaim given his Hamlet and his Iago and King Lear (considered, after Hamlet, his finest roles) made the German engagement the peak of his career. At home, his financial affairs improved permanently when, in 1886, he formed a business and acting partnership with the American actor-manager Lawrence Barrett.

In 1888 Booth founded a club, the Players, in New York City, that was intended as a gathering place for actors and eminent men in other professions. He lived at the club in his last years. His farewell stage appearance was as Hamlet, in 1891 at the Academy of Music in Brooklyn. To his own and later generations, the nobility of his mature character, his splendid achievement in his art, and his zeal to raise both the moral and social standing of his fellow actors combined to make him one of the great figures of the American stage.

Earlier biographies include Richard Lockridge, *Darling of Misfortune* (1932, reprinted 1971), especially interesting for details of Booth's business misadventures; and William Winter, *Life and Art of Edwin Booth* (1893, reissued 1968), a standard and valuable study by a contemporary. An exhaustive work by Stanley Kimmel, *The Mad Booths of Maryland*, 2nd rev. and enlarged ed. (1970); and Gene Smith, *American Gothic* (1992), examine the entire Booth clan.

Booth, George: see Delamere, George Booth, 1st Baron.

Booth, John Wilkes (b. May 10, 1838, near Bel Air, Md., U.S.—d. April 26, 1865, near Port Royal, Va.), member of one of the United States' most distinguished acting families of the 19th century, who assassinated President Abraham Lincoln.

The ninth of ten children born to the actor Junius Brutus Booth, he early showed excellent theatrical potential but also exhibited an emotional instability and a driving egocentricity that made it difficult for him to accept his brother Edwin's rise to acclaim as the foremost actor of the day.

After an unsuccessful Baltimore theatrical debut in 1856, John played minor roles in Philadelphia until 1859, when he joined a Shakespearean stock company in Richmond, Va. He was widely acclaimed on a tour of the Deep South in 1860 and remained in demand as an actor throughout the Civil War.

John Wilkes Booth

By courtesy of the National Archives, Washington, D.C.

A vigorous supporter of the Southern cause, Booth was outspoken in his advocacy of slavery and his hatred of Lincoln. He was a volunteer in the Richmond militia that hanged the Abolitionist John Brown in 1859.

By the autumn of 1864 Booth had begun to plan a sensational abduction of President Lincoln. He recruited several coconspirators, and throughout the winter of 1864–65 the group gathered frequently in Washington, D.C., where they mapped out a number of alternative abduction plans. After several attempts had miscarried, Booth resolved to destroy the president and his officers no matter what the cost.

On the morning of April 14, 1865, he learned that the president was to attend an evening performance of the comedy *Our American Cousin* at Ford's Theatre in the capital. Booth hurriedly assembled his band and assigned each member his task, including the murder of Secretary of State William Seward. He himself would kill Lincoln. About 6 PM Booth entered the deserted theatre, where he tampered with the outer door of the presidential box so that it could be jammed shut from the inside. He returned during the play's third act to find Lincoln and his guests unguarded.

Entering the box, Booth drew a pistol and shot Lincoln through the back of the head. He grappled briefly with a patron, swung himself over the balustrade, and leaped off it, shouting "Sic semper tyrannis!" (the motto of the state of Virginia, meaning "Thus always to tyrants!") and "The South is avenged!" He landed heavily on the stage, breaking a bone in his left leg, but was able to make his escape to the alleyway and his horse. The attempt on Seward's life failed, but Lincoln died shortly after seven the following morning.

Eleven days later, on April 26, Federal troops arrived at a farm in Virginia, just south of the Rappahannock River, where a man said to be Booth was hiding in a tobacco barn. David Herold, another conspirator, was in the barn with Booth. He gave himself up before the barn was set afire, but Booth refused to surrender. After being shot, either by a soldier or by himself, Booth was carried to the porch of the farmhouse, where he subsequently died. The body was identified by a doctor who had operated on Booth the year before, and it was then secretly buried, though four years later it was reinterred. There is no acceptable evidence to support the rumours, current at the time, doubting that the man who had been killed was actually Booth.

Booth, Maud Ballington, née MAUD ELIZABETH CHARLESWORTH (b. Sept. 13, 1865, Limpsfield, Surrey, Eng.—d. Aug. 26, 1948, Great Neck, N.Y., U.S.), Salvation Army leader and cofounder of the Volunteers of America.

Charlesworth began attending Salvation Army meetings in 1881 and was soon working for the organization in France, Switzerland, and England. In 1886 she married Ballington Booth, son of William Booth, the founder of the Salvation Army, and the next year they took command of Salvation Army work in the United States.

For nine years Maud Booth helped to establish the Salvation Army in America. In 1896 a disagreement with William Booth over administrative policy led Maud and Ballington Booth to resign from the Salvation Army and to establish the rival Volunteers of America, which became a lasting religious and charitable organization.

Maud Booth later became absorbed in prison reform, working for the religious and social rehabilitation of prisoners and contributing to the development of the parole system.

Booth, William (b. April 10, 1829, Nottingham, Nottinghamshire, Eng.—d. Aug. 20,

1912, London), founder and general (1878–1912) of the Salvation Army.

The son of a speculative builder, Booth was apprenticed as a boy to a pawnbroker. At 15 he underwent the experience of religious conversion and became a revivalist preacher. In 1849 he went to London, where he worked in a pawnbroker's shop at Walworth, hating the business but bound to it by the necessity of sending money home. At this period he met Catherine Mumford, his future wife and lifelong helpmate (see Booth, Catherine). In 1852 he had become a regular preacher of the Methodist New Connection, and in 1855 they were married. After nine years of ministry Booth broke loose from the New Connection and began his career as an independent revivalist.

Booth held the simple belief that eternal punishment was the fate of the unconverted. Coupled with this was a profound pity for the outcast and a hatred of dirt, squalor, and suffering. In 1864 Booth went to London and continued his services in tents and in the open air and founded at Whitechapel the Christian Mission, which became (in 1878) the Salvation Army. Booth modeled its "Orders and Regulations" on those of the British army. Its early "campaigns" excited violent opposition; a "Skeleton Army" was organized to break up the meetings, and for many years Booth's followers were subjected to fines and imprisonment as breakers of the peace. After 1889 these disorders were little heard of. The operations of the Army were extended in 1880 to the United States, in 1881 to Australia, and later to the European continent, to India, to Ceylon (now Sri Lanka), and elsewhere—General Booth himself being an indefatigable traveler, organizer, and speaker.

In 1890 General Booth published *In Darkest England, and the Way Out*, in which he had the assistance of William Thomas Stead. He proposed to remedy pauperism and vice by means of: homes for the homeless; training centres to prepare emigrants for overseas colonies; rescue homes for fallen women; homes for released prisoners; legal aid for the poor; and practical help for the alcoholic. There was vast public support for the program; money was liberally subscribed, and a large part of the scheme was carried out. The opposition and ridicule with which Booth's work was for many years received gave way, toward the end of the 19th century, to very widespread sympathy as its results were more fully realized. The active encouragement of King Edward VII, at whose insistence in 1902 he was invited officially to be present at the coronation ceremony, marked the completeness of the change; and when, in 1905, General Booth went through England, he was received in state by the mayors and corporations of many towns. The fiery old man had become a great figure in English life.

BIBLIOGRAPHY. Richard Collier, *The General Next to God: The Story of William Booth and the Salvation Army* (1965).

Booth, William Bramwell (b. March 8, 1856, Halifax, Yorkshire, Eng.—d. June 16, 1929, London), second general of the Salvation Army (1912–29) and eldest son of William and Catherine Booth.

He became an active full-time collaborator in 1874 and, from 1880, was the Army's chief organizer. He carried into practice the social services plans outlined by his father. In 1885, together with William Thomas Stead, he stood trial at the Old Bailey on a technical charge connected with the successful attempt to secure legislation protecting young girls in moral danger, but he was acquitted. The trial—and Stead's vigorous press campaign—proved to a skeptical public that in 19th-century England

girls could be bought and sold for immoral purposes, not only without their consent but against their will. An able speaker and a tireless exponent of the doctrine of Christian perfection, he published nine books, of which *Echoes and Memories* (1925) and *These Fifty Years* (1929) are perhaps the best known. William Bramwell Booth was also an enthusiast for religious work among young people. He became general on his father's death.

Boothbay Harbor, town, Lincoln county, southern Maine, U.S. It lies on a peninsula of the Atlantic coast, between the Sheepscot and Damariscotta rivers, 59 miles (95 km) east-northeast of Portland. Originally part of Boothbay (supposedly settled in 1630), it was set off and incorporated in 1889 and developed as a trading and shipbuilding centre. Boothbay Harbor is now the pivot of a resort and fishing area. Light manufactures include canvas goods, boats, and food products. There are railway and historical-society museums in the town, and the *Sherman Zwicker*, a Grand Banks fishing schooner, is preserved as a museum. The headquarters of the State Sea and Shore Fisheries Research Station is 3 miles (5 km) west at McKown's Point. Old schooners sail into the harbour for the annual Windjammer Days (July). Pop. (1992 est.) 2,356.

Boothferry, borough and district, county of Humberside, England. The borough lies at the head of the Humber Estuary and centres on the port of Goole. Its name recalls the old Booth ferry, replaced by a road bridge in 1928, across the River Ouse near the medieval market town of Howden.

The largely agricultural district is crossed by five rivers. Through drainage, diversion, and warping (silt reclamation), rich arable lands yield heavy crops of cereals, sugar beets, and vegetables. Goole has light industry, and the borough includes Epworth (the birthplace of John Wesley) and Howden, noted for its ancient church. Area 250 square miles (647 square km). Pop. (1991 prelim.) 63,100.

Boothia Peninsula, northernmost portion of mainland North America, reaching 71°58' N, in Kitikmeot region, Northwest Territories, Canada. It was discovered in 1829 by Sir James Ross, who named it Boothia Felix in honour of Sir Felix Booth (the expedition's financier); Ross established the first location of the north magnetic pole on the peninsula's western coast (1831). Other explorers, namely Sir John Franklin and Roald Amundsen, visited Boothia Peninsula in later years. The peninsula is a treeless plateau with an area of 12,483 square miles (32,330 square km) and a width of 120 miles (195 km). It extends 170 miles into the Arctic Ocean. The peninsula is sparsely populated; Spence Bay (with a notable garment [parka] industry) and Thom Bay in the south are the only settlements.

Booths, Feast of (Judaism): see Sukkoth.

bootlace worm: see ribbon worm.

bootlegging, in U.S. history, illegal traffic in liquor in violation of legislative restrictions on its manufacture, sale, or transportation. The word apparently came into general use in the Midwest in the 1880s to denote the practice of concealing flasks of illicit liquor in boot tops when going to trade with Indians. The term became part of the American vocabulary when the Eighteenth Amendment to the U.S. Constitution effected the national prohibition of alcohol from 1920 until its repeal in 1933.

Prohibition ended the legal sale of liquor and thereby created demand for an illicit supply. The earliest bootleggers began smuggling foreign-made commercial liquor into the United States from across the Canadian and Mexican borders and along the seacoasts from ships

under foreign registry. Their favourite sources of supply were the Bahamas, Cuba, and the French islands of St. Pierre and Miquelon, off the southern coast of Newfoundland. A favourite rendezvous of the rum-running ships was a point opposite Atlantic City, N.J., just outside the three-mile limit beyond which the U.S. government lacked jurisdiction. The bootleggers anchored in this area and discharged their loads into high-powered craft that were built to outrace U.S. Coast Guard cutters.

This type of smuggling became more risky and expensive when the U.S. Coast Guard began halting and searching ships at greater distances from the coast and using fast motor launches of its own. Bootleggers had other major sources of supply, however. Among these were millions of bottles of "medicinal" whiskey that were sold across drugstore counters on real or forged prescriptions. In addition, various American industries were permitted to use denatured alcohol, which had been mixed with obnoxious chemicals to render it unfit for drinking. Millions of gallons of this were illegally diverted, "washed" of noxious chemicals, mixed with tap water and perhaps a dash of real liquor for flavour, and sold to speakeasies or individual customers. Finally, bootleggers took to bottling their own concoctions of spurious liquor, and by the late 1920s stills making liquor from corn had become major suppliers. Faultily distilled batches of this "rotgut" could be dangerously impure and cause blindness, paralysis, and even death.

Bootlegging helped lead to the establishment of American organized crime, which persisted long after the repeal of Prohibition. The distribution of liquor was necessarily more complex than other types of criminal activity, and organized gangs eventually arose that could control an entire local chain of bootlegging operations, from concealed distilleries and breweries through storage and transport channels to speakeasies, restaurants, nightclubs, and other retail outlets. These gangs tried to secure and enlarge territories in which they had a monopoly of distribution. Gradually the gangs in different cities began to cooperate with each other, and they extended their methods of organizing beyond bootlegging to the narcotics traffic, gambling rackets, prostitution, labour racketeering, loan-sharking, and extortion. The national American crime syndicate, the Mafia, arose out of the coordinated activities of Italian bootleggers and other gangsters in New York City in the late 1920s and early '30s.

In 1933 Prohibition was abandoned. The bootlegger did not become extinct, however. In the late 20th century, prohibition still existed in many U.S. counties and municipalities, and bootlegging continued to thrive as an illegal business. See also prohibition.

bop (music): see bebop.

Bophuthatswana, former republic (though never internationally recognized as such) that was the legally designated homeland for the Republic of South Africa's Tswana people. It consisted of seven distinct territorial units located north or west of the Witwatersrand, in north-central South Africa, and lying near or on the border with Botswana. Its capital, Mmabatho, was situated northwest of the city of Mafikeng (formerly Mafeking), which became part of Bophuthatswana in 1980. The name of the republic meant "that which binds" (*bophutha*) to the Tswana-speaking people.

The Tswana settled in the area about 1600. The region suffered from wars started by Shaka, the founder of the Zulu empire, and from famine between 1822 and 1837. The resulting migrations led to the formation of subgroups of Tswana and new settlements. In 1837 the Boers gained control of the region. The constituent areas of Bophuthatswana were designated a Tswana "homeland" by the South

African government in the 1960s. The territorial assembly created in 1961 was replaced a decade later with a partly elected, partly appointed legislative assembly. The state became officially self-governing (1972) as one of South Africa's nonindependent black states, with Lucas M. Mangope as chief minister. Bophuthatswana was declared an independent republic in December 1977. Only South Africa recognized it as an independent state. See also black state.

Most of Bophuthatswana's semiarid terrain was used for grazing beef and dairy cattle, while the scarce arable land supported corn (maize), sorghum, wheat, and peanuts (groundnuts). The republic's small-scale industries produced beverages, processed tobacco, textiles, wood products, and leather goods. Mafikeng and the Witwatersrand were places of employment for many of Bophuthatswana's commuters and contract migrant workers. Gambling casinos also became a source of income during the 1980s.

Under the new South African constitution, which abolished the apartheid system, Bophuthatswana in 1994 was dissolved and reincorporated into South Africa. Its various enclaves became parts of Orange Free State province and the newly created North-West and Eastern Transvaal provinces.

Bopp, Franz (b. Sept. 14, 1791, Mainz, archbishopric of Mainz [Germany]—d. Oct. 23, 1867, Berlin, Prussia [Germany]), German linguist who established the importance of Sanskrit in the comparative study of Indo-European languages and developed a valuable technique of language analysis.

Bopp
Bruckmann—Art Resource

Bopp's first important work, *Über das Conjugationssystem der Sanskritsprache* . . . (1816; "On the System of Conjugation in Sanskrit . . ."), foreshadowed his major achievement. In it he sought to trace the common origin of Sanskrit, Persian, Greek, Latin, and German, a task never before attempted. Concentrating on a historical analysis of the verb, he assembled the first trustworthy materials for a history of the languages compared. In 1820 he extended the study to include the other grammatical parts.

Professor of Oriental literature and general philology at the University of Berlin (1821–67), Bopp published a Sanskrit grammar (1827) and a Sanskrit and Latin glossary (1830). His chief activity, however, centred on the preparation of his great work in six parts, *Vergleichende Grammatik des Sanskrit, Zend, Griechischen, Lateinischen, Lithauischen, Altslawischen, Gotischen und Deutschen* (1833–52; "Comparative Grammar of Sanskrit, Zend, Greek, Latin, Lithuanian, Old Slavic, Gothic, and German"). In this work he attempted to describe the original grammatical structure of the languages, trace their phonetic laws, and investigate the origin of their grammatical forms. He also produced a number of monographs, including studies of several European language groups, papers on the relation

of the Malayo-Polynesian (Austronesian) and Indo-European languages (1840), and on the accent in Sanskrit and Greek (1854).

Boppard, city, Koblenz *Regierungsbezirk* (administrative district), Rheinland-Palatinate *Land* (state), western Germany. Boppard is located on the left bank of the Rhine, some 12 miles (20 km) south of the city of Koblenz.

The city was the site of an early Celtic settlement and of the Roman fort of Baudobriga, from which the modern name is derived. Under the Merovingian dynasty it became a royal residence. During the Middle Ages it was a considerable centre of commerce and shipping, and under the Hohenstaufen emperors it became a free imperial city. In 1312, however, the emperor Henry VII pledged the town to his brother Baldwin, archbishop-elect of Trier, and it remained in the possession of the electors for centuries. It was assigned to Prussia by the Congress of Vienna in 1815.

Boppard is still partly surrounded by medieval walls, and its picturesque appearance has made it a centre of tourism. There is also a diversified light industrial sector, with products including machinery and pharmaceuticals. Notable buildings include the Romanesque Church of St. Severus (12th–13th century), the Gothic Carmelite Church (14th century), and the archbishop's castle (14th century), which now houses the municipal museum. The city also has a spa with mineral springs. Pop. (2002 est.) 16,424.

Bor, city, Nizhegorod *oblast* (province), western Russia, on the left bank of the Volga River opposite the city of Nizhny Novgorod, to which it is connected by a highway bridge. Industries include ship repair and the manufacture of ships' fittings, port equipment, textiles, and glass articles. Bor became a city in 1938. Pop. (2000 est.) 63,300.

Bor, city, eastern Serbia, Serbia and Montenegro. Bor is the site of one of the largest copper mines in Europe, and it has been a mining centre since 1904, when a French company began operations there. The city is situated on a road and railroad running southeast from Belgrade to Zaječar and Niš. A copper mine has opened at the Bor Mining and Smelting Works (RTB Bor), the massive works producing copper, gold, silver, and, through the electrolytic refining of silver and gold, platinum and palladium as well. Nearby, at Veliki Krivelj, there is a large deposit of high-grade copper ore.

Bor has a mining college and a mining museum. The town of Gamzigrad, with medieval remains, is nearby. Pop. (2002) 39,387.

Bor, town, southern Sudan, on the eastern bank of the al-Jabal River, and about 87 miles (140 km) north of Jübā. It is located at an elevation of 1,394 feet (425 m). In 1840 Bor was the headquarters of the second expedition under Selim "Caputan" sent by Muhammad 'Alī, the viceroy of Egypt, for the conquest of the southern Sudan.

Bor is an agricultural centre for the surrounding areas supporting grain production (mainly millet and sesame) and subsistence herding of livestock. Traditional handicrafts comprise leather and woodworking and primary processing of hides. It serves as a station for the Jübā-Khartoum ferry service. Roads link it with Jübā and Malakāl, and it has a domestic airport. A school was founded in Bor in 1905 by a Christian missionary society; it was taken over by the government after the expulsion of missionaries in 1962.

bora, very strong, cold wind that blows from the northeast onto the Adriatic region of Italy and the Balkans. The word is Venetian dialect, from Latin *boreas*, "northwind." It is most common in winter and occurs when cold air crosses the mountains from the east and de-

scends to the coast so rapidly that it has little time to warm up. It often reaches speeds of more than 100 km (60 miles) per hour and has been known to knock people down and overturn vehicles.

The name bora is given to similar winds in other parts of Europe, including Bulgaria, the Black Sea, and Novaya Zemlya in the Russian Arctic.

Bora-Bora, volcanic island, Îles Sous le Vent (Leeward Group), Society Islands, French Polynesia, central South Pacific, about 165 miles (265 km) northwest of Tahiti. The mountainous island, some 6 miles (10 km) long and 2.5 miles (4 km) wide, has Mount Otemanu (Temanu; 2,385 feet [727 m]) and twin-peaked Mount Pahia (2,159 feet [658 m]) as its highest peaks. It is surrounded by coral reefs. On the west side of the main island is a large lagoon in which the smaller islands of Toopua and Toopuati protect a spacious harbour, popular with yachtsmen. Vaitape, the principal village and administrative centre, is on the west coast.

The island's name in Tahitian is spelled Pora-Pora and means "First Born." Bora-Bora was visited by Captain James Cook in 1777 and annexed by France in the late 19th century. During World War II the island had a U.S. naval base, and Motu Mute islet on the northwest side of Bora-Bora's reef was a U.S. air base; the airstrip is still in use.

Tourism is Bora-Bora's primary industry. Chief products are copra, vanilla, and mother-of-pearl. Pop. (1996) 5,767.

Borach, Fannie (comedienne): see Brice, Fanny.

boracite, colourless, glassy borate mineral, magnesium chloroborate ($Mg_3B_3O_9Cl$). It has been found as crystals embedded in sedimentary deposits of anhydrite, gypsum, and halite. A massive variety occurs as nodules in the salt-dome deposits at Stassfurt, Ger., where it has been mined as a source of boron. For detailed physical properties, see borate mineral (table).

borage (*Borago officinalis*), a 60-centimetre (2-foot), hairy, annual plant with large, rough, oblong leaves and loose, drooping clusters of starlike, bright blue flowers. It belongs to the

Borage (*Borago officinalis*)
A to Z Botanical Collection

family Boraginaceae. The five bright yellow stamens form a cone at the star centre. Flowers are sometimes white or rose, and flowering stalks are usually reddish.

Borage was native to the eastern Mediterranean region and was used by the ancient Greeks. It is cultivated today in various parts of Europe and North America.

The leaves of the borage plant have a cool, cucumber-like aroma and taste, and they are rich in calcium and potassium. Leaves and flowers are used in salads, and in Europe the leaves are cooked as a vegetable. Dried or fresh

leaves are used to season stews and soups and to flavour wine cups and other drinks. Borage is also grown for bee feeding.

Boraginaceae, family of annual plants, composed of approximately 150 genera and about 2,500 species, chiefly of herbs but also including some trees and shrubs, characterized by

Prickly comfrey (*Symphytum asperum*), a member of the Boraginaceae family

© Thomas C. Boyden

hairy foliage. Members of the borage family are found in tropical, subtropical, and temperate areas and are most concentrated in the Mediterranean region.

The leaves are usually alternate and simple; flowers are funnel-shaped or tubular and flaring, with five lobes, often nodding or in coiled sprays. The flowers are frequently distinguished for their bright blues, which sometimes show a shading of red.

Among the members of this family are several ornamental plants grown to a limited extent in gardens, including the Virginia bluebell (*Mertensia virginica*), forget-me-nots (*Myosotis* species), heliotropes (*Heliotropium* species), lungworts (*Pulmonaria* species), and borage (*Borago officinalis*). Somewhat lesser known are honeywort (*Cerinth* species), hounds' tongue (*Cynoglossum* species), and viper's bugloss (*Echium* species). The blue devil, or blue weed (*E. vulgare*), tends to be a bristly, noxious weed and is difficult to eradicate. The few members known for other economic significance include borage, used as an herbal and bee plant and eaten as a vegetable; comfrey (*Symphytum officinale*), grown as an herbal plant; dyer's alkanet (*Alkanna tinctoria*), the roots of which yield a red colouring agent; and gromwell (*Lithospermum officinale*), the leaves of which can be used to make a tea. In tropical areas some species of *Cordia* have been grown for timber, and some species produce edible fruits.

Borah, William E., in full WILLIAM EDGAR BORAH (b. June 29, 1865, Fairfield, Ill., U.S.—d. Jan. 19, 1940, Washington, D.C.), Republican U.S. senator from Idaho for 33 years, best known for his major role at the end of World War I (1918) in preventing the United States from joining the League of Nations and the World Court.

Borah

By courtesy of the Library of Congress, Washington, D.C.

Borah practiced law in Boise, Idaho, and in 1892 became chairman of the Republican State Central Committee. He first won election to the U.S. Senate in 1906 and was returned to office five times by large majorities, making his tenure one of the longest in U.S. history. Borah's distrust of government centralization limited his commitment to social reform, but he did sponsor bills establishing the Department of Labor as well as the federal Children's Bureau. He also strongly supported the federal income tax and fought the trusts.

Isolationism dominated Borah's attitudes toward foreign policy. He did, however, sponsor a congressional resolution (1921) calling for an international naval disarmament conference in Washington, D.C., resulting in the Naval Armament Limitation Treaty concluded Feb. 6, 1922. Assuming the chairmanship of the Senate Committee on Foreign Relations in 1924, he wielded enormous power in this area for the next 16 years.

Borah did not object to international compacts so long as the enforcement mechanism was limited to moral sanctions; thus he lent his support to the Kellogg-Briand Pact (Paris, 1928)—an ineffective multilateral agreement theoretically outlawing war as an instrument of national policy. He consistently upheld diplomatic recognition of the Soviet Union and also helped establish the Good Neighbor

policy toward Latin America by advocating a fair deal for Mexico during the controversy over foreign-held oil properties (1926-28).

During the Great Depression of the 1930s, Borah supported many New Deal measures designed to relieve internal economic conditions. As European tensions mounted, however, he held fast to his isolationist stance by resisting all attempts to involve the U.S. on the side of the Allies.

Borah Peak, highest point (12,662 ft [3,859 m]) in Idaho, U.S., in Lost River Range, part of Challis National Forest, in Custer County, 50 mi (80 km) northeast of Hailey. It was named for William E. Borah, U.S. senator from Idaho.

borane, any of a homologous series of inorganic compounds of boron and hydrogen or their derivatives (see boron).

Borås, town, *län* (county) of Älvsborg, southwestern Sweden, on Viskan River, east of Göteborg. It was founded in 1622 by King Gustavus II Adolphus. Borås is Sweden's leading textile centre, with cotton and woollen mills, dye works, hosiery factories, and weaving colleges. It is also the main centre for ready-made clothing and for mail order firms. In the western part of town is an open-air museum, the buildings of which include the

wooden Kinnarumma Church and old peasant houses. Pop. (1983 est.) mun., 100,715.

borate mineral, any of various naturally occurring compounds of boron and oxygen. Most borate minerals are rare, but some form large deposits that are mined commercially.

Borate mineral structures incorporate either the BO₃ triangle or BO₄ tetrahedron in which oxygen or hydroxyl groups are located at the vertices of a triangle or at the corners of a tetrahedron with a central boron atom, respectively. Both types of units may occur in one structure. Vertices may share an oxygen atom to form extended boron-oxygen networks, or if bonded to another metal ion consist of a hydroxyl group. The size of the boron-oxygen complex in any one mineral generally decreases with an increase of the temperature and pressure at which the mineral forms.

Two geological settings are conducive for the formation of borate minerals. The first is commercially more valuable and consists of an environment where an impermeable basin received borate-bearing solutions that resulted from volcanic activity. Subsequent evaporation caused precipitation of hydrated alkali and alkaline-earth borate minerals. With increased depth of burial resulting from additional sedimentation, beds of compositionally stratified borates crystallized as a consequence of temperature and pressure gradients. Because evaporation must occur for precipitation of the borates, such basin deposits usually occur in desert regions, as for example the Kramer

Borate minerals

name formula	colour	lustre	Mohs hardness	specific gravity	habit or form	fracture or cleavage	refractive indices	crystal system space group	remarks
boracite Mg ₃ B ₇ O ₁₃ Cl	colourless or white	vitreous	7-7½	2.9-3.0	isolated, em- bedded, cubelike crystals	conchoidal to uneven fracture	α = 1.658-1.662 β = 1.662-1.667 γ = 1.668-1.673	orthorhombic (isometric above 265° C) Cmm	strongly piezo- electric and pyroelectric
borax Na ₂ B ₄ O ₇ · 10H ₂ O	colourless to white; gray- ish, bluish, greenish	vitreous to resinous	2-2½	1.7	short prismatic crystals	one perfect, one good cleavage	α = 1.445 β = 1.469 γ = 1.472	monoclinic C ₂ c	feeble, sweetish alkaline taste; diamagnetic
colemanite Ca ₂ B ₆ O ₁₁ · 5H ₂ O	colourless; white, yellow- ish, gray	brilliant vitreous to adamantine	4½	2.4	short prismatic crystals; massive	one perfect, one distinct cleavage	α = 1.586 β = 1.592 γ = 1.614	monoclinic P ₂ m	
inoite Ca ₂ B ₆ O ₁₁ · 13H ₂ O	colourless, be- coming white and cloudy after partial dehydration	vitreous	2	1.7	short prisms and coarse crystal aggre- gates; ge- odes; drusy crusts; granu- lar massive	one good cleavage	α = 1.492-1.495 β = 1.501-1.510 γ = 1.516-1.520	monoclinic	
kernite Na ₂ B ₄ O ₇ · 4H ₂ O	colourless	vitreous	2½	1.9	very large crys- tals; fibrous, cleavable, irregular masses	two perfect cleavages	α = 1.454 β = 1.472 γ = 1.488	monoclinic P ₂ c	
ludwigite Mg ₂ Fe ⁺³ BO ₅	dark green to coal black	silky	5	3.6 (lud) to 4.7 (paig)	fibrous masses; rosettes; sheaflike aggregates	no observed cleavage	α = 1.83-1.85 β = 1.83-1.85 γ = 1.97-2.02	orthorhombic	forms a solid so- lution series with paigeite in which Fe ⁺² replaces Mg
pricite Ca ₄ B ₁₀ O ₁₉ · 7H ₂ O(?)	white	earthy	3-3½	2.4	soft and chalky to hard and tough nodules	earthy to conchoidal	α = 1.569-1.576 β = 1.588-1.594 γ = 1.590-1.597	triclinic(?)	
sussexite MnBO ₃ (OH)	white to straw- yellow	silky to dull or earthy	3-3½	2.6 (szai) to 3.3 (suss)	fibrous or felted masses or veinlets; nodules		α = 1.575-1.670 β = 1.646-1.728 γ = 1.650-1.732	probably orthorhombic	forms a solid so- lution series with szaibelyite in which Mg replaces Mn; szaibelyite has the lower re- fractive indices
tincalconite Na ₂ B ₄ O ₅ (OH) ₄ · 3H ₂ O	white (natural); colourless (artificial)	vitreous		1.9	found in nature as a fine- grained powder; physical prop- erties are given for arti- ficial pseudo- cubic crystals	hackly frac- ture	ω = 1.461 ε = 1.474	hexagonal R32	
ulexite NaCaB ₅ O ₉ · 8H ₂ O	colourless; white	vitreous; silky or satiny	2½	2.0	small nodular, rounded, or lenslike crys- tal aggre- gates; fibrous botryoidal crusts; rarely as single crystals	one perfect, one good cleavage	α = 1.491-1.496 β = 1.504-1.506 γ = 1.519-1.520	triclinic	

district of the Mojave Desert and Death Valley in California, where enormous beds of stratified kernite, borax, colemanite, and ulexite are recovered, primarily by stripping away the overburden and mining the borates by classical open-pit techniques. Other noteworthy evaporite deposits occur in the Inderborsky district of Kazakstan and in Tuscany, Italy. The sequence of precipitating alkali borates can be duplicated in the laboratory because the temperatures and pressures of their formation are low and easily accessible. Solutions of the alkali borates and the addition of metal ions such as calcium and magnesium result in the precipitation of yet other borate compounds. Among the borates commonly found in evaporite deposits are borax, colemanite, inyoite, kernite, and tinalconite.

The second geologic setting for borate minerals is a metamorphic carbonate-rich environment, where they are formed as a result of alteration of the surrounding rocks by heat and pressure; similar borates also occur as nodules in some deeply buried sediments. These compounds were formed at relatively high temperatures and usually consist of densely packed BO_3 triangles associated with such small metal ions as magnesium, manganese, aluminum, or iron. The origin of these borates is not as obvious as that of the evaporite varieties. Some were produced by the reaction of boron-bearing vapour derived from hot intruding granites during metamorphism; others are the recrystallization products of evaporite borates. Numerous borosilicates (e.g., dumortierite and tourmaline) were formed under these conditions. Compounds of this type contain both BO_3 triangular units and SiO_4 tetrahedral units. Among the borate minerals associated with metamorphosed environments are boracite, ludwigite, and sussexite.

Boratynsky, Yevgeny Abramovich: *see* Baratynsky, Yevgeny Abramovich.

borax, also called TINCAL, sodium tetraborate decahydrate ($\text{Na}_2\text{B}_4\text{O}_7 \cdot 10\text{H}_2\text{O}$). A soft and light, colourless crystalline substance, borax is used in many ways—as a component of glass and pottery glazes in the ceramics industry, as a solvent for metal-oxide slags in metallurgy, as a flux in welding and soldering, and as a fertilizer additive, a soap supplement, a disinfectant, a mouthwash, and a water softener.

Borax has been known since early times, when it was obtained from saline lakes in Kashmir and Tibet and taken to Europe to be refined. It has been produced commercially from colemanite, kernite, and tinalconite, as well as from the mineral borax, by dissolving the ore in water, filtering out the clay, and evaporating the solution. Colemanite was the chief source until the 1930s, when it was supplanted by kernite, which was subsequently replaced by the mineral borax. About 50 percent of the world's supply of commercial boron compounds comes from southern California: the borax crusts and brine from Searles Lake, the large kernite and borax deposits near Kramer, and the colemanite deposits from Death Valley, formed by the evaporation of hot springs or saline lakes and playas. For detailed physical properties, *see* borate mineral (table).

Borbón, HOUSE OF (Spanish), Italian BORBONE: *see* Bourbon, house of.

Borda, Jean-Charles de (b. May 4, 1733, Dax, Fr.—d. Feb. 20, 1799, Paris), French mathematician and nautical astronomer noted for his studies of fluid mechanics and his development of instruments for navigation and geodesy, the study of the size and shape of the Earth.

Borda entered the French army at an early age and later transferred to the navy, where he attained the rank of *capitaine de vaisseau* ("post captain"), took part in several scientific voyages, and played a role in the U.S. War of

Independence. Borda developed and used many instruments for measuring an arc of a meridian, or longitude line, and helped introduce the metric system into France. He applied his studies of fluid flow and fluid resistance to artillery, ships, and hydraulic pumps. He also developed a series of trigonometric tables in conjunction with his surveying techniques. In 1782, while commanding a flotilla of six ships, he was captured by the British but was immediately released on parole.

Bordaberry Arocena, Juan María (b. June 17, 1928, Montevideo, Uruguay), president of Uruguay in 1972–76.

Bordaberry was born into a wealthy ranching family and attended law school at the University of the Republic in Montevideo before assuming management of the family ranch after his father's death. He entered political life during the upheaval that resulted from the blow to Uruguay's economy when world prices of beef and wool declined in the 1950s. In the elections of 1958 the economic crisis led to the ouster of the liberal Colorado Party and brought to power the conservative National (Blanco) Party, with which Bordaberry was affiliated. He served on several agricultural boards (1959–62) and in the Senate from 1962 to 1965. In 1964 he headed the Federal League for Rural Action, representing landowners who successfully campaigned to replace the ruling nine-man executive council with a presidential system. In 1969 Bordaberry switched to the Colorado Party and was named Minister of Agriculture and Livestock by President Jorge Pacheco Areco.

Bordaberry's 1972 election to the presidency was followed by an army-conducted recount and accusations of fraud. Six weeks after his inauguration, Bordaberry suspended the constitution and individual liberties, allowing the military free rein in stamping out the guerrilla forces (Tupamaros) that were terrorizing the country. By 1973 the president had become a virtual puppet of the military, passing actual control to a seven-man National Security Council. Under severe pressure from the armed forces, Bordaberry abolished the Congress, banned all political parties, and acquiesced in press censorship and political repression. Economic conditions continued to worsen, and Bordaberry was ousted by the military on June 12, 1976, after which he returned to the ranching business.

Bordeaux, city and port, capital of Gironde *département*, Aquitainic *région*, southwestern France. It lies along the Garonne River 15 miles (24 km) above its junction with the Dordogne and 60 miles (96 km) from its mouth, in a plain east of the wine-growing district of Médoc.

The dry soil of Médoc attracted settlement as early as the Bronze Age; and, at least since Roman times, Bordeaux has been a flourishing town and port, with connections particularly with Spain and Britain. As Burdigala, it was the chief town of the Bituriges Vivisci, a Celtic people. Under the Romans it was the capital of the province of Aquitania, which extended from the Pyrenees to the Loire. In the 4th century Burdigala, then the capital of Aquitania Secunda (one of the three parts into which the emperor Diocletian had divided Aquitania), was described by the writer Ausonius, a native of the city, as a square, walled town and one of the great educational centres of Gaul. In the decline of the Roman Empire, the region around Bordeaux entered a period of political instability from which it recovered only when the dukes of Aquitaine established themselves early in the 10th century.

As part of the inheritance of Eleanor of Aquitaine, Bordeaux, along with the rest of the duchy, became English in 1154 upon the accession of her husband to the English throne, as Henry II. His 14th-century descendant Edward the Black Prince, who for 20 years held

court at Bordeaux and whose son, Richard (later King Richard II), was born there, is still honoured in the city. Under the English, Bordeaux was given unusual freedom: mayors were elected from 1235, and a thriving trade developed with England's ports. Neighbouring towns such as Saint-Émilion and Libourne joined a federation under the leadership of Bordeaux. After the French victory over the English at Castillon in 1453, the city was united to France; but the burghers of Bordeaux long resisted limitation of their municipal freedoms, and 120 of them were executed after a salt-tax rebellion in 1548.

The Pont de Pierre bridge over the Garonne River, Bordeaux, Fr.

Gail Mooney—Corbis

The 17th century was a period of disturbance. There were massacres in the Wars of Religion, and trade withered. In the 18th century Bordeaux again prospered from the "triangular" trade: slaves from Africa to the West Indies, sugar and coffee back to Bordeaux, then arms and wines back to Africa. The Marquis de Tourny, intendant of Guyenne, made the city pleasing with squares and fine buildings. The Girondist Party of the French Revolution was formed in Bordeaux, which suffered severely during the Reign of Terror. After suffering from the English blockade during the Napoleonic Wars, the city in 1814 declared for the Bourbons, prompting Louis XVIII to give his grandnephew the title of Duke de Bordeaux.

After the coming of the railways, the great improvements to the port and the increase in trade with West Africa and South America led to increased prosperity. In 1870, during the Franco-German War, the French government was transferred to Bordeaux when the Germans approached Tours, and the government was at Bordeaux when Paris was threatened by the Germans in August 1914, at the outset of World War I. In June 1940, during World War II, when a German advance became again a menace to Paris, the French government moved first to Tours and later to Bordeaux. There Premier Paul Reynaud led a minority in the government favouring "war to the finish." Among his supporters were Charles de Gaulle and Georges Mandel. Reynaud sent appeals for immediate help to the United States and Great Britain. He was overridden by the opposition, however, and resigned on June 16, two days after the Germans entered Paris. Bordeaux was severely bombed before its occupation by German troops and, again,

by the Allies when it was an important German air and submarine base. The city was re-occupied, largely by French forces, in August 1944. Since 1945 Bordeaux has continued to expand, with many new suburbs being built.

The modern city of Bordeaux is surrounded by a semicircle of boulevards, beyond which lie the suburbs of Le Bouscat, Caudéran, Mérignac, Talence, and Bègles. The Garonne River (1,650–2,250 feet [500–690 m] wide), separating the city proper from the suburb of La Bastide, embraces a 5-mile (8-kilometre) crescent of broad quays, behind which rise tall warehouses, factories, and mansions. Outside the great city squares are characteristic low, white houses. La Bastide, on the right bank, is reached by a 19th-century bridge. Some gates of the old city wall remain, and there are ruins of a Roman amphitheatre. The Grand Théâtre (1775–80), with its statue-topped colonnade, is one of the finest in France; its imposing double stairway and cupola were later imitated by the architect Tony Garnier for the Paris Opéra. Farther down the quay is the Esplanade des Quinconces, one of the largest squares in Europe; it contains a monument to the Girondins and huge statues of Montesquieu and Michel de Montaigne (the latter's tomb is at the university, founded 1441). Bordeaux's ecclesiastical antiquities include two 15th-century bell towers: the bell tower of Pey-Berland, near Saint-André's Cathedral, and the Saint-Michel Tower, with a spire of 357 feet (109 m). A late 20th-century urban development plan called for the renovation of the city centre and extension of new districts northward around a large lake and along the west bank of the Gironde Estuary. An exhibition hall was built, as well as a large, modern bridge connecting the city with the nearby national highway (only one bridge formerly existed for foot and automobile traffic across the Garonne).

The great families of Bordeaux made their fortunes in shipping and trade, especially of the celebrated wines of Bordeaux. The prosperity of these wine-growing and wine-trading houses took a great leap at the time of the English domination. After a critical period during the 15th–17th century, prosperity returned in the 18th century and has maintained itself ever since, despite problems of weather and grape parasites, the most critical of which was the phylloxera infestation of 1869. The modern extent of the vineyards is about half its former maximum area. The government of France and the local growers regard control of quality and quantity of these wines as essential to the preservation of a major export market. The port area has had importance since the 18th century, but it is increasingly transferring this function to its five outports (seaward terminals for deep-draft vessels), especially for traffic with the Antilles, Africa, and the west coast of France. In recent years the major import in terms of tonnage handled has been petroleum. This trade has favoured the accumulation of capital but has not fostered the growth of industry, although efforts have been made. To the traditional food-processing and furniture industries have been added in recent years petroleum refining, petrochemical and pharmaceutical industries, and an automobile plant. Pop. (1990) 210,336.

Bordeaux I, II, and III, Universities of, French UNIVERSITÉS DE BORDEAUX I, II, ET III, coeducational, autonomous, state-financed institutions of higher learning at Bordeaux, France. The three universities were established in 1970 under the 1968 Orientation

Act, reforming French education, to replace the original University of Bordeaux, which was founded in 1441 and confirmed by papal bull during the reign of King Charles VII. The university played an important role in politics and church affairs; it even sent representatives to the great church councils.

From the 15th to the 18th century, the university produced such renowned figures as the essayist Michel de Montaigne (1533–92) and the French jurist and political philosopher Montesquieu. Its faculties of theology, canon and civil law, medicine, and arts were typical of European Renaissance universities. The university was suppressed during the French Revolution and replaced by faculties of the University of France. In 1896 Bordeaux was reconstituted as a university and given autonomy and state financing.

The modern universities have been restructured into study and research units, each having academic and administrative independence. Bordeaux I has units of law, economics, and sciences; it also has an observatory. Bordeaux II has units of medicine and life sciences and affiliated research institutes. Bordeaux III has units of letters and arts and of languages and a technological institute.

Bordeaux, Henri Dieudonné, Duke (duc) de; see Chambord, Henri Dieudonné, Count (comte) de.

Bordeaux wine, also called CLARET, any of numerous wines of the region surrounding the city of Bordeaux, France. Bordeaux has a long history in wine culture; like Burgundy and the Rhine region, it was known in Roman times. During the English occupation of Bordeaux, a charter was granted, first by Richard I and second by John in 1199, to the still-functioning *jurade*, a controlling body dating originally from the 12th century, which in its ceremonies still observes its medieval ritual and uses its traditional robes of the St. Emilion district for the supervision of wine making. Claret meant in those days a pale wine made by mixing reds and whites; the word claret is not used in modern French.

The modern Bordeaux region is one of the world's most important regions making fine wines. It is divided by the Bordeaux wine classification into 36 districts, which in turn are divided into communes. Within these communes, again, are certain individual vineyards, called *châteaux* in this region, that produce the finest wines. The *châteaux* bottle their own wine and label it under their names, thus guaranteeing that it is not a blend. The *château*-bottled wines rated best are classified as *crus classés*, which in turn have five categories called *growths*. These five growths are not altogether based on excellence, which in fine wines remains always a matter of taste to some degree; other criteria, such as market price, exportation, and fame also formed these ratings. Rated in 1855, this classification is also outdated; nevertheless it has held up well over the years apart from excluding the possibility of improvement after 1855. After these *crus classés* are *crus exceptionnels*, comprising a half dozen wines, and several hundred wines named *crus bourgeois* and *crus artisans*, or *paysans*. The last two categories are largely obsolete owing to the growth of cooperative wineries, which have enabled small proprietors to use up-to-date wineries managed by expert vintners, thus raising the quality of less-expensive wine in Bordeaux and elsewhere. Although strict labeling is in force in Bordeaux *château*-bottled wines, inferior wines are still sold as Bordeaux. Further, because a poor year produces wine of inferior quality, such wines must be known by vintage as well.

Wines of the Bordeaux region are labeled Bordeaux. Wines from specific districts of Bordeaux are usually of specific type and have more interest; they are labeled with the district name, as Médoc or St. Emilion. Within the

districts are communes, of specific wine type and of superior character; these are labeled with the name of the commune, St. Julien or St. Estèphe. Of the 17 districts in Bordeaux, Médoc, Graves, St. Emilion, and Pomerol are best known. Médoc, Sauternes, and Barsac were classified in 1855, Graves in 1953, and St. Emilion in 1955.

Médoc. These wines are red, generally of light body and strong flavour. Médoc, 50 miles (80.5 km) long and 3–7 miles (5–11 km) wide, has a dozen communes, each possessing soil that produces wine of particular quality; Pauillac, Margaux, St. Julien, Cantenac, and St. Estèphe are of these. Of the 61 red wines classified *crus classés* in 1855, all but one were from Médoc. First growth *châteaux* are Lafite-Rothschild, Margaux, and Latour; other *crus classés* number among them Mouton-Rothschild and Kirwan.

Graves. The general reputation of Graves is for white wine, rich in taste and not too sweet. Actually Graves produces as much red as white. These balanced, fine-coloured, and rather fruity reds are sometimes rated finer than the whites. Château Haut-Brion was classified first growth in 1855; it is one of eight classified red wines of Graves in the 1959 official classification of Graves. Five *châteaux* were selected as classified white wines of Graves in 1959.

Sauternes and Barsac. The natural sweet wines, fruity with enduring rich flavour, of this district are usually considered among the world's finest. To achieve their quality the grapes are left until overripe on the vines before harvesting, thus producing the ripeness known as *pourriture noble*, which leaves an abundance of sugar in the grape, sweetening the wine and producing a high alcoholic content. A label of Haut-Sauternes is also allowed for wines of this district, although no such area exists. Wines from the village area of Barsac, similar to Sauternes, are allowed the label of Sauternes or Barsac. Château d'Yquem is classified first superior growth, and 24 other *châteaux* are classed in the first and second growths.

St. Emilion. Sometimes called masculine wines, St. Emilions are full-bodied and of darker colour than Médocs. The 1955 classification listed 12 called first great growths of St. Emilion, among which are Château Cheval Blanc and Château Ausone, of long-standing reputation. There were 63 *châteaux* rated as great growths. These classes, like those of Graves, are peculiar to these districts, not part of the 1855 Médoc classification.

Other Bordeaux districts. White wines come from Sainte Foy, Entre-Deux-Mers, Langouan. At their best the whites of Ste. Croix-du-Mont, Loupiac, and Cérons have characteristics of Sauternes. Good red and white wines are produced in Bourg, Blaye, Cadillac, and Camblanes-et-Meynac.

Vintages and age. Some wines prosper in generally bad years or fail in good years. Thus vintage charts are not a certain guide. Bordeaux reds are at their peak 8 to 23 years after vintage. They are long-lived, however, and full-bodied reds will last 50 years or more. Dry whites may be ready to drink in 1 to 2 years but age faster than reds or sweet whites, fading sometimes after 7 years. Sweet whites may be drunk about 3 years after vintage, will be at their peak at 10 years, and may last 30 years.

Borden, also called PORT BORDEN, TOWN, Prince county, southern Prince Edward Island, Canada, on Northumberland Strait. Named Carleton Point by the English surveyor Samuel Holland in 1765, it was renamed (1916) after Sir Robert Laird Borden, then the Canadian prime minister. Although a fishing port, it is economically dependent upon its role as a transportation hub. Highways and a Canadian National Railway line to

Charlottetown (35 miles [56 km] east) and other provincial centres radiate from the harbour, where car ferries regularly dock, connecting the island with Cape Tormentine, N.B., 9 miles (14.5 km) south. From a point near Borden to Cape Tormentine the first submarine telegraph cable in North America was successfully laid (1851). Inc. 1919. Pop. (1991) 436.

Borden, Sir Frederick William (b. May 14, 1847, Cornwallis, Nova Scotia—d. Jan. 6, 1917, Canning, Nova Scotia, Can.), Canadian statesman who, as Liberal minister of militia and defense (1896–1911), helped to create a Canadian navy.

Sir Frederick Borden, 1905
By courtesy of the Public Archives of Canada

Borden studied medicine at Harvard University and practiced as a physician for some years in Canning. He was elected in 1874 as Liberal member of the Canadian House of Commons for Kings County and represented this constituency (except for the years 1882–87) until his defeat in 1911. He was knighted in 1902. As minister of the militia, Borden made improvements in training and discipline in the little-developed Canadian services. With the acquisition of naval establishments at Halifax, Nova Scotia, and Esquimalt, B.C., his department became responsible for developing the Canadian navy and was influential in terminating the practice of appointing a British officer to command the Canadian militia.

Borden, Gail (b. Nov. 9, 1801, Norwich, New York, U.S.—d. Jan. 11, 1874, Borden, Texas), American philanthropist, businessman, and inventor, who envisioned food concentrates as a means of safeguarding the human food supply. He was the first to develop a commercial method of condensing milk, and the dairy company founded by him (renamed Borden, Inc., in 1968) expanded and diversified to become a sizable conglomerate.

As a youth Borden helped survey the future city of Covington, Ky., where his family settled on their travels westward. He taught school in southern Mississippi and immigrated to Texas in 1829, where he prepared the first topographical map of Texas, helped write the first constitution of that state, was cofounder of the first long-lived Texas newspaper, and laid out the city of Galveston.

Among Borden's first inventions was a meat biscuit that won a gold medal at the Great Council exhibition in London in 1851; it was commercially unsuccessful, however. Borden next developed a process for concentrating milk, receiving U.S. and British patents in 1856, and opened a condensery in 1861.

Borden, Lizzie (Andrew) (b. July 19, 1860, Fall River, Mass., U.S.—d. June 1, 1927, Fall River), woman suspected of murdering her stepmother and father; her trial became a national sensation in the United States. A pretrial jingle celebrated her name: "Lizzie Borden took an ax/ And gave her mother forty whacks;/ And when she saw what she had done/ She gave her father forty-one."

Lizzie's mother died when she was two, and her father remarried in 1865. Lizzie was popu-

lar and engaged in charitable work; her father, by contrast, was reputedly dour and parsimonious—as well as eminently wealthy—and Lizzie and her sister Emma were ever at odds with him and their stepmother, often over financial matters. On a Thursday morning, Aug. 4, 1892, Mr. Borden left home to conduct his business, leaving in the house, besides his wife, an Irish maid (Bridget Sullivan) and Lizzie. (Emma was away visiting.) On his return, he settled on a couch for a nap. At about 11:15 AM, Lizzie (according to her testimony) discovered her father dead, repeatedly struck in the head with a sharp instrument. Upstairs his wife's body was found, even more brutally mutilated; examination proved that her death had preceded her husband's by an hour or so. It was found that Lizzie had tried to purchase prussic acid on August 3, and a few days later she was alleged to have burned a dress in a stove. Bridget Sullivan, who also has been suspected, later that evening reportedly left the house carrying an unexamined parcel. No weapon was found, though an axe found in the basement was suspected.

Lizzie was arrested and tried for both murders in June 1893 but was acquitted, given the circumstantial evidence. She remained in Fall River until her death at age 66, largely ostracized by the community.

Borden, Sir Robert (Laird) (b. June 26, 1854, Grand Pré, Nova Scotia [Canada]—d. June 10, 1937, Ottawa, Ont., Can.), eighth prime minister of Canada (1911–20) and leader of the Conservative Party (1901–20), who played a decisive role—notably by insisting on separate Canadian membership in the League of Nations—in transforming the status of his country from that of colony to that of nation. He was knighted in 1914.

Sir Robert Borden
National Film Board of Canada Photothèque

Borden cut short his formal education before his 15th year, when he accepted the post of assistant master of the private school he was attending. His teaching career ended in 1874, when he became articled to a Halifax law firm. Admitted to the bar of Nova Scotia in 1878, he rose to a commanding position in legal circles, and after his marriage to Laura Bond (1889) he founded a law firm that acquired one of the largest practices in the Maritime Provinces. His friendship with Sir Charles Hibbert Tupper, son of one of the original "Fathers of Confederation," led him to accept the conservative nomination for Halifax in 1896. Borden's entry into politics coincided with the victory of the Liberal Party under the leadership of Sir Wilfrid Laurier. Though he remained an obscure backbench opposition member during his first term, Borden was invited by the caucus upon his reelection in 1900 to assume temporarily the leadership of the party. He accepted the post, and, despite repeated intrigues against his leadership and his own professions of distaste for it, occupied it until 1911, when the Liberal decision to accept a reciprocal trade agreement with the United States led to Laurier's defeat.

As prime minister, Borden's major interest was Anglo-Canadian relations. He had long

argued for the establishment of a Canadian voice in imperial policy. His naval policy before World War I—which involved a grant of \$35,000,000 to Britain for the construction of three battleships—was a mixture of opportunism and wishful thinking about the extension of Canada's influence in the councils of empire. During the first two years of war Borden frequently referred to the necessity of Canadian participation in British decisions, but it was not until the British prime minister David Lloyd George created the Imperial War Cabinet (IWC) in 1917 that Borden was given a chance to express Canada's point of view. At the meetings of the IWC in London and its subsequent sessions in Paris during the negotiation of the Treaty of Versailles, Borden supported the Fourteen Points of U.S. president Woodrow Wilson and argued that Canada's interests demanded the closest possible alliance between the British Empire and the United States. (Borden saw nothing incompatible between insisting on the right to participate in shaping imperial policy and Canada's independent membership in the League of Nations. He seemed to envisage the empire-commonwealth as an alliance in which smaller members might have to defer to the interests of the great power, but only after a process of continuous consultation.)

Borden's Conservative administration confronted unprecedented administrative, financial, and political challenges during the years of World War I, and when, despite the voluntary recruitment of half a million Canadians for overseas service, conscription was required to maintain the Canadian forces at full strength, he initiated the formation of a coalition government. The success of the Unionist forces in the election of 1917 ensured a continuation of Borden's policies of total commitment to the war effort and an international role for Canada—but at the price of antagonizing the French-Canadian population, who were unrepresented in the government and opposed to its policies.

Borden's preoccupation with Anglo-Canadian relations may partly account for his first administration's poor performance in domestic affairs. He dealt indecisively with his controversial minister of militia, Sam Hughes, whom he did not remove from office until late in 1916. As charges of incompetence, patronage, and war profiteering were leveled against Borden's government, public confidence in him decreased. His decision, however, to form a coalition government in order to implement conscription gave him the opportunity to reconstruct his cabinet and to surround himself with a group of able colleagues. With Arthur Meighen, his successor as prime minister, to manage the House of Commons and with two Liberals, Newton Rowell and Alexander K. Maclean, in charge of key cabinet committees, Borden was free to concentrate on the larger questions under discussion in London and Paris. He supported Allied intervention in the Russian Civil War, in which he was anxious to have Canadian troops participate. Public opinion forced the return of a 3,000-man expeditionary force from Vladivostok, which Borden had hoped would establish a Canadian presence leading eventually to trade concessions. His policy of arresting the leaders of the Winnipeg General Strike (1919) and of charging them under a revised definition of sedition that was rushed through Parliament in the form of an amendment to the criminal code won him the enmity of labour. He resigned in July 1920.

In retirement he attended the Washington Naval Disarmament Conference (1921) as Canada's delegate and wrote *Canadian Constitutional Studies* (1922) and *Canada in the Commonwealth* (1929). (J.T.C.)

BIBLIOGRAPHY. Robert Craig Brown, *Robert Laird Borden*, 2 vol. (1975–80), is a biography. Harold A. Wilson, *The Imperial Policy of Sir Robert Borden* (1966), is a brief examination of Borden's quest for a voice in British foreign and imperial policy. John English, *The Decline of Politics* (1977), describes Conservative party organizational changes during the period of Borden's leadership, 1901–20.

Bordentown, city, Burlington county, western New Jersey, U.S., on the Delaware River, just south of Trenton. Settled in 1682 by Thomas Farnsworth, a Quaker, it was early known as Farnsworth's Landing. In 1734 Joseph Borden (for whom the settlement was renamed) established a stage line and packet service at the site. Joseph Bonaparte, oldest brother of Napoleon and exiled king of Spain, purchased about 1,500 acres (600 hectares) on the outskirts of Bordentown which he developed (1816–39) into a "little kingdom," where he entertained many European notables; Bonaparte Park is a remnant of his estate. The Clara Barton Schoolhouse, dating from the Revolutionary period but organized in 1851 by Clara Barton (founder of the American Red Cross) as one of the nation's first free public schools, has been restored, as have several historic residences in the city.

During the 19th century, Bordentown became the terminal of the Delaware and Raritan Canal, and New Jersey's first railroad shops were located there. Diversified farming and light manufacturing (sportswear, printing and box making machinery, and bricks) are current economic activities. Inc. borough, 1825; city, 1867. Pop. (1990) 4,341.

Border, Allan Robert (b. July 27, 1955, Cremorne, Sydney, N.S.W., Australia), Australian cricketer who became the all-time leading run-scorer in Test (international) matches in 1993.

A left-handed batsman and bowler, Border grew up in Sydney and entered first-class cricket in 1977. He played his first Test match in Melbourne in 1978–79, captained the Queensland team in 1983–84, and succeeded Kim Hughes as captain of the Australia team in the 1984–85 season. Border became the most prolific batsman in Australian Test history and maintained a Test average of about 51 despite captaining a losing side throughout much of his career. In 1993 he surpassed the Indian batsman Sunil Gavaskar's record of 10,122 runs to become the highest run scorer in Test cricket history. Border played in more Test matches (150 by the 1992–93 season) than any other player in history. He led Australia to victory over England in the 1987 World Cup competition.

border ballad, type of spirited heroic ballad celebrating the raids, feuds, seductions, and elopements on the border between England and Scotland in the 15th and 16th centuries, where neither English nor Scottish law prevailed. Among the better known border ballads are "Johnny Cock," "Jock o' the Side," "Hobie Noble," and "The Bonny Earl of Murray." Though a few deal with events of historical importance, most are concerned with the personal retributions of the outlaws and robber clans who maintained their own grim code on the border. *See also* coronach.

border terrier, breed of terrier developed in the border country of England and Scotland to hunt and kill foxes that were preying on livestock. The border terrier stands about 33 cm (13 inches) and weighs 5–7 kg (11–15 pounds). It has a short, otterlike head, narrow shoulders, and a dense, weather-resisting

coat of blue-gray and tan or golden or reddish brown.

Borders, region of southeastern Scotland, created by the administrative reorganization of 1975. It consists of the former counties of Berwick, Peebles, Roxburgh, and Selkirk and a small part of the former county of Midlothian. The region is divided into the districts of Tweeddale, Ettrick and Lauderdale, Roxburgh, and Berwickshire. Newton Saint Boswells is the regional headquarters. Area 1,814 square miles (4,698 square km). Pop. (1991 prelim.) 102,649.

Bordes, Charles (b. May 12, 1863, Rochecorbon, near Vouvray, France—d. Nov. 8, 1909, Toulon), French composer, choirmaster, and musicologist who was important in reviving Renaissance polyphonic choral music.

Bordes was a pupil of the composer César Franck. In 1890 he became chapelmaster of St. Gervais in Paris, which he made the centre of the study and practice of 15th-, 16th-, and 17th-century vocal music. With the organist Alexandre Guilmant and the composer Vincent d'Indy, he founded (1894) the Schola Cantorum, a society that in 1896 became a school for church music with Bordes as professor. Its publication, *La Tribune de St. Gervais* (1895), became the main organ of French musicology. He also began publication of the *Anthologie des maîtres religieux primitifs*, which provided choral societies with invaluable material. By 1905 he had moved to Montpellier, where he started a provincial branch of the Schola Cantorum.

Also interested in folk song, Bordes toured the Basque country in 1889 to collect traditional melodies, 100 of which were published in *Archives de la tradition basque* (1889–90). As a composer he achieved particular success with his songs. He also wrote piano music, sacred and secular choral works, a *Suite basque* for flute and strings, *Danses béarnaises*, and a symphonic poem for orchestra.

Bordet, Jules, in full JULES-JEAN-BAPTISTE-VINCENT BORDET (b. June 13, 1870, Soignies, Belg.—d. April 6, 1961, Brussels), Belgian bacteriologist and immunologist who received the Nobel Prize for Physiology or Medicine in

Bordet
Harlingue—H. Roger-Viollet

1919 for his discovery of immunity factors in blood serum; this was a development vital to the diagnosis and treatment of many dangerous contagious diseases.

Bordet's research on the destruction of bacteria and red corpuscles in blood serum, conducted at the Pasteur Institute, Paris (1894–1901), contributed significantly to the foundation of serology, the study of immune reactions in body fluids. In 1895 he found that two components of blood serum are responsible for the rupture of bacterial cell walls (bacteriolysis): one is a heat-stable antibody, found only in animals already immune to the bacterium; the other is a heat-sensitive substance that is found in all animals and is now known to be a complement. Three years later, Bordet discovered that foreign red corpuscles (erythrocytes) were also ruptured in blood serum. This process, which he called hemolysis, was analogous to bacteriolysis and also required complement.

In Brussels, where he founded and directed (1901–40) the Pasteur Institute of Brabant, Bordet continued his immunity research with Octave Gengou. Their work provided the basis of serological tests for many disease organisms, including those of typhoid fever, tuberculosis, and, most notably, syphilis (the Wassermann test). After his discovery (with Gengou in 1906) of the bacterium responsible for whooping cough, now called *Bordetella pertussis*, Bordet became professor of bacteriology at the University of Brussels (1907–35).

Bordighera, town, Imperia *provincia*, Liguria *regione*, northwestern Italy. It lies along the Riviera di Ponente coast between Ventimiglia and San Remo. The Institute of Ligurian Studies, formerly the Bicknell Museum, displays a unique collection of the flora of the Riviera. A leading winter resort, Bordighera exports flowers, olive oil, and palm branches for religious ceremonies during Holy Week at St. Peter's (Rome) and other churches. Pop. (1993 est.) mun., 11,121.

Bordone, Paris, in full PARIS PASCHALINUS BORDONE (b. 1500, Treviso, republic of Venice [now in Italy]—d. Jan. 19, 1571, Venice), Renaissance Venetian painter of religious, mythological, and anecdotal subjects.

Bordone was a pupil of Titian but did not remain in his studio for long. He spent most of his working life in Venice, though he visited France and is also said to have visited Augsburg and worked for the Fugger family sometime in the 1540s. Most of his pictures cannot be dated with any certainty.

Bordone painted many scenes of the Madonna and saints seated in a landscape, along with other religious subjects such as "Christ Among the Doctors" (Gardner Museum, Boston). His finest historical painting is "Fisherman Consigning a Ring to the Doge" (1540; Academy, Venice), which has typically bright colours, heavy Titianesque figures, and a sweeping landscape. Bordone's style gradually became more Mannerist, with warmer colours, tightly curled draperies, and figures in oddly tilted poses occupying the extreme foreground against a distant landscape. Though he continued to paint Holy Families in outdoor settings, late in his career he also painted a series of groups of blonde, statuesque female figures. Among these erotic paintings are "Diana with Two Nymphs" (State Art Collections, Dresden) and "Venus with Flora" (Hermitage, St. Petersburg). Bordone also painted portraits throughout his career.

Bordoni, Faustina, married name HASSE (b. c. 1700, Venice [Italy]—d. Nov. 4, 1781, Venice), Italian mezzo-soprano, one of the first great prima donnas, known for her beauty and acting as well as her vocal range and breath control.

Of a noble family, she studied with Michelangelo Gasparini under the patronage of

Alessandro and Benedetto Marcello. In 1716 she made a sensational debut in Venice in Carlo Francesco Pollarolo's *Ariodante*. By 1722 her fame in Italy was such that a medal was created in Naples to honour her. In 1723 she made her first appearance in Munich in Pietro Torri's *Griselda*. After hearing her in the Vienna Court Opera in 1724, George Frideric Handel engaged her, and in 1726 she appeared in his *Alessandro*, performed by his opera company in London. There she and Francesca Cuzzoni, a leading soprano, became rivals, and devotees of both singers exacerbated their bitter relationship, which erupted in 1727 in a scandalous hair-pulling battle during a performance of Giovanni Bononcini's *Astianatte*. The two divas were subsequently satirized as Polly and Lucy in John Gay's *The Beggar's Opera* and its sequel, *Polly*. Bordoni created other Handel roles: Alcestis in *Admeto* and Pulcheria in *Riccardo Primo* in 1727 and Emira in *Siroe* and Elisa in *Tolemeo* in 1728. Bordoni married the composer Johann Adolf Hasse, and they moved to Dresden, where she performed in at least 15 of his operas. During long visits to Italy she performed in more than 30 operas in Venice. In 1750 she sang at court in Paris. She was still active in her 70s, when she retired to Venice.

bore, in guns, the interior diameter of the barrel of the firearm.

In guns that have rifled barrels, e.g., rifles, pistols, machine guns, and artillery or naval guns, the measurement of the bore is termed the calibre. In the traditional Anglo-U.S. system, calibre (or caliber) is measured in inches for cannons and hundredths of inches for small guns. In the metric system, millimetres and occasionally centimetres are the units of measurement. Calibre also designates the outside diameter of the projectile or ammunition used in the gun and is also expressed in inches or millimetres. Calibre is sometimes expressed in two figures, to indicate both the diameter and the length of the bullet. Thus, calibre 6 × 47 indicates a bullet 6 mm in diameter and 47 mm long.

The measurement of the bore in shotguns is expressed in terms of gauge. The gauge of a shotgun originally was expressed as the number of round lead balls of bore diameter necessary to make a total weight of one pound. Thus, if eight lead balls of bore diameter added up to one pound, the shotgun was designated an eight-gauge gun. The smaller the gauge number, therefore, the larger the bore. Gauge, however, later became standardized in terms of diameter and no longer relates directly to the original method of determination.

bore, also called TIDAL BORE, body of water that, during exceptionally high sea tides, rushes up some rivers. Traveling upstream about two or three times as fast as the normal tidal current, a bore usually is characterized by a well-defined front of one or several waves, often breaking, followed by the bore's main body, which rises higher than the water level at its front. The height of the bore is greater near the banks of a river than at midstream. Because of momentum, some bores continue to move upstream for about one-half hour after high water. Not arising in estuaries, tidal bores are formed at a position a short distance upstream, where the river channel has become sufficiently narrow or shallow to concentrate the momentum of the rising tide. Bores occur at spring tides and at several tides preceding and following spring tides but never at neap tides. The formidable tidal bore that occurs on the lower Seine in France between Rouen and the sea is known as the Mascaret.

Boré, (Jean) Étienne (b. Dec. 27, 1741, French North America—d. Feb. 2, 1820, near New Orleans, La., U.S.), founder of the sugar industry in Louisiana.

Of noble Norman ancestry, Boré was edu-

cated in France and served for 10 years in the household guard of Louis XV before he established himself as an indigo planter in Louisiana. When pests ruined the indigo crop in the early 1790s, he perfected a sugar-granulating process (1794 or 1795) and devoted his land (now within New Orleans) to raising sugarcane. Unlike many other agrarian experimenters, he profited greatly from his innovation. He was mayor of New Orleans under French and U.S. rule (1803–04).

Boreal Climatic Interval, climatic period of the Holocene epoch. Radiocarbon dating indicates that the Boreal Climatic Interval began about 9,500 years ago and ended about 7,500 years ago. The Boreal followed the Pre-Boreal and preceded the Atlantic climatic intervals.

Climate during the Boreal was warm and dry. In Europe the Early Boreal is characterized by forests dominated by a hazel-pine assemblage, and sea levels were regressing. In the Late Boreal a hazel-oak forest was dominant, and the seas were again transgressing the land. Climates in both phases, however, remained warm and dry.

boreal forest: see taiga.

boreal forest moss: see feather moss.

Boreas, in Greek mythology, the personification of the north wind. He carried off the beautiful Oreithyia, a daughter of Erechtheus, king of Athens; they lived in Thrace as king and queen of the winds and had two sons,

Boreas abducting Oreithyia, detail of an Attic hydria, 5th century bc; in the Vatican Museum

Alinari—Art Resource/EB Inc

Calais and Zetes. To show his friendliness for the Athenians, Boreas wrecked the fleet of the Persian king Xerxes off the promontory of Sepias in Thessaly; in return the Athenians built him a sanctuary or altar near the Ilissus and held a festival (Boreasmos) in his honour. In works of art Boreas was represented as bearded, powerful, draped against cold, and winged.

Borel, (Félix-Édouard-Justin-) Émile (b. Jan. 7, 1871, Saint-Affrique, Fr.—d. Feb. 3, 1956, Paris), French mathematician who created the first effective theory of the measure of sets of points and who shared with René Baire and Henri Lebesgue of France in launching the modern theory of functions of a real variable.

Appointed to the faculty of the École Normale Supérieure, Paris, in 1896, Borel discovered the elementary proof of Picard's theorem. This sensational accomplishment set the stage for his formulation of a theory of integral functions and the distribution of their values, a topic that dominated the theory of complex functions for the next 30 years.

As the creator of the first effective theory of the measure of sets of points, Borel helped launch the modern theory of functions of a real variable. Although he was not the first to define a conventional sum of a divergent series (a series of numbers that does not approach a certain number), he was the first to conceive and develop a systematic theory of such series

(1899). In 1909 he was appointed to the chair of theory of functions created for him at the Sorbonne. He completed a series of papers on game theory (1921–27) and became the first to define games of strategy.

Borel also served in the French Chamber of Deputies (1924–36) and as minister of the navy (1925–40). After his arrest and brief imprisonment under the Vichy regime in 1940, he returned to his native village and worked in the Resistance. For this work he was awarded the Resistance Medal (1945) to add to his Croix de Guerre (1918) and, later, the Grand Cross of the Legion of Honour (1950) and the first gold medal of the National Centre of Scientific Research (1955).

Borel, Jacques (b. Dec. 17, 1925, Paris, Fr.), French writer, translator, and critic.

The son of a civil servant, Borel was educated at the Sorbonne, graduating in 1949, and for several years was an English teacher at various lycées in France (1952–67) and a visiting professor at various colleges and universities in the United States (1966–83). His principal novel, *L'Adoration* (1965; "The Adoration"; Eng. trans. *The Bond*), which won the Prix Goncourt, was a semiautobiographical account of a son's relationship to a widowed mother and had Proustian or Joycean characteristics in presenting vast details of events and thoughts. This work was followed by a sequel, *Le Retour* (1970; "The Return") and by other novels, books of poetry, and criticisms. He also edited the complete works of Paul Verlaine (1959–62) and translated poems by James Joyce (1967).

Borel, Petrus, original name JOSEPH-PIERRE BOREL, also called BOREL D'HAUTERIVE (b. June 29, 1809, Lyon, Fr.—d. July 1859, Mostaganem, Alg.), French poet, novelist, and critic who played a leading role in the Romantic movement.

The 12th of an ironmonger's 14 children, Borel was trained as an architect but turned to literature and became one of the most eccentric young writers of the 1830s, assuming the name of "Lycanthrope" ("Wolf-Man"). He became a leader of the group of daring writers known as Les Bousingos, among whom were Gérard de Nerval and Théophile Gautier. With the revival of interest in classical style, he fell into poverty; however, he was able to

Petrus Borel, detail of an engraving after a portrait by C.-F. Nanteuil-Leboeuf, 1839

J.P. Zolot

obtain a post in the colonization of Algeria. Because of his proud and touchy nature, he was dismissed in 1855 and spent the rest of his life in a Gothic mansion in Mostaganem, where he lived as a ragged eccentric. His works, redolent of horror and melodrama, include *Rhapsodies* (1832), the short stories *Champavert, contes immoraux* (1833; "Champavert, Immoral Stories"), and *Madame Putiphar* (1839), with a verse prologue that foreshadows the poet Charles Baudelaire's spiritual style.

Borelli, Giovanni Alfonso, original name GIOVANNI FRANCESCO ANTONIO ALONSO (b. Jan. 28, 1608, Naples, Kingdom of Naples [Italy]—d. Dec. 31, 1679, Rome), Italian physiologist and physicist who was the first to explain muscular movement and other body functions according to the laws of statics and dynamics.

He was appointed professor of mathematics at Messina in 1649 and at Pisa in 1656. In 1667 he returned to Messina and in 1674 went to Rome, where he lived under the protection of Christina, former queen of Sweden. His best-known work is *De Motu Animalium* (1680–81; "On the Movement of Animals"), in which he sought to explain the movements of the animal body on mechanical principles; he thus ranks as the founder of the iatrophysical school.

Borelli also wrote many astronomical works, including a treatise in 1666 that considered the influence of attraction on the satellites of Jupiter. In a letter published in 1665 under the pseudonym Pier Maria Mutoli, he was the first to suggest the idea that comets travel in a parabolic path.

borer beetle, any of the approximately 1,100 species of insects of the family Anobiidae (order Coleoptera). These beetles tend to be small (1 to 9 mm, or less than 0.5 inch) and cylindrical. When disturbed they usually pull in their legs and play dead.

The best-known borers are the cigarette beetle, deathwatch beetle, drugstore beetle, and furniture beetle. They live in drugs, cereals, spices, wood, tobacco products, and upholstery materials, and still others live in fungi, seeds, galls, and under bark.

The name borer beetle is also applied to tree-boring members of the family Scolytidae.

Borg, Björn (Rune) (b. June 6, 1956, Södertälje, Swed.). Swedish tennis player who was one of the finest competitors of the modern era. He was the first man to win the Wimbledon singles championship five successive times (1976–80) since Laurie Doherty (1902–06). He won the French Open men's singles championship an unprecedented four times in a row and six times in all (1974–75, 1978–81).

Borg learned to play tennis at a very early age, and, by the time he was 13, he was beating Sweden's top junior players. Noted for his powerful serve and two-handed backhand, Borg joined the professional circuit at age 14 and went on to win the Italian Open at 17 and the French Open at 18. In 1975 he helped Sweden win its first Davis Cup, and by that time he had won 16 consecutive cup singles, passing Bill Tilden's record of 12. By the spring of 1981, when he finally lost at Wimbledon to John McEnroe, Borg had won 41 singles matches and 5 championships in a row, a record never previously set. Borg, however, proved unable ever to win two of the four grand-slam events, the U.S. Open and Australian championships.

In January 1983 he announced his permanent retirement from professional tennis. He had earlier made his permanent home in Monaco, for tax purposes. He wrote, with Eugene Scott, *Björn Borg: My Life and Game* (1980).

Borgå (Finland): see Porvoo.

Borge Mountains National Park, Norwegian BØRGEFJELL NASJONALPARK, national park occupying an area of 420 square miles (1,087 square km), straddling the border between Nord-Trøndelag and Nordland *amter* (counties), Norway.

Designated a national park in 1970, the site consists mostly of granitic mountains with an alpine terrain of cirques and steep-walled

valleys. Lower valleys, hills, and marshes occupy the remainder of the park. The highest peak in the park is Kvig, reaching 5,587 feet (1,703 m) above sea level, and the largest lake is Simskar. Several rivers cross the park, including the Jengel and the Or. Birches are the most common trees found in forested areas, and there are small evergreen stands in the south and southwest. Other vegetation includes blueberry heaths, sedge grass, willows, and snow-bed plants.

Many birds inhabit the northern part of the park near the Simskar River, particularly blue throat, red-necked phalarope, long-tailed duck, bean goose, and Teminck's stint. Snow bunting, ptarmigan, rough-legged buzzard, golden eagle, and osprey live in the mountain areas. Mammals include moose, reindeer, wolverine, lynx, and bear. An abandoned settlement at Fagerneset, on Nams Lake, was inhabited for several hundred years by the Lapps, who raised reindeer.

Borgen, Johan (Collet Müller) (b. April 28, 1902, Kristiania [now Oslo], Nor.—d. Oct. 16, 1979, Hvaler), Norwegian novelist, short-story writer, dramatist, and essayist, one of 20th-century Norway's most important and versatile writers.

His principal work was a novel trilogy: *Lillelord* (1955; "Lillelord"), *De mørke kilder* (1956; "The Dark Springs"), and *Vi har ham nå* (1957; "Now We Have Him"), all three translated into English under the title *Lillelord* (1982). In these novels Borgen gives a picture of upper-middle-class life in Norway from 1917 through World War II; and in the figure of the protagonist, Wilfred Sagen, he draws a profound portrait of the kind of alienated and disaffected individual who, during the war, collaborated with the Nazis. The novel is equally valuable as a period study, with vignettes of the artist life in Copenhagen and Paris, and as a psychological study.

Borgen began his career as a short-story writer with the collection *Mot mørket* (1925; "Toward the Dark") and continued to do some of his best work in that genre. *Noveller om kjaerlighet* (1952; "Love Stories") was a great success both critically and with the general public, as was also the collection *Noveller i utvalg* (1961; "Selected Short Stories").

In his later, more experimental novels, Borgen continued to create fictions that posed questions concerning alienation and identity: *Jeg* (1959; "I"); *Blåtind* (1964; "Blue Mountain"); and *Den røde tåken* (1967; *The Red Fog*).

Borgen also wrote plays and over a long career developed a mastery of the short, witty essay. He won the Nordic Council's literary prize for a collection of short stories, *Nye noveller. Frydenberg* (1965; "New Stories. Frydenberg"). From 1954 to 1959, he was editor of the literary journal *Vinduet*. He was also a great critic, in the sense of being able to transmit his enthusiasm for books in lucid analyses. In this role he introduced many foreign writers to Norwegian readers.

Borger, city, Hutchinson county, northwestern Texas, U.S., in the Texas Panhandle, near the Canadian River Dam, 45 miles (72 km) northeast of Amarillo. Part of a tri-city industrial complex (Borger-Phillips-Bunavista) in an area producing oil and gas, Borger was founded in 1926 and incorporated the same year with the completion of the first oil well. Overnight it became a boomtown of tents and shacks; it was named for A.P. Borger, a land investor. Major industrial products include (in addition to petroleum and natural gas) carbon black, printer's ink, and synthetic rubber. With increased irrigation, diversified farming and cattle ranching have become economic assets. Nearby are Lake Meredith (formed by Sanford Dam) and Alibates Flint Quarries National Monument (1,333 acres [539 hectares]), commemorating prehistoric Indian quarries.

Frank Phillips College (1946) is in the city. Pop. (1990) 15,675.

Borgerhout, town, eastern suburb of Antwerp, Antwerp province, northern Belgium. An independent town since 1836, it was originally a village between Antwerp and Deurne. It was occupied by the Germans in World Wars I and II. Borgerhout has bleaching and dye works; manufactures candles, chemicals, tobacco, and tapestries; and specializes in diamond cutting and polishing. Gallo-Roman burial urns have been discovered in the vicinity, and the 19th-century church was the first in the neo-Gothic style built in Belgium. Pop. (1982) mun., 43,556.

Borges, Jorge Luis (b. Aug. 24, 1899, Buenos Aires, Arg.—d. June 14, 1986, Geneva, Switz.), Argentine poet, essayist, and short-story writer credited with establishing the modernist Ultraist movement in South America.

Life. Borges was reared in the then-shabby district of Palermo, the setting of some of his works. His family, which had been notable in Argentine history, included British ancestry, and he learned English before Spanish. The first books that he read—from the library of his father, a man of wide-ranging intellect who taught at an English school—included *The Adventures of Huckleberry Finn*, the novels of H.G. Wells, *The Thousand and One Nights*, and *Don Quixote*, all in English. Under the constant stimulus and example of his father, the young Borges from his earliest years recognized that he was destined for a literary career.

In 1914, on the eve of World War I, Borges was taken by his family to Geneva, where he learned French and German and received his B.A. from the Collège de Genève. Leaving there in 1919, the family spent a year in Majorca and a year in Spain, where Borges joined the young writers of the Ultraist movement, a group that rebelled against what it considered the decadence of the established writers of the Generation of '98.

Returning to Buenos Aires in 1921, Borges rediscovered his native city and began to sing of its beauty in poems that imaginatively reconstructed its past and present. His first published book was a volume of poems, *Fervor de Buenos Aires, poemas* (1923; "Fervour of Buenos Aires, Poems"). He is also credited with establishing the Ultraist movement in South America, though he later repudiated it. This period of his career, which included the authorship of several volumes of essays and poems and the founding of three literary journals, ended with a biography, *Evaristo Carriego* (1930).

During his next phase, Borges gradually overcame his shyness in creating pure fiction. At first he preferred to retell the lives of more or less infamous men, as in the sketches of his *Historia universal de la infamia* (1935; *A Universal History of Infamy*). To earn his liv-

Borges

ing, in 1938 he took a major post at a Buenos Aires library named for one of his ancestors. He remained there for nine unhappy years.

In 1938, the year his father died, Borges suffered a severe head wound and subsequent blood poisoning, which left him near death, bereft of speech, and fearing for his sanity. This experience appears to have freed in him the deepest forces of creation. In the next eight years he produced his best fantastic stories, those later collected in the series of *Ficciones* ("Fictions") and the volume of English translations entitled *The Aleph and Other Stories, 1933-69*. During this time, he and another writer, Adolfo Bioy Casares, jointly wrote detective stories under the pseudonym H. Bustos Domecq (combining ancestral names of the two writers' families), which were published in 1942 as *Seis problemas para don Isidro Parodi* ("Six Problems for Don Isidro Parodi"). The works of this period revealed for the first time Borges' entire dreamworld, an ironical or paradoxical version of the real one, with its own language and systems of symbols.

When the dictatorship of Juan Perón came to power in 1946, Borges was dismissed from his library position for having expressed support of the Allies in World War II. With the help of friends, he earned his way by lecturing, editing, and writing. A 1952 collection of essays, *Otras inquisiciones (1937-1952) (Other Inquisitions, 1937-1952)*, revealed him at his analytical best. When Perón was deposed in 1955, Borges became director of the national library, an honorific position, and also professor of English and American literature at the University of Buenos Aires. By this time, Borges suffered from total blindness, a hereditary affliction that had also attacked his father and had progressively diminished his own eyesight from the 1920s onward. It had forced him to abandon the writing of long texts and to begin dictating to his mother or to secretaries or friends.

The works that date from this late period, such as *El hacedor* (1960; "The Doer," Eng. trans. *Dreamtigers*) and *El libro de los seres imaginarios* (1967; *The Book of Imaginary Beings*), almost erase the distinctions between the genres of prose and poetry. Later collections of stories included *El informe de Brodie* (1970; *Dr. Brodie's Report*), which dealt with revenge, murder, and horror, and *El libro de arena* (1955; *The Book of Sand*), both of which are allegories combining the simplicity of a folk storyteller with the complex vision of a man who has explored the labyrinths of his own being to its core.

Assessment. After 1961, when he and Samuel Beckett shared the prestigious Formentor Prize, Borges' tales and poems were increasingly acclaimed as classics of 20th-century world literature. Prior to that time, Borges was little known, even in his native Buenos Aires, except to other writers, many of whom regarded him merely as a craftsman of ingenious techniques and tricks. By the time of his death, the nightmare world of his "fictions" had come to be compared with the world of Franz Kafka and to be praised for concentrating common language into its most enduring form. Through his work, Latin-American literature emerged from the academic realm into the realm of generally educated readers throughout the Western world.

(E.R.-M.)

BIBLIOGRAPHY. Ana Maria Barrenechea, *Borges, the Labyrinth Maker* (1965), is a critical study, with bibliography. Ronald Christ, *The Narrow Act: Borges' Art of Allusion* (1969), perceptively analyzes one of Borges' key methods of creation. Martin S. Stabb, *Jorge Luis Borges* (1970), presents a superficial overview. Emir Rodríguez-Monegal, *Jorge Luis Borges: A Literary Biography* (1978), embraces the life, work, and criticism on Borges and contains a selective bibliography. Gene H. Bell-Villada, *Borges and His Fiction: A Guide to His Mind and Art* (1981), is also useful.

Borghese FAMILY, a noble Italian family, originally from Siena, who first gained fame in the 13th century as magistrates, ambassadors, and other public officials. They moved to Rome in the 16th century and there, following the election (1605) of Camillo as Pope Paul V, rose in wealth and fame.

Among the early members, Galgano was papal ambassador to Naples (1456), Pietro was nominated senator by Leo X (pope 1513-21) in 1516, and Giambattista was a famed apologist for Clement VII (pope 1523-34).

The move to Rome was started by Marcantonio (1504-74), the father of Camillo Borghese, the future Pope Paul V. (See Paul V under Paul [Papacy].) Paul V bestowed privileges upon family members, first naming as cardinal his nephew Scipione Caffarelli (1576-1633), whom he adopted into the Borghese family.

Augmenting his wealth and influence, Scipione played a leading role in church politics. His chief interest, however, was the cultivation of the arts, to which he devoted the greater part of his life and wealth. Most importantly, he recognized and encouraged the talent of the young Gian Lorenzo Bernini (1598-1680), who later became the outstanding sculptor and architect of the Italian Baroque.

With the sizable income that he enjoyed from the several ecclesiastic offices that he held, Scipione financed the restoration and construction of many churches and palaces in the city of Rome. His major project was to have the Villa Borghese built in Rome, where he assembled an important collection of paintings and sculptures.

Pope Paul V also helped his nephew Marcantonio II (1601-58), who fathered the present branch of the Borghese family, whose wealth and estates he vastly augmented. Paul V obtained for Marcantonio the important principality of Sulmona and made him prince of Vivaro. Marcantonio married Camilla Orsini (1619), thereby acquiring the estates of the powerful Orsini family. He also arranged the marriage of his son Paolo (d. 1646) to Olimpia, the Aldobrandini heiress.

Other family members who remained prominent in church affairs in Siena included Cardinals Pier Maria (c. 1600-1642), Francesco (1697-1759), and Scipione (1734-82). Somewhat later, Marcantonio III became viceroy of Naples. The Borghese tradition of patronage of the arts was carried on by his nephew Marcantonio IV (1730-1800), who had the Villa Borghese renewed. He also enlarged the Borghese estates by his marriage to the wealthy and prominent Maria Salviati.

In the 19th century, Camillo Filippo Ludovico (1775-1832) played an important role in Franco-Italian relations. Having married Napoleon's sister Marie Pauline (1803), he reached the rank of general in the army and was named governor of Piedmont (1807). After Napoleon's abdication, he concluded a surrender with the victorious Austrians and later maintained order during the transfer of power. Camillo won infamy for having sold to Napoleon the magnificent Borghese family art collection, part of which he recovered in 1815.

Camillo's brother Francesco (1776-1839) later became a general. Francesco's grandsons split the family into two branches. One, led by Paolo (1845-1920), retained the name Borghese; the other, led by Giulio (1847-1914), took the cognomen Torlonia.

Borghese Gallery, Italian GALLERIA BORGHESI, state museum in Rome distinguished for its collection of Italian Baroque painting and ancient sculpture. It is located in the Borghese Gardens on the Pincian Hill and is housed in the Villa Borghese, a building designed by the Dutch architect Jan van Santen (Giovanni Vasanio) and built between 1613 and 1616.

The paintings were largely collected in the 17th century by Pope Paul V (Camillo Borghese) and his nephew Cardinal Scipione Borghese, while the antiquities were primarily obtained by Marcantonio Borghese in the 18th century and by Francesco Borghese in the 19th century. In 1902 the villa and its collection were acquired from the Borghese family by the Italian government.

Borgia FAMILY, Spanish BORJA, descendants of a noble line, originally from Valencia, Spain, that established roots in Italy and became prominent in ecclesiastical and political affairs in the 1400s and 1500s. The house of the Borgias produced two popes and many other political and church leaders. Some members of the family became known for their treachery.

Four Borgias became especially noteworthy in a historical sense. Alfonso de Borgia (1378-1458) established the family's influence in Italy and became Pope Calixtus III in 1455 (see Calixtus III). Rodrigo Borgia became a cardinal of the Roman Catholic church and, later (1492), Pope Alexander VI (see Alexander VI under Alexander [Papacy]). As cardinal and pope, Rodrigo fathered a number of children by his mistress Vannozza Catanei. Cesare Borgia (q.v.; c. 1475/76-1507), son of Rodrigo, achieved political power while ruthlessly attempting to establish a secular kingdom in central Italy. Lucrezia Borgia (q.v.; 1480-1519), a daughter of Rodrigo and a patron of the arts, became famous for her skill at political intrigue.

The family produced many other persons of lesser importance. One, St. Francis Borgia (1510-1572), a great-grandson of Rodrigo, was canonized. The family began to decline in the late 1500s. By the middle of the 18th century it had disappeared.

Borgia, Cesare, DUC (duke) DE VALENTINOIS, Italian DUCA VALENTINO (b. c. 1475/76, probably Rome [Italy]—d. 1507, near Viana, Spain), natural son of Pope Alexander VI. He was a Renaissance captain who, as holder of the offices of duke of the Ro-

Cesare Borgia, oil painting; in the Uffizi, Florence
Alinari—Art Resource/EB Inc

magna and captain general of the armies of the church, enhanced the political power of his father's papacy and tried to establish his own principality in central Italy. His policies led Machiavelli to cite him as an example of the new "Prince."

Youth and education. Cesare Borgia was the son of his father's most famous mistress, Vannozza Catanei. His father, at that time Cardinal Rodrigo Borgia, was vice chancellor of the church and had had three earlier children by other mistresses. Cesare was, however, the oldest of the four children born to Vannozza and Rodrigo (the others being Juan, Lucrezia, and Jofré) and was Rodrigo's second son. As was customary for second sons he was educated for a career in the church and in 1480 was dispensed from the slur of illegitimacy by Pope Sixtus IV so that he might hold ecclesiastical offices.

Although he was born in Italy and spent most of his life there, Cesare's family and cultural background was almost entirely Spanish. His elder half brother, Pedro Luis, was duke of Gandía, and all of his early benefices were in Spain. At the age of seven Cesare was made an apostolic protonotary and canon of the cathedral of Valencia.

His early tutors were Paolo Pompilio and Giovanni Vera, both Catalans, and he was recognized as being exceptionally brilliant, as well as being, according to at least one observer, "the handsomest man in Italy." In 1489 he went to the University of Perugia to study law and then passed on to the University of Pisa, where he studied under the famous jurist Filippo Decio and gained a degree in canon and civil law. In 1491 he became bishop of Pamplona, and in 1492, after the accession of his father to the papal throne, he was made archbishop of Valencia.

Rise to power. The election of his father as pope in 1492 changed the fortunes of Cesare Borgia. Besides becoming an archbishop, he was also made a cardinal in 1493, with the titular church of Sta. Maria Nova; he was now one of his father's principal advisers. It was already clear, however, that he did not have a true religious vocation; he was better known at the papal court for his hunting parties, his amorous liaisons, and his magnificent clothes than for the meticulous observance of his ecclesiastical duties.

On the death of Pedro Luis in 1488 the title of duke of Gandía had by-passed him and gone to his younger brother Juan, and it was he who was made commander of the papal army in 1496 for the first of Alexander's campaigns against his rebellious nobility, the Orsini. Cesare was reputed to have been extremely jealous of his brother, and when Juan was mysteriously murdered in 1497 the rumour gradually spread that Cesare was the culprit. There is, however, no evidence that Cesare murdered his brother (who had many other enemies) beyond the fact that he was certainly capable of murder, as he subsequently proved.

After the death of Juan, Cesare's martial and political leanings and his father's need for a trustworthy secular lieutenant coincided, and in 1498 Cesare gave up his cardinalate. Plans were laid for an important dynastic marriage for him, and, after an abortive attempt to win the hand of Carlotta, daughter of the King of Naples, he travelled to France to marry Charlotte d'Albret, sister of the King of Navarre. At the same time he received from Louis XII, the French king, the title of duke of Valentinois, and from this title he derived his nickname—*Il Valentino*.

The French marriage of Cesare ensured for him and his father French assistance in their plans to reestablish control in the Papal States and, if possible, to carve out a permanent Borgia state in Italy for Cesare. In 1499 Cesare, as captain general of the papal army, assisted by a large contingent of French troops, began a systematic occupation of the cities of Romagna and the Marches, which had largely

fallen under the control of semi-independent papal vicars.

The campaign of 1499 saw the conquest of Imola and Forlì; that of 1500–01 brought Rimini, Pesaro, and Faenza into Cesare's hands; finally, in 1502, he captured Urbino, Camerino, and Senigallia. It was in this last campaign that Machiavelli, as one of the Florentine ambassadors attached to Cesare's camp, was able to observe at first hand the methods of the man who was to figure so largely in his later writings.

The activities of Alexander and Cesare, although they conformed very much to a pattern established by earlier 15th-century popes, aroused immense opposition within the Papal States and from the other Italian states. The propaganda war waged against them was vitriolic and lastingly effective. Cesare was portrayed as a monster of lust and cruelty who had gained an unnatural ascendancy over his father after having supposedly killed his brother, the favourite son, Juan. It seems likely, however, that the two Borgias worked very much in harmony; Alexander was by far the more astute politician, and Cesare the more ruthless man of action. Ambitious and arrogant, he was determined to establish himself as an Italian prince before his father died and left him deprived of the political and financial support of the papacy. *Aut Caesar, aut nihil* ("Either Caesar or Nothing") was the motto he adopted to indicate the single-mindedness of his purpose. A number of political assassinations have been attributed to him, but the crime of which he was most clearly the author was the murder in August 1500 of his brother-in-law Alfonso, duke of Bisceglie, the second husband of Lucrezia. It seems likely that this was an act of personal vengeance rather than a politically motivated assassination, but it contributed greatly to the fear and loathing in which Cesare was held.

The best example of Cesare's methods was his third Romagna campaign (1502–03). He opened with a lightning march on unsuspecting Urbino, which surrendered without a shot being fired. He then turned on Camerino, which was also quickly subdued. At this stage his leading commanders, fearing his power, turned against him in the so-called Magione conspiracy. Cesare, stripped of most of his troops, was forced to fight defensively in the Romagna. With lavish use of papal funds, however, he managed to rebuild his army while at the same time working on the diplomatic front to break up the league of the conspirators. Having succeeded in breaking it up, he arranged a rendezvous for reconciliation with some of the conspirators at Senigallia and, having isolated them from their troops, he then arrested and executed them (December 1502).

Cesare, with a powerful army he could trust, now seemed to be at the zenith of his fortunes. It is probable that he was planning an attack on Tuscany, which would have provided him with the independent state he craved, when his father died on Aug. 18, 1503. He himself was also ill at the time, and this circumstance, together with the subsequent election of a bitter enemy of the Borgias, Giuliano della Rovere, as Pope Julius II, lessened his already slim chances of survival. Julius refused to confirm Cesare as duke of the Romagna or captain general of the church and demanded the restoration of the Romagna cities. Cesare was arrested, won a brief respite by agreeing to surrender his cities, and fled to Naples only to be arrested once more by Gonzalo de Córdoba, the Spanish viceroy, who refused to join him in a league against the Pope. Cesare was then taken to Spain and imprisoned, first in the castle of Chinchilla near Valencia, and then at Medina del Campo, from whence he escaped in 1506. Unable to see any immediate prospect of returning to Italy, he took service with his brother-in-law, the King of

Navarre, and was killed in 1507 in a skirmish with Navarrese rebels outside Viana. He was buried in the church of Sta. Maria in Viana.

Assessment. Cesare Borgia was a man of extraordinary contrasts. Machiavelli found that he could be at times secretive and taciturn, at others loquacious and boastful. He alternated bursts of demonic activity, when he stayed up all night receiving and dispatching messengers, with moments of unaccountable sloth, when he remained in bed refusing to see anyone. He was quick to take offense and rather remote from his immediate entourage and yet very open with his subjects, loving to join in local sports and to cut a dashing figure.

There can be no doubt of the impact that he made in the Italy of his own day, but this impression was largely because of the backing he received from papal money and French arms. He was undoubtedly a master of politico-military manoeuvre, and it was a combination of daring and duplicity that brought him his striking successes and made him feared all over Italy. His abilities as a soldier and an administrator, however, were never really tested. He fought no major battles in his short military career, but this was perhaps a measure of his success as a planner. He had little time for the organization of the government of his Romagna duchy, but there are indications that he had plans for centralized government and bureaucratic efficiency, which to some extent justify the claims made for him as an administrator by Machiavelli. His interests tended to be scientific and literary rather than artistic, but once again time was too short for him to emerge as an important Renaissance patron. Leonardo da Vinci was for a short time his inspector of fortresses but executed no artistic commissions for him.

Machiavelli's apparent admiration for a man who was so widely feared and abhorred has led many critics to regard his portrayal of Cesare as an idealization. This interpretation, however, is not really the case. Machiavelli was well aware of the failings and limitations of Cesare Borgia, but he saw in him some of the qualities that he considered essential for the man who aspired to be a prince. The aggressiveness, the speed and ruthlessness of planning and execution, the opportunism of Cesare all delighted Machiavelli, who saw far too little of these qualities in the Italy of his day. Machiavelli was not attempting a rounded portrait of Cesare's character and qualities, which baffled him as much as they did most of his contemporaries.

(Mi.Ma.)

BIBLIOGRAPHY. The standard biography is still W.H. Woodward, *Cesare Borgia* (1913). More recent but less useful are C.E. Yriarte, *Cesare Borgia* (Eng. trans. 1947); C.M.L. Beuf, *Cesare Borgia: The Machiavellian Prince* (1942); and Sarah Bradford, *Cesare Borgia, His Life and His Times* (1976). On the background of the period and the family, see L. Collison-Morley, *The Story of the Borgias* (1932); and M.E. Mallett, *The Borgias* (1969), with the most complete bibliography.

Borgia, Saint Francis, Spanish SAN FRANCISCO DE BORJA, original name FRANCISCO DE BORJA Y ARAGON, 4th DUQUE (4th duke) DE GANDÍA (b. Oct. 28, 1510, Gandía, Spain—d. Sept. 30/Oct. 1, 1572, Rome; canonized 1671; feast day October 10), Spanish nobleman who, as the third general of the Society of Jesus, was instrumental in spreading the Jesuits' influence throughout Europe.

Educated at Saragossa, Spain, he married Eleanor de Castro, a Portuguese noblewoman, in 1529. After holding various appointments in the court of King Charles I of Spain, he was made viceroy of the Spanish region of Catalonia (1539), where he tried to carry out badly needed social and economic reforms. He resigned in 1543 when he succeeded to his father's dukedom.

After Eleanor's death in 1546, Borgia entered the Society of Jesus. He founded the

Jesuit College in Gandia, which was made a university by papal bull in 1547. In 1550 he went to Rome, where he was received by St. Ignatius Loyola, and his entry into the society was made public. He returned to Spain (1551), where he was ordained a priest. Ignatius named him commissary general of the Spanish provinces in 1554, and he was chosen general of the society in 1565.

Under his leadership new provinces and colleges were established in Europe. Although his mission to Spanish Florida proved unsuccessful, the provinces of Peru and New Spain were established. He urged Pope St. Pius V to adopt two important policies for foreign missions: first, to centralize their government through a Roman congregation (similar to the later Congregation for the Propagation of the Faith); second, to insist that the civil rulers treat the native peoples humanely in order to win them to the faith.

In 1571 Pius sent Borgia to Spain, Portugal, and France to strengthen the league against the Turks. He fell ill on the return journey and died shortly after reaching Rome. A selection of Borgia's letters was edited in *Monumenta Historica Societatis Jesu, S. Franciscus Borgia*, 5 vol. (1894-1911). M. Yeo's *The Greatest of the Borgias* appeared in 1936.

Borgia, Lucrezia (b. April 18, 1480, Rome—d. June 24, 1519, Ferrara, Papal States), Italian noblewoman and a central figure of the infamous Borgia family of the Italian Renaissance.

Daughter of the Spanish cardinal Rodrigo Borgia, later Pope Alexander VI, and his Ro-

Lucrezia Borgia, detail from the fresco the "Dispute of St. Catherine," by Pinturicchio, 1492-94; in the Vatican

Alinari—Art Resource/EB Inc

man mistress Vannozza Catanei, and sister of Cesare, Lucrezia is often accused of sharing in their many crimes and excesses. In historical perspective, however, she seems to have been more an instrument for the ambitious projects of her brother and father than an active participant in their crimes. Her three successive marriages into prominent families helped augment the political and territorial power of the Borgias.

In 1491 the young Lucrezia was successively betrothed to two Spanish nobles. But after her father became pope in 1492, he sought an alliance with the Sforza family of Milan against the Aragonese dynasty of Naples. Accordingly, Lucrezia was in 1493 married to Giovanni Sforza, lord of Pesaro. When Alexander allied himself with Naples, and Milan with the French, Giovanni, fearing for his life, fled from Rome and became an enemy of the Borgias, later charging incestuous relations between Lucrezia and Alexander. Alexander annulled the marriage in 1497 on the dubious grounds of nonconsummation.

Seeking to strengthen his ties with Naples, the Pope in 1498 arranged a marriage between Lucrezia and the 17-year-old Alfonso, duke of Bisceglie, an illegitimate son of Alfonso II of Naples. Upon Cesare's alliance with the French king Louis XII (1499) and his subsequent campaign in the Romagna, which threatened Naples, Alfonso fled Rome in August but returned with Lucrezia in October. In July 1500 he was wounded by four would-be assassins on the steps of St. Peter's. While recovering, he was strangled by one of Cesare's servants. The murder provoked the desired rupture with Naples.

Lucrezia retired to Nepi, and during this period the mysterious *Infans Romanus* (Roman Infant) was first seen, the three-year-old boy named Giovanni, with whom Lucrezia appeared in 1501. Two papal bulls recognized the child as the illegitimate son first of Cesare, then of Alexander, who was probably the true father. The mysterious origin of the child as well as Lucrezia's presence at a celebrated night orgy at the Vatican have been used to support the rumours of incest in the Borgia family.

Alfonso d'Este, son of Ercole I, duke of Ferrara, married Lucrezia on Dec. 30, 1501, although he shunned the union for a time because of the Borgias' unsavoury reputation. This marriage was arranged by Cesare to consolidate his position in the Romagna. When Alexander VI died in 1503, Lucrezia ceased to play a political role and led a more normal life at the brilliant court of Ferrara, which became a centre for the arts and letters of the Italian Renaissance. She turned to religion in her last years and died at the age of 39.

Borglum, (John) Gutzon (de la Mothe) (b. March 25, 1867, St. Charles, Bear Lake, Idaho, U.S.—d. March 6, 1941, Chicago), U.S. sculptor who revived the ancient Egyptian and Mesopotamian practice of carving gargantuan political statues in immense natural formations of rock.

Borglum studied art in San Francisco, then, from 1890 to 1893, in Paris, at the Académie Julian. Both his painting and his sculpture were admitted to the officially recognized salon there, and in England he received important commissions and royal recognition.

In 1901 Borglum established himself in New York City, where he sculpted a bronze group called "The Mares of Diomedes," the first piece of American sculpture bought for the Metropolitan Museum of Art, New York City. With prodigal versatility he sculptured many

Borglum

By courtesy of the Library of Congress, Washington D.C

portrait busts of patriots as well as such heroic figures as the twelve Apostles for the Cathedral of St. John the Divine, in New York City. But he soon turned toward what his wife, a scholar in cuneiform and other Middle Eastern scripts, described as "the emotional value of volume." From a six-ton block of marble he executed the colossal head of President Lincoln in the Capitol Rotunda at Washington, D.C. This suggested to some Southern women the idea of having a similar head of the Confederate general, Robert E. Lee. But Borglum was moved to begin instead a titanic sculptural procession of Lee and his staff and soldiers marching in the Stone Mountain Memorial, in Georgia. Disputes with his patrons led Borglum to abandon the enormous work, which was completed by others. He was then engaged on a government stipend to turn another mountain into a monument.

In the Mount Rushmore National Memorial, in South Dakota, Borglum carved the heads of Washington, Jefferson, Lincoln, and Theodore Roosevelt. His engineering prowess invented new methods that took advantage of the capacity of dynamite and pneumatic hammers to carve large quantities of stone quickly. The work was completed in 1941, the year of Borglum's death, although the last details were completed by his son, Lincoln.

Borgo Maggiore, town and seat of Borgo Maggiore *castello* (district), Republic of San Marino, located northeast of the city of San Marino, the republic's capital, on the slopes of Monte Titano, at an elevation of 1,706 ft (520 m) above sea level. It is considered a suburb of the city of San Marino and has most of the capital's shops and offices. Borgo Maggiore is the principal market town of the republic, and is also the seat of the Italian consulate. Historically it was incorporated into the city of San Marino but is now a separate town. Borgo Maggiore is connected to the capital by funicular and road and to Rimini, Italy, by helicopter service (in the summer) and highway. Pop. (1982 est.) 1,970.

Borgongini-Duca, Francesco (b. Feb. 26, 1884, Rome—d. Oct. 4, 1954, Rome), cardinal, Vatican dignitary, and author of the

Borgongini-Duca
Pontificia Fotografia Felici

Lateran Treaty, which assured the Holy See independence from Italy and sovereignty in international relations.

Ordained priest on Dec. 22, 1906, Borgongini-Duca was, from 1907 to 1921, professor of theology at the Urban College of Propaganda, Rome. As a faculty member of the North American College, Rome, he taught many U.S. seminarians, including Francis Cardinal Spellman, who later translated into English his popular meditations as *The Word of God* (1921). Borgongini-Duca's greatest diplomatic achievement was probably his role in the negotiations that culminated in the Lateran Treaty of 1929, which he wrote and, with Pietro Cardinal Gasparri (secretary of state)

and Benito Mussolini, signed, as secretary of the Vatican's Congregation for Extraordinary Ecclesiastical Affairs. He then became the first papal nuncio to modern Italy.

On June 7, 1929, Pope Pius XI named Borgogini-Duca titular archbishop of Heraclea in Turkey, and he was consecrated on June 29 by Gasparri. In May 1951 he visited the United States, and on Nov. 29, 1952, Pope Pius XII made him cardinal. Following the consistory (*i.e.*, solemn meeting of cardinals convoked and presided over by the pope) of Jan. 12, 1953, he was assigned the titular church of Santa Maria in Vallicella. He was named cardinal protector of the Ursuline nuns on May 19, 1953. His *Le LXX settimane di Daniele e le date Messianiche* (1951; "The Seventy Weeks of Daniel and the Messianic Date") fixed the date of Jesus Christ's crucifixion as April 7, AD 30.

Borgu, also spelled **BORGOU**, inland region of West Africa, covering parts of what is now Benin and Nigeria and bounded northeast and east by the Niger River. Its name probably derives from the aquatic grass called *borgu*, a cattle food. The tribes of the region formerly gave allegiance to the sultan of Borgu and the chief of Busa. After a dispute over the territory in 1894, an Anglo-French convention of 1898 declared the western part French and the eastern British. Nigerian areas of this region are protected game and forest reserves.

Borgu, traditional emirate, Niger State, western Nigeria. After a race by the colonial developer Frederick Lugard, on behalf of the Royal Niger Company, in 1894 to beat the French to Nikki (now in Benin), the capital of the Borgu kingdom, to sign a commercial treaty, France and Britain settled their territorial claims to Borgu by a convention of 1898. Eastern Borgu, the area of which contained the 12,000-square-mile (31,000-square-km) Bussa, Kaiama, and Illo chiefdoms, was ceded to the British, who created Borgu Province in 1900, recognized Bussa chiefdom (founded c. 1730) as an emirate, and established Kaiama's Chief Mora Tsaude (Murata Sidi) as emir of Kaiama. After Illo was transferred to Sokoto province in 1905, what remained of Borgu was given (1907) to Kontagora province; Borgu division was incorporated into Ilorin province in 1923. In 1954, when Kaiama's emir resigned, Kaiama and Bussa emirates were joined; Muhammadu Sani, emir of Bussa, then became the first emir of Borgu. Today, the emir functions in a traditional and religious capacity.

Borgu's area of plains and wooded savanna is drained by several small streams that flow eastward to the Niger River, the area's eastern boundary. Poor soils, low rainfall (especially in the dry season), and Fulani slave raids in the 19th century have made Borgu one of Nigeria's least-populated regions. Most inhabitants are of the Bargu (Borgu, Bariba, Borgenci), Busa (Bussa, Bussangi), Boko (Bokoboro), Reshe (Gungunci, Gungawa), Fulani, Kambari, or Yoruba ethnic group and mainly engage in cattle and poultry raising, subsistence farming (sorghum, millet, shea nuts, onions, corn [maize], peanuts [groundnuts], cotton, tobacco), and fishing. Gold mining, once important around Kaiama and Bussa, is no longer significant. The creation of Kainji Lake (1968) forced the evacuation of several towns along the Niger, including Bussa, the former spiritual headquarters of the Borgu kingdom. Kaiama, New Bussa (built in 1966; 24 miles [39 km] south of old Bussa), Okuta, and Wawa are the chief towns.

Borhyaenidae, family of extinct South American marsupial mammals occurring from the Late Paleocene Epoch into the Pliocene (from about 63.5 to 5 million years ago). It is named

for the genus *Borhyaena*; hyena-like specimens of this genus, found in early Miocene rocks of Argentina (26,000,000 years old), had large skulls and heavy crushing teeth. Not all borhyaenids, however, were hyenoid. *Thylacosmilus* was a Pliocene-aged marsupial counterpart of the sabre-toothed tiger. Many other forms were wolflike and foxlike.

boric acid (H_3BO_3), white crystalline, oxygen-bearing acid of boron found in certain minerals and volcanic waters or hot springs (*see* boron).

boride, any of a class of hard substances in which boron is chemically combined with various metals (*see* boron).

Borinage, coal-mining and industrial region of southwestern Belgium, Hainaut province, southwest of Mons. Borinage's development was based on coal extracted from the area since the Middle Ages. The mines are no longer operative; the principal industries are metallurgy (in the town of Jemappes) and glassmaking (at Boussu). The city and workshops of Grand Hornu constitute a remarkable reconstruction (begun c. 1820) of an ancient mine and its attendant industrial complex.

Boring, Edwin G., in full EDWIN GARRIGUES BORING (b. Oct. 23, 1886, Philadelphia, Pa., U.S.—d. July 1, 1968, Cambridge, Mass.), American psychologist first recognized for his experimental work but later known as a historian of psychology.

Boring studied engineering and psychology at Cornell University (Ithaca, N.Y.), receiving his Ph.D. in the latter in 1914. He taught at Clark University (Worcester, Mass.) and then went to Harvard University (1922), where he became director (1924) of the Psychological Laboratory. From 1957 to 1968 he was professor emeritus of psychology.

Boring's experimental work focused on sensory stimulation of the alimentary tract and the physiological consequences of dividing nerve fibres. However, his research also covered a vast number of other topics, giving him one of the widest backgrounds of any American psychologist and preparing him to write his best-known work, *A History of Experimental Psychology* (1929), which established him as one of the first historians of the field in the United States. Boring also wrote *The Physical Dimensions of Consciousness* (1933) and *Sensation and Perception in the History of Experimental Psychology* (1942).

boring machine, device for producing smooth and accurate holes in a workpiece by enlarging existing holes with a bore, which may bear a single cutting tip of steel, cemented carbide, or diamond or may be a small grinding wheel. Single-point tools, gripped in a boring head attached to a rotating spindle, are moved circularly against the sides of the existing holes. The diameter of the hole swept out by the tool is controlled by adjustment of the boring head.

Grinding-wheel cutters have a planetary motion, rotating rapidly about their own axes, which in turn slowly rotate with the boring head about the spindle axis; the hole diameter is controlled by adjusting the distance between the wheel axis and the spindle axis. The spindles on boring machines may rotate about vertical or horizontal axes.

Boring machines used in toolmaking shops have one vertical spindle and a work-holding table that can be moved horizontally in two directions perpendicular to each other so that holes can be accurately spaced. On some machines the spacing error is less than 0.002 percent. In mass-production plants, special boring machines with multiple spindles are common.

Boris I, baptismal name MIKHAIL, English MICHAEL (d. May 2, 907, Preslav, Bulg.), khan of Bulgaria (852–889), whose long reign

witnessed the conversion of the Bulgarians to Christianity, the founding of an autocephalous Bulgarian church, and the advent of Slavonic literature and establishment of the first centres of Slav-Bulgarian scholarship and education. Boris' active domestic and foreign diplomacy was of great importance in the formation of a united Bulgarian ethnic community, and it left lasting traces on Bulgaria's subsequent development.

When Boris inherited the throne from his father, Bulgaria's territorial, military, and political potential had made it one of the largest states in Europe. Bulgaria's approximate frontiers were the Dnieper River in the northeast, the Carpathian Mountains in the north, the Tisa (Tisza) River in the northwest, the Adriatic Sea in the west, and the Tomorr (Tomor), Belasica, Pirin, Rhodope, and Strandzha mountains in the south. Many Slavic tribes lived within the boundaries of the state, together with the proto-Bulgarians, a tribe of Turkic origin that had settled in the Balkan Peninsula at the end of the 7th century. In view of the religious, ethnic, and language difficulties between the Slavs and the Bulgars, the introduction of a common and compulsory religion for all subjects was one of the principal preconditions for the formation of a united Bulgaria. Pagan Bulgaria needed to join the "family of Christian states," but the existence of two competing centres of Christianity—Rome and Constantinople—made it difficult for Boris to make his choice. Boris originally intended to accept Roman Christianity, but an unsuccessful war with the Byzantines forced him to adopt the Orthodox faith of Constantinople (864). Boris (at his baptism he took the Christian name Michael), his family, and the nobles who supported his policy were baptized one night in secret by a Byzantine bishop and priests who had been sent to Pliska, the Bulgarian capital. There was serious opposition by both the nobility and the common people to Boris' attempt to enforce mass baptism. A pagan rebellion broke out, and Boris retaliated by executing 52 boyars, together with their families.

Negotiations took place between Boris and Photius, patriarch of Constantinople, on the status of the Bulgarian diocese but did not lead to the result expected by the Bulgarians. The Byzantines demanded that the Bulgarian church organization should be entirely subjected to Constantinople. Dissatisfied, Boris renewed his diplomatic contacts with the West. In 866 he sent embassies to Pope Nicholas I (858–867) and to King Ludwig of Germany. The Pope immediately responded by sending a mission to Bulgaria. The Roman clergy's stay (866–870) soon became a sore point in the acute rivalry between Rome and Constantinople. But since Pope Nicholas I and his successor, Adrian II, proved dilatory on the question of church organization in Bulgaria (they hesitated over the creation of an independent Bulgarian archbishopric), Boris again reopened negotiations with Constantinople. The Bulgarian church question was finally solved at the eighth oecumenical council in Constantinople in 869–870. Bulgaria was formally placed under the nominal ecclesiastical jurisdiction of the patriarch of Constantinople but received an independent archbishopric. The attempts of the popes to bring the Bulgarian ruler back into the Roman church by pleas and promises of concessions continued until 882 but produced no results.

Boris was quite active in inculcating the Christian faith among the Bulgarian people, in organizing the Bulgarian church as an independent institution, and in building churches throughout the country. In 886 he gave asylum to Clement, Nahum, and Angelarius, the disciples of Cyril and Methodius, missionaries to the Slavs, who had been driven out of Moravia. With Boris' active assistance and material support, these disciples founded cen-

tures of Slavic learning at Pliska, Preslav, and Ohrid. As a result of the intensive work of the Slav scholars, the Slavic language replaced Greek in church services and in literary life and became the country's official language.

In 889 Boris I abdicated and became a monk, but he retained the right to take an active part in the government of the state. Boris' eldest son and heir, Vladimir (889–893), abandoned his father's policy and became the instrument of a pagan reaction and a leader of the opponents of Slavic letters and literature. Boris then returned to active politics. With the aid of loyal boyars and the army, Boris drove his son from the throne. Vladimir was blinded, unfitting him for rule, and was replaced by Boris' third son, who ruled as Symeon the Great (893–927). Boris afterward retired to his monastery, making generous grants to the Bulgarian Church and patronizing Slav scholarship. He was canonized by the Orthodox Church, and his feast is celebrated on May 15 (new style; May 2, old style). (W.T.G.)

BIBLIOGRAPHY. Vasil Gjuzev, *Knjaz Boris Pärvi* (1969), the most recent and complete study in line with the achievements of modern historiography; Frantisek Dvornik, *Les Slaves, Byzance et Rome au IX^e siècle* (1926), chiefly concerning the diplomacy of Boris I of Bulgaria with a view to relations between the churches of Rome and Constantinople; *The Photian Schism: History and Legend* (1948), a brilliant study in which the author gives an appreciation of the work of Boris I.

Boris III (b. Jan. 30, 1894, Sofia, Bulg.—d. Aug. 28, 1943, Sofia), king of Bulgaria from 1918 to 1943, who during the last five years of his reign headed a thinly veiled royal dictatorship.

The son of Ferdinand I of Bulgaria and Maria Luisa of Bourbon-Parma, Boris, despite his

Boris III, c. 1934
BBC Hulton Picture Library

Roman Catholic parentage, was brought up in the Orthodox faith for political and dynastic reasons. He succeeded his father as king of Bulgaria when he abdicated Oct. 4, 1918. An opponent of Bulgaria's political strongman, the Agrarian Union leader Aleksandür Stamboliyski, Boris is generally considered to have played some role in the coup that removed Stamboliyski from power in June 1923. During the following years he was the object of terrorist conspiracies; two attempts were made on his life within a few days in April 1925. His marriage to Princess Giovanna of Italy (1930) temporarily cemented Italian relations; but during the late 1930s he passed more into the German orbit and sought rapprochement with Yugoslavia. After the establishment of a military dictatorship in Bulgaria (1934), he worked gradually to reassert his power; by November 1935 he had successfully installed Georgi Kyoseivanov, a personal favourite, as prime minister. From 1938 until his death he was dictator in all but name.

After Bulgaria's adhesion to the Axis pact (March 1941), Boris maintained a modicum of independence; even after Bulgaria's entry into World War II on the side of the Axis and after participating in the invasion of Yugoslavia and Greece, he was able to resist

declaring war against Russia. He died shortly after a stormy interview with Adolf Hitler. Whether his death was caused by heart attack or by assassination is uncertain.

Boris GODUNOV: see Godunov, Boris.

Borisoglebsk, city, Voronezh *oblast* (province), southwestern Russia, on the left bank of the Vorona River, near its confluence with the Khoper. Founded in 1646 as a fortress against the Tatars, it now serves as a grain collection centre. Other industries are related to agriculture—e.g., flour milling and meat packing. Railway repair shops are located in the city. There are teacher-training, medical, and music schools. Pop. (1991 est.) 72,100.

Borisov, city, Minsk *oblast* (province), Belarus, on the Berezina River at its confluence with the Skha. Founded in the 12th century, Borisov has been at various times under Lithuanian, Polish, and Russian rule. Napoleon's disastrous retreat across the Berezina River in 1812 took place north of the city. An important communications centre at which the Moscow–Warsaw railway and highway cross the navigable Berezina, it is also a major timberworking city and produces plastics, electrical automobile equipment, cranes, and glassware. Pop. (1991 est.) 150,200.

Borkou, also spelled BORKU, region in northern Chad, centred around the town of Faya (formerly Largeau). It is mostly a sandy desert of the southeastern Sahara, south of the Tibesti massif and west of the Ennedi plateau. Formerly a vassal state of Ouaddai, a Muslim (Sanūsi) sultanate, it was ceded to France under an Anglo-French agreement (1899), but Sanūsi control over the region was not broken until 1913–14. French troops remained in Borkou (and neighbouring Ennedi and Tibesti) until 1965 because the area was considered hard to control. The more fertile oases grow dates, barley, and vegetables and support camels, donkeys, and goats. The area is drained underground by the Lake Chad Basin. The population consists of nomadic and semi-nomadic Tedas, Arabs, and Berbers.

Borkou-Ennedi-Tibesti, northernmost and largest *préfecture* of Chad, with an area of 231,795 sq mi (600,350 sq km). Its capital is Faya (formerly Largeau). The terrain is primarily arid desert with a sparse population of nomadic and semi-nomadic Arabs, Berbers, Tedas, and Nakazas. The region was historically important as a crossing place in the trans-Saharan trade between West Africa and Cyrenaica (Libya); the Islamic pilgrimage route from West Africa to Mecca in Saudi Arabia also passed through it. In the early 1900s it came under French control when the resistance of the Sanūsi brotherhood was somewhat subdued. Nevertheless, the area was considered ungovernable, and, following Chad's independence in 1960, it remained under French military administration. In 1965 the French withdrew at Chad's request, and the region was incorporated into the Chad republic; but its nomadic tribes continued to resist the autocratic, southern-dominated central government. Pop. (1988 est.) 109,000.

Borlänge, town, *län* (county) of Kopparberg, central Sweden, on Dalälven (Dal River). In the Middle Ages a stronghold known as Borghnäs was located near the present site; its

destruction in 1434 opened a war of liberation against the Danes. With the coming of railroads, beginning in 1875, Borlänge developed into an important commercial centre for the surrounding agricultural and industrial areas. In 1891 it became a municipality and in 1898 a market town. After absorbing the villages of Domnarvet and Kvarnsveden, it was chartered as a town in 1944.

Located near the rich Bergslagen mining region, Borlänge is an important ironworking and steel-milling centre. In addition, it has paper mills, sawmills, engineering works, foundries, printing establishments, slaughterhouses, power stations, and factories producing headgear and leather goods. It is also an important rail and bus junction. Domnarvet open-air museum contains 16th- and 17th-century buildings. Pop. (1991 est.) mun., 46,671.

Borlaug, Norman Ernest (b. March 25, 1914, Cresco, Iowa, U.S.), American agricultural scientist, plant pathologist, and winner of the Nobel Prize for Peace in 1970. He was one of those who laid the groundwork of the so-called Green Revolution, the agricultural technological advance that promised to alleviate world hunger.

He studied plant biology and forestry at the University of Minnesota and earned a Ph.D. in plant pathology there in 1941. From 1944 to 1960 he served as research scientist at the Rockefeller Foundation's Cooperative Mexican Agricultural Program in Mexico. At a research station at Campo Atizapan he developed strains of grain that dramatically increased crop yields. Wheat production in Mexico multiplied threefold in the time that he worked with the Mexican government; "dwarf" wheat imported in the mid-1960s was responsible for a 60 percent increase in harvests in Pakistan and India. He also created a wheat-rye hybrid known as triticale.

Borlaug served as director of the Inter-American Food Crop Program (1960–63) and as director of the International Maize and Wheat Improvement Center, Mexico City, from 1964 to 1979. In constant demand as a consultant, Borlaug has served on numerous committees and advisory panels on agriculture, population control, and renewable resources.

Borman, Frank (b. March 14, 1928, Gary, Ind., U.S.), American astronaut who, with James A. Lovell and William A. Anders, made the first manned flight, in Apollo 8, around the Moon in December 1968. Three years earlier Borman and Lovell had made the Gemini 7 endurance flight in which they remained in space for 330 hours 35 minutes.

Borman graduated from the U.S. Military Academy, West Point, N.Y., in 1950, was commissioned in the Air Force, and served with the 44th Fighter Bomber Squadron in the Philippines between 1951 and 1956. He subsequently taught at the Air Force Fighter

Borman, 1964

By courtesy of the National Aeronautics and Space Administration

Weapons School. After taking his master's degree in aeronautical engineering (1957) at California Institute of Technology, Pasadena, Borman taught at West Point and at the Air Force Aerospace Research Pilots School. In 1962 he was chosen by the National Aeronautics and Space Administration (NASA) to be a member of the second group of astronauts. After the Apollo 8 flight he became deputy director of flight-crew operations for NASA.

In July 1970 Borman resigned from NASA and became a company executive of Eastern Air Lines (1970–86).

Bormann, Martin (b. June 17, 1900, Halberstadt, Ger.—d. May 1945, Berlin?), powerful party leader in Nazi Germany, one of Adolf Hitler's closest lieutenants.

An avowed and vocal pan-German in his youth, Bormann participated in right-wing German Free Corps activities after the close of World War I. Bormann was imprisoned in 1924 for participation in a political murder, and after his release he joined the National Socialists. He became head of the Nazi press in Thuringia in 1926 and from 1928 held posts in the high command of the *Sturmabteilung* (Storm Troopers). In 1933 he became chief of staff to the deputy führer, Rudolf Hess.

On May 12, 1941, Hitler appointed Bormann to fill the post of head of the party chancellery, succeeding Hess after the latter had made his quixotic flight to Scotland. Bormann thus became head of the administrative machinery of the Nazi Party, and through intrigue, party fighting, and his shrewd manipulation of Hitler's weaknesses and eccentricities, he became a shadowy but extremely powerful presence in the Third Reich. He controlled all acts of legislation and all party promotions and appointments, and he had a broad influence on domestic policy questions concerning internal security. He controlled the personal access of others to Hitler and drew up the Führer's schedule and appointments calendar, insulating him from the independent counsel of his subordinates. Bormann was a rigid and unbending guardian of Nazi orthodoxy; he was a major advocate of the persecution and extermination of Jews and Slavs, and he played a role in expanding the German slave labour program. He disappeared shortly after the death of Hitler, and it was presumed that he was either dead or in hiding. He was indicted Aug. 29, 1945, along with other Nazi leaders, on charges of war crimes and was found guilty and sentenced to death in absentia by the International Military Tribunal at Nürnberg on Oct. 1, 1946.

Later reports, especially in the 1960s, alleged that Bormann had escaped and had been living in South America, possibly Paraguay. However, early in 1973 a Berlin forensic expert established "with near certainty" that one of two skeletons unearthed during construction in West Berlin in December 1972 was that of Bormann, and on April 11, 1973, West German authorities officially declared him dead.

Born, Bertran de: see Bertran de Born.

Born, Max (b. Dec. 11, 1882, Breslau, Ger.—d. Jan. 5, 1970, Göttingen), German physicist, winner of the Nobel Prize for Physics in 1954, with Walther Bothe of Germany, for his statistical formulation of the behaviour of subatomic particles.

In 1921, the year he became professor of theoretical physics at the University of Göttingen, Born produced a very precise definition of quantity of heat, the most satisfactory mathematical statement of the first law of thermodynamics. In 1926, after his student Werner Heisenberg had formulated the first laws of a new quantum theory, Born collaborated with him to develop the mathematical

Max Born

By courtesy of Godfrey Argent, photograph, Walter Stoneman

formulation that would adequately describe it. Somewhat later, when Erwin Schrödinger put forward his quantum mechanical wave equation, Born showed that the solution of the equation has a statistical meaning of physical significance. Born also introduced a useful technique, known as the Born approximation, for solving problems concerning the scattering of atomic particles. He and J. Robert Oppenheimer initiated a widely used simplification of the calculations dealing with electronic structures of molecules.

In 1933 Born fled the Nazis and became Stokes lecturer at the University of Cambridge. He was elected to the Tait chair of natural philosophy at the University of Edinburgh in 1936, becoming a British subject in 1939. After his retirement in 1953 Born returned to Göttingen.

Borneo, one of the great islands of the world, situated southeast of the Malay Peninsula in the Greater Sunda group of the Malay Archipelago. The island is bounded by the South China Sea (northwest) and, clockwise, by the Sulu and Celebes seas, the Makassar Strait, and the Java Sea. The largest political segment of the island is Indonesian (until 1949 Dutch), known as Kalimantan. Along the northwest coast and northern tip lie Sarawak and Sabah (formerly North Borneo), which in 1963 joined the Malaysian federation, and between them, the Islāmic sultanate of Brunei. The population of the island in 1990 was estimated at 12,305,000, of which Kalimantan had 8,911,000, Sabah and Sarawak 3,135,000, and Brunei 259,000.

Borneo is mountainous and largely covered in dense rain forest. With a length of 830 miles (1,336 km) northeast–southwest and a maximum breadth of 600 miles (960 km), it has an area (including adjacent islands) of about 292,000 square miles (755,000 square km). A dorsal range, rising to its greatest height at 13,455-foot (4,101-metre) Mount Kinabalu, in the far northeast, extends southwest across the island into the Crocker, Nieuwenhuis, and Muller mountains.

A large part of Borneo is drained by navigable rivers, the principal and often the only lifelines of trade and commerce. Farther north, as the island narrows, few rivers are navigable for more than 100 miles (160 km), often much less, a condition largely responsible for the northern interior of Borneo remaining, until recently, one of the least-known parts of the world. The climate is equatorial—hot and humid with a fairly distinct division into two seasons, the monsoon (*landas*) between October and March and a relatively drier, calmer period of summer (*tedoh*) for the rest of the year. The average rainfall is about 150 inches (3,800 mm) a year. Both the floral and the faunal populations of Borneo are extremely varied. They include rafflesia (the largest flower in the world), the orangutan and gibbon, the clouded leopard, elephant, rhinoceros, and many insects.

The island is sparsely inhabited by Asian standards. The population, of which nearly

three-fourths is in Indonesian territory, is varied. It includes the non-Muslim Dayaks, the Islāmic Malays, the Chinese, and a small minority of Europeans.

Borneo is poor in commercial mineral resources. Gold, diamonds, antimony, mercury, gypsum, and iron have all at some time since the beginning of the 19th century been exploited on an individual producer basis using small-scale methods. There are oil fields at Tanjung Balikpapan, in Brunei, and at more than a dozen other sites on the continental shelf off the north shore of the island. East coast development is centred on the Attaka area. Bauxite has been developed near Cape Datu (southwest) since 1958, and coal is mined in the southwest.

Generally, Borneo soils are poor, with a few exceptions of fertile volcanic areas. Rice, the staple food, is supplemented with corn (maize), cassava (manioc), cucumber, and pumpkin. Rubber is grown on small native plantations. Pepper is grown on a large scale by the resident Chinese. Newer markets are for the seeds of the shorea tree and for chicle. Coastal area exports are sago, copra, cutch (a dye extracted from mangrove bark), and marine products. Tobacco is grown in the uplands and traded to the lowlands. Experimental plantings of coffee, cocoa, and hemp have been made.

Borneo is first mentioned in Ptolemy's *Guide to Geography* of about AD 150. Roman trade beads and Indo-Javanese artifacts have been discovered that give evidence of a flourishing civilization dating to the 2nd or 3rd century BC. Three rough foundation stones with an inscription recording a gift to a Brahman priest date from the early 5th century AD, found at Kutai, provide evidence of a Hindu kingdom in eastern Kalimantan. Brahmanic and Buddhist images in the Gupta style have been found in the valleys of the Kapuas and other rivers in western Kalimantan. Later Kalimantan rulers were probably feudatories of the Majapahit empire of eastern Java (c. 1293–1520). With the arrival of Islām early in the 16th century, a number of Muslim kingdoms were founded, including the Banjarmasin, Sambas, Sukadana, and Landak. The Sukadana rulers owed allegiance to the Muslim Mataram kingdom of Java.

Modern European knowledge of Borneo dates from travelers who passed through Southeast Asia in the 14th century. The first recorded European visitor was the Franciscan friar Odoric of Pordenone, who visited Talamasim on his way from India to China in 1330. The Portuguese, followed by the Spanish, established trading relations on the island early in the 16th century. At the beginning of the 17th century the Portuguese and Spanish trade monopoly was broken by the Dutch, who, intervening in the affairs of the Muslim kingdoms, succeeded in replacing Mataram influence with their own. The coastal strip along the South China and Sulu seas was long oriented toward the Philippines and was often raided by Sulu pirates. British interests, particularly in the north and west, diminished that of the Dutch. The Brunei sultanate was an Islāmic kingdom that at one time had controlled the whole island but by the 19th century ruled only in the north and northwest. Sarawak was split away on the southwest, becoming an independent kingdom and then a British colony; North Borneo (later Sabah) to the northeast was obtained by a British company to promote trade and suppress piracy, but was not demarcated until 1912. These losses left a much reduced Brunei, which became a British protectorate.

During World War II the Japanese invasions of Borneo (1941–42) quickly eliminated the token British and Dutch forces on the island, which was not retaken until 1945. In July 1946 both Sarawak and North Borneo were made British crown colonies. In Dutch Borneo a strong nationalist sentiment developed

and led to fighting between Indonesian and Dutch forces as the latter attempted to reimpose Netherlands control. Sovereignty passed to the Indonesians in 1949, and in 1950 a new constitution proclaimed Dutch Borneo part of the Republic of Indonesia.

The British government relinquished its sovereignty over Sabah and Sarawak in 1963, when these territories joined the Malaysian federation. This marked the commencement of Indonesian hostilities in the form of guerrilla raids across the border. These raids ceased by agreement in 1966. Except for the period of Japanese occupation, Brunei was under British protection from 1888 to 1983. It became fully independent on Jan. 1, 1984.

Bornholm, Danish island and *amtskommune* (county commune), in the Baltic Sea, 105 miles (169 km) southeast of Copenhagen and 22 miles (35 km) southeast of Sweden. Once a Viking stronghold, independent until the 10th century, it was controlled by Sweden and

Coastal view, Bornholm, Denmark
G. Glase—Osman Agency

then, in the 16th century, by Lübeck (a German city of the Hanseatic League). Awarded to Sweden by the Treaty of Roskilde (1658), Bornholm was returned to Denmark in 1660. It was occupied by the Germans during World War II and was the only part of Denmark to be bombed (by the Russians in 1945 to hasten the German surrender).

The island has an area of 227 square miles (588 square km). Its northern two-thirds is composed of granite with a rocky cliff coast and a hilly wooded interior. The more populous southern part forms an undulating surface of sandstone, limestone, and shale, with a dune coast. The moderately fertile soil supports grains, dairy farming, and pig raising. Principal exports are fish (herring, salmon, and cod), granite, porcelain, and pottery. Tourism is also an important economic factor.

Medieval remains include four of Denmark's six 12th-century round churches (fortress-churches) and the ruins of the imposing 13th-century castle of Hammershus (former stronghold of the bishops of Lund, Swed.), now a historical monument. There are also Viking relics. The island is centred on Rønne (its seat, dating from the 12th century) and Nekso. Pop. (1993 est.) 45,224.

Bornholm disease: *see* pleurodynia.

bornite, a copper-ore mineral, copper and iron sulfide (Cu₃FeS₃). Typical occurrences are found in Mount Lyell, Tasmania; Chile; Peru; and Butte, Mont., U.S. Bornite, one of the common copper minerals, forms isometric crystals but is seldom found in these forms. It alters readily upon weathering to chalcocite and other copper minerals. For detailed physical properties, *see* sulfide mineral (table).

Borno, formerly BORNUN, state, northeastern Nigeria. It is the central fragment of the old Borno empire of the Kanuri people. Its name is said to mean "Home of the Berbers."

The territory became part of Northern Nige-

ria after the division of Bornu between the British and the French at the turn of the century and became Borno state in 1967. Borno state was divided in 1991, and its western half became Yobe state. Borno borders the Republic of Niger to the north, Lake Chad (and the Republic of Chad) to the northeast, and Cameroon to the east; on the south and west it borders the Nigerian states of Adamawa, Bauchi, and Yobe.

The vegetation in Borno state is mainly of the Sudan savanna type, which includes the acacia (a source of gum arabic), baobab, locust bean, shea butter, dum palm, and kapok trees; however, there is a region of Sahel savanna, mostly thorn scrub and with sandy soils, in the north. Prominent physical features include the Borno Plains, the volcanic Biu Plateau, and the *firki* ("black cotton") swamps south and southwest of Lake Chad. Most of the state is drained by seasonal rivers flowing toward Lake Chad. The far south, however, is drained by the Gongola River, a tributary of the Benue.

The Kanuri are the dominant ethnic group, but the area also contains clusters of other peoples. The growing of sorghum, millet, peanuts (groundnuts), onions, corn (maize), sesame, *acha* ("hungry rice"), cotton, and indigo and the herding of cattle are the chief occupations, with fishing significant around Lake Chad. The lake is connected to Maiduguri by a road from Baga, a town on a peninsula extending into the lake. The Lake Chad Commission, established (1964) by Cameroon, Chad, Niger, and Nigeria, is charged with regulating the use of the waters of the lake and the basin for the development of livestock, crop, fishery, and water resources. Nigeria also has established a Chad Basin Authority.

Maiduguri is the state capital, its main industrial centre, and by far its largest city. Biu and Bama also are sizable market towns. Maiduguri has an airport and is served by a railway to Bauchi and the south, as well as by trunk roads to Potiskum, Bauchi, Yola, and Ndjamena (Chad). Pop. (1991) 2,596,589.

Bornu, historical kingdom and emirate in northeastern Nigeria. Bornu was originally the southernmost province of the Kanem empire, an ancient kingdom that reached its peak in the 12th and 13th centuries. Toward the end of the 14th century the power of Kanem waned, and the empire shrank until little was left of it except Bornu. Succeeding centuries saw the

The stupa complex at Borobudur in Java, Indon.
Robert Harding Picture Library/Photobank, BKK

final dissolution of the Kanem kingdom by its hostile neighbours (c. 1380) and the rise of Bornu. In the early 16th century, Bornu managed to recapture Kanem and made it a protectorate. The reamalgamated kingdom of Kanem-Bornu probably reached its height in the reign of Mai Idris Alawma (reigned c. 1571–c. 1603).

Birni Gazargamu, the capital of the Bornu kingdom, was captured in the jihad (holy

war) conducted by Fulani tribesmen in 1808. Muhammed (al-Amin) al-Kanami, a member of the royal family who advised the *mais* ("emperors") of Bornu, founded Kukawa (80 miles [130 km] north-northeast of Maiduguri) as the Kanuri capital in 1814 and restored Bornu's independence from Fulani domination in the 1820s. After the death of the Se-fawa Mai Ali Dalatami in 1846, al-Kanami's son Umar (Omar) proclaimed himself the first *shehu* (that is, sheikh, or sultan) of Bornu.

Bornu was defeated and Kukawa was destroyed by the Sudanese warrior Rābih az-Zubayr (Rabah Zubayr) in 1893, and Dikwa (54 miles [87 km] east-northeast of Maiduguri) served as Rābih's headquarters until he was killed by the French in 1900. The French restored the al-Kanami dynasty in Dikwa; but, after the final partition of Bornu among the British, the French, and the Germans, Shehu Bukar Garbai fled in 1902 to Northern Nigeria and was recognized as the *shehu* of British Bornu. Bornu was thus acknowledged as an emirate, but Garbai moved its headquarters from Monguno (65 miles [105 km] north-northeast of Maiduguri) to Kukawa in 1904 and, finally, to Yerwa in 1907. The *shehu* of Bornu still resides at Yerwa and is officially recognized as Nigeria's second most important traditional Muslim leader, after the Fulanis' sultan of Sokoto. Much of the emirate's former territory is now in Borno and Yobe states.

Borobudur, also spelled BARABUDUR, massive Buddhist monument in central Java, Indonesia, 42 miles (68 km) northwest of Yogyakarta. It was constructed between about AD 778 and 850, under the Sailendra dynasty. The Borobudur monument combines the symbolic forms of the stupa (originally a relic mound commemorating the Buddha), the temple mountain, and the mandala (a mystic Buddhist symbol of the universe, combining the square as earth and the circle as heaven). The style of Borobudur is influenced by Indian Gupta and post-Gupta art. Borobudur was apparently neglected from about 1000 and overgrown with vegetation until restored by Dutch archaeologists in 1907–11. A second restoration was completed in the early 1980s.

Built with about 2,000,000 cubic feet (57,000 cubic m) of gray volcanic stone, Borobudur

encloses a small hill and is shaped like a stepped pyramid, the base and the first five terraces being square and the higher three terraces being circular; the highest centre, 103 feet (31.5 m) above the base, consists of a large individual stupa. Each of the terraces represents the individual stages toward perfection in a person's life; the pilgrim walks around the monument nine times (reflecting the mystic number of nine in Buddhism) be-

fore reaching the top. There are four stairways, one on each side, leading up to the top.

A series of reliefs on the terrace walls of the monument represent the ascending stages of enlightenment toward nirvana (spiritual freedom). Those on the lower level illustrate the effect of good and bad deeds in this life; on the second level are the events in the life of the historical Buddha and scenes from the *Jātakas* (stories of his previous lives); on the upper level are reliefs illustrating more philosophical themes taken from Mahāyāna Buddhist scriptures. The upper circular terraces have a much wider spaciousness and more simplicity and carry 72 bell-shaped stupas, some containing meditative Buddhas half visible through the perforated stonework.

Borodin, Aleksandr (Porfirievich) (b. Nov. 12 [Oct. 31, Old Style], 1833, St. Petersburg, Russia—d. Feb. 27 [Feb. 15], 1887, St. Petersburg), major Russian nationalist composer of the 19th century. He was also a scientist notable for his research on aldehydes.

The illegitimate son of a Georgian prince and of the wife of an army doctor, he was reared in comfortable circumstances. He early showed marked gifts for languages and music, and as a schoolboy he learned to play the piano, flute, and cello and composed. From 1850 to 1856 he studied at the Medico-Surgical Academy, specializing in chemistry, and received his doctorate in 1858. From 1859 to 1862 he studied in western Europe. On his return to Russia he became "adjunct-professor" of chemistry at the Medico-Surgical Academy and full professor in 1864. From this period dates his first major work, the *Symphony No. 1 in E-flat Major* (1862–67), written as a result of his acquaintance with Mily Balakirev, of whose circle ("The Five") he was a member, along with Nikolay Rimsky-Korsakov, Modest Mussorgsky, and César Cui. Borodin began his *Symphony No. 2 in B Minor* in 1869, when he also began work on his operatic masterpiece, *Prince Igor* (completed posthumously by Rimsky-Korsakov and Aleksandr Glazunov). Act II of *Prince Igor* contains the often-played

Aleksandr Borodin
Sovioto

"Polovtsian Dances." He also found time to write two string quartets, a dozen remarkable songs, the unfinished *Symphony No. 3 in A Minor*, and his tone poem *In the Steppes of Central Asia*.

Borodin's musical work was never more than relaxation from his scientific work. In addition to his research and teaching, he helped found medical courses for women in 1872. In the 1880s pressures of work and ill health left him little time for composition. He died suddenly while at a ball.

Borodin's compositions place him in the front rank of Russian composers. He had a strong lyric vein but also was noted for his handling of heroic subjects. He had an unusu-

ally fine rhythmic sense and excelled in the use of orchestral colour and in the evocation of distant places. In his symphonies and string quartets—among the finest of the Romantic era—he developed a formal structure in which the musical material of a movement was derived from a single initial motif. His melodies reflect the character of Russian folk melodies, and like other composers of the Russian national school he used striking harmonies unconventional in western European music.

Borodin, Mikhail Markovich, original name MIKHAIL GRUZENBERG (b. July 9, 1884, Yanovichi, Russia [now in Belarus]—d. May 29, 1951, Siberia), chief Comintern agent in China in the 1920s, who built the loosely structured Nationalist Party (Kuomintang) of Sun Yat-sen into a highly centralized Leninist-style organization.

Borodin joined the Bolshevik party in Russia in 1903. In 1906 he was arrested and exiled. The same year he emigrated to the United States, attended Valparaiso University, Indiana, and later founded a school for émigrés in Chicago. After the Russian Revolution of 1917 he returned to Russia and was dispatched as a communist agent to Scandinavia, Mexico, Spain, Turkey, and Great Britain. He went to China in 1923 as an adviser to Sun Yat-sen, after the Nationalist leader acquiesced in the Soviet wish that Chinese communists be allowed to join the Kuomintang. Besides helping to restructure Kuomintang organization and ideology, Borodin gave the Chinese Nationalists Soviet aid in developing a party army, which made them a powerful force in Chinese politics. After Sun Yat-sen's death in 1925, Chiang Kai-shek, back from training in Moscow, became head of the army. In 1927 Chiang broke with the communists, and Borodin left the country.

Returning to Moscow, Borodin served as deputy people's commissar for labour, deputy director of Tass news agency, and, from 1932, editor of the *Moscow Daily News*, published in English. He disappeared in February 1949 in a wave of arrests directed by Joseph Stalin against Jewish intellectuals. He died in 1951 in a Siberian labour camp.

Borodino, Battle of (Sept. 7 [Aug. 26, Old Style], 1812), bloody battle of the Napoleonic Wars, fought during Napoleon's invasion of Russia, about 70 miles (110 km) west of Moscow, near the river Moskva. It was fought between Napoleon's 130,000 troops, with more than 500 guns, and 120,000 Russians with more than 600 guns. Napoleon's success allowed him to occupy Moscow. The Russians were commanded by General M.I. Kutuzov, who had halted the Russian retreat at the town of Borodino and hastily built fortifications, to block the French advance to Moscow. Napoleon feared that an attempt to outflank the Russians might fail and allow them to escape, so he executed a crude frontal attack. From 6 AM to noon the fierce fighting seesawed back and forth along the three-mile (five-kilometre) front. By noon the French artillery began to tip the scales, but the successive French attacks were not strong enough to overwhelm Russian resistance. Napoleon, distant from, and perhaps unsure of, the situation on the smoke-obscured battlefield, refused to commit the 20,000-man Imperial Guard and 10,000 other practically fresh troops. Because Kutuzov had already committed every available man, Napoleon thus forfeited the chance of gaining a decisive, rather than a narrow, victory. Both sides became exhausted during the afternoon, and the battle subsided into a cannonade, which continued until nightfall. Kutuzov withdrew during the night, and a week later Napoleon occupied Moscow unopposed. The Russians suffered about 45,000 casualties, including Prince Pyotr Ivanovich Bagration, commander of the 2nd Russian army. The French lost about 30,000 men. Al-

though the Russian army was badly mauled, it survived to fight again and, in the end, drove Napoleon out of Russia.

Borommatrilokanat (king of Siam): see Trailok.

boron (B), chemical element, semimetal of main Group IIIa (boron group) of the periodic table, essential to plant growth and of wide industrial application.

Properties, occurrence, and uses. Pure crystalline boron is a black, lustrous, semiconductor; i.e., it conducts electricity like a metal at high temperatures and is almost an insulator at low temperatures. It is hard enough (9.3 on Mohs scale) to scratch some abrasives, such as carborundum, but too brittle for use in tools. Constituting about 0.001 percent by weight of the Earth's crust, boron occurs combined as borax, kernite, and tincalconite (hydrated sodium borates), the major commercial boron minerals, especially concentrated in the arid regions of California, and as widely dispersed minerals such as colemanite, ulexite, and tourmaline. Sassolite—natural boric acid—occurs especially in Italy.

Boron was first isolated (1808) by Joseph-Louis Gay-Lussac and Louis-Jacques Thénard and independently by Sir Humphry Davy by heating boron oxide (B₂O₃) with potassium metal. The impure, amorphous product, a brownish black powder, was the only form of boron known for more than a century. Pure crystalline boron may be prepared with difficulty by reduction of its bromide or chloride (BBr₃, BCl₃) with hydrogen on an electrically heated tantalum filament.

Limited quantities of elemental boron are widely used to increase hardness in making steel. Added as the iron alloy ferroboration, it is present in many steels, usually in the range 0.001 to 0.005 percent. Boron is also utilized in the nonferrous-metals industry, generally as a deoxidizer, in copper-base alloys and high-conductance copper as a degasifier, and in aluminum castings to refine the grain. In the semiconductor industry, small, carefully controlled amounts of boron are added as a doping agent to silicon and germanium to modify electrical conductivity.

In the form of boric acid or borates, traces of boron are necessary for growth of land plants and thus indirectly essential for animal life. Vegetable "brown heart" and sugar beet "dry rot" are among the disorders due to boron deficiency. In excess quantities, however, borates act as unselective herbicides.

In nature, boron consists of a mixture of two stable isotopes—boron-10 (19.8 percent) and boron-11 (80.2 percent); slight variations in this proportion produce a range of ±0.003 in the atomic weight. Because of the high thermal neutron cross section of the rarer isotope boron-10 (3,836 barns), boron and some of its compounds have been used as neutron shields. Pure boron exists in at least four crystalline modifications or allotropes.

Crystalline boron is almost inert chemically at ordinary temperatures. Boiling hydrochloric acid does not affect it, and hot concentrated nitric acid only slowly converts finely powdered boron to boric acid (H₃BO₃). Boron in its chemical behaviour is nonmetallic.

Compounds. In its compounds boron shows a valence of three. The first three ionization energies of boron, however, are much too high to allow formation of compounds containing the B³⁺ ion; thus in all its compounds boron is covalently bonded, with boron being either three or four-coordinated. The three coordinated derivatives are planar molecules that readily form donor-acceptor complexes (called adducts), with compounds containing lone pairs of electrons; in these adducts the boron atom is four-coordinated, the four groups being tetrahedrally disposed around it. The tetrahedral bonds result from the formation of anions or from the reception of an unshared

pair of electrons from a donor atom. This allows a variety of structures to form. Solid borates show five types of structures involving several anions (i.e., BO_3^{3-} , formed of boron and oxygen) and shared-electron bonds. The most familiar borate is sodium tetraborate, commonly known as borax, $\text{Na}_2\text{B}_4\text{O}_7 \cdot 10\text{H}_2\text{O}$, which occurs naturally in salt beds. Borax has long been used in soaps and mild antiseptics. Because of its ability to dissolve metallic oxides, it has also found wide applications as a soldering flux.

Another boron compound with diverse industrial applications is boric acid, H_3BO_3 . This white solid, also called boracic, or orthoboric acid, is obtained by treating a concentrated solution of borax with sulfuric or hydrochloric acid. Boric acid is commonly used as a mild antiseptic for burns and surface wounds and is a major ingredient in eye lotions. Among its other important applications are its use as a fire-retardant in fabrics, in solutions for electroplating-nickel or for tanning leather, and as a major constituent in catalysts for numerous organic chemical reactions. Upon heating, boric acid loses water and forms metaboric acid, HBO_2 ; further loss of water from metaboric acid results in the formation of boron oxide, B_2O_3 . The latter is mixed with silica to make heat-resistant glass (borosilicate glass) for use in cooking ware and certain types of laboratory equipment. Boron combines with carbon to form boron carbide (B_4C), an extremely hard substance that is used as an abrasive and as a reinforcing agent in composite materials.

Boron combines with various metals to form a class of compounds called borides. The borides are usually harder, chemically less reactive, and electrically less resistive and have a higher melting point than the corresponding pure metallic elements. Some of the borides are among the hardest and most heat-resistant of all known substances. Aluminum boride (AlB_2), for example, is used in many cases as a substitute for diamond dust for grinding and polishing.

With nitrogen, boron forms boron nitride (BN), which, like carbon, can exist in two allotropic (chemically identical but physically different) forms. One of them has a layer structure resembling that of graphite, while the other has a cubic crystalline structure similar to that of diamond. The latter allotropic form, called borazon, is capable of withstanding oxidation at much higher temperatures and is extremely hard—properties that make it useful as a high-temperature abrasive. Boron reacts with all halogen elements to give monomeric, highly reactive trihalides. These so-called Lewis acids form complexes with amines, phosphines, ethers, and halide ions.

With hydrogen, boron forms a series of compounds called boranes, the simplest being diborane (B_2H_6). The molecular structure and chemical behaviour of these boron hydrides are unique among inorganic compounds. Typically, their molecular structure reveals some boron and hydrogen atoms closely surrounded by or bonded to more atoms than can be explained by an electron-pair bond for each pair of atoms. This variance led to the concept of a chemical bond consisting of an electron pair not localized between two atoms but shared by three atoms (three-centre bond). Diborane combines with a wide variety of compounds to form a large number of boron or borane derivatives, including organic boron compounds (e.g. alkyl- or aryl-boranes and adducts with aldehydes).

boron carbide (B_4C), crystalline compound of boron and carbon. It is an extremely hard, synthetically produced material that is used in abrasive and wear-resistant products, in lightweight composite materials, and in control rods for nuclear power generation.

With a Mohs hardness between 9 and 10, boron carbide is one of the hardest synthetic substances known, being exceeded only by cubic boron nitride and diamond. As an abrasive, it is used in powdered form in the lapping (fine abrading) of metal and ceramic products, though its low oxidation temperature of 400–500° C (750–930° F) makes it unable to withstand the heat of grinding hardened tool steels. Because of its hardness, together with its very low density, it has found application as a reinforcing agent for aluminum in military armour and high-performance bicycles, and its wear resistance has caused it to be employed in sandblasting nozzles and pump seals. A neutron absorber, boron carbide is used in powdered or solidified form to control the rate of fission in nuclear reactors.

Boron carbide is produced by reducing boron oxide with carbon at high temperatures in an electric furnace. After grinding, the black powder is solidified by pressing at temperatures exceeding 2,000° C (3,630° F). Its melting point is approximately 2,350° C (4,260° F).

boron group element, any of the five chemical elements constituting Group IIIa of the periodic table. The elements are boron (B), aluminum (Al), gallium (Ga), indium (In), and thallium (Tl).

A brief treatment of the boron group elements follows. For full treatment, see MACROPAEDIA: Chemical Elements.

Boron group elements are relatively rare, except for aluminum, the third most common element in Earth's crust. None of these elements occurs uncombined in nature. Boron, the lightest of the family, is often considered a metalloid (having properties of both metals and nonmetals), whereas the others are silvery white metals. Every boron group element has three electrons in the outermost shell of its atomic structure. Thus they have maximum oxidation numbers of three and usually form ions with three positive charges.

Borotra, Jean (b. Aug. 13, 1898, Arbonne, France—d. July 17, 1994, Arbonne), prominent French tennis player of the 1920s. In 1927, as one of the Four Musketeers (the others being René Lacoste, Henri Cochet, and Jacques Brugnon), he helped France win the Davis Cup for the first time.

Nicknamed "the Bounding Basque" because of his quick dashes and energetic acrobatic

Borotra competing at Wimbledon, July 1924

play, Borotra won Wimbledon in 1924 and 1926, the Australian championship in 1928, and the French title in 1924 and 1931. He was also victorious in numerous Grand Slam doubles and mixed doubles matches. As an individual, he won a total of 19 Grand Slam titles. Borotra was celebrated by fans for his exuberant personality and his ever-present blue beret. Borotra played for the French Davis Cup team in 1922, 1924–37, and as late as 1947. He was elected to the International Tennis Hall of Fame in 1976.

borough, in Great Britain, incorporated town with special privileges or a district entitled to elect a member of Parliament.

The medieval English borough was an urban centre identified by a charter granting privileges, autonomy, and later, incorporation. As an autonomous corporation, the borough functioned outside the general administrative hierarchy of the shire and hundred. From the 16th century the importance of boroughs as units of local government declined, but they gained a new importance as parliamentary constituencies. By the late 17th century, about 200 English boroughs were returning about four-fifths of the members of the House of Commons.

By the early 19th century, the system of Parliamentary representation for boroughs had become antiquated, since depopulated boroughs controlled by the nobility and gentry were overrepresented while the growing industrial cities and towns were underrepresented. The First Reform Act of 1832 stripped many old boroughs of their representation and created many new ones centred on industrial towns. The reform of municipal corporations in 1835 gave English boroughs a uniform constitution and transformed them into modern units of local government.

In America the word appeared occasionally in colonial Virginia but was not widely used after the Revolution. Village, town, and city were the names most often applied to municipal units. The U.S. city corresponded most closely to the English borough as a full-fledged urban unit. In a few states where the borough was officially recognized, it indicated an incorporated town or village of lesser status than a city. The New York legislature adopted the name in 1897, when it combined five large areas known as the boroughs of Manhattan, Brooklyn, Queens, the Bronx, and Richmond to form the city of Greater New York.

borough-English, the English form of ultimogeniture, the system of undivided inheritance by which real property passed intact to the youngest son or, failing sons, to the youngest daughter. Ultimogeniture was the customary rule of inheritance among unfree peasants from Anglo-Saxon times and continued in English boroughs after the Norman Conquest. "Borough-English" became the accepted legal term for the custom after a famous case in 1327 drew attention to the fact that in the French borough of Nottingham, which had grown up beside the English borough, land passed to the eldest son, whereas in the English borough it passed to the youngest son. As a system of undivided inheritance, borough-English applied mostly to unfree peasants and, like primogeniture, acted to preserve the manorial unit; among free peasants, land tended to pass by equal division among sons and daughters. The custom continued in many rural manors until abolished by the Administration of Estates Act of 1925.

Borovichi, also spelled BOROVIČI, administrative centre, Borovichi rayon (sector), Novgorod oblast (province), northwestern Russia, on the Msta River. A town since 1770, it has a varied economy. As well as an old handicraft in-

dustry, especially hosiery, there are ceramics, paper, and wood-using industries. Borovichi has medical and teacher-training schools. Pop. (1983 est.) 62,000.

Borovský, Havel (Czech author); see Havlíček Borovský, Karel.

Borowski, Tadeusz (b. Nov. 12, 1922, Zhitomir, Ukrainian S.S.R.—d. July 3, 1951, Warsaw), Polish fiction writer and poet.

In German-occupied Warsaw, Borowski published an illegal collection of poems entitled *Gdziekolwiek ziemia* (1942; "Where E're the Land"). During 1943–45 he was one of the many inmates of the German concentration camps at Auschwitz (Oświęcim) and Dachau. After the war he published in Munich a volume entitled *Imiona nurtu* (1945; "The Names of the Undercurrent").

In Poland under Communist rule, Borowski in 1948 turned to publishing prose. Two series of stories, *Pożegnanie z Marią* ("Farewell to Maria") and *Kamienny świat* ("World of Stone"), deal mainly with life in Nazi concentration camps and explore the depths of human depravity and degradation. He started collaborating with the new regime by joining the Communist Party and was a co-founder of the Young Intellectuals' Club; but he soon felt alienated by the police state and committed suicide.

Borrorean Islands, Italian ISOLE BORROMEI, four tiny (about 50 ac [20 ha]) islands in Lake Maggiore, off Baveno and Stresa, Novara province, Piemonte (Piedmont) region, northwestern Italy. Geologic continuations of the Pallanza promontory, the islets are named for the Borromeo family, to whom they have belonged since the 12th century. Isola Bella, named for Isabella, countess Borromeo, is known for its chateau and terraced gardens, built by Count Vitaliano Borromeo (died 1690). To the northeast is Isola Madre, the largest of the group, with a palazzo and gardens; to the north, off Pallanza, is the smallest, Isola di San Giovanni. The westernmost is Isola Superiore, or Isola dei Pescatori, occupied by a picturesque fishing village. Pop. (latest est.) 208.

Borromeo, Saint Charles, Italian SAN CARLO BORROMEI (b. Oct. 2, 1538, Arona, Duchy of Milan—d. Nov. 3, 1584, Milan; canonized 1610; feast day November 4), cardinal and archbishop who was one of the most important figures of the Counter-Reformation in Italy.

Borromeo received a doctorate in civil and canon law from the university of Pavia in 1559. The following year his uncle, Pope Pius IV, appointed him a cardinal and archbishop of Milan. Chief among his curial functions was heading the Consulta, a position that made him secretary of state to Pius.

The Pope leaned upon him heavily in directing the third convocation of the Council of Trent (1562–63). When the council closed, Borromeo served in executing its decrees and was largely instrumental in bringing out the Roman catechism in 1566. Also at this time he was actively sponsoring the conversion of Swiss Protestants. Upon the death of his uncle, Borromeo took part in the conclave that elected Pius V (1566).

Thereafter, he resided at Milan, where serious administrative problems confronted him. He regularly visited his more than 1,000 widely scattered parishes, which fell under the jurisdictions of King Philip II of Spain and also of Venice, Genoa, and Novara. Borromeo fostered clerical education by establishing seminaries and colleges at Milan and in the Italian cities of Inverigo and Celano. Colleges for lay students also were erected and entrusted to the Jesuits. The archbishop's last undertaking was

the opening of the college at Ascona, Switz., in 1584.

Political and other turmoils beset Borromeo. He became embroiled with the Milanese Senate and with Gov. Luis de Requesens y Zúñiga as well as with the rebellious canons of Sta. Maria della Scala and the order of the Humiliati (The Humble Ones). Borromeo nevertheless had the support of many religious congregations, including his own Oblates of St. Ambrose. In 1569 one of the Humiliati, the priest Girolamo Donato Farina, attempted to assassinate Borromeo. Despite the archbishop's pleas for leniency, Farina and his accomplices were tortured and executed.

Borromeo's heroic behaviour during the plague of 1576–78 won him much respect.

Borromini, Francesco, original name FRANCESCO CASTELLI (b. Sept. 25, 1599, Bissone, Duchy of Lombardy—d. Aug. 2, 1667, Rome), Italian architect who was a chief formulator of Baroque architectural style. Borromini (who changed his name in about 1627) secured a reputation throughout Europe with his striking design for a small church, S. Carlo alle

Interior of the dome of the church of S. Ivo della Sapienza, Rome, by Francesco Borromini, 1642–60
GEKS

Quattro Fontane, Rome. He differed from Gian Lorenzo Bernini and other contemporaries in basing his designs on geometric figures (modules) rather than on the proportions of the human body.

Youth and education. Born to Giovanni Domenico Castelli and Anastasia Garogo, Borromini was introduced to the craft specialities of architecture when his father sent him to Milan (1608 or 1614) to learn stonemasonry. After several years training in the skills and technology of both architecture and sculpture, he collected a debt owed to his father and, without informing his parents, fled to Rome in 1620. There he became a draftsman and stonemason in the office of his kinsman, Carlo Maderno, who had established himself as the major practicing architect in Italy.

Celibate and irascible, Borromini dedicated himself to the discipline of architecture. Maderno quickly recognized Borromini's potential. The aging master and his young pupil worked together closely on various problems at St. Peter's, whose fundamental plan was revised by Maderno. For the Palazzo Barberini, Maderno determined a basic concept, then entrusted Borromini with the realization of specifics. A convergence of both talents produced the facade design of S. Andrea della Valle, and Borromini was permitted to undertake the lantern of the church's dome himself. Borromini's personality is apparent in these projects, though Maderno's style dominates

them. A facade to be attached to the late 16th-century oval church of S. Anna dei Palafrenieri was Borromini's personal project. His attempt to integrate a five-bay front and two towers with the existing oval dome prefigured his S. Agnese in Agone (in Piazza Navona) in its placement of plastic volumes in space. Equally significant was his transformation of Maderno's plan for S. Ignazio. Through his use of pairs of free-standing columns, he suggested an articulation of space, a major characteristic of his style. Space in his structures is not merely a void but rather something corporeal, an element in itself, molded by the surrounding shell of the building. Later he would develop this concept by replacing the enclosing wall with an extensively penetrated framework, as in the Re Magi chapel.

Maderno died in January 1629, three months after construction had begun at the Palazzo Barberini. The famous Gian Lorenzo Bernini was put in charge of this project, though his architectural abilities were underdeveloped. Borromini continued in a key position, working out the specifics of Maderno's plan and collaborating successfully with Bernini. The patron, however, began to draw heavily on the advice of a third designer, Pietro da Cortona, and eventually abandoned Maderno's project for the east facade of the palace. Unable to work with Cortona and despairing of these changes, Borromini left the project in 1631. Together with Bernini he dedicated himself entirely to the task of designing the baldachin in St. Peter's, which was conceived as a monumental canopy raised over the tomb of St. Peter, recalling the canopy that is traditionally supported over the pope when he is carried in state through the church. The enormous bronze baldachin was realized through the closest cooperation between Borromini and Bernini; the huge, S-shaped volutes that crown four corkscrew columns are their most important common creation. Bernini was in command of all enterprises at St. Peter's, but he paid Borromini a substantial sum from 1631 to 1633 for this work, indicating the great importance of his contribution.

An independent architect. The baldachin was completed in 1633. The year before, on the commendation of Bernini and Cardinal Francesco Barberini, Borromini was awarded the office of university architect. With his new position as support, he began to seek patronage as an independent architect. His first independent commission represented an extraordinary challenge to tradition; it was the Roman church and monastery of S. Carlo alle Quattro Fontane, begun in 1638. No larger inside than the dimensions of a single pier at St. Peter's, the small church electrified Rome, and its reputation spread like wildfire through Europe. Borromini began by stacking together three distinct units that normally would have been employed only in separate buildings: a curious, undulating lower zone; a middle one suggesting the standard Greek-cross plan; and an oval dome, a relatively new and still little-used form. This audacious combination of precedent and novelty is integrated by complex, interweaving rhythms. Bold, illusionistic effects, achieved by calculated lighting, intensify the space. The dome appears to be floating above the interior of the church like a hallucinatory vision because its springing point and light sources are concealed by the zone below.

Borromini established contacts with the eminent Spada family and was also sponsored by Pope Innocent X for a decade, but his relations with patrons were frequently stormy and at times reached an impasse because of his intransigent, defiant attitude. Though bitterly resentful of what he felt to be a lack of just recognition, he was indifferent toward wealth and rejected the fashions of normal dress. Intractable and melancholic, he was infamous for his fits of rage. On one of his building sites he was infuriated to discover a man damag-

ing some materials and had him so violently beaten that he died.

Given Borromini's gloomy disposition, it is not surprising that a conflict developed with the famous and popular Bernini. While they were working together, the relationship between the two artistic giants had been mutually profitable: Borromini's style was injected with a new vitality under Bernini's influence, and Bernini was strongly impressed by Borromini's novel formulations of architectural detail. Later, however, a bitter conflict arose between them. Perhaps Borromini's subordinate position at St. Peter's sufficiently rankled him to provoke his departure. He definitely felt this way later in life, claiming that Bernini had begged him not to abandon him on the work at St. Peter's and had promised to recognize his many labours with a worthy reward. Borromini said that after he had carried out the work, Bernini withheld the remunerations and rewards and never gave him anything except good words and grand promises.

Divergent characters, disparate backgrounds, and different attitudes toward life presumably provoked the antagonism. Bernini worked easily with the aristocratic and powerful; immensely successful as a sculptor and painter as well as an architect, he was outgoing, charming, and witty. Borromini, on the other hand, was a lonely, withdrawn man; he prided himself on his highly specialized training, and he resented his modest degree of recognition. Conflict between the two became public in 1645 over the decision to eliminate the towers Maderno had designed for the facade of St. Peter's. Maderno left them as substructures, and in 1636 Bernini submitted a proposal for completing them. After one was erected, however, technical deficiencies halted further construction in 1641, and four years later a commission decided on its removal. Borromini emerged as Bernini's most effective and destructive critic, accusing him of incompetence. Bernini seldom indulged in professional envy, however, but, during his Paris visit of 1665, he accused Borromini of abandoning the anthropometric basis of architecture. Because the body of Adam was modelled not only by God but also in his image and likeness, it was argued, the proportions of buildings should be derived from those of the body of man and woman. Borromini, however, based his buildings on geometric configurations in an essentially medieval manner that he probably learned in Lombardy, where medieval building procedures had been handed down from generation to generation. Borromini's approach consisted of establishing a geometric figure for a building or room, then articulating this figure by means of geometric subunits. He thus stood accused of denying the basis of good architecture. He never divorced himself completely from the anthropometric basis of design, however; he insisted, at least once, that his architecture contained human references. The concave facade of St. Philip Neri represented to him the welcoming gesture of outstretched arms: the central unit stood for the chest, the two-part wings for arm and forearm.

The bizarre quality of Borromini's designs was as unsettling as his departure from anthropomorphism. Even his supporters felt uneasy with his novel creations. Presumably his license departed too far from orthodox interpretations of antiquity, which were accepted at this time as the fundamental standards of form for architecture. This seems paradoxical because he was an avid student of the ancient world; his drawings of antique fragments demonstrate a critical contact with Roman architecture, and his evocations of classical thought on the project for the Villa Pamphili at San Pancrazio are recorded with philological exactness. Nevertheless, the notion was in the air that it was possible to use and then progress beyond the achievements of antiq-

uity, and Borromini strongly identified with this attitude. He said that he certainly would never have given himself to architecture with the idea of being merely a "copyist," and he invoked the example of Michelangelo, who said that he who follows others never goes ahead. Borromini declared antiquity and nature to be his points of departure (although he included the work of Michelangelo as well), but he actually spurned the regular and orthodox compositional motifs of the ancient world. Instead he turned to novel, curious, and marvelous interpretations, such as could be found in Hadrian's Villa at Tivoli, and to Roman structural achievements, such as their brickwork and their use of bevelled corners for vault supports.

Just as Borromini's attitude toward antiquity was uncommon, so too were his historical roots in medieval architecture in an era that had rejected medieval culture as corrupt. Yet his tendency toward the annulment of the wall, his use of structural ribwork to strengthen vaults, his designs derived from geometric configurations, his use of decorative motifs, and perhaps even his awareness that light can be given major compositional importance, all represent ideas that originated in the medieval experience. Closer to his own time, Borromini investigated certain formal qualities found in both Florentine architecture of the 15th century and Mannerist architecture of the 16th century, especially in that of Michelangelo, whose architecture was of decisive importance and suggested Borromini's still more radical experiments. The manner in which space seemed to expand and contract in a number of Michelangelo's designs indicated to Borromini the dynamic potential of this medium. Responding to the past with greater freedom than his contemporaries, Borromini employed those elements that suited his purposes.

This broad selection of styles was complemented by his understanding of structures and materials. The artisan tradition of Lombardy stressed technical excellence, which provided Borromini with the knowledge to approach a full range of structural problems. It gave him a firm base for his technical virtuosity, which is demonstrated by a long list of achievements. Among these achievements are: the careful balancing of his towers for the facade of St. Peter's; the supporting metal cage for a barrel vault in the Palazzo Pamphili in Piazza Navona; the precise brickwork of the Oratory of St. Philip Neri; and his inventive domes and vaults, such as those of S. Ivo della Sapienza or the Re Magi chapel. He used the building yard as an extension of his drafting table and as a place where he could experiment and improvise to generate a fruitful exchange between design and execution. At S. Carlo alle Quattro Fontane, for example, the three-dimensional curve of the arches opening to the chapel vaults, as well as other features, could not have been realized without Borromini's personal guidance of the stonecutters on the site.

Borromini's urban sensibilities were also highly developed, as one of his unexecuted schemes demonstrates. He wished to create a dynamic setting for the facade of S. Giovanni in Laterano by means of a piazza. The street passing through this space was to be surrounded by 24 uniform building fronts, establishing a large-scale, tightly organized arrangement of spaces. Always alert in his commissions to contextual interpretations, he displayed a deep sensitivity to the relationship of his buildings to the surrounding urban fabric. The bell-tower facade of St. Philip Neri, for example, is composed to conclude and monumentalize the street running up to it.

Later years and influence. Even late in his life, Borromini's innovations continued to be as energetic and radical as ever. For the Re Magi chapel in the Collegio di Propaganda

Fide, on which he worked until his death, he designed six pairs of colossal pilasters to define a generally rectangular space with bevelled corners.

In the 1660s, Borromini's fortunes tragically declined. He was increasingly frustrated by the fame and success of his rival, Bernini. His only disciple, Francesco Righi, and his most sympathetic patron, Padre Virgilio Spada, both died early in the decade. His major commission of S. Agnese in Agone, in Piazza Navona, was taken from him; work on another of his projects, S. Andrea delle Fratte, came to a halt; and his facade of St. Philip Neri was disfigured by lateral extensions. Suffering severe melancholia, he travelled to Lombardy, but when he returned to Rome his melancholy returned to him, and he spent whole weeks without ever leaving his house. Borromini burned all of his drawings in his possession. Taken ill, his condition was made worse by hypochondriac hallucinations and, when he suffered fits, it was decided that he should be denied all activity so that he might sleep. On a hot summer's night, unable to rest and forbidden to work, he arose in a fury, found a sword, and fell upon it. Borromini recovered a lucid mind after mortally wounding himself, repented, received the last sacraments of the church, and wrote his will before he died. At his own request, he was buried anonymously in the grave of his teacher and friend, Maderno. It has been suggested that Borromini's suicide was the result of an increasing schizophrenia and that this pathological process is reflected in his architecture, but this contention is impossible to demonstrate. His career appears to have been successful until the disillusionments of the last years.

In denying the restrictive, enclosing qualities of wall in order to treat space and light as architectonic components, Borromini confronted his architectural inheritance with its most complete and compelling challenge. Scores of designers would capitalize upon this revolutionary legacy. Borromini's works from the first had created an uproar in Rome, and his influence proved highly suggestive for design in northern Italy and in central Europe over the course of the next century. Later, as Neoclassical attitudes gained force, he was increasingly despised. Largely forgotten during most of the 19th century, Borromini's architecture has again been recognized in the 20th century as the creation of genius.

(C.F.O.)

MAJOR WORKS. All works are in Rome—S. Andrea della Valle (with Maderno, c. 1622); Palazzo Barberini (with Bernini, 1629-31); St. Peter's (with Bernini, baldachin, 1631-33; facade design 1645); Oratory of St. Philip Neri (begun 1637); S. Carlo alle Quattro Fontane (1638-41); S. Ivo della Sapienza (1642-60); Palazzo Pamphili (vault, 1645-50); Collegio di Propaganda Fide (1646-67, including the Re Magi chapel [1662-64]); S. Giovanni in Laterano (reconstruction, 1647-50); S. Agnese in Agone (continuation, begun 1652; Piazza Navona); S. Andrea delle Fratte (exterior, 1653-65); Biblioteca Alessandrina in S. Ivo della Sapienza (1659-61).

BIBLIOGRAPHY. *Opera del Borromini*... (1720) and *Opus architectonicum* (1725), Borromini's discussion and engravings of S. Ivo della Sapienza and the monastery of St. Philip Neri—both reprinted in the critical edition by Paolo Portoghesi, *Opera and Opus architectonicum* (1964). The Graphische Sammlung Albertina in Vienna holds more than 450 Borromini drawings.

Eberhard Hempel, *Francesco Borromini* (1924), the first complete monograph (in German), still basic to any study of Borromini and his work, though outdated in some respects; Paolo Portoghesi, *Borromini* (1967; Eng. trans. 1968), not distinguished by its scholarship but a most exhaustive monograph, with a thorough bibliography.

Borrow, George (Henry) (b. July 5, 1803, East Dereham, Norfolk, Eng.—d. July 26, 1881, Oulton Broad), English traveler, linguist, and one of the most imaginative prose writers of the 19th century.

Borrow, detail of an oil painting by Henry W. Phillips, 1843; in the National Portrait Gallery, London

By courtesy of the National Portrait Gallery, London

Borrow was the son of a professional soldier and led a wandering childhood as his father's regiment was moved around the British Isles; these peregrinations inspired memorable passages in his masterpiece, *Lavengro* (1851). Between 1815 and 1818 he attended grammar school at Norwich, and it was here that he began to acquire a smattering of many languages. An attempt to apprentice him to the law proved unsuccessful, and early in 1824 he decided to try his luck in London. There he remained for about a year. At length his health collapsed, and he went on a long bohemian pilgrimage through rural England. His adventures, including many contacts with Gypsies, provided some of the background for *Lavengro* and *The Romany Rye* (1857). He strayed back again, however, to Norwich, where he completed *Romantic Ballads*, translated from the Danish (1826). In Spain, while working for a Bible society, he found his literary homeland, whence came the raw materials for *The Zinçali: An Account of the Gypsies in Spain* (1841) and for his brilliantly picturesque, yet highly informative, travel book *The Bible in Spain* (published 1842; title page date 1843). Its success was "instantaneous and overwhelming."

Borsa, Roger: see Roger under Roger (Apulia).

borsch, also spelled BORSCHT, BORSHT, or BORTSCH, beet soup of the Slavic countries. Although borsch is important in Russian and Polish cuisines, the Ukraine is frequently cited as its place of origin. Borsches are eaten hot or cold; some are clear and light, others thick and substantial.

Ukrainian borsch is a hearty soup of beef and a variety of vegetables in which root vegetables and cabbage predominate, and the soup takes its characteristic colour from beets. The soup is often eaten with a sour cream garnish and with *pirozhki*, turnovers filled with beef and onions. A meatless beet soup is made with a stock flavoured with forest mushrooms; this Polish *barszcz* is served with tiny mushroom-filled dumplings, *uszka*. Some Russian borsches are made with kvass, a mild beer fermented from grain or bread.

Borsippa, modern BIRS, or BIRS NIMRUD, ancient Babylonian city southwest of Babylon in central Iraq. Its patron god was Nabu, and the city's proximity to the capital, Babylon, helped it to become an important religious centre. Hammurabi (reigned 1792–50 BC) built or rebuilt the Ezida temple at Borsippa, dedicating it to Marduk (the national god of Babylonia); subsequent kings recognized Nabu as the deity

of Ezida and made him the son of Marduk, his temple becoming second only to that of Marduk in Babylon.

During Nebuchadrezzar II's reign (605–562 BC), Borsippa reached its greatest prosperity. An incomplete and now ruined ziggurat built by Nebuchadrezzar was excavated in 1902 by the German archaeologist Robert Koldewey. The ziggurat appears to have been destroyed by an extremely hot fire, probably caused by the spontaneous combustion of reed matting and bitumen originally placed in the core of the structure for internal support. Borsippa was destroyed by the Achaemenian king Xerxes I in the early 5th century and never fully recovered.

Borsod-Abaúj-Zemplén, *megye* (county), northern Hungary, with an area of 2,798 square miles (7,247 square km). The terrain is mostly hilly with riverine lowlands created by streams flowing north-south from Slovakia to the Tisza River. Several of these in upper Borsod have been dammed for flood control and storage. At Aggtelek is one of Europe's largest underground cave systems, with subterranean lakes and limestone formations. The flat plain land, Bodrogköz, in the east, is the *megye*'s most arable, and peas and lentils are grown there. The Tokaj district is renowned for its wines.

Borsod-Abaúj-Zemplén is one of the most populous and industrialized counties in Hungary. West of industrialized Miskolc (*q.v.*), the *megye* seat, is Lillafüred, a well-known spa and resort. Leninváros is a rapidly developing town with a chemical works and an oil refinery. Sátoraljaújhely, just north of Sárospatak, is a commercial centre with Baroque houses and a Piarist church dating from about the 13th century. In the southwest of the *megye* is the Matyó area, centred on Mezökövesd, where quaint, ornate local costumes survive. On the Mohi lowlands, to the south of the Bükk Mountains, King Béla IV's Magyar army was routed by the Mongol invaders in 1241. Pop. (1990 prelim.) 770,000.

Borstal system, English reformatory system designed for youths between 16 and 21, named after an old convict prison at Borstal, Kent. The system was introduced in 1902 but was given its basic form by Sir Alexander Paterson, who became a prison commissioner in 1922. Each institution consists of houses containing, ideally, not more than 50 young offenders, with a housemaster or housemistress and house staff. Training is exacting, based on a full day's hard and interesting work. There are vocational-training courses, with six hours a week of evening education either in the Borstal or in local technical colleges.

The period of training, governed by the progress of the inmate through a grade system, averages about 15 months. On release, the inmate comes under the supervision of the Central Aftercare Association and may be recalled for further training if necessary. Brendan Behan's *Borstal Boy* (1958) gives a humorous, grim picture of life in a Borstal.

bort, one of the varieties of industrial diamond (*q.v.*).

bortsch (beet soup): see borsch.

Borüjerd, also spelled BURÜJIRD, or BARÜJIRD, chief town, Borüjerd *shahrestân* (county), Lorestân *ostân* (province), western Iran. Borüjerd is situated 5,500 feet (1,700 m) above sea level, below high mountains, in a wide, fertile valley. It is a flourishing regional centre on the main highway from the Persian Gulf and Khüzeštân to Tehrân; it is connected by roads with Hamadân and Kermânsähân *ostâns*. The district has many traces of ancient settlement in the form of *tappehs*, or mounds. Pop. (1986) 183,879.

böryokudan (Japanese: "tough gang"), any of various Japanese criminal gangs of centuries-

long tradition, which combined in the 20th century into Mafia-like organizations. Members, often called *yakuza* ("good-for-nothing"), or *gyangu* ("gangster"), adopt samurai-like rituals and often bear elaborate body tattoos. They engage in extortion, blackmail, smuggling, prostitution, drugs, gambling, loan sharking, day-labour contracting, and other rackets and control many restaurants, bars, pachinko parlours, trucking companies, talent agencies, taxi fleets, factories, and other businesses in major Japanese cities. The *böryokudan* were also involved in criminal activities in the United States.

The *böryokudan* date to the 16th century, when unemployed samurai turned to banditry, often gathering into small gangs. By the late 20th century their numbers exceeded 150,000 (according to police estimates), organized into more than 2,000 gangs—most of them affiliated under the umbrella of one of a dozen or fewer conglomerate gangs. The largest conglomerates include the Yamaguchi-gumi, founded about 1926 by Yamaguchi Harukichi but fully developed and aggrandized only after World War II by Taoka Kazuo (*q.v.*); Inagawa-kai; and Sumiyoshi-Rengo.

The leader of any gang or conglomerate of *yakuza* is known as the *oyaban* ("boss") and the followers are known as *koban* ("proteges," or "apprentices"); the rigid hierarchy and discipline of the *böryokudan* are usually matched by a right-wing, ultranationalistic ideology. *Kobun* take a blood oath of allegiance, and a member who breaks the *yakuza* code must show penance—often ritualistically by cutting off his little finger with a sword and presenting it, wrapped in a silk scarf, to his *oyaban*.

Borzage, Frank (b. April 23, 1893, Salt Lake City, Utah, U.S.—d. June 19, 1962, Los Angeles, Calif.), American motion-picture director and producer noted for his romantic transcendentalism and luminous filmmaking.

The son of a master stonemason, Borzage began his association with acting at age 13. He went to Hollywood in 1912 to work as a film actor. His directorial debut occurred in 1915 or 1916, and he acted in all of the 15 films that he directed in 1916. He is believed to have directed more than 50 silent films, but few—*Lazybones* (1925) among them—have survived.

Borzage's first popular success was *Seventh Heaven* (1927), the earliest of his powerful melodramas. It was released both as a silent film and with a score and sound effects; it won him an award as best director of 1927/28 from the Academy of Motion Picture Arts and Sciences. Borzage followed up with a number of remarkable films, including *Street Angel* (1928), *A Farewell to Arms* (1933), and *Three Comrades* (1938). In 1946 he signed a contract with Republic Pictures Corporation, known for their production of low-budget movies. During his three years at Republic, Borzage made his last exceptional, though not popularly successful, motion picture, *Moonrise* (1949). It is an extraordinarily lighted, stylish, and moody crime melodrama of redemption through love.

Noted for his interest in character development, Borzage was an unstudied, natural director, and many critics consider him, at his best, to be equal to his more famous contemporaries John Ford and Howard Hawks.

borzoi, breed of hound dog developed in Russia to pursue wolves. It is descended from the Arabian greyhound and a collielike Russian sheepdog. The borzoi—formerly known as the Russian wolfhound—is a graceful, strong, and swift dog, attaining a height of about 26 to 31 inches (66 to 79 cm) and a weight of 55 to 105 pounds (25 to 48 kg). It has a long, narrow head, small ears, a deep but narrow chest, long, muscular hindquarters, and a long, curved tail. The silky coat is flat or slightly curled and usually white with

Borzoi
Sally Anne Thompson—EB Inc

darker markings. The dog is noted for its elegant appearance.

Bosanquet, Bernard (b. June 14, 1848, Alnwick, Northumberland, Eng.—d. Feb. 8, 1923, London), philosopher who helped revive in England the idealism of G.W.F. Hegel and sought to apply its principles to social and political problems.

Made a fellow of University College, Oxford, in 1870, Bosanquet was a tutor there until 1881, when he moved to London to devote himself to philosophical writing and to work on behalf of the Charity Organisation Society. He was professor of moral philosophy at St. Andrews University in Scotland (1903–08).

Although Bosanquet owed much to Hegel, his first writings were influenced by the 19th-century German philosopher Rudolf Lotze, whose *Logik* and *Metaphysik* he had edited in English translation in 1884. The fundamental principles of such early works as *Knowledge and Reality* (1885) and *Logic* (1888) were further explicated in his *Essentials of Logic* (1895) and *Implication and Linear Inference* (1920), which stress the central role of logical thought in systematically addressing philosophical problems.

Bosanquet's debt to Hegel is more evident in his works on ethics, aesthetics, and metaphysics. Having translated in 1886 the introduction to Hegel's *Philosophy of Fine Art*, he proceeded to his own *History of Aesthetic* (1892) and *Three Lectures on Aesthetic* (1915). Both reflect his belief that aesthetics can reconcile the natural and the supernatural worlds. As elsewhere in his work, Bosanquet revealed his distaste for the materialism of his day and favoured the neo-Hegelian antidote, which held that everything considered to be real is a manifestation of a spiritual absolute.

Bosanquet's ethical and social philosophy, particularly the practical work *Some Suggestions in Ethics* (1918), shows a similar desire to view reality coherently, as a concrete unity in which pleasure and duty, egoism and altruism are reconciled. He asserted that the same passion shown by Plato for the unity of the universe reappeared in Christianity as the doctrine of the divine spirit manifesting itself in human society. Social life requires a communal will that both grows out of individual cooperation and maintains the individual in a state of freedom and social satisfaction. This view is expounded in *Philosophical Theory of the State* (1899) and in *Social and International Ideals* (1917).

Basing his metaphysics on Hegel's concept of the dynamic quality of human knowledge and experience, Bosanquet emphasized the interrelated character of the content and the object of human thought. Thought, he wrote in *Three Chapters on the Nature of Mind* (1923), is "the development of connections" and "the sense of the whole."

The popularity of Bosanquet's views declined after intense criticism by the British philosophers G.E. Moore and Bertrand Russell.

BIBLIOGRAPHY. Helen Bosanquet, *Bernard Bosanquet* (1924), was written by his wife. J.H. Muirhead (ed.), *Bernard Bosanquet and His Friends* (1935), illustrates his philosophical development through his correspondence.

Boscawen, Edward, byname **OLD DREADNOUGHT** (b. Aug. 19, 1711—d. Jan. 10, 1761, Hatchlands Park, Surrey, Eng.), British admiral who played a distinguished part in the Seven Years' War.

The third son of Hugh, 1st Viscount Falmouth, Boscawen entered the navy at an early age, serving under Vice Admiral Francis Hosier in the West Indies in 1726 and under Admiral Edward Vernon at Portobelo (1739) and at Cartagena (1741). On his return he married Fanny Glanville, a noted "blue-stocking" (an intellectual woman of the 18th century), whose conversation, said Samuel Johnson, was the best of any woman whom he had met.

Boscawen became member of Parliament for Truro in 1742 but continued to serve at sea, notably at the battle off Cape Finisterre in May 1747 when the French squadron suffered an overwhelming defeat. He was then sent out in command of a fleet in India. His premature capture of the French ships *Alcide* and *Lys* off Newfoundland in April 1755 helped to precipitate the outbreak of the Seven Years' War. In 1758 he was promoted admiral and in cooperation with Jeffrey Amherst and James Wolfe captured Louisburg, Cape Breton.

The next year, when in command of the Mediterranean fleet, he chased a French fleet off Lagos, took three ships and burned two, thus defeating the proposed concentration of the French fleet at Brest for an invasion of Great Britain. As a reward, in December 1760 he was given the lucrative post of general of marines, but his death the following month cut short a brilliant career.

Bosch, Carl (b. Aug. 27, 1874, Cologne, Germany—d. April 26, 1940, Heidelberg), industrial chemist who developed the Haber-Bosch process for high-pressure synthesis of ammonia and received, with Friedrich Bergius, the 1931 Nobel Prize for Chemistry for devising chemical high-pressure methods.

Bosch was educated at the University of Leipzig, where he studied under Johannes

Carl Bosch
Bavaria-Verlag

Wislicenus and obtained his Ph.D. in 1898 for research in organic chemistry. His interests were, however, general, and he studied engineering in Charlottenburg in 1894 and obtained workshop experience. Leaving Leipzig, he worked for Badische Anilin- und Soda-Fabrik AG, of which (when it became part of the cartel IG Farben) he was later president; and here he succeeded in transferring from laboratory to industrial scale Fritz Haber's process for synthesizing ammonia from its elements, hydrogen and nitrogen, catalytically at high pressures. Research on this process involved the carrying out of more than 20,000

experiments, including an exhaustive search for catalysts among the metals and their compounds.

He also invented the Bosch process for preparing hydrogen on a manufacturing scale by passing a mixture of steam and water gas over a suitable catalyst at high temperature.

Bosch, Hiëronymus, also spelled **JHERONIMUS BOS**, pseudonym of **JEROME VAN AEKEN**, also spelled **AQUEN**, or **AKEN**, also called **JEROEN ANTHONISZON** (b. c. 1450, 's Hertogenbosch, Brabant [now in The Netherlands]—d. Aug. 9, 1516, 's Hertogenbosch), brilliant and original northern European painter of the late Middle Ages whose work reveals an unusual iconography of a complex and individual style. Although at first recognized as a highly imaginative "creator of devils" and a powerful inventor of seeming nonsense full of satirical meaning, Bosch demonstrated insight into the depths of the mind and an ability to depict symbols of life and creation.

Bosch was a pessimistic and stern moralist who had neither illusions about the rationality of human nature nor confidence in the kindness of a world that had been corrupted by man's presence in it. His paintings are sermons, addressed often to initiates and consequently difficult to translate. Unable to un-

"The Temptation of St. Anthony," triptych, interior of left panel, oil painting by Hiëronymus Bosch, middle period; in the Museu Nacional de Arte Antiga, Lisbon

lock the mystery of the artist's works, critics at first believed that he must have been affiliated with secret sects. Although the themes of his work were religious, his choice of symbols to represent the temptation and eventual ensnarement of man in earthly evils caused many critics to view Bosch as a practitioner of the occult arts. More recent scholarship views Bosch as a talented artist who possessed deep insight into human character and as one of the first artists to represent abstract concepts in his work. A number of exhaustive interpretations of Bosch's work have been put forth in recent years, but there remain many obscure details.

An exact chronology of Bosch's surviving work is difficult because, of the approximately 35 to 40 paintings attributed to him, only 7 are signed and none are dated. There exists little documentary information on his early life other than the fact that he was the son and grandson of accomplished painters. His name does appear on the register of the Brotherhood of Our Lady, located in the city of his birth, and there is mention of him in official records from 1486 until the year of his death, when he was acclaimed an *Insignis pictor* ("distinguished painter"). In addition to painting he undertook decorative works and altarpieces and executed designs for stained glass.

Works attributed to his youthful period show an awkwardness in drawing and composition and brushwork somewhat limited in its scope. Such paintings as "The Cure of Folly," "Crucifixion," "The Adoration of the Magi," "The Seven Deadly Sins," "The Marriage at Cana," "Ecce Homo," and "The Conjuror" are representative of this period. The presence of certain motifs, expanded in the more sophisticated works of the artist's middle period, and a limited technique, unsure yet bold, provide a beginning from which to view Bosch's artistic origins. Between the first painting in this early group, "The Cure of Folly," and the last, "The Conjuror," a steady development can be seen. The iconography of the latter is more complex, and the characteristic themes that received their fullest expression in the great masterpieces of his late period have begun to emerge.

In these early paintings Bosch had begun to depict humanity's vulnerability to the temptation of evil, the deceptive allure of sin, and the obsessive attraction of lust, heresy, and obscenity. In calm and prosaic settings, groups of people exemplify the credulity, ignorance, and absurdities of the human race. However, the imagery of the early works is still relatively conventional, with only an occasional intrusion of the bizarre in the form of a lurking demon or a strangely dressed magician.

To Bosch's fruitful middle period belong the great panoramic triptychs such as the "Hay Wain," "The Temptation of St. Anthony," and the "Garden of Earthly Delights." His figures are graceful and his colours subtle and sure, and all is in motion in these ambitious and extremely complex works. These paintings are marked by an eruption of fantasy, expressed in monstrous, apocalyptic scenes of chaos and nightmare that are contrasted and juxtaposed with idyllic portrayals of mankind in the age of innocence. During this period Bosch elaborated on his early ideas, and the few paintings that survive establish the evolution of his thought. Bosch's disconcerting mixture of fantasy and reality is further developed in the "Hay Wain," the outside wings, or cover panels, of which recall the scenes of "The Seven Deadly Sins." The cursive style that he worked out for the triptych resembles that of watercolour. In the central panel, a rendition of the Flemish proverb "The world is a haystack from which each takes what he can," Bosch shows the trickery of the demon who guides the procession of people from the earth-

ly paradise depicted on the left wing to the horrors of hell shown on the right one.

Bosch's "The Temptation of St. Anthony" displays his ascent to stylistic maturity. The brushstrokes are sharper and terser, with much more command than before. The composition becomes more fluid, and space is regulated by the incidents and creatures that the viewer's attention is focused on. His mastery of fine brush-point calligraphy, permitting subtle nuances of contour and movement, is fully evident. Bosch portrays man's struggle against temptation, as well as the omnipresence of the Devil, in his "St. Anthony," one of the best keys to the artist's personal iconography. The hermit saint in this work is cast as the heroic symbol of man. In the central panel St. Anthony is beset by an array of grotesque demons, their horrible bodies being brilliantly visualized amalgamations of human, animal, vegetable, and inanimate parts. In the background is a hellish, fantastically bizarre landscape painted with the most exquisite detail. Bosch's development of the theme of the charlatan deceiving man and taking away his salvation receives its fullest exposition in the "St. Anthony," with its condemnation of heresy and the seductions of false doctrines.

The "Garden of Earthly Delights," representative of Bosch at his mature best, shows the earthly paradise with the creation of woman, the first temptation, and the fall. The painting's beautiful and unsettling images of sensuality and of the dreams that afflict the people who live in a pleasure-seeking world express Bosch's iconographic originality with tremendous force. The chief characteristic of this work is perhaps its dreamlike quality; multitudes of nude human figures, giant birds, and horses cavort and frolic in a delightfully implausible, otherworldly landscape, and all the elements come together to produce a perfect, harmonious whole.

Bosch's late works are fundamentally different. The scale changes radically, and, instead of meadows or hellish landscapes inhabited by hundreds of tiny beings, he painted densely compacted groups of half-length figures pressed tight against the picture plane. In these dramatic close-ups, of which "The Crowning with Thorns" and the "Carrying of the Cross" are representative, the spectator is so near the event portrayed that he seems to participate in it physically as well as psychologically. The most peaceful and untroubled of Bosch's mature works depict various saints in contemplation or repose. Among these works are "St. John the Evangelist in Patmos" and "St. Jerome in Prayer."

Bosch's preoccupation in much of his work with the evils of the world did not preclude his vision of a world full of beauty. His adeptness at handling colour harmonies and at creating deeply felt works of the imagination is readily apparent. Though a spate of imitators tried to appropriate his visual style, its uniqueness prevented his having any real followers.

BIBLIOGRAPHY. Explications of Bosch's paintings include D. Bax, *Hieronymus Bosch: His Picture-Writing Deciphered* (1979), a pioneer Dutch study originally published in 1949; Wilhelm Fraenger, *Hieronymus Bosch* (1983), a controversial viewpoint; and Carl Linfert, *Bosch*, rev. ed. (1989). Walter S. Gibson, *Hieronymus Bosch: An Annotated Bibliography* (1983), includes a short critical introduction.

Bosch, Johannes, graaf van den (count of) (b. Feb. 2, 1780, Herwijnen, Neth.—d. Jan. 28, 1844, The Hague), statesman who instituted the paternalistic Dutch East Indies Culture System, by which vast riches in export crops were extracted from 1830 to about 1860.

In his early years (1798–1810), Bosch served in the army in Batavia (now Jakarta, Indon.) in the Dutch East Indies, and on this experience he based his *Nederlandsche bezittingen in Azia, Amerika, en Afrika* (1818; "Dutch Pos-

sessions in Asia, America, and Africa"), in which he argued against a liberal colonial system and for a strongly paternalistic one, claiming that people unaccustomed to a work ethic needed strong guidance. In 1830 he was named governor-general in the Dutch East Indies, and he instituted a "Culture System" that made Indonesian noblemen semiautonomous rulers, exacted compulsory labour from villagers, and required each village to devote at least one-fifth of its land to export crops.

Bosch (Gaviño), Juan (b. June 30, 1909, La Vega, Dom. Rep.—d. Nov. 1, 2001, Santo Domingo), Dominican writer, scholar, and politician elected president of the Dominican Republic in 1962 but deposed less than a year later.

Bosch, an intellectual, early opposed Rafael Trujillo's dictatorial regime. He went into exile in 1937 and in 1939 founded the leftist Dominican Revolutionary Party (Partido Revolucionario Dominicano; PRD). The PRD was the first organized political party of the Dominican Republic and the only one with a constructive program ready to implement after Trujillo's death in 1961. Bosch, a dazzling and charismatic orator, won a landslide victory in the elections of Dec. 20, 1962. He was the first politician to directly address the peasantry, a heretofore ignored group that gave Bosch an overwhelming majority in the election. He not only appealed to the poor but also cut across class lines to win the favour of the middle class and intellectuals.

Bosch, entering office on Feb. 27, 1963, faced severe problems at the outset of his term. The United States was dismayed by the Fidel Castro government in Cuba and leery of the slightest whiff of leftist politics in the Caribbean. This fear was fed by damaging reports of the new regime from an openly hostile U.S. ambassador in the Dominican Republic. And Bosch's constitution of April 29, liberal and democratic, alienated four powerful groups in the country: landholders, even small ones, were frightened by his prohibition against latifundia (large plantation-type farms); the Roman Catholic church was angered by the secular nature of the constitution; industrialists felt the constitution was worker-oriented; and the military considered that its powers were curtailed. On Sept. 25, 1963, the military deposed Bosch. Two years later his followers staged a rebellion in hopes of returning Bosch to power. The United States, fearful of a communist revolution, sent troops to end the uprising.

After a two-year exile in Puerto Rico (Sept. 28, 1963–September 1965), Bosch was allowed to return and reluctantly agreed to take part in the new elections. Fearful for his safety, Bosch campaigned half-heartedly, making no public appearances, and lost to Joaquín Balaguer, the conservative candidate with heavy backing from the United States. Bosch and his party abstained from participating in the 1970 elections, but by 1973 the PRD wanted to rejoin the political process. Bosch resigned from the PRD and formed a third party, the Party of Dominican Liberation (Partido de la Liberación Dominicana). In subsequent presidential elections Bosch repeatedly lost but claimed vote fraud. He last ran for president in 1994, finishing third.

His term in office was too short to judge his effectiveness as a president, but Bosch's contribution to his country's political development was of paramount importance. After 31 years of dictatorship, Bosch created a genuine political party, forcing the opposition to do the same, and enabling his country to have legitimate, representative elections.

Bosch was a respected historian and essayist, having written mostly on Dominican and Caribbean politics. He also wrote novels and a biography, *Simón Bolívar* (1960).

Bosch, Robert, in full ROBERT AUGUST BOSCH (b. Sept. 23, 1861, Albeck, near Ulm, Württemberg [Germany]—d. March 9, 1942, Stuttgart, Ger.), German engineer and industrialist who was responsible for the invention of the spark plug and magneto for automobiles and whose firm produced a wide range of precision machines and electrical equipment in plants throughout the world.

Trained in the United States, where he worked with the inventor Thomas A. Edison and his colleague the German electrical engineer Siegmund Bergmann, Bosch founded the manufacturing company that bears his name in Stuttgart in 1886. In 1902 his coworker G. Honold invented the Bosch spark plug, which greatly aided the development of the automobile. Bosch himself developed the Bosch magneto, a device used to generate current for the ignition in internal-combustion engines, and he worked on automobile lamps, horns, and oil-pump devices. Bosch's social views were advanced for his time. He introduced an eight-hour day in 1906 and advocated industrial arbitration and free trade.

Bosch GmbH, in full ROBERT BOSCH, GMBH, German-based company that is Europe's largest auto-parts manufacturer and one of the world's leading makers of auto ignition, fuel injection, and lighting equipment and antilock braking systems. The company also produces industrial hydraulics and pneumatics equipment, telecommunications equipment and systems, power tools, household appliances, radios, television sets, and audio-visual equipment. Headquarters are in Stuttgart, and it has subsidiaries throughout Europe, North and South America, Asia, and Australia.

Robert Bosch (q.v.) founded the company in 1886 to repair electrical equipment. Two inventions—Bosch's magneto and his partner's spark plug—became the basis for the company's line of auto parts, which now includes technologically advanced fuel-injection equipment developed by Bosch engineers.

Bosch began making auto parts in the United States in the early 1900s. However, in 1918 the majority of Bosch's American properties were expropriated by the Alien Property Custodian. Bosch's remaining American business was taken over during World War II, but in 1974 the company opened a new factory in the United States.

The company, whose stock was publicly held between 1917 and 1937, is now solely owned by descendants of Robert Bosch.

Bosco, Saint John, Italian in full SAN GIOVANNI MELCHIOR BOSCO, byname DON BOSCO (b. Aug. 16, 1815, Becchi, near Turin, Piedmont, kingdom of Sardinia [Italy]—d. Jan. 31, 1888, Turin; canonized April 1, 1934; feast day January 31), pioneer in educating the poor and founder of the Salesian Order.

Bosco was ordained a Roman Catholic priest (1841) in Turin and, influenced by St. Joseph Cafasso, began to work to alleviate the plight of boys who came to seek employment in the city. Working in borrowed premises, Bosco provided boys with education, religious instruction, and recreation; eventually he headed a large establishment containing a grammar school, a technical school, and a church, all built through his efforts. He also achieved a local reputation as a popular preacher. In Turin he and 22 companions founded (1859) the Society of St. Francis de Sales (Salesians of Don Bosco), which before his death had spread to England, France, Spain, and South America. With St. Mary Mazzarello he founded the Daughters of Our Lady Help of Christians, a congregation of nuns dedicated to similar work among girls.

Boscovich, Ruggero Giuseppe, Serbo-Croatian RUDJER JOSIP BOŠKOVIĆ (b. May 18, 1711, Ragusa, Dalmatia, Venetian territory [now Dubrovnik, Croatia]—d. Feb. 13, 1787,

Milan [Italy]), astronomer and mathematician who gave the first geometric procedure for determining the equator of a rotating planet

Boscovich, detail of a portrait by an unknown artist; in Dubrovnik Cloister, Croatia

Archiv für Kunst und Geschichte, Berlin

from three observations of a surface feature and for computing the orbit of a planet from three observations of its position.

Boscovich's father was a Serb (converted from Eastern Orthodoxy to Roman Catholicism), and his mother was Italian. He entered the Society of Jesus (Jesuits) in 1726 and studied mathematics and physics at the Collegium Romanum, Rome, where he was appointed professor of mathematics in 1740. One of the first scientists of continental Europe to accept Isaac Newton's gravitational theory, he published nearly 70 papers on optics, astronomy, gravitation, meteorology, and trigonometry.

A pioneer in geodesy, the science concerned with the size and shape of the Earth, he measured a meridian arc between Rome and Rimini, Italy, in 1750 in order to test his theory of the shape of the Earth. He accepted the chair of mathematics at the University of Pavia in 1764 and also served as director of the Brera Observatory in Milan. In 1769 he was invited to lead an expedition to California to observe a transit of Venus but the offer was rescinded because of Spanish bias against the Jesuits. When the Jesuits were suppressed in Italy in 1773, Boscovich accepted an invitation from King Louis XV of France to settle in Paris as director of optics for the navy. He returned to Italy in 1783.

Bose, Sir Jagadis Chandra (b. Nov. 30, 1858, Mymensingh, Bengal, India—d. Nov. 23, 1937, Giridih, Bihār), Indian plant physiologist and physicist whose invention of highly sensitive instruments for the detection of minute responses by living organisms to external stimuli enabled him to anticipate the parallelism between animal and plant tissues noted by later biophysicists. Bose's experiments on the quasi-optical properties of very short radio waves (1895) led him to make improvements on the coherer, an early form of radio detector, which have contributed to the development of solid-state physics.

With a degree from the University of Cambridge (1884), Bose became professor of phys-

Sir Jagadis Chandra Bose

By courtesy of the Bose Institute, Calcutta

ical science at Presidency College, Calcutta (1885–1915), which he left to found and direct (1917–37) the Bose Research Institute, Calcutta. To facilitate his research, he constructed automatic recorders capable of registering extremely slight movements; these instruments produced some striking results, such as Bose's demonstration of an apparent power of feeling in plants, exemplified by the quivering of injured plants. His books include *Response in the Living and Non-Living* (1902) and *The Nervous Mechanism of Plants* (1926).

Bose, Satyendra Nath (b. Jan. 1, 1894, Calcutta, India—d. Feb. 4, 1974, Calcutta), Indian mathematician and physicist noted for his collaboration with Albert Einstein in developing a theory regarding the gaslike qualities of electromagnetic radiation (see Bose-Einstein statistics).

Bose, a graduate of the University of Calcutta, taught at the University of Dacca (1921–45) and then at Calcutta (1945–56). Bose's numerous scientific papers (published from 1918 to 1956) contributed to statistical mechanics, the electromagnetic properties of the ionosphere, the theories of X-ray crystallography and thermoluminescence, and unified field theory. Bose's *Planck's Law and the Hypothesis of Light Quanta* (1924) led Einstein to seek him out for collaboration.

Bose, Subhas Chandra, byname NETAJI (Hindi: "Respected Leader") (b. c. Jan. 23, 1897, Cuttack, Orissa, India—d. Aug. 18, 1945, Taipei, Taiwan?), Indian revolutionary who led an Indian national force against the Western powers during World War II.

Subhas Chandra Bose
Netaji Research Bureau, Calcutta

The son of a wealthy and prominent Bengali lawyer, Bose studied at Presidency College, Calcutta (from which he was expelled in 1916 for nationalist activities), and the Scottish Churches College (graduating in 1919) and then was sent by his parents to the University of Cambridge in England to prepare for the Indian Civil Service. In 1920 he passed the civil-service examination, but in April 1921, after hearing of the nationalist turmoils in India, he resigned his candidacy and hurried back to India.

The Non-cooperation Movement had been started by Mohandas K. Gandhi, who had made the Indian National Congress a powerful nonviolent organization. Bose was advised by Gandhi to work under Chitta Ranjan Das, a politician in Bengal. There he became a youth educator, journalist, and commandant of the Bengal Congress volunteers. His activities led to his imprisonment in December 1921. In 1924 he was appointed chief executive officer of the corporation of Calcutta, with Das as mayor. Bose was soon after deported to Burma (Myanmar) because he was suspected of connections with secret revo-

lutionary movements. Released in 1927, he returned to find Bengal Congress affairs in disarray after the death of Das.

Gandhi resumed his Congress activity, and Bose was elected president of the Bengal Congress. When the civil disobedience movement was started in 1930, Bose was already in detention. Released and then rearrested, he was finally allowed to proceed to Europe after a year's detention. In enforced exile, he wrote *The Indian Struggle, 1920-1934* and pleaded India's cause with European leaders. He returned from Europe in 1936, was again taken into custody, and was released after a year. In 1938 he was elected president of the Indian National Congress and formed a national planning committee, which formulated a policy of industrialization. This did not harmonize with Gandhian economic thought, which clung to the spinning wheel as a symbol. Bose's vindication came in 1939, when he defeated a Gandhian rival for reelection. Nonetheless, the "rebel president" felt bound to resign because of the lack of Gandhi's support. He founded the Forward Bloc, hoping to rally radical elements, but was again incarcerated in July 1940. His refusal to remain in prison at this critical period of India's history was expressed in a determination to fast to death, which frightened the British government into releasing him. On Jan. 26, 1941, though closely watched, he escaped from his Calcutta residence in disguise and, traveling via Kabul and Moscow, eventually reached Germany in April.

In Nazi Germany Bose came under the tutelage of a newly created Special Bureau for India, guided by Adam von Trott zu Solz. He and other Indians who had gathered in Berlin made regular broadcasts from the German-sponsored Azad Hind Radio beginning in January 1942, speaking in English, Hindi, Bengali, Tamil, Telugu, Gujarati, and Pashtu.

A little more than a year after the Japanese invasion of Southeast Asia, Bose left Germany, traveling by German and Japanese submarines and plane, and arrived in May 1943 in Tokyo. On July 4 he assumed leadership of the Indian Independence Movement in East Asia and proceeded, with Japanese aid and influence, to form a trained army of about 40,000 Indian men and women rounded up in Japanese-occupied Southeast Asia. On Oct. 21, 1943, Bose proclaimed the establishment of a provisional independent Indian government, and his so-called Indian National Army (Azad Hind Fauj), alongside Japanese troops, advanced to Rangoon (Yangon) and thence overland into India, reaching Indian soil on March 18, 1944, and moving into Kohima and the plains of Imphal. In a stubborn battle, the mixed Indian and Japanese forces, lacking Japanese air support, were defeated and forced to retreat; the Indian National Army nevertheless for some time succeeded in maintaining its identity as a liberation army based in Burma and then Indochina. With the defeat of Japan, however, Bose's fortunes ended.

A few days after Japan's announced surrender in August 1945, Bose, fleeing Southeast Asia, reportedly died in a Japanese hospital in Taiwan as a result of burn injuries from a plane crash.

Bose-Einstein statistics, one of two possible ways in which a collection of indistinguishable particles may occupy a set of available discrete energy states. The aggregation of particles in the same state, which is characteristic

of particles obeying Bose-Einstein statistics, accounts for the cohesive streaming of laser light and the frictionless creeping of superfluid helium. The theory of this behaviour was developed (1924-25) by Albert Einstein and the Indian physicist Satyendra Nath Bose, who recognized that a collection of identical and indistinguishable particles can be distributed in this way.

In contrast to Fermi-Dirac statistics (*q.v.*), the Bose-Einstein statistics apply only to those particles not limited to single occupancy of the same state—that is, particles that do not obey the restriction known as the Pauli exclusion principle (*q.v.*). Such particles are named bosons, after the statistics that correctly describe their behaviour.

Boselli, Paolo (b. June 8, 1838, Savona, Piedmont, kingdom of Sardinia [now in Italy]—d. March 10, 1932, Rome, Italy), statesman who headed the Italian government that declared war on Germany in World War I.

The first professor of financial science at the University of Rome, Boselli served as a parliamentary deputy for half a century from 1870 to 1921, representing the right centre, and as a senator from 1921. He was minister of education in the government of Francesco Crispi in 1888, reorganized the Bank of Italy as minister of the treasury under Premier Luigi Pelloux in 1899, and was a minister in the government of Sidney Sonnino in 1906.

Favouring Italy's entry into World War I against Austria-Hungary (1915), he made an important speech in the chamber in support of a bill giving full powers to Premier Antonio Salandra. When Salandra's government fell after the Austrian offensive of May-July 1916, the 78-year-old Paolo Boselli became premier, forming a coalition government. After recovering territory lost in the Austrian offensive, Boselli's government declared war on Germany on Aug. 28, 1916. The following year Italy's disastrous defeat at Caporetto brought about Boselli's resignation on Oct. 30, 1917.

After Benito Mussolini's accession to power in 1922, Boselli declared his allegiance to the new fascist regime. In March 1929 he acted as government spokesman in the Senate for the bill to approve the Lateran treaties between Italy and the Vatican. He also served as president of the Italian Historical Institute and founded the Museum of the Risorgimento in Rome.

Bösendorfer, Ignaz (b. July 28, 1796, Vienna, Austria—d. April 14, 1859, Vienna), Austrian builder of pianos and founder of the firm that bears his name.

Bösendorfer served an apprenticeship with the Viennese piano maker Joseph Brodmann. After Franz Liszt began using Bösendorfer's instruments, his company gained international fame, and Bösendorfer was formally recognized by the Austrian emperor as imperial piano-manufacturer in 1830.

Bösendorfer experimented with a variety of actions (mechanisms whereby the finger's pressure is transmitted to a padded hammer and thence imparted to the strings), using different action designs for his smaller and largest grand pianos. The imperial grand, his largest size, had the extraordinary compass of eight octaves; later, it was shortened to the standard seven and one-half. The modern Bösendorfer concert grand is more than 3 m (9 feet) long and is highly prized for its tone.

Bösendorfer was succeeded in his business by his son Ludwig, who in 1872 built the Bösendorfer Hall in Vienna, a centre for the performance of chamber music and piano recitals. After Ludwig's death in 1919, the business passed into other hands.

Bošković, Rudjer Josip (astronomer): *see* Bosovich, Ruggero Giuseppe.

Bosman, Herman Charles (b. Feb. 5, 1905, Kuils River, near Cape Town, Cape Colony

[now in South Africa]—d. Oct. 14, 1951, Edendale, S.Af.), South African writer who is esteemed primarily for his short stories depicting rural Afrikaner character and life.

Bosman, the son of Afrikaner parents, had an English education at the University of Witwatersrand, Johannesburg, where he took his degree in education. His teaching career was terminated abruptly when, home on a visit, he shot and killed his stepbrother. Bosman was sentenced to death; the sentence was commuted to 10 years, of which he actually served 4. The earliest of his stories featuring the character Oom Schalk Lourens were written in prison, and later Bosman wrote *Cold Stone Jug* (1949), a collection of sardonic, comic prison sketches.

Published in various journals, his stories were first collected in *Mafeking Road* (1947). The rest were posthumously published in *Unto Dust* (1963), *Jurie Steyn's Post Office* (1971), and *A Bekkersdal Marathon* (1971). *Bosman at His Best* (1965) and *The Collected Works of Herman Charles Bosman* (1981) were edited by Lionel Abrahams, who in large measure is responsible for Bosman's emergent reputation. Bosman also wrote several books of poems and two complete novels, *Jacaranda in the Night* (1947) and *Willemsdorp* (1977).

At their best, the early stories are a brilliant adaptation of the short-story form to the circumstances of the harsh Transvaal veld. Bosman vividly portrays both the worst and best characteristics of Afrikaners in an economical and ironic style. The later stories and sketches are often more open-ended, and the Oom Schalk character gave way to characters of a newer, more uncertain generation after the triumph of the National Party in 1948.

Bosna River, also spelled *VOSNA*, river of Bosnia and Herzegovina, rising from a spring at the foot of Mount Igman and following a 168-mile (271-km) course northward to enter the Sava River. Its tributaries are the Željeznica, Miljacka, Fojnica, Lašva, Gostović, Krivaja, Usora, and Spreča rivers, all noted for freshwater fishing. The major cities along the river are Sarajevo, Zenica, and Doboj. A trunk rail line follows the Bosna from Sarajevo, and after World War II industry—especially metallurgical industry—expanded along the river valley.

Bosnia and Herzegovina, officially **REPUBLIC OF BOSNIA AND HERZEGOVINA**, Herzegovina also spelled **HERCEGOVINA**, Serbo-Croatian **BOSNA I HERCEGOVINA**, country of the west-central Balkan Peninsula that was formerly, from 1918 to 1991-92, part of Yugoslavia.

Bosnia and Herzegovina

Herzegovina consists of the southernmost triangular sector that includes Mostar (the principal city); Bosnia, far larger, consists of the broad central and northern sectors and includes Sarajevo. For most of its history, Herzegovina has been subject to Bosnia.

Bosnia and Herzegovina is bordered on the east by the modern country of Serbia and Montenegro and is surrounded on three sides—north, west, and south—by Croatia. A narrow corridor gives Herzegovina outlet to the sea at

Neum, on the Neretva Channel of the Adriatic Sea; the corridor splits Croatia along the Dalmatian coast about 25 miles (40 km) northwest of Dubrovnik. The capital of Bosnia and Herzegovina is Sarajevo. Area 19,741 square miles (51,129 square km). Pop. (1996 est.) 3,200,000.

A brief treatment of Bosnia and Herzegovina follows. For full treatment, see MACROPAEDIA: Balkan States.

For current history and for statistics on society and economy, see BRITANNICA BOOK OF THE YEAR.

Physical and human geography. The relief of Bosnia and Herzegovina is largely mountainous, and elevations of more than 6,000 feet (1,800 m) above sea level are common; but heights drop abruptly southward toward the Adriatic Sea. The land is drained by the Sava, Drina, and Neretva rivers and their tributaries. The southwest, including the Dinaric Alps, is characterized by karst (limestone areas with crevices, sinkholes, and caves), with small depressions containing cultivable soils.

In Bosnia the weather is generally mild, though apt to be bitterly cold in winter. Weather in Herzegovina, by contrast, is characterized by oppressively hot summers.

Bosnia and Herzegovina is occupied by people of many ethnic groups, but the major groups are Muslims (nearly half of the population), Serbs (almost one-third), and Croats (about one-sixth). These three peoples speak the same language, Serbo-Croatian, and are racially indistinguishable, but the Serbs are mostly Orthodox Christians who use the Cyrillic alphabet, while the Croats are Roman Catholic and use the Roman alphabet. The Muslims are descended from Slavs who converted to Islām during the long period of Turkish (Ottoman) rule. Throughout their history, the Bosnian and Herzegovinian peoples have lived intermingled with one another in a mixed pattern that has given the country a cosmopolitan air during times of peace but has also contributed to the viciousness of its many wars.

More than one-sixth of the country's area is under cultivation, with the fertile soils mainly in the north. These soils are well adapted for growing cereals, especially corn (maize) and wheat. Potatoes also are important. Soybeans, rapeseed, olives, plums, grapes, mulberries, figs, pomegranates, melons, oranges, lemons, rice, and tobacco are grown in Herzegovina and the more sheltered portions of Bosnia. Cropping is usually combined with livestock raising (cattle, sheep, and pigs), and nearly one-fourth of the country's land is devoted to pasture.

Bosnia and Herzegovina possesses a variety of minerals, including iron, bauxite, and coal. In addition, the country's rivers have considerable hydroelectric potential. Modern mining and industry began under Austrian rule, and the Yugoslav state encouraged the development of industry, particularly metallurgy. Nevertheless, Bosnia and Herzegovina was one of the poorest regions of Yugoslavia.

The multiethnic population of Bosnia and Herzegovina has long figured into its administration. Each of the components of the federalized state—the Serb Republic and the Croat-Muslim federation—has its own legislature and president. The central government comprises a lower house with two-thirds of its seats reserved for the federation and one-third for the republic, an upper house in which each of the three ethnic groups is guaranteed five seats, and a tripartite presidency with one Muslim, one Serb, and one Croat member.

History. The ancient inhabitants of Bosnia and Herzegovina were Illyrians who overran the northwestern part of the Balkan Peninsula. Most of the country was included in the Roman province of Dalmatia. Slav settlement began in the latter half of the 6th century. For the next five centuries various parts of the re-

gion fell under the rule of Serbs, Croats, Hungarians, Venetians, and the Byzantines. In the 12th century the Hungarian kingdom began to rule the region through a series of "bans," or governors, though Bosnia enjoyed periods of power and independence. In 1322 a Bosnian, Stjepan Kotromanić, was elected ban, and for the rest of the 14th century the Kotromanić dynasty (especially under Stjepan's nephew, Tvrtko I) expanded Bosnia's territory to include the Serb province of Hum and much of the Adriatic coast.

The Ottoman Turks invaded Bosnia in 1386, and after many battles it became a Turkish province in 1463. Hum held out longer under rulers who styled themselves *herceg* ("duke") of St. Sava—a name recalled today in Herzegovina. During the 16th and 17th centuries, Bosnia was an important Turkish outpost in the constant warfare against the Habsburgs and Venice. During this period much of the native population converted to Islām. As the Ottoman Empire was pushed out of Europe, its rule in Bosnia became more onerous, and Muslims and Christians alike grew resentful of interference from Constantinople.

At the Congress of Berlin after the Russo-Turkish War of 1877–78, Bosnia and Herzegovina was assigned to Austro-Hungarian occupation, though it was still nominally Turkish. It was annexed to Austria-Hungary in October 1908. A new constitution divided the electorate into three electoral colleges and assigned in each a fixed proportion of seats to the Orthodox, Roman Catholics, and Muslims. This did little to satisfy growing Serb nationalism, and on June 28, 1914, the Austrian archduke Francis Ferdinand was assassinated at Sarajevo by a Bosnian Serb student, Gavrilo Princip. This event precipitated World War I. Bosnia and Herzegovina was annexed to Serbia on Oct. 26, 1918, as part of the Kingdom of Serbs, Croats, and Slovenes. During World War II Bosnian Serbs suffered greatly under the genocidal policies of the Croatian puppet state. In 1946 the twin territory became one of the republics of communist Yugoslavia.

With the collapse of communism in 1989–90, Bosnia and Herzegovina was engulfed by a wave of nationalism that swept Yugoslavia. After Croatia quit the federation in 1991, Bosnian Croats and Muslims approved referenda calling for an independent, multinational republic. The Bosnian Serbs, however, refused to secede from Yugoslavia, which by now was dominated by Serbia, and from 1992 Bosnia and Herzegovina was wracked by a civil war in which entire populations were "cleansed" from areas taken over by each nationality. Serbs seized much of the north and east, Croats took the west, and Muslims held onto cities in the centre and northwest. The war ended in December 1995 with a peace accord that created a loosely federalized Bosnia and Herzegovina divided roughly evenly between a Bosnian-Muslim-Bosnian-Croat federation and a Bosnian-Serb republic.

Bosnian crisis of 1908, state of severe international tension caused by the annexation by Austria-Hungary of the Balkan provinces of Bosnia and Herzegovina. The Congress of Berlin (1878) had given Austria-Hungary the right to occupy and administer Bosnia and Herzegovina temporarily, but the provinces officially remained possessions of the Ottoman Empire. Still, the Austrian administration tried mightily and at great expense to improve the strategically valuable region economically and to link it closely with Austria-Hungary. When in July 1908 the Young Turks staged a revolution in Constantinople (now Istanbul), established a constitutional government, and inaugurated a reform program, the Austrian foreign minister Aloys, Count Lexa von Aehrenthal, resolved to annex Bosnia and Herzegovina before the new Turkish regime could regain control over them.

To that end Aehrenthal met the Russian foreign minister, Aleksandr P. Izvolsky, at Buchlau, in Moravia; and, on Sept. 16, 1908, Izvolsky agreed that Russia would not object to the annexation. Aehrenthal pledged that in return Austria would not object to opening the Bosphorus and Dardanelles straits to Russian warships, an advantage that had been denied to Russia since 1841. By a rescript of Oct. 7, 1908, Austria-Hungary annexed Bosnia and Herzegovina.

Izvolsky, unprepared for such immediate action, could not control the strong popular opposition to the annexation that developed in Russia. Furthermore, Serbia, which was closely related to Bosnia and Herzegovina geographically and ethnically, was outraged by the annexation. It demanded that Austria cede a portion of Bosnia and Herzegovina to Serbia, and Izvolsky, pressed by anti-Austrian opinion in Russia, was forced to support the Serbian claims. Austria, however, firmly supported by its ally Germany, threatened to invade Serbia if that country persisted in its demands. Russia, having failed to secure equally strong support from its ally France, could not risk a war against both Austria-Hungary and Germany for Serbia's sake, and in March 1909 Izvolsky notified Germany that Russia accepted Austria's annexation. Although the crisis was resolved without immediate warfare, the resulting embittered relations between Serbia and Austria-Hungary and Russia's resentment at having been deceived and humiliated contributed to the outbreak of World War I.

Boso, French **BOSON** (d. Jan. 11, 887, Vienne [France]), king of lower Burgundy, or Provence, from 877.

The son of Buvin (or Beuves), Count of Ardenne, Boso was given the governorance of Lombardy (876) by his brother-in-law Charles II the Bald, king of the West Franks (France), and received the title of duke. During the minorities of the West Frankish kings Louis III and Carloman, he convoked the bishops of Provence and had them proclaim him their king (Oct. 15, 879). Boso thereafter proceeded to expand his domains. The territory over which he usurped royal authority included not only Provence but many lands to the north, as far as Autun—an enlarged Burgundy.

In succeeding years, especially 880–882, Boso lost many of the marginal northern lands to the French and German Carolingians, who were reestablishing their authority. He was succeeded by his son, Louis, who in 901 became the Frankish emperor Louis III.

Bōsō Peninsula, Japanese BŌSŌ-HANTŌ, peninsula, coextensive with Chiba *ken* (prefecture), Honshu, Japan. It extends for 81 miles (130 km) into the Pacific Ocean, enclosing Tokyo Bay on the west. The Bōsō Peninsula has a maximum width of 66 miles (106 km) and is marked by low hills that decrease in height from southeast (330 feet [100 m]) to northwest (98 feet [30 m]) and that are dissected by wide valleys. The coastal plain of Kujukuri stretches along the Pacific in the northeast, and the floodplain of the lower Tone River constitutes the peninsula's northern border.

boson, subatomic particle with integral spin (*i.e.*, angular momentum in quantum-mechanical units of 0, 1, etc.) that is governed by the Bose-Einstein statistics (*q.v.*). Bosons include mesons (*e.g.*, pions and kaons), nuclei of even mass number (*e.g.*, helium-4), and the particles required to embody the fields of quantum field theory (*e.g.*, photons and gluons). Bosons differ significantly from a group of subatomic particles known as fermions in that there is no limit to the number that can occupy the same quantum state. This behaviour gives

rise, for example, to the remarkable properties of helium-4 when it is cooled to become a superfluid.

Bosorra, also spelled BOSORA (ancient Syria): see Bostra.

Bosporus, also spelled BOSPHORUS, Turkish İSTANBUL BOGAZI, KARADENİZ BOGAZI, or BOGAZIÇI, strait (*boğaz*, "throat") uniting the Black Sea and the Sea of Marmara and separating parts of Asian Turkey (Anatolia) from European Turkey.

The Bosphorus is 19 miles (30 km) long, with a maximum width of 2.3 miles (3.7 km) at the northern entrance and a minimum width of 2,450 feet (750 m) between the Ottoman fortifications of Rumelihisari and Anadoluhisari. Its depth varies from 120 to 408 feet (36.5 to 124 m) in midstream. In its centre a rapid current flows from the Black Sea to the Sea of Marmara, but a countercurrent below the surface carries water of greater salinity from the Sea of Marmara to the Black Sea. The Bosphorus is heavily fished, since the channel is a seasonal migration route for fish to and from the Black Sea. Both shores are well wooded and are dotted with villages, resorts, and fine residences and villas.

Bosporus literally means "ox ford" and is traditionally connected with the legendary figure of Io, who in the form of a heifer crossed the Thracian Bosphorus in her wanderings. Because of its strategic importance for the defense of Constantinople (now Istanbul), straddling the southern end of the strait, the Byzantine emperors and later the Ottoman sultans constructed fortifications along its shores, especially on the European side. Two noteworthy examples are the castles of Anadoluhisari, which was constructed on the Asian shore by Bayezid I in 1390–91, and Rumelihisari, built directly across the strait by Mehmed II in 1452.

With the growing influence of the European powers in the 19th century, rules were codified (in treaties of 1841 and 1871) governing the transit of commercial and naval vessels through the strait. An international commission assumed control of the strait after the Ottoman defeat in World War I; Turkey resumed control in 1936. Two bridges have been built across the strait. The first, the Bôgaziçi (Bosporus I) Bridge, was completed in 1973 and has a main span of 3,524 feet (1,074 m). The second bridge, the Fatih Sultan Mehmed (Bosporus II), was completed in 1988 and has a main span of 3,576 feet (1,090 m).

Bosporus, Kingdom of the, also called CIMMERIAN BOSPORUS, ancient Greek state situated on Kerch Strait in present-day southern

Ukraine. It reached its peak of power in the 4th century BC.

The kingdom's major city, Panticapaeum (modern Kerch), was ruled by the Archaean-actid dynasty (480–438 BC), then by the Spartocid dynasty (438–110 BC), which annexed to Panticapaeum other Greek colonies—e.g., Nymphaeum, which had been founded in the region in the 7th and 6th centuries. After the second half of the 5th century, Athenian influence was strong among the Bosphorus cities; Athens controlled local trade until 404 BC and remained the chief customer of the Bosphorus' food and other exports throughout the 4th century. The Spartocids suppressed piracy in the Black Sea, and through their management of the trade in grain, fish, and slaves, the Bosphorus state prospered. The kingdom's dynastic and financial decline began in the middle of the 3rd century, and after 110 BC the kings of Pontus controlled the region. A new dynasty, established in the 1st century AD, ruled for 300 years under the protection of the Roman Empire. After AD 342 the country was alternately under barbarian and Byzantine control.

boss, in medieval architecture, keystone used in vaulting to provide a junction for intersecting ribs and to cover the actual complex of mitred joints. In medieval England it was

Bosses decorating the ceiling of the Lady Chapel, Gloucester Cathedral, Gloucestershire, England, 14th century

highly developed, but in France it was less developed because of the greater height of French naves. By the 13th century, decorative bosses with naturalistic carving were widely used in England (e.g., in the nave at Westminster Abbey, London, and at Ely Cathedral). In the 14th century, bosses comprising a series of narrative scenes appeared, and in the 15th century, fan vaulting was developed with long, pendant-like bosses.

Boss, Lewis (b. Oct. 26, 1846, Providence, R.I., U.S.—d. Oct. 12, 1912, Albany, N.Y.), American astronomer best known for his compilation of star catalogs.

Boss worked for the U.S. government at Washington, D.C., and on a survey of the U.S.-Canadian border. In 1876 he became director of the Dudley Observatory at Albany, and in 1882 he led an expedition to Chile to observe a transit of Venus. About 1895 Boss began to plan a general catalog of stars, giving their positions and motions. The project was supported by the Carnegie Institution, Wash-

ington, D.C., after 1906. With an enlarged staff he observed the northern stars from Albany and the southern stars from Argentina. With the new data, he corrected catalogs that had been compiled in the past, and in 1910 he published the *Preliminary General Catalogue of 6,188 Stars for the Epoch 1900*. Though he died leaving his work unfinished, his son Benjamin completed it in 1937 (*General Catalogue of 33,342 Stars for the Epoch 1950*, 5 vol.).

bossa nova (Portuguese: "new trend"), Brazilian popular music that evolved in the late 1950s from a union of samba (a Brazilian dance and music) and cool jazz. The music is in syncopated $\frac{3}{4}$ time. Instrumentation is varied and purposely simple, limited to a few rhythm instruments, e.g., guitar, *marimbau* (musical bow), drum, or a single-note piano accompaniment. In vocalized passages the musical background becomes more subdued to allow the singer greater range for improvisation. As a dance, the bossa nova differs little from the samba, requiring the same subtle body rhythm and two-step foot movement.

Bosse, Abraham (b. 1602, Tours, France—d. 1676, Paris), notable engraver, painter, and architect who was active during the Baroque period in France.

Under the influence of a mathematician, Girard Desargues, Bosse mastered perspective, of which he became a professor at the Academy of Painting. Elected an honorary academician, he was subsequently expelled because of his serious quarrels with colleagues. His prints—mostly of allegories, genre scenes, frontispieces, and costumes—include "The Ages of Man" (1636) and "The Marriage of Ladislav IV" (1645). One of Bosse's best-known writings is *Traité des manières de dessiner les ordres de l'architecture antique* (1664; "Treatise on the Ways of Designing the Orders of Classical Architecture"). His paintings, which today are rare, include "The Foolish Virgins." Contributing to the development of caricature and cartoon, Bosse also lampooned trades and professions with dispassionate woodcuts and engravings.

Bossert, Helmuth Theodor (b. Sept. 11, 1889, Landau, Ger.—d. Feb. 5, 1961, Istanbul, Turkey), German philologist and archaeologist who excavated the 8th-century-BC Hittite fortress city at Karatepe, Turkey, and discovered bilingual inscriptions permitting the translation of virtually all but the most archaic examples of Hittite hieroglyphics.

Bossert, 1940

By courtesy of Eva-Mana Fischer-Bossert

Bossert devoted himself to private scholarship and publication from 1919 until 1934. In 1934 he was appointed professor of Near Eastern languages and culture at the University of Berlin, at the same time accepting the directorship of the institute for studies in the same fields at Istanbul University.

About 1930 he turned to the determination of the phonetic values of Hittite hieroglyphics and the general structure of the language.

In Turkey he studied the ancient Anatolian cultures in the course of many expeditions. In February 1946 he first visited Karatepe, observing its sculptures, inscriptions, and fragments of reliefs. In 1947, under his direction, an excavation of Hittite architectural remains and relief sculptures began there. During this work Bossert discovered the long-sought bilingual key to the Hittite language.

His published works include *Geschichte des Kunstgewerbes aller Völker und Zeiten*, 6 vol. (1928–35; "History of the Arts and Crafts of All People and Times"); *Altanatolien* (1942; "Ancient Anatolia"); *Die Ausgrabungen auf dem Karatepe (Erster Vorbericht)* (1950; "The Excavation of Karatepe—Preliminary Report"); and *Altsyrien* (1951; "Ancient Syria").

Bossuet, Jacques-Bénigne (b. Sept. 25, 1627, Dijon, Fr.—d. April 12, 1704, Paris), bishop who was the most eloquent and influential spokesman for the rights of the French church against papal authority. He is now chiefly remembered for his literary works, including funeral panegyrics for great personages.

Bossuet, detail of an oil painting by Hyacinthe Rigaud, 1698; in the Uffizi, Florence

Alinari—Mansell

Early life and priesthood. Bossuet was born of a family of magistrates. He spent his first 15 years in Dijon and was educated at the Jesuit college there. Intended early for an ecclesiastical career, he was tonsured at the age of 10. In 1642 he went to study in Paris, where he remained for 10 years, receiving a sound theological education at the Collège de Navarre. In 1652 he was ordained priest and received his doctorate of divinity. Refusing a high appointment offered him at the Collège de Navarre, he chose instead to settle in Metz, where his father had obtained a canonry for him.

Though Bossuet belonged to the Metz clergy until 1669, he divided his time between Metz and Paris from 1656 to 1659, and after 1660 he left Paris hardly at all. When in Metz, he zealously performed his duties as canon. His main concerns, however, were preaching and controversy with the Protestants, and it was at Metz that he began to master these skills. His first book, the *Réfutation du catéchisme du sieur Paul Ferry* ("Refutation of the Catechism of Paul Ferry"), was the result of his discussions with Paul Ferry, the minister of the Protestant Reformed church at Metz. Bossuet's reputation as a preacher spread to Paris, where his "Panegyric of l'apôtre saint Paul" (1657; "Panegyric of the Apostle Saint Paul") and his "Sermon sur l'éminente dignité des pauvres dans l'église" (1659; "Sermon on the Sublime Dignity of the Poor in the Church") were particularly admired.

Lenten sermons and funeral orations. Bossuet's career as a great popular preacher unfolded during the next 10 years in Paris. He preached the Lenten sermons of 1660

and 1661 in two famous convents there—the Minims' and the Carmelites'—and in 1662 was called to preach them before King Louis XIV. The Lenten sermons, abundant with biblical citations and paraphrases, epitomize Baroque eloquence; yet, while they exhibit the majesty and the pathos of the Baroque ideal, the exaggeration and mannerism are conspicuously absent. He was summoned in 1669 to deliver the funeral orations that were customary after the death of an important national figure. These first "Oraisons funèbres" ("Funeral Orations") include panegyrics on Henrietta Maria of France, queen of England (1669), and on her daughter Henrietta Anne of England, Louis XIV's sister-in-law (1670). Masterpieces of French classical prose, these orations display dignity, balance, and slow thematic development; they contain emotionally charged passages but are organized according to logical argumentation. From the life of the departed subject, Bossuet selected qualities and episodes from which he could draw a moral. He convinced his listeners by the passion of his religious feelings, which he expressed in clear, simple rhetoric.

Apart from his work as a preacher, Bossuet, as a doctor of divinity, felt compelled to intervene in the controversy over Jansenism, a movement in the Roman Catholic church emphasizing a heightened sense of original sin and the role of God's grace in salvation. Bossuet tried to steer a middle course in the quarrel caused by the movement, devoting himself to his controversy with the Protestants.

In 1669 Bossuet was designated bishop of Condom, a diocese in southwest France, but had to resign the see in 1670 after his appointment as tutor to the dauphin, the king's eldest son. This post brought about his election to the Académie Française. Thoroughly absorbed in the duties of his new office, Bossuet found time to publish a work against Protestantism, *Exposition de la doctrine de l'église catholique sur les matières de controverse* (1671; "Exposition on the Doctrine of the Catholic Church on the Matters of Controversy"). He preached only occasionally thereafter. Though primarily concerned with the dauphin's religious and moral instruction, he also taught Latin, history, philosophy, and politics. His major political work, the *Politique tirée des propres paroles de l'Écriture sainte* ("Statecraft Drawn from the Very Words of the Holy Scriptures")—which uses the Bible as evidence of divine authority for the power of kings—earned Bossuet his reputation as a great theoretician of royal absolutism. In the *Politique* he developed the doctrine of divine right, the theory that any government legally formed expresses the will of God, that its authority is sacred, and that any rebellion against it is criminal. But he also emphasized the dreadful responsibility of the sovereign, who was to behave as God's image, govern his subjects as a good father, and yet remain unaffected by his power.

In 1681 Bossuet became bishop of Meaux, a post he held until his death. In this period he delivered his second series of great funeral orations, including those of Princess Anne de Gonzague (1685), the chancellor Michel Le Tellier (1686), and the Great Condé (1687). Though he kept in close touch with the dauphin and the king, he was not primarily a court prelate; he was, rather, a devoted bishop, living mostly among his diocesans, preaching, busying himself with charitable organizations, and directing his clergy. His excursions outside the diocese were in relation to the theological controversies of his time: Gallicanism, Protestantism, and Quietism.

The Gallican controversy. In the Gallican controversy, Louis XIV maintained that the French monarch could limit papal authority in collecting the revenues of vacant sees and in certain other matters, while the Ultramontanists held that the pope was supreme. An

extraordinary general assembly of the French clergy was held to consider this question in 1681–82. Bossuet delivered the inaugural sermon to this body and also drew up its final statement, the *Déclaration des quatre articles* ("Declaration of Four Articles"), which was delivered, along with his famous inaugural sermon on the unity of the church, to the assembly of the French clergy in 1682. The articles asserted the king's independence from Rome in secular matters and proclaimed that, in matters of faith, the pope's judgment is not to be regarded as infallible without the assent of the total church. They were accepted by all parties of the assembly, and his role in this controversy remained perhaps the most significant of Bossuet's life.

Concurrently he was engaged in the controversy with the Protestants. Though he opposed persecution and endeavored to convert the Protestants by intellectual argument, Bossuet supported the king's revocation in 1685 of the Edict of Nantes, an action that in effect prohibited French Protestantism. In 1688 he published a history of variations in the Protestant churches, *Histoire des variations des églises protestantes*, which was followed by information and advice to Protestants, *Avertissement aux protestans* (1689–91).

Although Bossuet had displayed moderation in the Gallican quarrel and in the controversy with the Protestants, he showed himself less tolerant in other cases, condemning the theatre as immoral, for example. Above all, he led an attack on the form of religious mysticism known as Quietism, which was being practiced by the archbishop of Cambrai, François Fénelon. Bossuet was by nature very intellectual and had been nourished on theology, and thus he was unable to understand a form of mysticism that consisted of passive devotional contemplation and total abandonment to the divine presence of God. He wrote such harsh works against the "new mystics" as his statement on Quietism, *Instruction sur les états d'oraison* (1697; "Instructions on the Calling of Oration") and the *Relation sur le quiétisme* (1698; "Report on Quietism"). After a duel of pamphlets and some unpleasant intrigue, he obtained Fénelon's condemnation in Rome in 1699.

Reputation. In the centuries since his death, Bossuet's reputation has been the subject of much controversy. The only point of agreement is the excellence of his style and eloquence. From a political point of view, he was praised by nationalists and monarchists, but spurned by the liberal tradition. From a religious point of view, he was often quoted as a master of French Roman Catholic thought, but he has been opposed by the Ultramontanists, Catholic progressives and modernists, and many of Fénelon's numerous admirers. His emphasis on immutability of doctrine and the perfection of the church made him seem old-fashioned in the atmosphere of Catholicism after the second Vatican Council (1962–65). (J.Tr./Ed.)

BIBLIOGRAPHY. An important study in English is Georgiana Terstegge, *Providence As idée-maitresse in the Works of Bossuet: Theme and Stylistic Motif* (1948, reprinted 1970).

Boston, district and borough, county of Lincolnshire, England, on the River Witham on the northern margin in the Fens. It has an area of 139 square miles (360 square km).

Boston has served as a small port since the 13th century, when, as a member of the Hanseatic League, it traded in wool and wine. With the progressive silting of the river and changing patterns of trade, the town's prosperity declined.

Boston's church is a landmark for the surrounding flat country of the Fens. The tower,

known as Boston Stump, is 272.5 feet (83 m) high. The church itself is a Decorated-style building extensively restored since 1931. It was from Boston that many of the Puritans set forth for the New World. The contemporary

St. Botolph's Church on the River Witham, Boston, Lincolnshire
A F. Kersting

importance of Boston derives from its continued modest function as a port and from the presence of agricultural and cattle markets. Industries are based largely on agricultural processing. Pop. (2001) town, 35,124; district, 55,739.

Boston, city, capital of the state of Massachusetts, and seat of Suffolk county, in the north-eastern United States. It is a major seaport at the head of Massachusetts Bay, an arm of the Atlantic Ocean, and is the historical, cultural, commercial, and industrial centre of New England. Area city, 47 square miles (122 square km); metropolitan area (MSA), 2,429 square miles (6,291 square km). Pop. (2003 est.) city, 581,616; (2000) Boston PMSA, 3,406,829; Boston-Worcester-Lawrence CMSA, 5,819,100.

A brief treatment of Boston follows. For full treatment, see MACROPAEDIA: Boston.

Boston and its sheltered deepwater harbour are ringed by rolling terrain. The site of the original settlement (1630), the hilly Shawmut Peninsula, was almost completely surrounded by water and connected to the mainland by the narrow Roxbury neck. To the east of the city was the harbour; to the west were the Charles River and expanses of salt marshes and mud flats known as Back Bay. Over the years the face of the peninsula changed dramatically. The hills were cut down (except for what remains of Beacon Hill) to provide material to fill in marshes and coves. The former peninsula is now an indistinguishable part of the mainland. Boston's climate is generally temperate and humid.

Banking, insurance, investment management, and other financial and business-service activities are the chief elements of the city's economy. The Federal Reserve Bank of the New England district is located there. Industries include biomedicine, electronics, food processing, printing, defense, telecommunication, and metal fabrication.

The centre of the colonial town was at the present Old State House (1711–47). Although

the original centre and the colonial South End have become commercial districts, some 18th-century buildings, such as Faneuil Hall (1742–1805) and the Old Corner Book Store (1711), survive. The Paul Revere House (c. 1680) and Old North Church (formerly Christ Church; 1723) stand in the North End section. The handsome residential district of Beacon Hill, which includes Louisburg Square, has been designated as the Beacon Hill Historic District. To the south lie the public acres of the Boston Common. Many of Boston's older neighbourhoods were renovated in the 1980s and '90s.

The changing face of the original peninsula allowed for a great amount of expansion. The flats of the former Back Bay were laid out as the Public Garden and the Parisian-styled Commonwealth Avenue; both were part of what was to become a continuous park system. The city eventually absorbed most of the earlier surrounding communities except for Cambridge and Brookline. In the centre of the city, many high-rise office and residential buildings, such as the Prudential Center and the John Hancock Tower, were constructed in the 1960s and '70s. Some planners, however, chose renewal over wholesale rebuilding, examples of which include the Faneuil Hall Marketplace. Street markets and narrow, winding routes are traditional features of the central city.

The Boston area has an abundance of colleges and universities; a partial listing includes Harvard University (1636), Boston University (1869), the Massachusetts Institute of Technology (1861), and the Tufts–New England Medical Center (originally the medical school of Tufts University; 1852); in 1999 Radcliffe College (1879) formally merged with Harvard and ceased to exist as a college. In addition, medical research centres and major hospitals, museums, libraries, and historical societies abound.

Boston's subway system, begun in 1897, was the first in the country and has been designated as a historic place. High-speed train service between Washington, D.C., and Boston began in 2000. Logan International Airport is in East Boston.

Boston, Ralph (b. May 9, 1939, Laurel, Miss., U.S.), American world-record holder in the long (broad) jump, the first man to jump more than 27 feet (8.23 m).

On Aug. 12, 1960, Boston jumped 26 feet 11.25 inches (8.21 m), breaking by 3 inches the world record set by Jesse Owens 25 years earlier. He then won the gold medal at Rome. On July 16, 1961, during a U.S.–Soviet meet in Moscow, he jumped 27 feet 1.75 inches (8.28 m). In 1964 he tied the world record set by the Soviet jumper Igor Ter-Ovanesyan with

Ralph Boston, 1964
UPI

a jump of 27 feet 3 inches (8.31 m) and on May 29, 1965, made his longest jump, 27 feet 4.75 inches (8.35 m). Boston won the silver medal at the 1964 Olympic Games in Tokyo and the bronze medal at the 1968 Olympic Games in Mexico City, where Bob Beamon shattered his world record. Later that year Boston was suspended by the Amateur Athletic Union for taking a job as a television sports commentator. After his track career ended, Boston was an administrator at the University of Tennessee (Knoxville).

Boston, Siege of (April 1775–March 1776), successful siege by American troops of the British-held city of Boston during the U.S. War of Independence. After the battles at Lexington and Concord (April 19, 1775), Boston was besieged by American militiamen. By June, 15,000 raw, undisciplined, ill-equipped colonialists—by then called the Continental Army—surrounded a force of 6,500 British regulars commanded by General Thomas Gage.

After the Battle of Bunker Hill (June 17, 1775), General George Washington assumed command of American forces, while, in October of that year, General William Howe succeeded Gage as British commander. Fighting remained stalemated for months, with both sides hesitant to attack. Finally, on March 4, 1776, Washington seized Dorchester Heights and trained his cannon—newly arrived from Fort Ticonderoga—on the city and harbour. Howe was forced to evacuate Boston by ship (March 17), and the siege ended.

Boston and Maine Corporation, formerly BOSTON AND MAINE RAILROAD COMPANY, largest of the New England railroads, largely operating in central and northern Massachusetts, southeastern Maine, and New Hampshire. The railroad was incorporated in New Hampshire in 1835, and the Boston and Maine Railroad Company was created in 1841. The first section of track, running east from Wilmington, Mass., opened in 1836.

Ultimately 111 companies were absorbed into the Boston and Maine, which connects New England with other rail lines serving regions to the south and west. The 4.75-mile (7.6-kilometre) Hoosac Tunnel, acquired along with the Fitchburg Railroad, was built in 1851–75 through the Berkshire Hills of Massachusetts, occasioning the first use of pneumatic drills in the United States. When it was completed, the tunnel was the longest rock tunnel in the United States.

Although the railroad went bankrupt in the 1970s, it operated 1,416 miles (2,278 km) of main and branch lines while undergoing reorganization. It derived its largest sources of freight revenue from the transport of paper, petroleum and coal, and food and grain-mill products. The Boston and Maine sold 279 miles (449 km) of its commuter lines to the Massachusetts Bay Transportation Authority in the 1970s. In 1984 the railroad was bought by Guilford Transportation Industries.

Boston Athenaeum, in Boston, independent research library containing about 700,000 volumes and housing an art gallery featuring the works of Boston-area artists and artisans. The library was founded in 1807. It moved into its present building on Beacon Street in 1847 and was expanded several times. Special collections include Confederate state imprints, the King's Chapel collection (1698), and the Charles E. Mason Print collection.

Its conservation department was one of the first established in the United States. The art gallery, founded in 1827, features 18th- and 19th-century Boston and New England prints.

Boston Globe, The, largest daily newspaper published in Boston, one of the most influential newspapers in the United States.

Founded in 1872, the *Globe* grew slowly at first, reaching a circulation of about 8,000 in 1877, when it was purchased by Charles H.

Taylor. Under Taylor as publisher, the *Globe* began to publish an evening as well as a morning edition, to increase its coverage of New England and local news, and to feature big headlines, especially on sensational stories of crime and catastrophe. Taylor laced the local and regional news as heavily as possible with subscribers' names.

The *Boston Globe* has long been ranked one of the top papers in the United States. In the 20th century the *Globe*, still under Taylor and then his sons, continued to stress local and regional news but devoted increasing attention to national and international news coverage while maintaining a generally liberal editorial stance. In 1993 the New York Times Company acquired the *Globe* for \$1.1 billion. The modern *Globe* is recognized for its makeup, for its investigative reporting, and for its wide range of comment on subjects ranging from music to politics and medicine.

Boston ivy, also called **JAPANESE IVY** (species *Parthenocissus*, or *Ampelopsis*, *tricuspidata*), clinging woody vine of the grape family (Vitaceae). Native to eastern Asia, the plant has been introduced to other regions, particularly as a climbing ornamental on stone and brick facades. The vine grows to a length of about 18 m (about 60 feet). The alternate leaves, which are either simple and three-lobed or compound with three leaflets, turn bright scarlet in the autumn. The inconspicuous flowers grow in clusters opposite the leaves. The small, bluish black fruit is sought by birds.

Boston Latin School, public secondary school, the oldest existing school in the United States. Its establishment in 1635 as the Latin Grammar School, open to all boys regardless of social class, set a precedent for tax-supported public education. Based on the English grammar school, its purpose was to educate young men in the classics as a preparation for university entrance. In 1789 the Latin School curriculum was changed from that of its English model by reducing the course from seven years to four. In 1877, 242 years after the start of the boys' school, the strictly college-preparatory Girls' Latin School was established.

Boston Marathon, a footrace from Hopkinton, Mass., U.S., to the Back Bay section of Boston, a distance of 42,195 m, or 26 miles 385 yards. The world's oldest annual foot race, it was held first in 1897 and annually thereafter on Patriot's Day (originally April 19; from 1969 the third Monday in April), which honours the 1775 ride of Paul Revere. It is sponsored by the Boston Athletic Association. Runners (more than 5,000 in the late 20th century, as opposed to about 200 in 1960) come from all over the world to participate. In 1967 Kathy Switzer, who had disguised herself as a man, was the first woman to contest the race, although the race director tried to prevent her. The Boston Marathon was the first marathon race to admit women runners officially, in 1972. For results, see *Sporting Record: Athletics*.

Boston Massacre (March 5, 1770), skirmish between British troops and a crowd in Boston, Mass., U.S. Widely publicized, it contributed to the unpopularity of the British regime in America in the years before the American Revolution. The incident was the climax of a series of brawls in which local workers and sailors clashed with British soldiers quartered in Boston. Harassed by a mob, the troops opened fire. Crispus Attacks, a black sailor and former slave, was shot first and died along with four others. Samuel Adams, a skillful propagandist of the day, shrewdly depicted the affair as a battle for American liberty.

Boston Mountains, range extending east-west for 200 miles (320 km) in northwestern Arkansas and northeastern Oklahoma, U.S.

The highest section of the Ozark Mountains, they are bounded by the White River (which has its source there) and by the Arkansas River. Several peaks, including Turner Ward Knob and Brannon Mountain, exceed 2,400 feet (730 m). The rugged mountains, 30 to 35 miles (50 to 55 km) wide with gorge-like valleys, embrace a division of the Ozark National Forest, Buffalo National River, and Devil's Den State Park, Arkansas.

Boston Police Strike (1919), strike of about 80 percent of Boston's police force protesting the opposition to their attempt to organize a union. The Boston police force, which had sought affiliation with the American Federation of Labor after World War I, was denied the right to unionize by the city's police commissioner. On September 9, 1919, the police went on strike.

Without police protection, the city was quickly experiencing robberies and riots. Mayor Andrew J. Peters called in Boston companies of militia, restoring order and breaking the strike. Later, Governor Calvin Coolidge—who had refused to act earlier to prevent the strike—sent in the entire Massachusetts militia even though the situation was then under control. The troops fired on a mob, killing two people.

Coolidge came to be regarded as the hero of the entire episode. Declaring, "There is no right to strike against the public safety by anybody, anywhere, anytime," Coolidge gained a national reputation as a staunch supporter of law and order. His role in the Boston police strike led largely to his nomination for vice president on the 1920 Republican ticket (he succeeded to the presidency following Warren G. Harding's death in 1923).

Boston Tea Party (Dec. 16, 1773), incident in which 342 chests of tea belonging to the British East India Company were thrown from ships into Boston Harbour by American patriots disguised as Mohawk Indians. The Americans were protesting both a tax on tea (taxation without representation) and the perceived monopoly of the East India Company.

The Townshend Acts passed by Parliament in 1767 and imposing duties on various products imported into the British colonies had raised such a storm of colonial protest and noncompliance that they were repealed in 1770, saving the duty on tea, which was retained by Parliament to demonstrate its presumed right to raise such colonial revenue without colonial approval. The merchants of Boston circumvented the act by continuing to receive tea smuggled in by Dutch traders. In 1773 Parliament passed a Tea Act designed to aid the financially troubled East India Company by granting it (1) a monopoly on all tea exported to the colonies, (2) an exemption on the export tax, and (3) a "drawback" (refund) on duties owed on certain surplus quantities of tea in its possession. The tea sent to the colonies was to be carried only in East India Company ships and sold only through its own agents, bypassing the independent colonial shippers and merchants. The company thus could sell the tea at a less-than-usual price in either America or Britain; it could undersell anyone else. The perception of monopoly drove the normally conservative colonial merchants into an alliance with radicals led by Samuel Adams and his Sons of Liberty.

In such cities as New York, Philadelphia, and Charleston, tea agents resigned or canceled orders, and merchants refused consignments. In Boston, however, the royal governor Thomas Hutchinson determined to uphold the law and maintained that three arriving ships, the *Dartmouth*, *Eleanor*, and *Beaver*, should be allowed to deposit their cargoes and that appropriate duties should be honoured. On the night of Dec. 16, 1773, a group of about 60 men, encouraged by a large crowd of Bostonians, donned blankets and Indian headdresses,

marched to Griffin's wharf, boarded the ships, and dumped the tea chests, valued at £18,000, into the water.

In retaliation, Parliament passed the series of punitive measures known in the colonies as the Intolerable Acts, including the Boston Port Bill, which shut off the city's sea trade pending payment for the destroyed tea. The British government's efforts to single out Massachusetts for punishment served only to unite the colonies and impel the drift toward war.

Boston terrier, breed of dog developed in the latter half of the 19th century in Boston, Mass. Bred from the English bulldog and a white English terrier, the Boston terrier is one of the few breeds to have originated in the United States. It has a terrier-like build, dark eyes, a short muzzle, and a short, fine coat of black or brindle, with white on the face, chest, neck, and legs. At maturity, it stands 35.5 to 43 cm (14 to 17 inches); weight may range from less than 7 to about 11 kg (15 to 25 pounds). The breed is characteristically gentle and affectionate.

Bostra, also called **BOZRAH**, Latin **BOSTRA**, Greek **BOSORRA**, or **BOSORA**, modern (Arabic) **BUŞRĀ** **ASH-SHĀM**, ruined Syrian city, 67 miles (108 km) south of Damascus. First a Nabataean city, it was conquered by the Roman emperor Trajan, made the capital of the Roman province of Arabia, and served as a key Roman fortress east of the Jordan River. The city eventually achieved the title metropolis under the Roman emperor Philip, a native of the city. It became the see of a bishop early in the 4th century but fell to the Muslims in 634/635. The Crusaders captured it in the 12th century but failed to hold it, and in the same century earthquakes, together with Turkish misrule, hastened its decline. The monumental remains of temples, theatres, triumphal arches, aqueducts, reservoirs, churches, mosques, and a 13th-century citadel stretch over the modern site.

Bostum (Iran): see **Baštām**.

Bosumtwi, Lake, lake, south-central Ghana, 17 miles (27 km) southeast of Kumasi. The only true inland lake in the country, it has no surface outlet and was formed either by volcanic eruption or by the impact of a meteorite. With an area of 19 square miles (49 square km) and a depth of 230–240 feet (70–73 m), the lake is fed by small streams that tumble down the steep sides (500–1,400 feet [150–425 m] above water level). Development of tourist facilities on the lakeshore in 1976 led to the resettlement of the residents of Abonu.

Boswell, James (b. Oct. 29, 1740, Edinburgh, Scot.—d. May 19, 1795, London, Eng.), friend and biographer of Samuel Johnson (*Life of Johnson*, 2 vol., 1791). The 20th-century publication of his journals proved him to be also one of the world's greatest diarists. *Edinburgh and London*. Boswell's father, Alexander Boswell, advocate and laird of Auchinleck in Ayrshire from 1749, was raised to the bench with the judicial title of Lord Auchinleck in 1754. The Boswells were an old and well-connected family, and James was subjected to the strong pressure of an ambitious family.

Boswell hated the select day school to which he was sent at the age of 5, and from 8 to 13 he was taught at home by tutors. From 1753 to 1758 he went through the arts course at the University of Edinburgh. Returning to the university in 1758 to study law, he became enthralled by the theatre and fell in love with a Roman Catholic actress. Lord Auchin-

leck thought it prudent to send him to the University of Glasgow, where he attended the lectures of Adam Smith. In the spring of 1760 he ran away to London. He was, he soon found, passionately fond of metropolitan culture, gregarious, high-spirited, sensual, and attractive to women; and London offered just the combination of gross and refined pleasures that seemed to fulfill him. At this time he contracted gonorrhoea, an affliction that he was to endure many times in the course of his life.

From 1760 to 1762 Boswell studied law at home under strict supervision and sought release from boredom in gallantry, in a waggish society called the Soaping Club, and in scribbling. His publications (mostly in verse) give no indication of conspicuous talent.

When Boswell came of age, he was eager to enter the foot guards. Lord Auchinleck agreed that if he passed his trials in civil law, he would receive a supplementary annuity and be allowed to go to London to seek a commission through influence. Boswell passed the examination in July 1762.

Anticipating great happiness, he began, in the autumn, the journal that was to be the central expression of his genius. His great zest for life was not fully savoured until life was

Boswell, detail of an oil painting from the studio of Sir Joshua Reynolds, 1786; in the National Portrait Gallery, London

By courtesy of the National Portrait Gallery, London

all written down, and he had a rare faculty for imaginative verbal reconstruction. His journal is much more dramatic than most because he wrote up each event as though he were still living through it, as if he had no knowledge of anything that had happened later. People in his journal talk and are given their characteristic gestures.

Boswell's second London visit lasted from November 1762 to August 1763. Soon after his arrival, he was informed of the birth in Scotland of a son, Charles, for whom he arranged Anglican Baptism. The mother (Peggy Doig) was probably a servant. He met Oliver Goldsmith, the novelist, playwright, and poet, as well as John Wilkes, the radical politician and polemicist. And on May 16, 1763, in the back parlour of the actor and bookseller Thomas Davies, he secured an unexpected introduction to Samuel Johnson, whose works he admired and whom he had long been trying to meet. Johnson was rough with him, but Boswell kept his temper, went to call a week later, and found himself liked—a great friendship was initiated. Johnson was 53 years old when they met, Boswell 22. There was condescension on both sides on account of differences in rank and intelligence. Having become genuinely convinced that the scheme to join the guards was not practicable, Boswell capitulated to his father and consented to become a lawyer. It was agreed that he should

spend a winter studying civil law at Utrecht and should then make a modest foreign tour.

Continental tour. Boswell had been deeply affected by Johnson's piety and on Christmas Day, in the ambassador's chapel at The Hague, received communion for the first time in the Church of England. His pious program proved stimulating for a time but palled when it had lost its novelty. He received word that his little boy had died. In the depression that ensued he had recurring nightmares of being hanged. He was discouraged to find that dissipation brought him more happiness than chastity and hard work, and he soon lapsed into his former promiscuity.

From Utrecht, Boswell traveled to Berlin in the company of the old Jacobite Earl Marischal, friend and counselor of Frederick II the Great, but he was never able to meet the king. Passing through Switzerland (December 1764), he secured interviews with both Jean-Jacques Rousseau and Voltaire. Boswell stayed nine months in Italy, devoting himself systematically to sightseeing. At Naples he established an intimacy with Wilkes (then outlawed) and traveled with Lord Mountstuart, eldest son of the Earl of Bute, the chief target of Wilkes's scurrilities.

The most original act of his life followed when he made a six weeks' tour of the island of Corsica (autumn 1765) to interview the heroic Corsican chieftain Pasquale de Paoli, then engaged in establishing his country's independence of Genoa. Paoli succumbed to his charm and became his lifelong friend. On his return to the mainland, Boswell sent off paragraphs to the newspapers, mingling facts with fantastic political speculation.

Scottish lawyer and laird. Back in Scotland, Boswell was admitted to the Faculty of Advocates on July 26, 1766, and for 17 years practiced law at Edinburgh with complete regularity and a fair degree of assiduity. His cherished trips to London were by no means annual and until 1784 were always made during the vacations. He was an able courtroom lawyer, especially in criminal cases, but in Scotland neither fortune nor fame could be won in the criminal court.

In February 1768 Boswell published *An Account of Corsica, The Journal of a Tour to That Island; and Memoirs of Pascal Paoli* and stepped into fame. France had unmasked its intention of annexing the island, and people were greedy for information about Corsica and Paoli. Motives of propaganda caused him to present himself in the book as completely naive and to cut the tour to a mere frame for the memoirs of Paoli, but the result is still pleasing. Paoli, probably wisely, is presented in a manner reminiscent of that which the ancient Greek biographer Plutarch employed in his lives of great men.

Between 1766 and 1769 Boswell amused himself with various well-hedged schemes of marriage, maintaining meantime a liaison with a young Mrs. Dodds. Their daughter, Sally, like Charles, seems to have died in infancy. Boswell ended by marrying (November 1769) the only woman he had ever wanted to marry, his first cousin, Margaret Montgomerie.

During the first few years of his marriage, Boswell was on the whole happy, hard-working, faithful to his wife, and confident of getting a seat in Parliament, a good post in the government, or at the very least a Scots judgeship. Paoli visited him in Scotland in 1771; in 1773 he was elected to The Club, the brilliant circle that Sir Joshua Reynolds had formed around Dr. Johnson; and later in the year Johnson made with him the famous tour of the Hebrides. He ultimately had five healthy and promising children. He was made an examiner of the Faculty of Advocates and one of the curators of the Advocates' Library; he served twice as master of the Canongate Kilwinning Lodge of Masons and declined nomination for the grand mastership

of Scotland. But by 1776 he began to feel strong intimations of failure. A headlong entry into Ayrshire politics had ranged him in opposition to Henry Dundas, who was then emerging as a political despot in the management of the Scottish elections. His practice was not becoming more notable. He began to drink heavily to replenish his spirits, not, as formerly, to give them vent. He returned to his old traffic with women of the town when separated from his wife by distance, by her pregnancy, or by her frequent complaints. As early as 1778 it was obvious that she was critically ill with tuberculosis.

Between 1777 and 1783 he published in *The London Magazine* a series of 70 essays, significantly entitled *The Hypochondriack*, which deserve to be better known, though they do not engage his full powers. At the end of 1783, in the hope of attracting the attention of Pitt's new government, he published a pamphlet attacking the East India Bill that had been introduced by Charles James Fox, Pitt's great rival. Pitt sent a note of thanks but made no move to employ him. Boswell succeeded to Auchinleck in 1782 and managed his estate with attention and some shrewdness. But he thought he could be happy only in London and encouraged himself in the groundless notion that he could be more successful at the English than at the Scottish bar.

Life of Johnson and London. Johnson died on Dec. 13, 1784. Boswell decided to take his time in writing the *Life* but to publish his journal of the Hebridean tour as a first installment. In the spring of 1785 he went to London to prepare the work for the press. *The Journal of a Tour to the Hebrides, with Samuel Johnson, LL.D. (1785)* tops all the others published later. It comes from the soundest and happiest period of Boswell's life, the narrative of the tour is interesting in itself, and it provides us with 101 consecutive days with Johnson. The book was a best-seller, but it provoked the scornful charge of personal fatuity that has dogged Boswell's name ever since. His intelligence was not really in question. But he deliberately defied the basic literary rule that no author who wishes respect as a man may publish his own follies without suggesting compensatory strengths of character. Boswell analyzed and recorded his own vanity and weakness with the objectivity of a historian, and in his Johnsonian scenes he ruthlessly subordinated his own personality, reporting the blows that Johnson occasionally gave him without constantly reassuring the reader that he understood the implications of what he had written.

In 1786 Boswell was called to the English bar from the Inner Temple and moved his family to London. Thereafter he had almost no legal practice. His principal business was the writing of the *Life of Johnson*, which he worked at irregularly but with anxious attention.

Though straitened in income, he gave his children expensive educations. He visited Edinburgh only once after his emigration and then almost surreptitiously. His wife pined for Auchinleck and insisted on being taken there when her health grew desperate. Boswell felt that he had to be in London in order to finish the *Life* and to be at the call of the Earl of Lonsdale, who had given him unexpected encouragement and caused him to be elected recorder of Carlisle. When his wife died (June 4, 1789), he was not at her side; and when he tried to detach himself from Lonsdale, he was treated with shocking brutality.

The Life of Samuel Johnson, LL.D. was published in two volumes on May 16, 1791. Contemporary criticism set the pattern of acclaim for the work and derision for its author. Boswell took intense pleasure in his literary fame but felt himself to be a failure. His later years were prevailingly unhappy. His eccentricities of manner seemed merely self-indulgent in a man of 50 or more; people were

afraid to talk freely in his presence, fearing that their talk would be reported, and his habit of getting drunk and noisy at other people's tables (he was never a solitary drinker) made him a difficult guest in any case. His five children, however, loved him deeply, and he never lost the solicitous affection of a few friends, including his editor, Edmond Malone, who recognized his worth and his need. He saw the second edition of the *Life* through the press (July 1793) and was at work on the third when he died in 1795.

Assessment. For long it was believed that Boswell's private papers had been destroyed shortly after his death, but the bulk of them were recovered in the 1920s at Malahide Castle near Dublin, and sold to an American collector, Ralph H. Isham, by Boswell's great-great-grandson, Lord Talbot de Malahide. These papers, as well as others found at Malahide Castle during the 1930s, were united with another portion discovered by a professor, Claude Collier Abbott, in Aberdeenshire in the home of descendants of Boswell's executor and sold to Yale University, which, under the editorship of Frederick A. Pottle, began a systematic program of their multivolume publication, beginning with *Boswell's London Journal, 1762-63* (1950).

The *Life of Johnson* will always be regarded as Boswell's greatest achievement, although, since the publication of his papers, its unique values can be seen to be derivative. It is the stretches of Johnson's conversation that make it superior, and those conversations were lifted bodily from the journal, sometimes with so little change that the journal leaves served as printer's copy. The extended commercial publication of the journal, by proving his ability to compete with 20th-century authors on their own terms, has confirmed and added to Boswell's stature as artist. It also for the first time gives the general reader a properly complex portrait. (F.A.P./Ed.)

BIBLIOGRAPHY. Frederick A. Pottle, *The Literary Career of James Boswell* (1929, reissued 1967), and his article on Boswell in *The New Cambridge Bibliography of English Literature*, vol. 2 (1971), provides a detailed biobibliography and selected list of works about Boswell, as well as an extensive list of criticism. Pottle's *James Boswell: The Earlier Years, 1740-1769* (1966, reissued 1985), was the first biography to draw on all the recovered papers; it is continued by Frank Brady, *James Boswell: The Later Years, 1769-1795* (1984). Other biographies include D.B. Wyndham Lewis, *James Boswell: A Short Life*, 2nd ed. (1952, reprinted 1980), warmly pro-Boswellian; and Chauncey Brewster Tinker, *Young Boswell* (1922, reissued 1970), a charming portrait.

Critical studies include Geoffrey Scott, introductions to vol. 1-5 of *Private Papers of James Boswell from Malahide Castle* and vol. 6, *The Making of The Life of Johnson...* (1928-29), a modern view of Boswell by a great stylist; and Frederick A. Pottle, "The Life of Johnson: Art and Authenticity," in James L. Clifford (ed.), *Twentieth Century Interpretations of Boswell's Life of Johnson: A Collection of Critical Essays* (1970), on the conversations in the *Life*, the quintessence of Boswell's view of Johnson.

Bosworth (England): see Hinckley and Bosworth.

Bosworth Field, Battle of (Aug. 22, 1485), battle in the English Wars of the Roses, fought 12 miles (19 km) west of Leicester and 3 miles (5 km) south of Market Bosworth, between the forces of the Yorkist King Richard III and the Lancastrian contender for the crown, Henry Tudor (the future Henry VII). It was in effect the last battle of the wars, and it established the Tudor dynasty on the English throne. Henry, returning from exile, landed at Milford Haven (August 7) and marched toward Richard at Leicester. Early on August 22 Richard's army reached a superior position on Ambien Hill. Richard's ally, John Howard, Duke of Norfolk, was killed in the initial

skirmish. Though called to the area by the king, Thomas, Lord Stanley (later 1st Earl of Derby), and Henry Percy, Earl of Northumberland, failed to assist the Yorkists in battle. When Richard moved against Henry Tudor, Sir William Stanley, brother of Lord Stanley who had privately pledged support for Henry, attacked Richard's flank. The Yorkist army melted away, while Richard, preferring death, was unhorsed and killed in the bog.

bot fly, any member of several small insect families of the order Diptera. The adults are bee-like in appearance, hairy but without bristles; the larvae are parasitic on mammals.

Horse bot flies (family Gasterophilidae) include species of *Gasterophilus*, a serious horse pest. The adult horse fly, often known as a gad fly, deposits between about 400 and 500 eggs (nits) on the horse's forelegs, nose, lips, and body. The larvae remain in the eggs until the horse licks itself. With the stimulus of moisture and friction the larvae emerge, are ingested, and attach themselves to the lining of the horse's stomach or intestine, obtaining all their nourishment and oxygen from the horse's alimentary canal. The larvae mature after 8 to 11 months and are eliminated with excrement. Warble flies (*Hypoderma lineatum* and *H. bovis*) greatly disturb cattle. Young larvae penetrate the skin, migrate through the body for several months, then come to rest beneath the skin of the animal's back; here

Rodent bot fly (*Cuterebra*)
William E. Ferguson

each larva causes a characteristic lump, or warble, from which a cattle grub emerges. The grub becomes a pupa and then a fly to deposit more larvae.

In the family Oestridae are the North American and European deer nose bot flies (*Cephenomyia*); perhaps the swiftest flying insects, they can fly approximately 50 miles per hour (80 km per hour). Another important nose fly (family Oestridae) is the sheep bot fly (*Oestrus ovis*). Active larvae, deposited in the nostrils of the sheep, often cause a nervous condition called blind staggers.

The important rodent bot flies (family Cuterebridae) are *Cuterebra cuniculi*, which infects rabbits, and *C. emasculator*, which attacks the scrotum of squirrels, sometimes emaculating them. The human bot fly (*Dermatobia hominis*) of the family Cuterebridae attacks livestock, deer, and humans. The female attaches her eggs to mosquitoes, stable flies, and other insects that carry the eggs to the actual host. Body warmth causes the eggs to hatch, and the tiny larvae penetrate the skin. In tropical America *Dermatobia* is responsible for loss of beef and hides.

botanical garden, also called BOTANIC GARDEN, originally, a collection of living plants designed chiefly to illustrate relationships within plant groups. In modern times, most botanical gardens are concerned primarily with exhibiting ornamental plants, insofar as possible in a scheme that emphasizes natural relationships.

Thus, the two functions are blended: eye appeal and taxonomic order. Plants that were once of medicinal value and extremely important in early botanical gardens are now chiefly of historical interest and are not particularly represented in contemporary collections. A display garden that concentrates on woody plants (shrubs and trees) is often referred to as an arboretum. It may be a collection in its own right or a part of a botanical garden.

A major contemporary objective of botanical gardens is to maintain extensive collections of plants, labeled with common and scientific names and regions of origin. Plant collections in such gardens vary in number from a few hundred to several thousand different kinds, depending on the land area available and the financial and scholarly resources of the institution.

As world populations become more urbanized, botanical gardens are increasingly recognized as among the important cultural resources of industrialized nations. Botanical gardens offer the city dweller part of the natural environment that he no longer has access to; furthermore, they offer a mental escape from population pressure and suggest new interests and hobbies having to do with the natural world.

History. What can be called the roots of the botanical garden as an institution are traceable to ancient China and many of the countries bordering the Mediterranean. These actually were often centres for the raising of fruit trees, vegetables, and herbs used for food and in making the crude medicines of the time. After the discovery of printing, manuscripts on plants, which had been in existence for centuries, became more widely circulated, and these stimulated further publication of descriptive works called herbals. The herbalists and their herbals, in turn, stimulated the founding of botanical gardens. By the end of the 16th century there were five such gardens in Europe, and by the mid-20th century several hundred. The first two were in Italy, at Pisa (1543) and at Padua (1545). At first, such gardens were associated with the medical schools of universities. Professors of medicine were mainly the botanists of that time, and their "physic gardens" served for the training of students as well as for growing plants to make medicines. But they served in other ways as well. Carolus Clusius, a noted botanist of the 16th century, for example, brought together an extensive collection of flowering bulbs at the botanical garden in Leiden, Neth., which proved to be the beginning of the Dutch bulb industry.

In the early 1800s Jean Gesner, a Swiss physician and botanist, noted that by the end of the 18th century there were 1,600 botanical gardens in Europe. During the 18th and 19th centuries, the science of botany took form, and many of the important botanists of the period were directors of the botanical gardens of their day. Since that time, the classical botanical garden as a teaching and medicinal garden declined, to be replaced by gardens devoted mainly to plant culture and the display of ornamental plants and plant groups of special interest.

The larger collections of living plants constitute a formidable resource for professional scholars; but, more importantly, they provide a rich opportunity for the general public to learn more about plants and how to grow them. Some gardens offer popular-level short courses on plants and plant cultivation each year, both for adults and for children.

Botanical gardens constitute reservoirs of valuable heritable characteristics, potentially important in the breeding of new varieties of plants. Longwood Gardens, near Kennett Square, Pa., in collaboration with the U.S.

Department of Agriculture, has in recent years sent out several expeditions to collect species that have promise as breeding stock or, in some instances, are already attractive ornamental plants. Historically, England's Royal Botanic Gardens at Kew are most famous for their collecting expeditions and the distribution of economic plants to parts of the world where they could be grown most successfully. Kew is responsible for the wide popularity and spread of such plants as the rubber tree (*Hevea brasiliensis*), pineapple, banana, tea, coffee, cacao, various timbers, and cinchona (yielding quinine) and other drug producers.

Still another function of botanical gardens is the training of gardeners. Canada has long had such a program at the Niagara Falls Parks Commission's School of Horticulture. Such training programs at Kew, Edinburgh, Dublin, and the Royal Horticultural Society's garden at Wisley have produced many able gardeners for supervisory positions in many countries.

Layouts and facilities. Botanical gardens and arboreta differ from parks in that they are generally laid out according to the scientific relationships of their plant collections, rather than exclusively for landscape effect or for playing fields or other essentially recreational endeavours. The traditional practice in laying out a botanical garden is, for example, to gather the trees and shrubs together in an arboretum section of the garden. Oftentimes, though, trees and shrubs are used to enhance landscape effects by interspersing them throughout the garden, in their respective taxonomic groups, with herbaceous collections.

Botanical gardens, or parts of them, are sometimes planned according to the geographic origin of plants. Not infrequently the layout is based on small, special gardens within the greater garden, such as rose, iris, rock, wildflower, and Japanese landscape gardens. Botanical gardens may range in size from a few hectares to as many as 1,000.

Although the layouts mentioned heretofore often preclude the possibility of arranging plants strictly according to their taxonomic relationships, this is still possible for certain groups. The genus *Rosa*, for example, includes a great many species and hundreds of named man-made hybrids. In addition to the genus *Rosa*, there are many other genera in the rose family (Rosaceae), with their species and innumerable cultivars. The rose family would be a typical taxonomic grouping for a botanical garden, though the tree species would be grown separately from the rose bushes. The same general principle of taxonomic groupings holds for other plant families and genera.

Usually associated with botanical gardens are the service or display greenhouses in which to propagate plants or to grow those that may

not survive seasonal changes. In temperate climates, where the winters are cold, for example, tropical orchids must be greenhouse grown. The same is true of tropical ferns, bromeliads, economic plants of the tropics or near-tropics, many cacti and other succulents, African violets, and begonias. Hotbeds as well as greenhouses serve for starting seedling plants that are to be set outdoors as soon as the weather is warm enough.

A botanical garden that aspires to large plant collections must also have storage areas that provide temperature conditions favourable to certain species at particular seasons. Cold frames may serve this purpose for many kinds of plants and for the wintering over of younger plants that need a cold period but will not tolerate freezing temperatures. Houses built of lathing may also be important for the temporary storage of some species in semishade or even for the growing of certain plants that are intolerant of the hot summer sun.

Many gardens possess herbaria, or collections of a few to many thousands of dried plant specimens mounted on sheets of paper. The

species thus mounted have been identified by experts and labeled by their proper scientific names, together with information on where they were collected, how they grew, and so on. They are filed in cases according to families and genera, always available for ready reference. Herbaria, like living plant collections, are the "dictionaries" of the plant kingdom, the reference specimens essential to the proper naming of unknown plants.

Many botanical gardens associated with universities possess extensive libraries, herbaria, and laboratory research facilities. Such gardens offer essential services for the professional plant taxonomist. Some large urban botanical gardens provide classroom and greenhouse workshop facilities for the novice gardener, and the trend for popular-level instruction is growing.

Most large botanical gardens publish technical journals and popular brochures. Books of general appeal and films are produced by some of the larger botanical gardens.

Professional considerations. The prime consideration in maintaining plant collections is, of course, good plant-culture practices. Skilled lawn maintenance is particularly important for botanical gardens in cities; the discerning citizen judges a garden more by its general appearance than by the excellence of its plant collections. Tree and shrub collections require systematic pruning, and no important tree should go for more than two years without such attention. Older trees require special pruning attention and care of wounds so that decay does not set in. Spraying for control of pests and diseases is often necessary.

In the early years of botanical gardens, new kinds of plants could be secured only by sending out knowledgeable collectors on ex-

peditions, often to distant places. They would seek out new species growing in the wild and bring back samples of the plants desired. But the nursery industry has now become so great that many smaller firms specialize in particular groups of plants; thus, numerous species and cultivars can be purchased directly from nursery firms, ready for planting. Exchanges of seeds as well as rare plants are often carried out between botanical gardens. Some gardens issue seed-exchange lists annually.

Equipment for the care of plant collections depends upon the size of the operation. Aside from a building adequate to take care of physical needs of the gardening staff and housing space for tools and equipment, attractive and efficient classroom space is essential for gardens with an educational program. A section of a greenhouse arranged for practical work by students (*i.e.*, a greenhouse classroom) is also desirable.

Staff needs depend upon the specific objectives of a botanical garden as well as upon the resources available, the climate, and the area to be cared for. At least one gardener should be a skilled propagator or nurseryman. The head gardener, with advanced horticultural training and experience, supervises the entire operation. If the physical plant is of sufficient size, a combination of skilled craftsmen and a superintendent is required to look after all structures and oversee the cleaning, heating, and other routine services.

Professional staff needs also depend upon an institution's objectives as well as financial resources. A general botanist is essential. A taxonomist is basic for the herbarium, as is a librarian, if the book and journal collection is of any size. The taxonomist usually has supervision over the making and placing of plant labels. A plant pathologist, or specialist in plant diseases, is desirable if the plant collections are large. If a teaching program for adults and children is part of the educational pattern of the institution, at least a skeleton force of teachers or part-time instructors who come in and conduct classes is necessary. The total botanical garden program, from gardening through professional staff, is coordinated by a director, who, in turn, is responsible to a board of trustees if the garden is a private corporation. A garden that is part of a university is generally the primary responsibility of a professor of botany or horticulture and is operated as an adjunct of his particular department. Gardens that are government supported usually operate under a director and advisory group.

Some botanical gardens are independently established and financially provided for through endowments set up by wealthy persons. Gardens directly operated by government agencies are usually supported by tax monies. Private colleges and universities with botanical gardens are privately supported and often receive financial assistance by organized, dues-paying-membership groups or by endowment funds established in their behalf.

A list of the abbreviations used in the MICROPEDIA will be found at the end of this volume

Botanical Garden, German BOTANISCHER GARTEN, botanical garden founded in 1914 by the German botanist Karl von Goebel in Munich. The garden's vast array of greenhouses, completed in 1958, includes 17 for display and 8 for service functions. The palm house is particularly notable. Other significant greenhouse collections are composed of alpine plants, insectivorous plants, cacti, African succulents, *Crassula*, and *Mesembryanthemaceae*. The 20-hectare (50-acre) outdoor gardens contain about 10,000 plant species. Although of great intrinsic botanical importance, the plants are arranged for maximum aesthetic effect.

The various plantings consist of a large rock garden featuring alpine species, an extensive systematic garden for instruction on plant evolution, several attractive display gardens for the public, and a series of wild gardens in which both indigenous and foreign species, including annuals, perennials, bulbs, and trees and shrubs, are grown. The garden also maintains the outstanding herbarium of Bavaria (the Botanical State Collection [Botanische Staatssammlung]), which contains about 1,500,000 specimens of dried plants.

Botanischer Garten und Botanisches Museum Berlin-Dahlem: see Berlin-Dahlem Botanical Garden and Botanical Museum.

botany, the branch of biology that deals with plants. It involves the study of the structure, properties, and biochemical processes of all forms of plant life, including trees. It also includes plant classification and the study of plant diseases and of the interactions of plants with their physical environment. Over the years various specialized branches of botany have developed, and the principles and findings of botany, moreover, have provided the base on which depend such applied plant sciences as agriculture, horticulture, and forestry.

For full treatment, see MACROPAEDIA: Biological Sciences. Other aspects of botany are treated in the following MACROPAEDIA articles. For the primary subjects of study, see Biochemical Components of Organisms; Cells; Coloration, Biological; Photosynthesis; Metabolism; Growth and Development, Biological; Reproduction and Reproductive Systems; Genetics and Heredity, Principles of; Evolution, Theory of. For the practical applications of botany, see Agricultural Sciences; Farming and Agricultural Technology; Gardening and Horticulture; Forestry and Wood Production.

For a description of the place of botany in the circle of learning and for a list of both MACROPAEDIA and MICROPAEDIA articles on the subject, see PROPAEDIA: Part Three, Division I.

Botany Bay, inlet of the Tasman Sea (Pacific Ocean), indenting New South Wales, Australia. Roughly circular, about 5 miles (8 km) across and 1 mile (1.6 km) wide at its mouth (between the La Perouse and Kurnell peninsulas), it receives the Georges and Cooks rivers.

The bay was the site in 1770 of Captain James Cook's first landing in Australia. He named it Stingray Harbour but later changed the name because of the variety of new plants found there by his expedition's naturalist, Joseph (later Sir Joseph) Banks. Plans were made for Captain Arthur Phillip, of the Royal Navy, to establish a convict settlement there, but when he arrived in 1788 he found the bay area unsuitable for habitation and moved the colony 5 miles north to Port Jackson (later Sydney). Jean La Perouse, a French mariner, explored the bay that same year.

Its shores are now ringed by the suburbs of Sydney, with Kingsford-Smith Airport to the northwest and an oil refinery on the south; the Bunnerong power station and several national nature reserves also border the inlet. Port Botany has been dredged and made safer for ships by means of a breakwater, and it is much used by container ships.

Botero, Fernando (b. April 19, 1932, Medellín, Colombia), Colombian artist known for his paintings and sculptures of inflated human and animal shapes.

As a youth, Botero attended a school for matadors for several years, but his true interest was in art. While still a teenager, he began painting and was inspired by the pre-Columbian and Spanish colonial art that surrounded him, as well as by the political work of Mexican muralist Diego Rivera. His own paintings were first exhibited in 1948, and two years later, in Bogotá, he had his first one-man

show. While studying painting in Madrid in the early 1950s, he made his living by copying paintings housed in the Prado Museum—particularly those of his idols at the time, Francisco de Goya and Diego Velázquez—and selling them to tourists.

Throughout the 1950s Botero began experimenting with proportions and size. When he moved to New York in 1960, he had developed his trademark style: the depiction of round, corpulent humans and animals. In these works he referenced Latin-American folk art in his use of flat, bright colour and boldly outlined forms. He favoured a smooth look in his paintings, eliminating the appearance of brushwork and texture, as in *Presidential Family* (1967). In works such as this, he also drew from the Old Masters he had emulated in his youth: his formal portraits of the bourgeoisie and political and religious dignitaries clearly reference the compositions of formal portraits by Goya and Velázquez. The inflated proportions of his figures, such as those in *Presidential Family*, also suggest an element of political satire, perhaps hinting at the subjects' inflated sense of their own importance. His other paintings from the period included *Bordello* scenes and nudes, which possess comic qualities that challenge and satirize sexual mores, and portraits of families, which possess a gentle, affectionate quality.

In 1973 Botero returned to Paris and began creating sculptures in addition to his works on canvas. These extended the concerns of his painting, as he again focused on rotund subjects. Successful outdoor exhibitions of his monumental bronze figures, including *Roman Soldier* (1985), *Maternity* (1989), and *The Left Hand* (1992), were staged around the world at the end of the 20th century.

Boteti River, formerly BOTLETLE RIVER, river of Botswana. It emerges near Maun and the Thamakalane River, developing from the outflow of the Okavango Delta, Botswana. It flows in a southeasterly direction to Lake Xau (Dow), then north to enter the Makgadikgadi Pans after a course of 190 miles (305 km).

Botetourt, Norborne Berkeley, Lord, also called BARON DE BOTETOURT (b. c. 1718, England—d. Oct. 15, 1770, Virginia [U.S.]), colonial governor of Virginia (1768–70).

After military and parliamentary service in England, Berkeley acquired a lordship, or barony, that had been in abeyance for more than three centuries, proving in 1764 that he was the legal successor. Four years later he was appointed governor of Virginia. Popular with the colonial assembly at the outset and secretly in sympathy with their strong position of

protest against the transfer of political prisoners to England, he nevertheless dissolved the assembly after it passed resolutions demanding exclusive powers of taxation. He attempted, by correspondence with the British secretary of state for the colonies, to bring about a repeal of all parliamentary taxes, but he failed to modify the action of Parliament. His brief service of two years as governor had won the approval of the colonial assembly, and a life-sized statue of him was erected by the assembly in the colonial capital of Williamsburg. He was buried on the grounds of the College of William and Mary. On his death, the barony again fell into abeyance.

Botev, Khristo (b. Jan. 6, 1849, Kalofer, Rumelia, Ottoman Empire [now in Bulgaria]—d. June 1, 1876, near Mount Veslez, Bulg.), patriot and poet, one of the heroes of the Bulgarian national revolutionary movement against Turkish rule.

In 1863 Botev was sent to complete his education in Russia, where he was much influenced by nihilist ideas. He returned to Bulgaria in 1867 but then fled to Romania. There he lived in poverty, devoting himself to the Bulgarian liberation movement through journalistic, literary, and organizational activity. A collection of his patriotic verses, *Pesni u stihove* ("Songs and Verses"), appeared in 1875. During the Bulgarian rising of early May 1876 he reentered Bulgaria with a small band of rebels, but he was killed by regular Turkish troops within a few days of his return.

Both, Jan (b. c. 1618, Utrecht, Neth.—buried Aug. 9, 1652, Utrecht), Baroque painter and etcher, the leading master of the "Italianate" trend of Dutch landscape painting in the 17th century.

Both first studied with his father, Dirck Both, a glass painter, and then with Abraham Bloemaert. From 1638 to 1641 he lived in Rome with his brother Andries; in the latter year he returned to Utrecht, where he became a prominent member of the painters' guild. His views of the mountains and wooded surroundings of Rome, filled with golden sunlight and enlivened with figures of Italian peasants, show the influence of Claude Lorraine and Pieter van Laer, both of whom he undoubtedly met in Rome (e.g., "Artists Sketching in an Italian Landscape"). He shared van Laer's and the Bamboccianti's interest in contemporary genre, although his primary concern was with landscape, in which human activity was incidental. Rather than

"Italian Landscape," oil painting by Jan Both; in the Rijksmuseum, Amsterdam
By courtesy of the Rijksmuseum, Amsterdam

the idealized classical compositions of Claude, with their generalized treatment of light and atmosphere, Both's depiction of nature was more specific and naturalistic, emphasizing observation over imagination.

The tradition according to which the figures in many of his paintings were done by his brother has not been borne out; in fact, no works of Jan prior to 1641, when Andries died, have been identified. The figures in his known landscapes were usually painted by himself, although in a few cases by Cornelis van Poelenburgh, who also painted Both's portrait. Both's etchings, based on some of his paintings, are most delicately done.

Both, Pieter (b. c. 1550, Amersfoort, Neth.—d. February 1615, Mauritius), Dutch colonialist who was the first governor-general of the Netherlands East Indies.

After sailing as an admiral in the Indies (1599–1601), he was sent in November 1609 to govern the colony, with instructions to see to it that the Netherlands had the entire monopoly of the trade with the islands and that no other nation had any share whatever. He began by establishing trading posts at Bantam and Jacatra (1610; renamed Batavia in 1619, later called Jakarta). This exclusionist policy meant driving out the English, which Both set out to do and which his successors had largely completed by the 1630s. Both drowned in a shipwreck off Mauritius and was succeeded as governor-general by the celebrated Jan Pieterszoon Coen.

Botha, Louis (b. Sept. 27, 1862, near Greytown, Natal—d. Aug. 27, 1919, Pretoria, Transvaal, Union of South Africa), soldier and statesman who was the first prime minister of the Union of South Africa and a staunch advocate of a policy of reconciliation between Boers and Britons.

The son of a voortrekker (pioneer settler of the interior), he grew up in the Orange Free State, where he received his only formal education at a German mission school. In 1884 he helped to found the New Republic in the Vryheid district in Zululand (now northern Natal). There he purchased a farm and married Annie Emmett, granddaughter of an Irish patriot. When the New Republic became part of the South African Republic (1888), Botha became politically active and held a number of posts before he was elected to the Volksraad (parliament) in 1897. There he sided with the moderates against President Paul Kruger's hostile policy toward the Uitlanders (non-Boer, mostly English, settlers).

With the outbreak of the South African War in 1899, Botha rose rapidly to command the southern force besieging Ladysmith. Leading an ambush, he captured an armoured train; Winston Churchill was among the prisoners.

Louis Botha, oil painting by Sir James Guthrie, late 19th century; in the Scottish National Portrait Gallery, Edinburgh

When Piet Joubert, the commandant general of the Transvaal forces, died (March 1900), Botha was named to succeed him. Despite his talents as a general, he could not hold back the overwhelming numbers of British reinforcements. After the surrender of a large Boer army at Paardeberg and the fall of Pretoria, Botha organized a guerrilla campaign, but Britain eventually forced him to negotiate. He was one of the signatories at the Peace of Vereeniging (May 1902).

The war over, Botha returned to politics as chairman of a new party, Het Volk (The People); and when the Transvaal was given self-government (1907), he was chosen prime minister. In 1910 a national convention selected him to serve as the first prime minister of the Union of South Africa, a post he held until his death.

In 1911 Botha established the South African Party, designed to unite the anti-imperialist parties of the Transvaal, Orange Free State, and Cape Colony. The Unionist Party, backed largely by the English-speaking element, was the official party of opposition, but Botha's program of continued conciliation caused a split among his own followers. Concerned with the survival of their Afrikaner heritage, they formed the Orangia-Unie (Orangia Union), headed by J.B.M. Hertzog and others. Differences were exacerbated after the outbreak of World War I, when Botha acceded to the British request to conquer German South West Africa (now Namibia). After successfully putting down an Afrikaner rebellion led by Christiaan Rudolf de Wet and Christiaan Beyers, he went on to defeat the Germans in a well-organized and well-executed campaign (1915) that he personally led. Throughout the rest of the war, Botha managed to survive the bitter political attacks of the Afrikaner nationalists. In 1919 he participated in the Versailles Peace Conference, where he advocated leniency for the former enemies.

Botha, Pieter Willem (b. Jan. 12, 1916, Paul Roux, S.Af.), prime minister (1978–84) and (September 1984–August 1989) first state president of South Africa.

A native of the Orange Free State, he studied law at the University of Orange Free State at Bloemfontein from 1932 to 1935 but left without graduating. Already active in politics in his teens, he moved to Cape Province at age 20 to become a full-time organizer for the National Party. He was elected to Parliament in the National landslide of 1948. By 1958 he was deputy minister of the interior, and thereafter (1961–80) he was successively minister of commercial development, Coloured affairs, public works, and defense. He succeeded to the prime ministry upon the resignation of B.J. Vorster in 1978.

Botha's government faced serious foreign and domestic difficulties. The coming to power of black governments in Mozambique, Angola, and Zimbabwe gave new energy to black South African nationalists and the South West African People's Organization (SWAPO). Other developments led to frequent black student and labour unrest in South Africa itself, especially in 1980. Botha responded with a military policy that included frequent South African raids combined with support for antigovernment groups in the border states, seeking to weaken the Angolan, Mozambican, and Zimbabwean governments. Botha also refused to withdraw from Namibia, though he continued negotiations on the question.

He combined this foreign policy with a program of reforms at home—such as the policy of granting "independence" to various black homelands—that were meant at once to mollify international public opinion while dividing his nonwhite domestic opposition. A key point in this program was the promulgation of a new constitution, which granted very limited powers to Asians and Coloureds

but which made no concessions to the black majority. Though the proposed reforms maintained white supremacy, to which Botha was fully committed, the right wing of the National Party split away in protest in 1982 to form the Conservative Party. Botha was still able to get the constitution passed by referendum of whites in 1983. The following year he was elected under the new constitution as state president by an electoral college selected from the racially segregated, white-dominated Parliament. During his term in office, Botha sought (with limited success) to find some middle ground between those who fully supported apartheid and the increasingly frustrated and militant nonwhite population. Early in 1989 Botha fell ill and resigned his post as party leader, but he did not yield the presidency until he faced opposition not only from the National Party but from within his own Cabinet.

Bothe, Walther (Wilhelm Georg) (b. Jan. 8, 1891, Oranienburg, Ger.—d. Feb. 8, 1957, Heidelberg, W.Ger.), German physicist who shared the Nobel Prize for Physics in 1954 with Max Born for his invention of a new method of detecting subatomic particles and for other resulting discoveries.

Bothe taught at the universities of Berlin (1920–31), Giessen (1931–34), and Heidelberg (1934–57). In 1925 he and Hans Geiger used two Geiger counters to gather data on the Compton effect—the dependence of the increase in the wavelength of a beam of X rays upon the angle through which the beam is scattered as a result of collision with electrons. Their experiments, which simultaneously measured the energies and directions of single photons and electrons emerging from individual collisions, refuted a statistical interpretation of the Compton effect and definitely established the particle nature of electromagnetic radiation.

With the astronomer Werner Kolhörster, Bothe again applied this coincidence-counting method in 1929 and found that cosmic rays are not composed exclusively of gamma rays, as was previously believed. In 1930 Bothe discovered an unusual radiation emitted by beryllium when it is bombarded with alpha particles. This radiation was later identified by Sir James Chadwick as the neutron.

During World War II Bothe was one of the leaders of German research on nuclear energy. He was responsible for the planning and building of Germany's first cyclotron, which was completed in 1943.

Bothnia, Gulf of, Swedish *BOTTNISKA VIKEN*, Finnish *POHJAN LAHTI*, northern arm of the Baltic Sea, between Sweden (west) and Finland (east). Covering an area of about 45,200 square miles (117,000 square km), the gulf extends for 450 miles (725 km) from north to south but only 50 to 150 miles (80 to 240 km) from east to west; it is nearly closed off by the Åland (Ahvenanmaa) Islands (south). Its maximum depth is 965 feet (295 m) in the west-central portion; its average depth is only about 200 feet (60 m). Because it receives the water of so many rivers, including the Angerman, Ume, Lule, Torne, Kemi, and Oulu, its salinity is extremely low, and, in consequence, ice cover is maintained for up to five months in the winter. There are many small islands, making navigation difficult. The main gulf ports are Pori, Vaasa (Vasa), and Oulu in Finland and Luleå, Härnösand, Sundsvall, and Gävle in Sweden. Many coastal sawmills process the vast forest resources of the hinterland, which was formerly called Bothnia (Botten), whence the gulf's name.

Bothriolepis, also spelled *BOTHRYOLEPIS*, genus of extinct fishes of the order Antiarcha, class Placodermi, characteristic of the Middle and Late Devonian (from about 387 million to 360 million years ago). The front end of *Bothri-*

olepis was very heavily encased in bony armour. The eyes were located on top of the head shield and situated very close to the light-receptive pineal eye. The shield was separated into two parts, one for the head, the other for the thorax. The posterior portions of the body were naked, lacking even scales. Very strongly developed bony spines in the shoulder region appear to have had a serrated edge and were movable. The genus apparently had functional lungs, indicating that lungs are very ancient structures. It is probable that *Bothriolepis* was a bottom-dwelling animal inhabiting streams and lakes and pulled itself about along the bottom with its hooklike arms. With its weakly developed mouth, *Bothriolepis* was clearly not an active predator.

Bothwell, Francis Stewart Hepburn, 5th earl of (d. before July 1614, Naples), nephew of the 4th earl; by his dissolute and proud behaviour, he caused King James VI of Scotland (afterward James I of Great Britain) gradually to consider him a rival and a threat to the Scottish crown, and he became an outlaw.

Created earl of Bothwell in 1581, he became lord high admiral of Scotland. In 1589 he suffered a short imprisonment for his share in a rising against England. Again imprisoned, this time on a charge of witchcraft, he escaped from captivity in 1591 and was deprived by Parliament of his lands and titles; as an outlaw his career was one of extraordinary lawlessness. In 1591 he attempted to seize Holyroodhouse, and in 1593 he captured the king, forcing from him a promise of pardon. But almost at once he reverted to his former manner of life, and he was forced to take refuge in France about 1595. He died at Naples in extreme poverty.

Bothwell, James Hepburn, 4th earl of, DUKE OF ORKNEY AND SHETLAND (b. 1535?—d. April 4, 1578, Dragsholm, Sjaelland, Den.), third husband of Mary, Queen of Scots. He evidently engineered the murder of

4th earl of Bothwell, miniature by an unknown artist, 1566; in the Scottish National Portrait Gallery, Edinburgh

By courtesy of the Scottish National Portrait Gallery, Edinburgh

Mary's second husband, Henry Stewart, Lord Darnley, thereby precipitating the revolt of the Scottish nobles and Mary's flight to England, where she was imprisoned by Queen Elizabeth I and eventually executed.

The son of Patrick Hepburn, 3rd earl of Bothwell, Hepburn succeeded to his father's title in 1556. Although a Protestant, he supported the Catholic Mary of Lorraine, who was regent for the young queen Mary Stuart, in her struggle against the Protestant Scottish nobles. Upon the death of Mary of Lorraine in 1560, Mary Stuart assumed control of the government, and in 1561 Bothwell became a member of her Privy Council. But he was soon embroiled in a feud with the powerful but deranged Earl of Arran. Accused by Arran of plotting to kidnap the Queen, Bothwell was imprisoned in Edinburgh Castle in March 1562. He escaped the following August and, after a period of detention in England, reached France in September 1564.

The following year Bothwell was recalled to

Scotland to help suppress the rebellion of Mary's half-brother, James Stewart, earl of Moray, who had opposed her marriage (in July 1565) to Lord Darnley. Bothwell then won the Queen's affection by acting with loyalty and resourcefulness during the critical events surrounding the murder on March 9, 1566, of her secretary, David Riccio, at the instigation of Darnley. By the end of the year Mary had made Bothwell the most powerful noble in southern Scotland, and she encouraged him to become her husband.

When Darnley was murdered in 1567, public opinion immediately accused Bothwell of perpetrating the crime with Mary's complicity. He was acquitted at an obviously rigged trial, and, already living with Mary, he early in May divorced his first wife. Mary and Bothwell were married by Protestant rites on May 15, the day after his creation as duke of Orkney and Shetland. The couple soon faced revolts by a coalition of Protestant and Catholic nobles, who considered Bothwell a usurper. The Queen's forces met the rebels at Carberry Hill near Edinburgh on June 15, and, when her troops refused to fight, she surrendered on the condition that Bothwell be allowed to escape. He fled north, first to Orkney and Shetland, then to Denmark, where he was taken into custody by King Frederick II. In June 1573, after the collapse of Mary's cause in Scotland, Bothwell was placed in solitary confinement in a castle at Dragsholm, where he died, insane, five years later. Mary had obtained an annulment of their marriage in 1570.

Botletle River (Botswana): see Boteti River.

Boto, Eza: see Beti, Mongo.

Botocudo, South American Indian people who lived in what is now the Brazilian state of Minas Gerais. They spoke a language of the Macro-Ge group. Their culture was similar to that of other nomadic tribes of the forests and mountains of eastern Brazil. Hunting bands of from 50 to 200 members were led by men considered most powerful in the supernatural realm. The Botocudo believed that spirits inhabited the sky and interceded in human affairs through the mediation of shamans, persons to whom were granted extraordinary powers. Interband conflicts were common, but these were usually resolved by duels between pairs of opponents using long sticks. Resistance to white expansion met with a policy of ruthless extermination. The few remaining Botocudo are descendants of those who took to agriculture and came to terms with the colonial advance.

Botoșani, județ (district), northeastern Romania, occupying an area of 1,946 square miles (4,965 square km), and bounded on the north by Ukraine and on the east by Moldova. The Prut and Siret rivers are, respectively, the district's eastern and western borders. Both rivers drain southeastward. Botoșani (*q.v.*) city, a textile centre, is the district capital. Other towns include Trușești, Nicolae Bălcescu, Dorohoi, Săveni, and Darabani. The area of the district characterized by rolling hills was long included in feudal Moldavia. Agricultural activities include cereal growing and livestock raising. Bucecea town has a sugar refinery. A museum, located in Dorohoi town, is dedicated to the composer Georges Enesco (1881–1955), who was born in the commune of Liveni (now Georges-Enesco town). A 15th-century church and the Adîncata Forest are other features of Dorohoi. Mihail Eminescu (1850–89), the poet, was born in Ipotesti village and a museum there commemorates his life. The Dragomirna Monastery, located near Itcani village, was built in 1609 by Anastase Crimca, metropolitan of Moldavia and a painter of miniatures. The monastery, fortified in 1627 by Prince Miron Barnevski, contains a collection of manuscripts decorated by illuminators who were trained in the school

that Crimca founded. Ștefănești village is the birthplace of Ștefan Luchian (1868–1916), the painter. Highways and railway connections extend through Botoșani and Dorohoi. Pop. (1997 est.) 460,115.

Botoșani, city, capital of Botoșani *județ* (district), northeastern Romania. It lies in a rich farming area of northern Moldavia, near the border with Moldova. As a settlement, it was first documented in 1439. The Popăuți Church dates from 1496. Long known as a market centre for agricultural produce and wines, Botoșani has also become an industrial centre, particularly in textiles. Pop. (1997 est.) 129,285.

Botox, also called BOTULINUM TOXIN TYPE A, trade name of a drug based on the toxin produced by the bacterium *Clostridium botulinum* that causes severe food poisoning (botulism). When locally injected in small amounts, Botox blocks the release of the neurotransmitter acetylcholine, interfering with the ability of the muscle to contract. It is used to treat severe muscle spasm or severe, uncontrollable sweating. Botox can also be used for cosmetic purposes to treat facial wrinkles. Results appear about three to seven days after treatment and generally last about three to four months.

botrytis blight, also called BOTRYTIS ROT, or GRAY MOLD BLIGHT, disease of plants growing in humid areas that is usually caused by the fungus *Botrytis cinerea*. Most vegetables, fruits, flowers, and woody plants are susceptible. Soft, tan to brown spots or blotches become covered with a dusty mold in moist weather. Seedlings, young shoots, or leaves may wither and collapse; buds rot; flowers become flecked and spotted; older flowers and fruit turn brown and rot. *Botrytis* commonly follows injury by ozone, an air pollutant.

Control involves the removal of infected parts. Proper cultivation, including spacing for ventilation, judicious fertilizing, and watering at the soil line are helpful in reducing the chances of botrytis blight. Harvested fruits and vegetables should be stored as close to 32° F (0° C) as practical and sprayed with a fungicide at least weekly in damp, cool weather.

Botsaris, Markos, Italian MARCO BOZZARI (b. c. 1788, Sofili, Greece, Ottoman Empire—d. Aug. 21, 1823, Karpenision), an important leader early in the Greek War of Independence.

Botsaris' early years were spent in the struggle between the Souliots of southern Epirus and Ali Paşa, who had made himself ruler of Ioánnina (Janina) in Epirus in 1788. After Ali Paşa succeeded in capturing the Souliot strongholds in 1803, Botsaris and most of his surviving clansmen fled to Corfu. He remained there for 16 years. Strongly influenced by the European ideas of national independence and identity, he joined the patriotic society Philiki Etairia in 1814.

Botsaris returned to Epirus with the Souliots in 1820 to join his former enemy Ali Paşa of Ioánnina in his revolt against the Turkish government and, after Ali Paşa was defeated, committed the Souliots to the Greek struggle for independence that had broken out in April 1821. After serving in the successful defense of the town of Missolonghi (Mesolóngion) during the first siege in 1822–23, he led a band of a few hundred Souliot guerrillas on the night of Aug. 21, 1823, in a bold attack on 4,000 Albanians encamped at Karpenision.

The Albanians, who formed the vanguard of a Turkish army advancing to join the siege, were routed, but Botsaris, who had proved to be one of the most promising commanders of the Greek forces, was killed. When Botsaris died, his command of the Souliots passed to

his friend Lord Byron, who formed 50 of them into a personal bodyguard at Missolonghi.

Botswana (people): *see* Tswana.

Botswana, officially REPUBLIC OF BOTSWANA, formerly BECHUANALAND, landlocked country in southern Africa. Consisting mostly of the Kalahari (desert), the country has a maximum length from north to south of about 600 miles (965 km) and a maximum width from east to west of about the same; it is bordered on the southeast and south by South Africa, on the west and northwest by Namibia, on the north by Zambia, and on the northeast and east by Zimbabwe. The capital is Gaborone. Area 224,848 square miles (582,356 square km). Pop. (2003 est.) 1,663,000.

Botswana

A brief treatment of Botswana follows. For full treatment, *see* MACROPAEDIA: Southern Africa.

For current history and for statistics, *see* BRITANNICA BOOK OF THE YEAR.

The land. Botswana, forming a part of the southern African Plateau, is almost entirely flat (mean elevation 3,300 feet [1,000 m] above sea level) except in the southeast, where the terrain is hilly (4,600 feet [1,400 m]) and broken. The country is divided into three distinct topographic regions: in the east, rocky hill ranges (hardveld) traversed by ephemeral watercourses; in the northwest, the Okavango Swamp (4,000 square miles [10,000 square km]); and in the south, the Kalahari (sandveld). The Kalahari is largely a semidesert with grass and acacia thorn scrub, and only in the southwest, where there are sand dunes, do true desert conditions prevail.

The only sources of permanent surface water are the Chobe River (with a drainage basin of 56,000 square miles [145,000 square km]), which marks Botswana's boundary with Namibia in the northwest; the Okavango River (with a basin of 53,000 square miles [137,300 square km]) in the far northwest; and the Limpopo River (with a basin of 30,000 square miles [77,700 square km]), Botswana's boundary with South Africa in the southeast. The Chobe and the Limpopo rivers drain into the Indian Ocean, the former through the Zambezi River. The Okavango flows from its source in Angola to its termination in the flat, marshy inland delta of the Okavango Swamp. Most of southern Botswana is without surface drainage.

Much of the country has a subtropical climate, though it is subject to continental extremes. The summer (October–March) temperatures rise to about 93° F (34° C), and winter (April–September) temperatures fall to 32° F (0° C). Average annual precipitation (most falling from December to April) is about 18 inches (460 mm), varying from 25 inches (635 mm) in the northeast to 15 inches (380 mm) in the east, and to 5 inches (130 mm) or less in the southwest. Rainfall is highly variable, and severe droughts and famines, often

lasting several years, are frequent. Favourable conditions for farming and cattle raising exist in the moderate-rainfall region of eastern Botswana (Limpopo drainage basin), which has some of the best grazing grounds in the country.

About three-fourths of the country's land area is covered by sparse savanna-type vegetation. Vegetation, corresponding to rainfall patterns, gradually changes from sparse grasses and thorn scrubs in the southwest eastward and northward to a bush and then to a tree savanna. True forests occur only on the banks of the Chobe River. Even the Kalahari contains adequate vegetation to support large populations of wild animals. The rich and varied fauna, including lions, elephants, leopards, hippopotamuses, giraffes, various species of antelopes, crocodiles, and several varieties of poisonous snakes, is protected in several national parks and game reserves.

Botswana's full mineral resources remain unknown, but it has begun to develop its diamond, nickel-copper, and coal deposits. The diamond mines of Orapa, Letlhakane, and Jwaneng together make up one of the largest reserves of diamonds in the world. Large reserves of coal are located near Morupule in the east, and deposits of salt and soda ash exist in the Makgadikgadi salt pans in the northeast. There are also deposits of plutonium, chromite, and platinum.

The people. The country's entire population is characterized as Batswana regardless of ethnic origin, and about two-thirds are ethnic Tswana. Other main groups include the Kalanga, Ndebele, and Herero. The Khoikhoi and San, who for centuries inhabited the Kalahari in scattered small groups and followed a nomadic way of life, have been almost entirely resettled outside their traditional areas. There are also small numbers of people of European ancestry, most of whom arrived by way of South Africa. The official language is English; the national language is Tswana.

About half of the people are nominal Christians, and most of the rest are followers of African traditional beliefs. More than two-fifths are practicing Christians. The majority of these are Anglicans, Congregationalists, and Methodists; these groups have united in Botswana. There are other, smaller Protestant and Roman Catholic communities in the country.

The country is sparsely populated because of the shortage of water. The east is the most densely populated area of Botswana, whereas the west-central and southwest are the least populous and, in places, are virtually uninhabited.

Life expectancy at birth has fallen dramatically since the early 1990s, to about 39 years, largely because of the spread of HIV/AIDS infection. Urban dwellers account for about half of the total population. Some two-fifths of Botswana's people are under 15 years of age.

The economy. Botswana has a developing mixed economy in which both the public and private sectors participate. The economy is largely based on mining (diamonds, copper, and nickel) and livestock raising. Diamond mining has been heavily subsidized by South Africa, the European Union (EU), and various international agencies. Manufacturing industries are little developed. The gross national product (GNP) has grown much more rapidly than the population. The GNP per capita is one of the highest in southern Africa, though still low by world standards.

Although agriculture accounts for only a small percentage of the gross domestic product (GDP), it employs about one-sixth of the workforce. Cattle raising is the chief agricultural activity and is dominated by a small number of households who own more than half of all of the cattle in Botswana. Most cattle are sold to the Botswana Meat Commission at Lobatse. Exports of meat to the EU are

favoured by the Lomé Conventions. Foot-and-mouth disease, once a serious problem, was all but eradicated after 1980 through vaccination and by building a system of cordon fences. Production of drought-resistant sorghum, vegetables and melons, corn (maize), millet, and beans, which are the chief staples, is largely by subsistence-level cultivation and frequently falls short of domestic demand as a result of unpredictable rainfall and poor soils. Cash crops include cotton and peanuts (groundnuts).

Mining accounts for more than one-third of the GDP, but it employs only a tiny proportion of the labour force. Mineral industries are dominated by the production and export of diamonds and copper-nickel matte; the export of diamonds is the major source of foreign exchange and public revenue. Diamonds are jointly mined by the government and De Beers Consolidated Mines of South Africa. The government also owns an interest in the production of copper and nickel. Coal is mined and used domestically to generate electricity. There is a shortage of skilled labour, and thousands of workers from Botswana are employed in South African mines.

Principal trading partners are members of the South African Customs Union, who supply most of Botswana's imports, and members of the EU, who accept most of the country's exports. Machinery and transport equipment and foodstuffs are the major imports.

Government and social conditions. Botswana is a multiparty republic with a parliamentary government. Its 1966 constitution vests legislative authority in the unicameral National Assembly, consisting of 40 directly elected members, 4 indirectly elected members, and 3 ex officio members (the president, the speaker, and the attorney general). Members serve a five-year term. The House of Chiefs, an elected body representing the principal tribes of Botswana, serves as an advisory body to the government; legislation affecting tribal affairs must be referred to the House before passage in the National Assembly. Executive power is vested in the president, who is directly elected to a five-year term. The president governs with the assistance of an appointed cabinet, which is responsible to the National Assembly. The Botswana Democratic Party has been the dominant party since the country achieved independence.

There is no social-security system, but government health services are provided free of charge. Health conditions improved dramatically beginning in the 1970s. However, those advances were offset from the early 1990s by the spread of HIV/AIDS, which has overshadowed all other health concerns and has severely taxed the country's health services. By the early 21st century more than one-third of Botswana's population was infected with HIV. Other common fatal diseases are those of the gastrointestinal and respiratory systems.

About three-fourths of the population is literate. Free primary education was introduced in 1980. Some four-fifths of school-age children attend primary schools, and more than two-fifths attend secondary schools. Higher education is available at the University of Botswana (founded 1976) in Gaborone.

History. The region was earliest inhabited by the Khoikhoi and San. Iron Age sites in Botswana date from as early as AD 190 and were settled during the southerly migration of Bantu-speaking farmers. Between the 7th and 13th centuries, chiefdoms developed in the southeast near Gabane and in the northwest as far as the Tsodilo Hills. Tswana dynasties, which developed in the western Transvaal in the 13th and 14th centuries, moved into Botswana in the 18th century and established several powerful states, including Ngwaketse, Kwena, and Tawana. Warfare in the early 19th century disrupted their development, but in the 1840s trading states were reconstituted.

European missionaries had been present in Botswana since the early 19th century, but it was the discovery of gold in the region in 1867 that excited European interest in the area. In 1885 the region became the British Bechuanaland Protectorate. The next year the area to the south of the Molopo River became a crown colony, and it was annexed by the Cape Colony a decade later. Bechuanaland itself continued as a British protectorate until the 1960s.

In 1961 executive and legislative councils were introduced to supplant the traditional resident commissioner. A 1965 constitution led to the first general elections in which the Bechuanaland (later Botswana) Democratic Party (BDP) won 28 of 31 legislative seats. On Sept. 30, 1966, the Republic of Botswana was proclaimed as an independent member of the British Commonwealth and became a member of the United Nations.

Since independence Botswana has attempted to maintain a delicate balance between its economic dependence on South Africa and its foreign relations with the surrounding African countries. In the late 1970s Botswana became a haven for Rhodesian refugees and guerrillas of the Zimbabwe People's Revolutionary Army, especially before Zimbabwe gained independence in 1980. Between 1984 and 1990 relations with South Africa were adversely affected, especially by raids on Gaborone in 1985 and 1986; but improvement in South Africa's political situation, and the independence of Namibia in 1990, eased tensions in the region. In 1999, amid growing economic prosperity, Botswana held its seventh free and fair election since independence, marking it as an island of calm in an otherwise turbulent region.

Botta, Carlo Giuseppe Guglielmo (b. Nov. 6, 1766, San Giorgio del Canavese, Piedmont [Italy]—d. Aug. 10, 1837, Paris, France), Italian-born French historian and politician who supported Napoleon.

Having graduated in medicine at the University of Turin in 1786, Botta was in his youth inspired by the ideas of the French Revolution. Arrested as a spy for the French in 1794, he left Italy for France the following year and from 1796 to 1798 served as a physician in Napoleon's campaigns in Italy and Corfu. He published a history of Corfu in 1799 and in the same year became a member of the Franco-Italian government of Piedmont.

An ardent supporter of Napoleon, though he later contributed to Napoleon's fall, he was elected vice president of the French legislative assembly in 1808. In 1815 he became a French citizen and was subsequently appointed rector of the academies of Nancy and Rouen.

His main work is a fanciful history of the American Revolution, based on contemporary documents and material supplied by Lafayette. An English translation, *History of the War of the Independence of the United States of America*, was published in Philadelphia (1820–21).

Botta, Paul-Émile (b. Dec. 6, 1802, Turin, Piedmont [Italy]—d. March 29, 1870, Achères, France), French consul and archaeologist whose momentous discovery of the palace of the Assyrian king Sargon II at Dur Sharrukin (modern Khorsabad), Iraq, in 1843, initiated the large-scale field archaeology of ancient Mesopotamia.

The son of a distinguished historian, Carlo Botta, he was educated as a physician. In 1842 he secured an appointment as consul at Mosul, in Ottoman Mesopotamia (modern Iraq), in order to secure a vantage point for discovering the vanished cities of Assyria, which were known at that time only from conflicting accounts of ancient writers and from biblical references. He started to excavate at Quyunjik, opposite Mosul on the east bank of the Tigris River, and he might have unearthed Nineveh had he not been drawn

by what appeared to be richer prospects at Khorsabad. A week's digging there revealed the remains of the great palace of Sargon, with its famed winged figures, relief sculptures, and cuneiform inscriptions. After Botta reported to Paris his mistaken belief that he had discovered Nineveh, government support financed further excavation, and the artist E.N. Flandin was dispatched to make on-site drawings of the remains, some of which tended to disintegrate quickly after being unearthed. One shipment of antiquities was sunk in transit, but another reached Paris and the Louvre. *Monuments de Ninive . . .* (1849–50; "Monuments of Nineveh . . .") consisted of a volume of Botta's text and four volumes of Flandin's illustrations. Botta subsequently devoted himself to cuneiform scholarship and was consul in Jerusalem (1846) and Tripoli, in Syria (1868).

Bottesini, Giovanni (b. Dec. 22, 1821, Crema, Austrian Empire [now in Italy]—d. July 7, 1899, Parma, Italy), Italian double bassist, composer, and conductor, best known for his facility with the double bass and for his contribution to double bass technique.

Bottesini received basic training in music at an early age from his father, a composer and clarinetist. His choice of the double bass as his specialty came about because, upon his application to the Milan Conservatory (1835), it was one of only two remaining scholarships. He learned within weeks to play the instrument adequately enough to be accepted for the scholarship. He left the conservatory in 1839 and toured throughout the United States and Europe.

Bottesini's first opera, *Cristoforo Colombo*, was first performed in Havana in 1847. On one of his tours, he met Giuseppe Verdi in Venice, and they became lifelong friends. In 1849 Bottesini made the first of many appearances in England, where he enjoyed great popularity for many years because of his extraordinary skill as a double bass virtuoso. He was also known throughout Europe as a conductor. He directed the first performance of Verdi's *Aida* at Cairo in 1871. From about 1870 he devoted an increasing amount of time to composition, turning out a number of operas, sacred works, orchestral pieces, and works for the double bass.

Botticelli, Sandro, original name ALESSANDRO DI MARIANO FILIPEPI (b. 1445, Florence [Italy]—d. May 17, 1510, Florence), one of the greatest painters of the Florentine Renaissance. His "The Birth of Venus" and "Primavera" are often said to epitomize for modern viewers the spirit of the Renaissance.

Early life and career. Botticelli's name is derived from his elder brother Giovanni, a pawnbroker who was called Il Botticello ("The

Little Barrel"). All our knowledge of Botticelli's life derives from Giorgio Vasari's biography of him, as supplemented and corrected from documents. Botticelli's father was a tanner who apprenticed Sandro to a goldsmith after his schooling was finished. But since Sandro preferred painting, his father then placed him under Fra Filippo Lippi, who was one of the most admired Florentine masters.

Lippi's painterly style, which was formed in the early Florentine Renaissance, retained certain elements of International Gothic delicacy and decorativeness. His style was fundamental to Botticelli's own artistic formation, and his influence appears even in his pupil's late works. Lippi taught Botticelli the techniques of panel painting and fresco and gave him an assured control of linear perspective. Stylistically, Botticelli acquired from Lippi a repertory of types and compositions, a certain graceful fancifulness in costuming, a linear sense of form, and a partiality to certain paler hues that is still visible even after Botticelli had developed his own strong and resonant colour schemes.

By 1470 Botticelli was already established in Florence as an independent master with his own workshop. Absorbed in his art, he never married, and he lived with his family. The figure style of Botticelli's teacher, Lippi, was softer and frailer than the sculptural style of Antonio Pollaiuolo and Andrea del Verrocchio, the leading Florentine painters of the 1460s, and under their influence, Botticelli transformed the forms he had learned from Lippi into figures of sculptural roundness and strength. He also replaced Lippi's International Gothic delicacy with a robust and vigorous naturalism, shaped always by conceptions of ideal beauty.

These transitions in Botticelli's style can be seen in the two small panels of "Judith and Holofernes" (c. 1469; Uffizi Gallery, Florence) and the "Chigi Madonna" and are fully realized in his first dated work, "Fortitude" (1470; Uffizi), which was painted for the hall of the Tribunale della Mercanzia, or merchants' tribunal, in Florence. Botticelli's art now shows a use of ochre in the shadowed areas of flesh tones that gives a brown warmth very different from Lippi's pallor. The forms in his paintings are defined with a line that is at once incisive and flowing, and there is a growing ability to suggest the character and mood of the figures by action, pose, and facial expression.

About 1478–81 Botticelli entered his artistic maturity: all tentativeness in his work disappears and is replaced by a consummate mastery. He is able to integrate figure and setting into harmonious compositions and to draw

"The Birth of Venus," oil on canvas by Sandro Botticelli, about 1485; in the Uffizi, Florence

Anderson—Alman from Art Resource

the human form with a compelling vitality. He would later display unequalled skill at rendering narrative texts, whether biographies of saints or stories from Boccaccio's *Decameron* or Dante's *Divine Comedy*, into a pictorial form that is at once exact, economical, and eloquent.

Devotional paintings. Botticelli worked in all the current genres of Florentine art. He painted altarpieces in fresco and on panel, tondi (circular paintings), small panel pictures, and small devotional triptychs. His altarpieces include narrow vertical panels such as the "St. Sebastian" (1474; Berlin); small oblong panels such as the famous "Adoration of the Magi" (c. 1476; Uffizi) from the Church of Santa Maria Novella; medium-sized altarpieces, of which the finest is the beautiful Bardi altarpiece (1484-85; Berlin); and large-scale works such as the St. Barnabas altarpiece (c. 1488; Uffizi) and the "Coronation of the Virgin" (c. 1490; Uffizi). His early mastery of fresco is clearly visible in his "St. Augustine" (1480) in the Church of Ognissanti, in which the saint's cogent energy and vigour express both intellectual power and spiritual devotion. Three of Botticelli's finest religious frescos (completed 1482) were part of the decorations of the Sistine Chapel undertaken by a team of Florentine and Umbrian artists who had been summoned to Rome in July 1481. The theological themes of the frescos were chosen to illustrate papal supremacy over the church; Botticelli's are remarkable for their brilliant fusion of sequences of symbolic episodes into unitary compositions.

Florentine tondi were often large, richly framed paintings, and Botticelli produced major works in this format, beginning with the "Adoration of the Magi" (c. 1473; National Gallery, London) that he painted for Antonio Pucci. Prior to Botticelli, tondi had been conceived essentially as oblong scenes, but Botticelli suppressed all superfluity of detail in them and became adept at harmonizing his figures with the circular form. His complete mastery of the tondo format is evident in two of his most beautiful paintings, "The Madonna of the Magnificat" (c. 1485; Uffizi) and "The Madonna of the Pomegranate" (c. 1487; Uffizi). Botticelli also painted a few small oblong Madonnas, notably the "Madonna of the Book" (c. 1480; Poldi-Pezzoli Museum, Milan), but he mostly left the painting of Madonnas and other devotional subjects to his workshop, which produced them in great numbers. In his art the Virgin Mary is always a tall, queenly figure wearing the conventional red robe and blue cloak, but enriched in his autograph works by sensitively rendered accessories. She often has an inner pensiveness of expression, the same inwardness of mood that is communicated by Botticelli's saints.

Secular patronage and works. Botticelli is the earliest European artist whose paintings of secular historical subjects survive in some number and are equal or superior in importance to his religious paintings. Nevertheless, much of his secular work is lost: from a working life of some 40 years, only eight examples by him survive in an already well-established genre, the portrait. One of these, the portrait of a young man holding a medal of Cosimo de' Medici (c. 1474; Uffizi), is especially significant because in it Botticelli copied the Flemish painter Hans Memling's recently invented device of setting the figure before a landscape seen from a high vantage point. This is the earliest instance of the influence on Botticelli of contemporary Flemish landscape art, which is clearly visible in a number of his landscape settings.

Perhaps it was Botticelli's skill in portraiture that gained him the patronage of the Medici family, and in particular of Lorenzo de' Medici

and his brother Giuliano, who then dominated Florence. Botticelli painted a portrait of Giuliano and posthumous portraits of his grandfather Cosimo and father Piero. Portraits of all four Medici appear as the Three Magi and an attendant figure in the "Adoration of the Magi" from Santa Maria Novella. Botticelli is also known to have painted (1475) for Giuliano a banner of Pallas trampling on the flames of love and Cupid bound to an olive tree. This work, though lost, is important as a key to Botticelli's use of classical mythology to illustrate the sentiment of medieval courtly love in his great mythological paintings.

After Giuliano de' Medici's assassination in the Pazzi conspiracy of 1478, it was Botticelli who painted the defamatory fresco of the conspirators on a wall of the Palazzo Vecchio. Lorenzo certainly always favoured Botticelli, as Vasari claims, but even more significant in the painter's career was the lasting friendship and patronage of Lorenzo di Pierfrancesco de' Medici, head of the junior Medici line and at first a covert and then from 1494 an open opponent of the senior line. Tommaso Soderini, who secured for Botticelli in 1470 the commission for the "Fortitude," and Antonio Pucci, for whom he painted his earliest surviving tondo, were both prominent Medicean partisans, as was Giovanni Tornabuoni, who about 1486-87 commissioned Botticelli's most important surviving secular frescos.

Mythological paintings. Many of the commissions given to Botticelli by these rich patrons were linked to Florentine customs on the occasion of a marriage, which was by far the most important family ceremony of that time. A chamber was usually prepared for the newly married couple in the family palace of the groom, and paintings were mounted within it. The themes of such paintings were either romantic, exalting love and lovers, or exemplary, depicting heroines of virtuous fame. Botticelli's earliest known commission of this kind was for the marriage of Antonio Pucci's son Giannozzo in 1483, a set of four panels narrating a story from Boccaccio. Mythological figures had been used in earlier Renaissance secular art, but the complex culture of late Medicean Florence, which was simultaneously infused with the romantic sentiment of courtly love and with the humanist enthusiasm for classical antiquity and its vanished artistic traditions, employed these mythological figures more fully and in more correctly antiquarian fashion. A new mythological language became current, inspired partly by classical literature and sculpture and by descriptions of lost ancient paintings and partly by the Renaissance search for the full physical realization of the ideal human figure.

Among the greatest examples of this novel fashion in secular painting are four of Botticelli's most famous works: the "Primavera" (c. 1477-78; Uffizi), "Pallas and the Centaur" (c. 1485; Uffizi), "Venus and Mars" (c. 1485; National Gallery, London), and "The Birth of Venus" (c. 1485; Uffizi). The "Primavera," or "Allegory of Spring," and "The Birth of Venus" were painted for the villa of Lorenzo di Pierfrancesco de' Medici at Castello. All four of these panel paintings have been variously interpreted by modern scholarship. The figures certainly do not enact a known myth but rather are used allegorically to illustrate various aspects of love: in the "Primavera," its kindling and its fruition in marriage; in "Pallas," the subjugation of male lust by female chastity; in "Venus and Mars," a celebration of woman's calm triumph after man's sexual exhaustion; and in "The Birth of Venus," the birth of love in the world. The "Primavera" and "The Birth of Venus" contain some of the most sensuously beautiful nudes and seminudes painted during the Renaissance, though medieval decorum still regulates some of their costuming. The four paintings' settings, which are partly mythological—that of the "Prima-

vera" is the Garden of the Hesperides—and partly symbolic, are pastoral and idyllic in sentiment.

Botticelli's frescos from a chamber in the Villa Tornabuoni, celebrating the marriage of Lorenzo Tornabuoni and Giovanna degli Albizzi in 1486, also draw on classical mythology for their subject matter. In these frescos, real personages mingle with mythological figures: Venus, attended by her Graces, gives flowers to Giovanna degli Albizzi, while Lorenzo Tornabuoni, who is called to a mercantile life, is brought before Prudentia and the Liberal Arts.

The influence of the Renaissance humanist Leon Battista Alberti's art theories is apparent in Botticelli's classical borrowings and his meticulous use of linear perspective. In fact, Botticelli took himself so seriously as the reviver of the lost glories of classical painting that he inserted miniature reproductions of his own works into "The Calumny of Apelles" (c. 1495; Uffizi), a subject recommended by Alberti, who took it from a description of a work by the ancient Greek painter Apelles. Botticelli also drew inspiration from classical art more directly. While in Rome in 1481-82, for example, he reproduced that city's Arch of Constantine in one of his Sistine frescos. Three of the figures in the "Primavera" are taken from a classical statue of the Three Graces, while the figure of Venus in "The Birth of Venus" derives from an ancient statue of "Venus Pudica."

Late works. An incipient mannerism appears in Botticelli's latest works of the 1480s, but the magnificent Castello "Annunciation" (1490; Uffizi) and the small "Pietà" now in the Poldi-Pezzoli Museum prove that he could still produce masterpieces. But after the early 1490s his style changed markedly: the paintings are smaller in scale, the figures in them are now slender to the point of idiosyncrasy, and the painter, by accentuating their gestures and expressions, concentrates attention on their passionate urgency of action. This mysterious retreat from the idealizing naturalism of the 1480s perhaps resulted from Botticelli's involvement with the fiery reformist preacher Girolamo Savonarola in the 1490s. The years from 1494 were dramatic ones in Florence: its Medici rulers fell, and a republican government under Savonarola's dominance was installed. Savonarola was an ascetic idealist who attacked the church's corruption and prophesied its future renewal. According to Vasari, Botticelli was a devoted follower of Savonarola, even after the friar was executed in 1498. The spiritual tensions of these years are reflected in two religious paintings, the apocalyptic "Mystic Crucifixion" (1497; Fogg Art Museum, Cambridge, Mass.) and the "Mystic Nativity" (1501; National Gallery, London), which expresses Botticelli's own faith in the renewal of the church. "The Tragedy of Lucretia" (c. 1499) and "The Story of Virginia Romana" (1499) appear to condemn the Medici's tyranny and to celebrate republicanism.

Botticelli, according to Vasari, took an enduring interest in the study and interpretation of Dante's *Divine Comedy*. He made some designs to illustrate the first printed edition of 1481 and worked intermittently over the following years on an uncompleted set of large drawings that matched each canto with a complete visual commentary. He was also much in demand by engravers, embroiderers, and tapestry workers as a designer; among his few surviving drawings are some that can be associated with these techniques.

Although Vasari describes Botticelli as impoverished and disabled in his last years, other evidence suggests that he and his family remained fairly prosperous. He received commissions throughout the 1490s and was still paying his dues, if belatedly, to the Company of Saint Luke, the Florentine artists' guild, in

1505. But the absence of any further commissions and the tentativeness of the very last Dante drawings suggest that he was perhaps overtaken by ill health. Upon his death in 1510 he was buried in the Ognissanti. About 50 paintings survive that are either wholly or partly from his own hand. The Uffizi Gallery's magnificent collection of his works includes many of his masterpieces.

Horne, *Alessandro Filipepi, Commonly Called Sandro Botticelli, Painter of Florence* (1908, reprinted as *Botticelli, Painter of Florence*, 1980); Jacques Mesnil, *Botticelli* (1938), in French; and Ronald Lightbown, *Sandro Botticelli*, 2 vol. (1978), comprising a critical biography and a complete catalog, with a 2nd ed. of vol. 1, *Sandro Botticelli: Life and Works* (1989).

bottle, narrow-necked, rigid or semirigid container that is primarily used to hold liquids and semiliquids. It usually has a close-fitting stopper or cap to protect the contents from spills, evaporation, or contact with foreign substances.

Although early bottles were made from such materials as gourds and animal skins, glass eventually became the major material employed. Before 1500 BC the Egyptians produced glass bottles by covering silica paste cores with molten glass and digging out the core after the bottle hardened. By 200 BC glassblowing was practiced in China, Persia (modern Iran), and Egypt. Except for making the finest and most costly decorative bottles, hand methods were eventually replaced by processes employing metal molds, and automatic equipment for the continuous manufacture of bottles was introduced commercially in 1903.

Glass bottles afford highly effective protection of their contents and are attractive because of their transparency and high gloss and the variety of shapes attainable. Fragility is a major disadvantage, and only coloured glass protects those products sensitive to the action of light. Returnable glass bottles, which can be reused a number of times, are the least expensive to manufacture on a per use basis; although repeated handling costs may dissipate any saving.

Plastic bottles, made from raw materials derived from petroleum and manufactured much like glass types, offer the advantage of breakage resistance and lightness, and their contents often can be dispensed by squeezing. In some applications they are less effective than glass in product protection and lack the attractive gloss and transparency of glass. Their disposal contributes to pollution, because few plastic containers disintegrate upon exposure to the elements. Beginning in the mid-1990s, plastic recycling, especially for the commonly used high-density polyethylene and polyethylene terephthalate bottles, was instituted to reduce the solid-waste problem.

bottle gourd, also called **WHITE-FLOWERED GOURD**, or **CALABASH GOURD** (*Lagenaria siceraria*), running or climbing vine, of the gourd family (Cucurbitaceae), native to the Old World tropics but cultivated in warm climates for centuries for its ornamental and useful hard-shelled fruits.

Many forms of the bottle gourd have been cultivated for specific purposes, and the sizes of the vines, leaves, and flowers, as well as the sizes and shapes of the fruits, vary greatly. The forms are named for the shape of the fruit—e.g., club, dipper, dolphin, kettle, and trough.

A bottle gourd vine is quick-growing, with a hairy stem, long forked tendrils, and a musky odour. The large, showy white flowers and dense foliage make it a popular screen and ornamental plant. The hard-shelled fruits, edible when young, are made into water bottles, dippers, spoons, pipes, and many other utensils and containers. They also are fashioned into

birdhouses, fancy ornaments, lamps, and musical instruments. The fruits of some cultivated varieties may be more than 1 m (about 3 feet) long. Bottle gourds may be grown easily from seed but require a long, hot growing season to mature.

bottle tree, any of various trees of the genus *Brachychiton*, within the caecao, or chocolate, family (Sterculiaceae), native to Australia.

Bottle tree (*Brachychiton rupestris*)
G.R. Roberts

They grow to a height of 18 m (60 feet) and are cultivated as ornamentals. The name refers to the peculiar shape of the trunk.

bottlenose (bird): see puffin.

bottlenose whale, any of four species of beaked whales distinguished by a bulbous forehead that drops sharply to the base of the beak. All inhabit deep offshore waters and eat squid, fish, and various bottom-dwelling animals. Bottlenose whales are capable of long, deep dives; biologists recorded the dive of one northern bottlenose (*Hyperoodon annapullatus*) to almost 1,500 metres (4,900 feet) as it remained submerged for nearly two hours.

Baird's beaked, or giant bottlenose, whale (*Berardius bairdii*)
length 13 m (43 ft)

Baird's beaked whale (*Berardius bairdii*), drawn to scale with a diver
Encyclopædia Britannica, Inc.

Arnoux's beaked whale (*Berardius arnuxii*) and Baird's beaked whale (*B. bairdii*) are commonly called giant bottlenose whales. These are the largest of all the beaked whales, measuring about 13 metres long. Both have two pairs of large triangular teeth at the tip of the lower jaw, earning them the additional common name of four-toothed beaked whales. Each tooth projects upward about 10 cm (4 inches). The two species of bottlenose whale in the genus *Hyperoodon* have only one pair of small, conical teeth.

Bottlenose whales belong to the beaked whale family, Ziphiidae, of the toothed whale suborder, Odontoceti.

bottom water, dense, lowermost layer of ocean water that can be distinguished clearly

from overlying waters by its characteristic temperature, salinity, and oxygen content. Most bottom waters of the South Pacific, southern Indian Ocean, South Atlantic, and portions of the North Atlantic are formed near Antarctica during the southern winter. The partial freezing of seawater over the Antarctic continental shelf, particularly in the Weddell and Ross seas, produces salt-free ice and residual brine with a salinity of 34.62 parts per thousand and a temperature of -1.9°C (28.6°F). The high density of the brine, 1.02789 grams per cubic centimetre, causes it to sink. It is warmed somewhat during sinking by mixing with other waters, but its temperature is still -0.9°C when it reaches the deep seafloor and continues to flow northward along the bottom. Traced by this temperature, Antarctic bottom water crosses the Equator in the Atlantic Ocean and is observed as far north as 45°N latitude, in the vicinity of the Grand Bank.

The oxygen that is dissolved in seawaters at the surface sites of origin of bottom water—in concentrations of 4 to 6 millilitres per litre—is the sole source of this element for benthic life. Sparse deep-sea benthos respire very little oxygen; the concentrations diminish with increased distance of travel of the bottom water away from its source, however, and this trend may be used to identify the sources and estimate the flow velocity of the water. Bottom waters flow very slowly, at velocities of 1 to 2 centimetres per second (0.4 to 0.8 inches per second), except along the western margins of the ocean basins, where velocities of 10 cm/sec have been calculated.

bottomry, a maritime contract (now almost obsolete) by which the owner of a ship borrows money for equipping or repairing the vessel and, for a definite term, pledges the ship as security—it being stipulated that if the ship be lost in the specified voyage or period, by any of the perils enumerated, the lender shall lose his money. A similar contract creating a security interest in the cargo is called a *respondentia*.

Bottrop, city, North Rhine-Westphalia *Land* (state), northwestern Germany. It lies at the northern edge of the Ruhr industrial region, on the Rhine-Herne Canal, northwest of

Essen. Although mentioned in the Middle Ages, it remained a small peasant community until coal was discovered there in the latter part of the 19th century. Most of its churches and public buildings date from after 1860, although the city was not chartered until 1921.

The annexations in 1975 of Kirehhellen and Gladbeck nearly doubled the population of the city. An industrial section lies to the south; extensive park and woodland (Köllnischer Wald) stretch to the north. Coal mining and coking dominate the economy; manufactures include chemical by-products of coal, machinery, and structural steel. Pop. (1995 est.) 119,669.

botulism, poisoning by the toxin, called botulinum toxin, or botulin, produced by *Clostridium botulinum* bacteria. This poisoning results

most frequently from the eating of improperly sterilized canned foods containing the toxin. *C. botulinum* bacteria cannot survive in the presence of oxygen and normally live in the soil, where they form heat-resistant spores that may contaminate fresh food to be canned. The spores survive if the food is not cooked at a high enough temperature for a sufficient length of time. Then, inside the sealed can, the spores germinate and release the bacteria, and, as the bacteria multiply, they secrete their toxin, a protein that is one of the most potent poisons known. Unlike the spores, the toxin is readily destroyed by heat; it remains potent if the contaminated food is not heated before it is eaten. Once ingested and absorbed, the toxin damages the autonomic nervous system by blocking the transmission of nerve impulses.

The first symptoms of poisoning, nausea and vomiting, usually appear six hours or less after the contaminated food is eaten, depending upon the amount of toxin ingested. The poisoned person becomes tired and may complain of headache and dizziness. Often his vision is blurred, and he may see double. The mucous membranes of the throat may become dry; the affected person may feel a constriction in the throat, soon associated with difficulty in swallowing and speaking; and a general muscle weakness occurs. The respiratory muscles become involved. Early tracheotomy—the cutting of an emergency air passage into the windpipe—and the prompt use of mechanical aids to respiration may be lifesaving; about half the deaths from botulism result from paralysis of the respiratory muscles. Usually a person recovers completely if he survives the paralysis. With early diagnosis, the chance of a person's surviving is greatly enhanced by the prompt administration of botulism antitoxins—substances that neutralize the toxin in the body. Often, however, the severe symptoms do not develop until the poison has already damaged the nervous system; at this stage, it is ordinarily too late for the antitoxins to be fully effective.

Botulism most commonly originates with home-canned foods, rather than with foods that have been canned commercially.

Botvinnik, Mikhail Moiseyevich (b. Aug. 17 [Aug. 4, Old Style], 1911, St. Petersburg, Russia—d. May 5, 1995, Moscow), Soviet chess master who held the world championship three times (1948–57, 1958–60, 1961–63).

At the age of 14, less than two years after he had learned the moves of chess, Botvinnik defeated the then-current world champion, José Raúl Capablanca, in one game of an exhibition in which Capablanca played simultaneously against several opponents. In 1931 Botvinnik won the chess championship of the Soviet Union for the first of seven times. He won the world championship in a 1948 tournament held to choose a successor to Alexander Alekhine, whose death in 1946 had left the title vacant. Botvinnik lost the title in 1957 to Vasily Smyslov but regained it the following year; in 1960 he was challenged successfully by Mikhail Tal but once more regained the championship in 1961. After losing to Tigran Petrosyan in 1963, he abandoned competition for the world title, though he continued to play in important tournaments and to write on chess.

Botvinnik's style of play was eclectic, methodical, and rational rather than strongly intuitive. He wrote numerous books on chess, and his scientific approach influenced a generation of Soviet chess players, among them Anatoly Karpov and Gary Kasparov.

Botvinnik graduated as an electrical engineer from the Leningrad Polytechnic Institute

in 1932 and from 1955 was an associate of the All-Union Scientific Research Institute of Electrical Energy.

Bou Saâda, town, north-central Algeria. It is located between el-Hodna Depression (a salt lake) and the mountains of the Saharan Atlas. Although north of the Sahara, Bou Saâda is a true oasis, spread along the left bank of the Bou Saâda Wadi and standing in pleasant contrast to the nearby barren Ouled Nail Mountains and the often dry salt marsh. The town's old walled quarter (*ksar*) of arched, winding alleyways lies north of the modern French-built sector. Farther north, thousands of date palms are watered from the steep-banked, permanent stream.

Long an important caravan centre between West Africa and the Mediterranean, the town supports a daily market of jewelry, metalwork, carpets, and the long, tapering *bousaadi* knives. Both Arab and Berber nomads frequent the town to trade and rest. Bou Saâda (meaning "place of happiness") is a popular winter resort. A textile mill is located in the new quarter. Pop. (1987 prelim.) 66,688.

Bouaflé, town, central Côte d'Ivoire (Ivory Coast). Bouaflé lies on the north bank of the Bandama Rouge River. It is the chief trade centre (coffee, yams, cassava, and plantains) of a transitional zone of dense forest and savanna, which is mainly inhabited by the agricultural Guro (Gouro) and Gagu (Gagou) peoples. Pop. (1988) 34,562.

Bouaké, city, central Côte d'Ivoire (Ivory Coast). It lies on the road and railroad from Abidjan (the national capital) to Ouagadougou, Burkina Faso (formerly Upper Volta). Bouaké was established as a French military post in 1899; it became an autonomous municipality in 1969. The city is the nation's second largest community and the commercial and transportation hub of the interior. Cotton, tobacco, sisal, and rice are processed there; the nearby Gonfreville Establishment is the oldest (1922) and largest textile mill in the country. Bouaké has been the chief trade centre for the rice, yams, and livestock raised by the Baule (Baoule) people since the completion of the railway in 1912. The city is also a collecting point for various goods that are sent to Abidjan, 238 miles (383 km) south-southeast, for export. Bouaké has textile and veterinary research institutes and is also the seat of a Roman Catholic bishop. Masks, bronzes, Senoufo (Senoufo) or Dahomean fabrics, and various other objects are marketed in Bouaké. Pop. (1988) 329,850.

Consult the INDEX first

Bouchardon, Edmé (b. May 29, 1698, Chaumont, France—d. July 27, 1762, Paris), French sculptor who was a precursor of Neoclassicism. His statues are characterized by a skillful combination of classical Roman techniques and contemporary motifs.

Bouchardon studied with Guillaume Coustou and in 1722 won the Prix de Rome. For the next 10 years he lived in Rome, executing marble replicas of antique statues as well as numerous portrait busts.

Upon returning to France he became sculptor to Louis XV and produced significant work for the royal residence. Though he began his career as an artist committed to classicism, Bouchardon did produce work with Rococo characteristics. The "Fountain of the Seasons" (1739–45) in the rue de Grenelle in Paris is an elaborate, two-storied architectural piece decorated with reliefs and statues of the seasons and a personification of Paris. The putti ornamentation shows the influence of the Rococo. "Cupid Cutting His Bow from the Club of Hercules" (1739–50) is a classical piece now exhibited at the Louvre. Bouchardon's bronze

equestrian statue of Louis XV (1748–62) once stood in the centre of the Place de la Concorde but was destroyed during the French Revolution.

Boucher, François (b. Sept. 29, 1703, Paris, France—d. May 30, 1770, Paris), painter, engraver, and designer whose works are regarded as the perfect expression of French taste in the Rococo period.

Trained by his father, a lace designer, Boucher won the Prix de Rome in 1723. He was influenced by the works of Giovanni Battista Tiepolo, Peter Paul Rubens, and his teacher François Le Moine (Le Moyne). Boucher's first major commission was for engravings of 125 drawings by Antoine Watteau. After illustrating an edition of Molière's works, he drew cartoons of farmyard scenes and chinoiserie for the Beauvais tapestry factory.

Boucher first won fame with his sensuous and light-hearted mythological paintings and pastoral landscapes. He executed important decorative commissions for the queen at Versailles and for his friend and patron, Mme de Pompadour, at Versailles, Marly, and Bellevue. He became a member of the Royal

"Spring," detail of a painting by François Boucher for Mme de Pompadour, 1755; in the Frick Collection, New York City

Copyright The Frick Collection, New York City

Academy in 1734 and then became the principal producer of designs for the royal porcelain factories, as well as director of the Gobelins tapestry factory. In 1765 he became director of the Royal Academy and held the title of first painter to King Louis XV.

During the 1740s and '50s Boucher's elegant and refined but playful style became the hallmark of the court of Louis XV. His work was characterized by the use of delicate colours, gently modeled forms, facile technique, and frivolous subject matter. Boucher is generally acclaimed as one of the great draftsmen of the 18th century, particularly in his handling of the female nude.

Although immensely successful, Boucher lost his artistic preeminence toward the end of his life; overproduction, poor translations of his paintings into tapestries, the growing sterility of his own work, and the emergence of Neoclassicism caused him to lose favour, both with the public and with such leading art critics as Denis Diderot.

Boucher de Perthes, Jacques, in full JACQUES BOUCHER DE CRÉVECOEUR DE PERTHES (b. Sept. 10, 1788, Rethel, France—d. Aug. 5, 1868, Abbeville), French archaeologist and writer who was the first to develop the idea that prehistory could be measured on the basis of periods of geologic time.

From 1825 Boucher de Perthes was director of the customhouse at Abbeville, near the mouth of the Somme River, and began devoting his leisure to archaeological searches

in the Somme valley. In 1837 he discovered flint hand axes and other stone tools, some imbedded with the bones of extinct mammals, in gravels deposited during the Pleistocene Epoch, or Ice Age (concluded about 10,000 years ago).

Though not the first to find evidence of Stone Age culture, Boucher de Perthes was the first to draw the attention of the scientific world to its revolutionary significance, because 4004 BC was then still thought to be the year of the creation. In 1838 the tools he presented in evidence before the scientific society of Abbeville met with disbelief, and his monograph on primitive toolmaking (1846) was ignored. At first he thought that the hand axes were made at the time of the deluge described in Genesis, but he subsequently concluded that, even if the gravels had resulted from but one deluge, the creators of the tools ("Antediluvian Man") must have existed prior to it.

In 1859, the year that Darwin's *Origin of Species* was published, Boucher de Perthes's conclusions were at last upheld by a group of eminent British scientists, including Charles Lyell, who visited the excavated sites. His archaeological writings include *Antiquités celtiques et antédiluviennes*, 3 vol. (1847-64).

Boucher-Desnoyers, Auguste-Gaspard-Louis: see Desnoyers, Auguste-Gaspard-Louis, Baron.

Boucherville, town, Montérégie region, southern Quebec province, Canada, on the east bank of the St. Lawrence River, opposite Montreal Island (Île de Montréal) and northeast of Montreal city. Founded in 1668 by Pierre Boucher, after whom it is named, the town has long been a market-gardening centre. Since World War II it has developed rapidly into a residential suburb linked to Montreal by the LaFontaine Bridge-Tunnel of the Trans-Canada Highway. Food canning and the manufacture of clothing are the main industries. The birthplace of Sir Louis Hippolyte LaFontaine (a prime minister of United Canada), Boucherville is also the site of a 17th-century manor house built by its founder. Inc. 1957. Pop. (1991) 33,796.

Bouches-du-Rhône, département, Provence-Alpes-Côte d'Azur région, southeastern France, at the *bouches* ("mouths") of the Rhône. It was formed in 1790 from the southern part of Provence. The *département* is bounded on the north by the Durance River, and its southern boundary fronts the Mediterranean coast for 120 miles (193 km), from the Rhône River delta to the rocky shore beyond La Ciotat. The marshy delta triangle below Arles, called the Camargue (*q.v.*), is devoted to rice growing and horse herding. East of the Rhône's main channel is the flat, irrigated, boulder-strewn tract of the Crau, stretching as far north as the Alpilles, a westward prong of the Alps. The Crau's vegetable and fodder plantings are sheltered from the mistral by belts of cypress. Elsewhere, the traditional Mediterranean trilogy prevails: wheat, wine, and olives. The eastern part of the *département* consists of lowland basins set amid scarped limestone hills. They include the Étang de Berre, a shallow coastal lagoon, connected to the sea by a narrow channel and to Marseille by the Tunnel du Rove, which tunnels through Mont Nerthe.

Economic enterprises include rice milling at Arles, naval shipbuilding at La Ciotat, ceramic manufacture at Aubagne, and cement making at La Bédoule. Although bauxite, named for the feudal Alpilles town of Les Baux, was first discovered and exploited in the Bouches-du-Rhône, production has shifted to the adjacent Var *département*. The great port city of Marseille dominates the *département's* commercial and industrial life. The oil port of Lavéra was established after World War II on the Étang de Berre to service the Marseille

shore refineries, and petrochemical industries followed. Brine evaporation has for long been a coastal activity. The construction of the industrial complex at Fos-sur-Mer (steel and petrochemicals) introduced heavy industry to France's Mediterranean littoral.

The ancient Roman cities of Aix and Arles are tourist centres. The paintings of Paul Cézanne and Vincent van Gogh have made known the sun-baked, terraced landscape of the region, which is traversed by the Roman Via Aurelia, a route to the Riviera and Italy, now followed by modern highways. Marseille, capital of the *département* and of the Provence-Alpes-Côte d'Azur economic planning *région*, is also the seat of an *arrondissement*, as are both Aix and Arles. Area 1,964 square miles (5,087 square km). Pop. (1991 est.) 1,775,076.

Boucicault, Dion, original name DIONYSIUS LARDNER BOURSICQUOT (b. Dec. 26, 1820/22, Dublin, Ire.—d. Sept. 18, 1890, New York, N.Y., U.S.), Irish-American playwright and actor, a major influence on the form and content of American drama.

Educated in England, Boucicault began acting in 1837 and in 1840 submitted his first play to Mme Vestris at Covent Garden; it was rejected. His second play, *London Assurance* (1841), which foreshadowed the modern social drama, was a huge success and was frequently revived into the 20th century. Other notable early plays were *Old Heads and Young Hearts* (1844) and *The Corsican Brothers* (1852).

In 1853 Boucicault and his second wife, Agnes Robertson, arrived in New York City, where his plays and adaptations were long popular. He led a movement of playwrights that produced in 1856 the first copyright law for drama in the United States. His play *The Poor of New York*, based on the panics of 1837 and 1857, had a long run at Wallack's Theatre in 1857 and was presented elsewhere as, for example, *The Poor of Liverpool*. *The Octoroon; or, Life in Louisiana* (1859) caused a sensation with its implied attack on slavery.

Boucicault and his actress wife joined Laura Keane's theatre in 1860 and began a series of his popular Irish plays—*The Colleen Bawn* (1860), *Arrah-na-Pogue* (1864), *The O'Dowd* (1873), and *The Shaughraun* (1874). Returning to London in 1862, he provided Joseph Jefferson with a successful adaptation of *Rip Van Winkle* (1865). In 1872 Boucicault returned to the United States, where he remained, except for a trip to Australia that resulted in his third marriage (for which he renounced the legitimacy of his second marriage). Among his associates in the 1870s was the young David Belasco. At the time of his death he was a poorly paid teacher of acting in New York City.

About 150 plays are credited to Boucicault, who, as both writer and actor, raised the stage Irishman from caricature to character. To the American drama he brought a careful construction and a keen observation and recording of detail. His concern with social themes prefigured the future development of drama in both Europe and America.

Boucicault, Jean II le Meingre (b. c. 1366—d. 1421, Yorkshire, Eng.), marshal of France, French soldier, and champion of the ideals of chivalry.

He was the son of Jean I le Meingre (d. 1368), also called Boucicault and likewise a marshal of France. After the younger Boucicault had served in several campaigns, Charles VI made him a marshal in 1391. During an expedition to Hungary in 1396, he was captured at Nicopolis (now Nikopol, Bulgaria) and ransomed by the Turks. In 1399, with troops and a fleet from the West, he defended the Byzantine Empire by defeating a Turkish fleet at Gallipoli and preventing the capture of Galata. After holding off the Turks from Constantinople for a year, he returned to France for volunteers. He was sent instead

to strengthen the French administration in Genoa, which he temporarily secured after a skirmish with Venice; the Genoese, however, ousted the French in 1409 while Boucicault was away.

Boucicault, detail of an engraving by an unknown artist

By courtesy of the Bibliothèque Nationale, Paris

Founder of the Dame Blanche à l'Écu Vert ("White Lady of the Green Shield"), an order to defend the female relatives of absent knights, he was skilled in the tournament. Boucicault was taken prisoner in the Battle of Agincourt in 1415 and died in England.

Boudewijn (Dutch personal name): see under Baldwin.

Boudewijn I (king of Belgium): see Baudouin I.

Boudicca, also spelled BOADICEA (d. AD 60), ancient British queen who in AD 60 led a revolt against Roman rule.

Boudicca's husband, Prasutagus, was king of the Iceni (in what is now Norfolk) as a client under Roman suzerainty. When Prasutagus died in 60 with no male heir, he left his private wealth to his two daughters and to the emperor Nero, trusting thereby to win imperial protection for his family. Instead, the Romans annexed his kingdom, humiliated his family, and plundered the chief tribesmen. While the provincial governor Suetonius Paulinus was absent in 60, Boudicca raised a rebellion throughout East Anglia. The insurgents burned Camulodunum (Colchester), Verulamium, the mart of Londinium (London), and several military posts; massacred (according to Tacitus) 70,000 Romans and pro-Roman Britons; and cut to pieces the Roman 9th Legion. Paulinus met the Britons at a point thought to be near present-day Fenny Stratford on Watling Street and in a desperate battle regained the province. Boudicca took poison or died of shock.

Boudin, Eugène (b. July 12, 1824, Honlleur, France—d. Aug. 8, 1898, Deauville), one of the first French landscape painters to paint in the open air, directly from nature. His many beach scenes directly link the carefully observed naturalism of the early 19th century and the brilliant light and fluid brushwork of late 19th-century Impressionism.

Encouraged at an early age by the French landscape artist Jean-François Millet, Boudin studied briefly in Paris, where he became enamored of the paintings of Jean-Baptiste-Camille Corot. Back on the Atlantic coast in 1853, Boudin began to paint the sea, his lifelong passion, making careful annotations on the backs of his paintings of the weather, the light, and the time of day. In 1858 he met Claude Monet, then only 18 years old, and persuaded him to become a landscape painter, helping to instill in him a love of bright hues and the play of light on water later evident in Monet's Impressionist paintings.

Boudin exhibited with the Impressionists in

1874 but was not an innovator, and from 1875 onward he exhibited in the official Salon. Although his beach scenes sold well, he received

"On the Beach of Deauville," painting on wood by Eugène Boudin, 1869, in the Louvre, Paris

Giraudon—Art Resource/EB Inc

little recognition until 1888, when the French government began to buy a few of his works for the Luxembourg Gallery. He eventually was generally recognized as a master and in 1892, when he was 68 years old, received the Legion of Honour.

boudinage (from French *boudin*, "sausage"), cylinderlike structures making up a layer of deformed rock. Seen in cross section, the cylinders, or boudins, are generally barrel-

Boudinage of feldspar intruded between hornblende gneiss, Tom Jones Mountain, Hudson Highlands, New York

Jerome Wyckoff

shaped but may be lenslike or rectangular. They commonly lie adjacent to each other and are joined by short necks to give the appearance of a string of sausages (hence their name). The thickest boudins are about 20 m (65 feet) thick, and the thinnest about 1 cm (0.39 inch).

Boudinage results from the stretching of a firm but flexible stratum, as during slip or flexure-slip folding. The exact method of formation is not clearly understood. Generally the boudins lie parallel to the fold axes, but occasionally two sets of mutually perpendicular boudins may occur in the same stratum, one set parallel to the fold axes, the other perpendicular to them. Adjacent weak strata may flow into the necks of the boudins, or the necks may be filled with recrystallized minerals such as quartz, feldspar, or calcite. Boudinage occurs in a variety of rock types and is one of the more common structures found in folded rocks.

Boudinot, Elias (b. May 2, 1740, Philadelphia—d. Oct. 24, 1821, Burlington, N.J., U.S.), American lawyer and public official who was involved in the U.S. War of Independence.

Boudinot became a lawyer and attorney-at-law in 1760. He was a leader in his pro-

cession, and, though he was a conservative Whig, he supported the American Revolution. He became a member of the Revolutionary Party at the outbreak of the American Revolution, serving first as deputy in the New Jersey provincial assembly and then as one of New Jersey's representatives in the Continental Congress. After the establishment of the government of the United States of America, Boudinot served for six years (1789–95) as a member of the national House of Representatives. He became director of the U.S. Mint at Philadelphia in 1795 and held that position for 10 years.

Boudjedra, Rachid (b. Sept. 5, 1941, Aïn Beïda, Alg.), prolific and revolutionary Algerian writer whose first novel, *La Répudiation* (1969; "The Repudiation"), gained notoriety because of its explicit language and frontal assault on Muslim traditionalism in contemporary Algeria. He was hailed as the leader of a new movement of experimental fiction.

Boudjedra was given a traditional Muslim upbringing in Algeria and Tunisia, then continued his education in Spain, Algeria, and Paris, where he obtained a degree in philosophy at the Sorbonne. He later taught philosophy in Paris and at Rabat, Mor., and worked for the Algerian Bureau of Cinematography.

La Répudiation draws upon Boudjedra's difficult youth. Conventional values and the smug complacency of the established powers in newly independent Algeria are rejected by Boudjedra, whose unorthodox sexual fury and lyrical savagery defied traditional morality. Boudjedra's next novel, *L'Insolation* (1972; "Sunstroke"), evoked experimental states of mind, confounding dream with reality. His later works employed different styles. *Topographie idéale pour une agression caractérisée* (1975; "Ideal Topography for a Specific Aggression") takes as its protagonist an illiterate Berber peasant drawn to the city by the prospect of work; lost in the capital's subway, he is bombarded by a host of bewildering scenes and events. In *L'Escargot enlété* (1977; "The Stubborn Snail"), a petty bureaucrat exposes his mediocre life and values, symbolizing the incompleteness of the Algerian revolution. With *Les 1001 Années de la nostalgie* (1979; "1,001 Years of Nostalgia"), Boudjedra created a satire of an imaginary Saharan village confronted with what he viewed as the newest

symbol of contemporary cultural imperialism, an American film company.

Boué, Ami (b. March 16, 1794, Hamburg [Germany]—d. Nov. 21, 1881, Vienna, Austria), Austrian geological pioneer who fostered international cooperation in geological research.

While studying medicine in Edinburgh, Boué became interested in geology through the influence of the noted Scottish geologist Robert Jameson. Boué studied the volcanic rocks in various parts of Scotland and the Hebrides and later published his findings in *Essai géologique sur l'Écosse* (1820; "Geological Essay on Scotland").

He received his M.D. in 1817 and continued his medical studies on the European continent but ultimately decided to devote himself to geology. He settled in Paris in 1830 and was a founder of the Société Géologique de France. For the next four years he published reports on geological progress in other countries in the *Bulletin de la Société Géologique de France* ("Bulletin of the Geological Society of France"). In 1835 he moved to Vienna. He later made three trips to Turkey and published his geological findings in *La Turquie d'Europe* (1840; "European Turkey"). He then

Boué, lithograph by Thierry Frères after a portrait by J. Bully, 1830

By courtesy of the Bild Archiv, Österreichische Nationalbibliothek, Vienna

returned to Vienna, and in 1845 he finished his comprehensive overview of geology, *Essai de carte géologique du globe terrestre* ("Essay on a Geological Map of the World").

Bouea (Cameroon): see Buea.

Boufarik, town, northern Algeria, in the centre of the irrigated Mitidja plain. Founded by Governor Bertrand Clauzel in 1836 on malarial swampland, the settlement successfully adopted intensive cultivation methods. Built on a rectangular plan with long, straight, shaded streets, the town is bounded by the Wadi el-Khemis (west), the Wadi Bouchemla (east), low-lying coastal hills (north), and the first ridges of the Atlas Mountains (south). An agricultural economy prevails based on grapes, citrus fruits, cereals, tobacco, and truck crops. Flowers are also raised and distilled for perfume. Boufarik has a cooperative wine distillery and a cattle market. Pop. (1987 prelim.) mun., 54,023.

Boufflers, Louis-François, duc de (duke of) (b. Jan. 10, 1644, Cagny, Fr.—d. Aug. 22, 1711, Fontainebleau), a leading French general in the wars of King Louis XIV.

Born into an ancient Picard family, he entered the French army in 1662 and distinguished himself as a commander of the royal dragoons during the Dutch War (1672–78). Boufflers became a marshal of France in 1693 during the War of the Grand Alliance (1689–97) between France and other major European powers. The following year he was created a duke. In 1695 he defended Namur for two months against Anglo-Dutch forces under William III of Orange; 8,000 Frenchmen perished before he finally surrendered the garrison.

The duke de Boufflers, engraving by Claude-Augustin Duflos, 17th century

By courtesy of the Bibliothèque Nationale, Paris

Spanish Succession, 1701–14), Boufflers was given the French command in the Spanish Netherlands. He defeated the Dutch at Nijmegen (1702) but was driven from Dutch soil by the British commander John Churchill, 1st duke of Marlborough. In 1704 he became commander of the royal bodyguard.

In 1708 Boufflers defended Lille for three months before surrendering to the British and Austrians. Despite his age and infirmities, he served under Marshal Villars in Flanders the following year. When Villars fell wounded at the Battle of Malplaquet (September 11), Boufflers led a masterly retreat that saved his army from annihilation.

Boufflers, Stanislas-Jean, chevalier de (knight of) (b. May 31, 1738, Nancy, France—d. Jan. 18, 1815, Paris), French writer, soldier, and academician remembered chiefly for his picaresque romance, *Aline, reine de Golconde* ("Aline, Queen of Golconda").

His mother, the marquise de Boufflers, became the mistress of Stanislaw Leszczyński, king Stanislaw I of Poland and duke of Lorraine, and brought her son up at the ducal court at Lunéville. While Boufflers was studying theology at Saint-Sulpice in Paris, he wrote his masterwork, *Aline*, a charming tale of a milkmaid who, after a series of improper adventures, becomes queen of Golconda. The story won its author immediate fame but caused his expulsion from Saint-Sulpice.

Boufflers joined the Knights of Malta, thus combining qualification for ecclesiastical benefices in Lorraine with the military career more suited to his taste. For the next 24 years he fought in campaigns in Europe, returning frequently to the salons of Paris, where he established a reputation for wit and fell in love with the comtesse de Sabran. After serving as governor of the new French colony of Senegal, he returned to France and won election to the

Académie Française (1788). In 1789 he was elected deputy for the nobility of Nancy to the States General, but the Revolution alarmed him, and he emigrated to Germany in 1791. The loss of his benefices permitted him to abandon his vow of celibacy and marry Mme de Sabran. In 1800, with Napoleon's rise to power, Boufflers returned to Paris and supervised the edition of his complete works (1803).

Bougainville, Louis-Antoine de (b. Nov. 11, 1729, Paris, France—d. Aug. 31, 1811, Paris), French navigator who explored areas of the South Pacific as leader of the French naval force that first sailed around the world (1766–69). His widely read account, *Voyage autour du monde* (1771; *A Voyage Round the World*, 1772), helped popularize a belief in the moral worth of man in his natural state, a concept of considerable significance in the French thought of his day.

He entered the army at age 24, went to Canada (1756) as aide-de-camp to Gen. Louis-Joseph de Montcalm, and distinguished himself against the British in the French and Indian War. Having left the army for the navy in 1763, he voyaged the next year into the Atlantic near the tip of South America to establish a colony for France in the Falkland Islands; it was ceded to Spain in 1767.

Bougainville, engraving by Émile Lassalle after Maurn

Commissioned by the French government to circle the Earth in a voyage of exploration, he put to sea in December 1766, accompanied by naturalists and other scientists. He passed through the Strait of Magellan, headed northwest through the South Pacific, and visited Tahiti. Sailing west, he touched Samoa and the New Hebrides and then continued west into waters not previously navigated by any European ship. He turned north on the fringes of the Great Barrier Reef without sighting Australia, passed the edge of the Solomon Islands, and went on to New Britain. Because his men were by then suffering from scurvy, and the ships needed refitting, he stopped at Buru in the Moluccas (September 1768) and at Batavia (now Jakarta) in Java. He returned to Saint-Malo, in Brittany, in March 1769.

Bougainville became secretary to Louis XV (1772) and served as *chef d'escadre* (commander) in operations of the French fleet off North America (1779–82) in support of the American Revolution. After a French defeat off Martinique (April 12, 1782), he was court-martialled. During the French Revolution, he escaped the massacres of Paris in 1792 and settled on his estate in Normandy. Napoleon I made him a senator, count, and member of the Legion of Honour. Named for him are the largest of the Solomon Islands, a strait in the New Hebrides group, and the plant genus *Bougainvillea*.

Bougainville Island, easternmost island of Papua New Guinea, in the Solomon Sea, southwestern Pacific Ocean. With Buka and several island groups, it forms the autonomous

region of Bougainville. Bougainville is the largest of the Solomon Islands, located near the northern end of that chain. It is 75 miles (120 km) long and 40–60 miles (65–95 km) wide. The Emperor Range, with active volcanoes reaching 9,000 feet (2,740 m), occupies the northern half of the island, and the Crown Prince Range occupies the southern half. Coral reefs fringe the shore. Buka is the capital.

The main island and the passage between it and Choiseul Island (southeast) were visited in 1768 by the French navigator Louis-Antoine de Bougainville, for whom both were named. Placed under German administration in 1898, it was occupied by Australian forces in 1914 and included in an Australian mandate in 1920. The Japanese occupied the island early in 1942, and remnants of the Japanese garrison remained until 1945. Bougainville was returned to Australian administration as part of the UN Trust Territory of New Guinea. When Australia granted independence to Papua New Guinea in 1975, Bougainville and neighbouring islands became part of the new country as North Solomons province (Bougainville province from 1997).

A secessionist movement emerged on Bougainville in the late 1980s, fanned by islanders' dissatisfaction with their share of the revenues from a copper mine at Panguna on Bougainville. An insurrection, begun in 1988, closed the mine the following year. Rebels controlled the island until 1991, when federal troops regained control, but the conflict continued; by the late 1990s as many as 15,000 people had been killed. In 2001, secessionists and the government reached an agreement that called for Bougainville and nearby islands to form an autonomous region. A constitution was approved in 2004, and in 2005, following elections, the new government took office.

Major Bougainville towns include Arawa and Kieta, which supports most of the commerce of the area. Copra and some cocoa and timber are exported from Kieta. Panguna is one of the world's largest open-cut mines; before it was shut down its copper accounted for much of the country's export earnings. Talks have been held on reopening the mine. Area 3,590 square miles (9,300 square km). Pop. (2000) province, 175,160.

Bougainvillea, genus of about 14 species of shrubs, vines, or small trees, in the four-o'clock family (Nyctaginaceae), native to South America. Many species are spiny. Only the woody vines have wide popularity; several species have produced very showy cultivated varieties often grown indoors and in conservatories.

The inconspicuous flowers are surrounded by brightly coloured papery bracts, for which one species, *B. glabra*, from Brazil, is called paperflower; the bracts are purple or magenta to lighter tints in certain varieties. *B. peruviana*, from Colombia to Peru, has rose to magenta bracts. *B. × buttiana*, a probable hybrid of *B. glabra* and *B. peruviana*, has given rise to varieties having lemon yellow ("Golden Glow"), orange ("Louis Wathen"), and crimson ("Mrs. Butt") bracts. Bougainvilleas are hardy in warm climates.

Boughton, Rutland (b. Jan. 23, 1878, Aylesbury, Buckinghamshire, Eng.—d. Jan. 25, 1960, London), composer of operas, the principal English advocate of the theories of music drama expounded by Richard Wagner.

Boughton studied at the Royal College of Music in 1900 but was otherwise self-taught. He had the idea of writing a series of music dramas based on Arthurian legends and of creating a festival theatre for their performance at Glastonbury. (A few performances took place in 1914.) His most notable success was the tuneful Romantic opera *The Immortal Hour* (1913), which ran for 216 performances in

London. His other operas include *The Queen of Cornwall* (1924), *The Lily Maid* (1934), and *Galahad* (1944). With Reginald Buckley, his partner in the Glastonbury scheme, he

published a book, *The Music Drama of the Future* (1908).

Bouguer, Pierre (b. Feb. 16, 1698, Le Croisic, Fr.—d. Aug. 15, 1758, Paris), versatile French scientist best remembered as one of the founders of photometry, the measurement of light intensities.

Bouguer was a prodigy trained by his father, Jean Bouguer, in hydrography and mathematics. Upon his father's death, Pierre—at age 15—succeeded the elder Bouguer as royal professor of hydrography. During the 1720s he made some of the earliest measurements in astronomical photometry, comparing the apparent brightness of celestial objects to that of a standard candle flame. In 1735 he set off on an expedition with C.M. de la Condamine to measure an arc of the meridian near the equator in Peru; he used the results obtained to make a new determination of the Earth's shape. He gave a full account of his researches in *La Figure de la terre* (1749; "The Shape of the Earth"). Bouguer measured gravity by pendulum at different altitudes and was the first to attempt to measure the horizontal gravitational pull of mountains. He observed the deviation of the force of gravity, measured on a high plateau, from that calculated on the basis of the elevation, and he correctly ascribed the effect to the mass of matter between his station and mean sea level. He made tables of atmospheric refraction, investigated the absorption of light in the atmosphere, and formulated Bouguer's law (sometimes called Lambert's law), regarding the attenuation of a light beam in a transparent medium. This law and his photometric work he published in his *Essai d'optique sur la gradation de la lumière* (1729; *Optical Treatise on the Gradation of Light*).

Bouguer devoted much of his life to the study of nautical problems. He wrote on naval maneuvers and navigation and, in ship design, derived a formula for calculating the metacentric radius, a measure of ship stability.

Bouguereau, William-Adolphe (b. Nov. 30, 1825, La Rochelle, Fr.—d. Aug. 19, 1905, La Rochelle), French painter, a dominant figure in his nation's academic painting during the second half of the 19th century.

Bouguereau entered the *École des Beaux-Arts* in 1846 and was awarded the *Prix de Rome* in 1850. Upon his return to France from four years' study in Italy, he attracted a wide following with his mythological and allegorical paintings, although his portrait paintings are perhaps held in higher esteem today. His work was characterized by a highly finished, technically impeccable realism and a sentimental interpretation of his subject matter. Bouguereau received many honours in the 1860s and '70s

as his career progressed; he exhibited regularly at the Salon for several decades and became for a time the most famous French painter of his day. As a proponent of official orthodoxy in painting, he played a major role in the exclusion of the works of the Impressionists and other experimental painters from the Salon. In his later years he decorated the chapels of several Parisian churches and painted religious compositions in a Pre-Raphaelite style. He exerted a wide influence, not only in France but in other countries, particularly the United States. In 1876 he was made a member of the Academy of Fine Arts.

Modern critics tend to assess Bouguereau as a painter who sacrificed boldness of technique and originality of outlook for a highly polished but conventional treatment of the human form.

bouillabaisse, complex fish soup originating on the Mediterranean coast of France, one of the glories of Provençal cuisine. Recipes for bouillabaisse abound, but the Marseilles formulation is generally acknowledged as the most authentic; it contains, besides fish and shellfish, olive oil, onions, tomatoes, garlic, parsley, saffron, fennel, thyme, bay leaf, and orange peel. True bouillabaisse must be made with Mediterranean fish, including the essential *racasse* (a bony rock fish), plus whiting, conger eel, mullet, chapon, saint-pierre, and a number of others. Spiny lobsters and crabs are used, as are mussels in the Parisian version of the dish. All the ingredients must be quickly boiled together. *Rouille*, a paste of garlic, red pepper, bread crumbs, and fish stock, is added at table as a condiment to heighten the flavour. Bouillabaisse has inspired literary praise in verse and prose, notably a ballad by William Makepeace Thackeray on his enjoying a bouillabaisse in Paris.

Bouillaud, Jean-Baptiste (b. Sept. 16, 1796, Garat, Fr.—d. Oct. 29, 1881, Paris), French physician and medical researcher who was the first to establish clinically that the centre of speech is located in the anterior lobes of the brain. He was also the first to differentiate between loss of speech resulting from the inability to create word forms and remember them and that resulting from the inability to control the movements involved in speech. Bouillaud further made important contributions in cardiology, establishing the connection between the occurrence of heart disease and acute articular rheumatism. He helped explain the mechanism and significance of the normal heart sounds and was the first to describe several abnormal heart sounds and pulse rhythms. He was among the first to recognize the value of the drug digitalis as "the opium of the heart."

Bouillaud's medical education was interrupted when he joined Napoleon's army during the Hundred Days (1815), but he returned to study in Paris after Waterloo. His rise to prominence was rapid. He became a professor of clinical medicine at the *Charité* in Paris in 1831, publishing an important book about the diseases of the heart four years later and another about rheumatism and the heart the following year. He was the first to accurately describe endocardium and endocarditis and introduced these terms for them into medicine.

Not all of his theories were medically sound. Sometimes called "the last of the great blood-letters," he favoured rapid bleeding as treatment for fever. Nevertheless, Bouillaud was an able diagnostician.

Bouillon, ancient town in Luxembourg province, Belgium, on the Semois River in the Ardennes. It was long known for the ducal title connected with it. Bouillon in the 11th century was held by the counts of Ardennes, whom the German kings invested with the dukedom of Lower Lorraine. Because Bouil-

lon was their chief stronghold, it became usual to designate these dukes, loosely, as dukes of Bouillon, though Bouillon was not yet a duchy. In 1096 the bishopric of Liège received the town, and the bishops thereafter often styled themselves dukes of Bouillon. One Guillaume de La Marck received Bouillon in 1482; and, although Liège took it back twice in the following century, Bouillon—now formally a dukedom—eventually descended, by marriage, to Henri de La Tour d'Auvergne in 1591. The duchy remained in this line until 1794, when Bouillon declared itself a republic (it was annexed by France the next year). On the defeat of Napoleonic France, the victorious powers in November 1815 gave the sovereignty, with Luxembourg, to The Netherlands. The ducal title was adjudged in 1816 to Charles-Alain-Gabriel de Rohan, duc de Montbazou (a descendant of Henri de La Tour d'Auvergne), in whose family it remains. On the partition of Luxembourg in 1831, Bouillon became Belgian. The town, a popular summer resort, is noted for its well-preserved medieval castle, which is located in the Ardennes hills above the town. Pop. (1983 est.) 5,427.

Bouira, town, north-central Algeria. Bouira is situated southwest of the Djurdjura Mountains, near the watershed of the Isser and Soummam wadis and 58 miles (93 km) southeast of Algiers. Bouira (Arabic: "The Small Wells") is a market centre for a low-yield olive- and cereal-producing area.

The surrounding region is encompassed by the ranges and valleys of the Tell Atlas. Although it is principally a region of olive and cereal cultivation, there are also vineyards near Aïn Bessem in the north. Sour el-Ghozlane in the drier south is a trading centre for horses, cattle, and sheep. Pop. (1987 prelim.) mun., 53,065.

Boulainvilliers, Henri de, COMTE DE (count of) SAINT-SAIRE (b. Oct. 21, 1658, Saint-Saire, Fr.—d. Jan. 23, 1722, Paris), French historian and political writer who set forth a broad cultural conception of philosophical history that influenced intellectual developments in the 18th century. He was among the first modern historians to claim that historical studies can supply the tools for analyzing the state of present society.

Boulainvilliers was trained in classical studies, French history, and the sciences. He read widely and was familiar with the works of Descartes, Spinoza, Newton, and Locke. He was in military service for nine years after 1679 and subsequently set out to win back his family's fortune and to cultivate his own literary talents.

Boulainvilliers's ideas of history were developed in a number of treatises (all published posthumously), among which *État de la France*, 3 vol. (1727-28; "The State of France") traced the history of the French monarchy to the end of Louis XIV's reign. In this work, considered to be his finest, he emphasized a socio-psychological explanation of events and a broad conception of institutional development. He defended the French nobility in the *Essai sur la noblesse de France* (ed. 1732; "Treatise on the French Nobility"), in which he analyzed the decline of the French nobility, attacked the absolutism of Louis XIV, and examined the legitimacy of French political institutions.

In his writings, Boulainvilliers worked out a theory of comparative historical study, based on a critique of natural law and the demand

for a "science" of politics and reform, which approached the later writings of Montesquieu.

In addition to writing on history, Boulainvilliers also wrote on philosophy in *L'Idée d'un système général de la nature* (1683); on comparative religions in *Histoire de la religion et de la philosophie ancienne* (1700?); and on occultism and astrology, contained in several miscellaneous works.
